As illustrated in Table 2, the highest mean score was recorded for Factor 3 (M = 4.12, SD = 0.55), indicating a highly positive internal orientation toward the technical capabilities of modern AI tools. Lecturers strongly perceive AI as a valuable asset for IELTS preparation. Conversely, the lowest score was observed for Factor 4 (M = 2.15, SD = 0.84). This indicates that severe professional time limits and heavy teaching schedules act as significant barriers to the exploration and practical integration of digital toolsets. Furthermore, Factor 5 scored moderately low (M = 2.89, SD = 0.91), validating the premise that AI adoption is currently occurring in a policy vacuum, forcing teachers to rely heavily on individual instructional agency (IA) rather than structured institutional guidance.

4.2. Qualitative interview themes

4.2.1. Efficiency gains vs. Algorithmic reliability

Lecturers widely acknowledged that AI applications significantly accelerated test-prep routines, particularly for generating topic-specific vocabulary and providing initial grammatical corrections. However, severe doubts persisted regarding the linguistic accuracy of generative AI feedback when applied to complex IELTS tasks. Participants noted that while AI excels at surface-level mechanics, it struggles with the rhetorical depth required for advanced band scores.

"AI is fantastic for quickly generating a list of collocations related to global supply chains for my logistics students. It saves me hours of preparation. But when I put a student's Task 2 essay into the software, the AI grades it a 7.5 based on vocabulary alone, completely ignoring the fact that the student's central argument lacks logical progression. It cannot read like a human examiner". (Participant 04)

4.2.2. Student dependence in pragmatic cohorts

A dominant theme was the rising anxiety over student over-dependence on generative AI. Students are often highly pragmatic, tech-savvy, and focused on efficiency. Consequently, they are highly susceptible to utilizing AI as an academic shortcut rather than a cognitive scaffold. This threatens the development of authentic communicative competence.

"My logistics students are brilliant at using technology to solve problems efficiently. The downside is that they treat IELTS writing as just another task to outsource. Instead of using ChatGPT to outline ideas for a manufacturing prompt, they ask it to write the whole essay, memorize it, and try to replicate it. They are submitting to the technology rather than learning from it, which destroys their independent language processing". (Participant 11)

4.2.3. The burden of Instructional Agency

The qualitative data strongly reflected the quantitative finding regarding low institutional support (M = 2.89). In the absence of clear departmental guidelines or systematic AI literacy training, the burden of regulating AI use falls entirely on the individual teacher's instructional agency.

"We are pressured to modernize our classrooms and ensure these high-quality cohorts hit their IELTS 6.5 benchmarks, but there is no official university policy on AI plagiarism or ethical use. I have to invent my own rules and boundaries for every writing assignment. It is exhausting to police this without institutional backing". (Participant 07)

5. Discussion

The empirical results of this study offer a nuanced examination of how tertiary EFL teachers reconcile the immense promises of AI with the rigid realities of high-stakes testing. The findings validate the theoretical premise that the pedagogical integration of AI is not determined by technological availability, but is deeply mediated by teacher cognition, instructional agency, and structural support.

5.1. The dissonance of PU and SC

The exceptionally high mean for *Personal Interest and Perceived Usefulness* (M = 4.12) demonstrates that Vietnamese EFL lecturers possess a strong progressive mindset toward educational technology. They clearly recognize AI's profound potential to revolutionize traditional, labor-intensive test preparation by providing real-time, low-stakes environments for lexical experimentation. However, this optimism is severely undercut by structural realities. The exceptionally low score for *Time Constraints* (M = 2.15) and the qualitative frustrations regarding workload reveal a critical operational bottleneck. Teachers recognize the value of AI, but lack the professional bandwidth required to rigorously test algorithmic reliability, adapt their lesson plans, and integrate these tools thoughtfully. This dissonance highlights that expecting educators to seamlessly absorb AI integration into their existing, heavy teaching schedules is an unsustainable institutional strategy.

5.2. Instructional Agency and the Challenges

The qualitative findings underscore the central role of Instructional Agency (IA) in navigating the risks of algorithmic dependence. The anxiety surrounding student over-reliance is particularly acute when instructing non-language majors, such as logistics students, who often prioritize task completion and operational efficiency over the slow, recursive process of language acquisition. In these high-quality tracks, where graduates must operate independently in unscripted, global professional landscapes, authentic communicative competence is non-negotiable.

When students use generative AI to synthesize entire responses, their apparent proficiency becomes a mere artifact of the software. To counteract this, teachers must exercise high instructional agency by deliberately setting pedagogical boundaries—such as restricting AI use to the brainstorming phase or requiring students to critically critique AI-generated essays against official IELTS rubrics. This agentic, selective integration proves that AI cannot replace the contextual, human expertise of an EFL educator; rather, it demands that the teacher evolves into a critical digital media mediator.

5.3. The Institutional support and Professional Development

The moderation effect of Institutional and Ethical Support (IES) is clearly visible in the teachers' narratives. The relatively low quantitative score for institutional culture (M = 2.89) correlates directly with the qualitative exhaustion teachers expressed regarding the "policy vacuum". When institutional governance is weak, the entire burden of defining ethical AI use and managing academic integrity falls on individual instructors. This approach creates inconsistencies across classrooms and increases teacher burnout.

To move beyond superficial technology adoption, universities must transition from passive observation to active structural support. This necessitates systematic, institutionalized PD that goes beyond basic software training. Effective PD must focus on AI literacy and digital pedagogy, teaching educators how to deconstruct algorithmic biases, align automated feedback with human IELTS rubrics, and design assessments that are resilient to generative AI shortcuts.

Furthermore, clear, university-wide ethical guidelines must be established to provide teachers with the institutional backing needed to confidently exercise their instructional agency.

5.4. Overreliance on AI writing

Identifying the threat of algorithmic dependence is insufficient without offering actionable pedagogical countermeasures. To mitigate the overreliance of pragmatic, tech-savvy logistics students, EFL lecturers must deploy proactive digital pedagogy solutions that reclaim instructional agency and enforce authentic cognitive engagement. *First,* teachers can adopt a *Flipped-AI-Framework*, which strictly confines generative AI tools to the pre-writing phase. While students may use AI to rapidly generate logistics-specific collocations or map structural outlines, the actual drafting must be conducted in-class without digital assistance, ensuring the cognitive effort of translating ideas into academic English remains entirely with the learner. *Second,* educators can implement *"Reverse Evaluation Tasks"* to foster critical AI literacy. By requiring students to generate an essay using AI and actively critique its flaws against official IELTS public band descriptors, teachers shift the student's role from a passive consumer to a critical evaluator. *Finally,* moving towards *"Process-Oriented Assessment and Verbal Defenses"* neutralizes the shortcut of automated text generation. Instructors should evaluate drafting iterations rather than just the final product and implement brief, randomized verbal defenses where students orally explain their lexical or grammatical choices. Together, these strategies act as powerful deterrents against submitting unedited, AI-generated work and foster genuine communicative competence.

6. Conclusion

This study investigated the core factors influencing how Vietnamese tertiary EFL lecturers perceive and adopt AI-supported and digital technologies within high-stakes IELTS preparation frameworks, specifically for logistics-majored student cohorts in high-quality academic tracks. The findings demonstrate that technology integration in this specialized context is a highly complex, non-linear process mediated by teacher cognition, instructional agency, and structural constraints.

While lecturers exhibit strong personal interest and clearly recognize the operational utility of AI in accelerating feedback loops and enhancing vocabulary generation, their pedagogical adoption is heavily hindered by severe time constraints and a pervasive institutional policy vacuum. Furthermore, the unique pragmatic characteristics of logistics students amplify profound concerns regarding automated reliability and algorithmic dependence. When students utilize generative AI as an academic shortcut rather than a cognitive scaffold, they bypass the recursive learning processes essential for authentic language acquisition, risking misalignment with strict human-evaluated IELTS rubrics.

To ensure that AI functions as a legitimate driver of deep language learning, higher education institutions must urgently transition away from ad-hoc technological usage. It is imperative that universities implement systematic, institutionalized professional development (PD) focused on digital pedagogy and AI literacy, empowering teachers to critically evaluate algorithmic outputs. Concurrently, establishing transparent, university-wide ethical guidelines (IES) is essential to relieve the regulatory burden on individual educators. Only through deliberate, agentic integration, supported by robust institutional frameworks, can EFL practitioners maximize the transformative potential of AI while preserving the academic rigor required for sustainable, high-level English communicative competence in global professional landscapes.

Thai Ho-Van is a lecturer at the Faculty of Foreign Languages, College of Foreign Economic Relations (COFER) in Ho Chi Minh City, Vietnam. Holding a TESOL Master's degree, PhD candidate at Open University of Ho Chi Minh City, his primary research explores innovative educational methodologies, including TBL, CLIL, and EMI. His current academic focus investigates the critical integration of AI-driven tools for students, aiming to enhance English competence in higher education.

#92 BEYOND ACCURACY: PRAGMATIC FORCE IN AI-MEDIATED TRANSLATING AND INTERPRETING TRAINING

Dương Thị Hoàng Oanh, Nguyễn Xuân Đạt

Abstract

In the context of increasing attention to assessing communicative competence and real-world language use, this study explores the role of pragmatic force in AI-mediated translating and interpreting (T&I) training and assessment in English as a Second Language/ English as a Second Language (ESL/EFL) contexts, with particular relevance to language education in Vietnam. While recent advances in Artificial Intelligence (AI) have improved the accuracy and efficiency of T&I, they remain limited in capturing essential aspects of communication such as speaker/writer intention, implicature, stance, and interactional meaning. This paper therefore reconceptualises T&I assessment beyond linguistic accuracy by positioning pragmatic force as a central component of meaningful communication in technology-supported environments. Drawing on current literature and classroom-informed practices, the study examines how human–machine collaboration is reshaping T&I into human-in-the-loop models, where translators and interpreters actively monitor, adjust, and intervene to ensure pragmatic appropriateness. It also proposes practical pedagogical strategies for ESL/EFL educators, including the use of authentic, simulation-based tasks and AI-supported activities that reflect real-life communicative demands. The findings emphasise that communicative competence in T&I involves not only accurate language transfer but also the ability to interpret and convey meaning appropriately in context, especially in AI-mediated settings. The study suggests that T&I education in ESL/EFL classrooms should prioritise pragmatic awareness, critical use of AI tools, and flexible decision-making skills. In conclusion, placing pragmatic force at the heart of training and assessment can better equip students to communicate effectively and confidently in today's increasingly technology-rich professional environments.

Keywords: Pragmatic Force; Communicative Competence; AI-Mediated Tools; ESL/EFL; Translator/Interpreter Training

1. Introduction

The ability to use language appropriately in context is widely recognized as a fundamental component of communicative competence. This insight remains highly relevant in today's rapidly evolving language landscape, where advances in Artificial Intelligence (AI) are transforming the practice and training of translating and interpreting (T&I). AI-powered tools such as neural machine translation, speech recognition systems, computer-assisted translation technologies, and large language models (LLMs) have significantly enhanced the speed, accessibility, and efficiency of multilingual communication. These technologies are increasingly integrated into professional workflows and educational settings, offering valuable support for language learners, translators, and interpreters alike.

Despite these technological advances, concerns remain regarding the ability of AI systems to capture the deeper dimensions of human communication. While AI can often generate linguistically fluent and seemingly accurate translations and interpretations, it frequently struggles with aspects of meaning that depend heavily on context, culture,

interpersonal relationships, and communicative intent. Nuances such as implicature, politeness, stance, irony, persuasion, and speaker intention may be overlooked or inadequately conveyed. Consequently, a translation or interpretation that appears accurate at the lexical or grammatical level may nevertheless fail to achieve its intended communicative effect. This limitation foregrounds **pragmatic force**, the intended meaning and communicative impact of an utterance, as a critical yet often underrepresented dimension of T&I performance.

Although an increasing body of research has examined AI-assisted translation, machine translation quality, translator competence, and human, AI collaboration (Bowker, 2023; O'Hagan, 2020), comparatively little attention has been paid to how **pragmatic force should be conceptualized, taught, and assessed in AI-mediated T&I environments**. Existing studies tend to focus on linguistic accuracy, productivity, technological efficiency, or post-editing performance, while the communicative consequences of pragmatic misalignment remain underexplored. Similarly, assessment frameworks in translation and interpreting continue to privilege semantic equivalence and linguistic correctness, often providing limited guidance on how pragmatic competence can be evaluated in contexts where AI increasingly participates in the communication process. **This represents an important gap in literature, particularly within ESL/EFL educational settings where communicative competence is a central learning outcome.**

The problem addressed in this paper is that current T&I training and assessment practices do not adequately account for pragmatic force in AI-mediated communication. As AI technologies become embedded in educational and professional contexts, learners may produce or rely on linguistically accurate outputs that fail to convey intended meanings, interpersonal relationships, or culturally appropriate messages. Without explicit attention to pragmatic competence, students risk developing technological proficiency without acquiring the communicative judgment necessary to evaluate, adapt, and improve AI-generated translations and interpretations. This challenge is particularly significant in ESL/EFL contexts, where learners must simultaneously develop language proficiency, intercultural awareness, and digital literacy.

The issue is especially relevant in Vietnam. Recent educational reforms have emphasized communicative competence and international engagement, while national initiatives promoting English language proficiency have increased the importance of effective multilingual communication. At the same time, AI technologies such as ChatGPT, Google Translate, Gemini, and other language-support tools are being adopted rapidly by students and educators. As graduates prepare for increasingly technology-rich workplaces, they require not only linguistic competence but also the ability to critically evaluate AI-generated outputs, recognize pragmatic mismatches, and make informed decisions to ensure communicative effectiveness across languages and cultures.

This paper is conceptual in nature and focuses specifically on translation and interpreting training and assessment in higher-education ESL/EFL contexts, with particular reference to Vietnam. It does not attempt to evaluate the technical performance of specific AI systems, compare machine translation engines, or provide empirical measurement of learner outcomes. Rather, it examines how insights from pragmatics, communicative competence, translation studies, and AI-assisted language learning can be integrated to reconceptualize T&I education in the age of AI. Accordingly, the discussion is limited to educational and pedagogical implications for translator and interpreter training, rather than professional industry practices beyond the educational context.

Against this backdrop, the paper reconceptualizes T&I training and assessment by positioning pragmatic force at the heart of communicative competence in AI-mediated environments. It examines how human–machine collaboration is reshaping T&I into human-in-the-loop models, where translators and interpreters actively monitor, revise, and intervene to ensure pragmatic appropriateness. The paper further proposes pedagogical strategies to promote pragmatic awareness, critical AI literacy, and context-sensitive decision-making. By moving beyond accuracy as the sole benchmark of quality, the study argues for a more comprehensive understanding of T&I competence that better prepares learners to communicate effectively and professionally in an increasingly AI-driven world.

2. From Linguistic Accuracy to Communicative Competence in Translating and Interpreting

2.1 Theoretical Framework: Understanding Pragmatic Force in AI-Mediated T&I

2.1.1 Speech Act Theory: Meaning Beyond Words

This study is primarily grounded in **Speech Act Theory** (Austin, 1962; Searle, 1969), which views language as action rather than merely a vehicle for transmitting information. Austin (1962) argues that communication operates on three interconnected levels: the **locutionary act** (what is said), the **illocutionary act** (what is intended), and the **perlocutionary act** (the effect on the audience). From this perspective, successful translation and interpreting involve more than transferring linguistic content; they require preserving the intended communicative force of the original message.

Speech Act Theory provides a particularly useful lens for examining AI-mediated T&I because many translation errors arise not from lexical inaccuracies but from failures to convey illocutionary force. A machine-generated translation may accurately reproduce propositional content while misrepresenting requests, warnings, refusals, apologies, or persuasive intentions. Consequently, this theory provides the primary conceptual foundation for the notion of pragmatic force adopted in this study.

2.1.2 Systemic Functional Linguistics: Language as Social Meaning

To complement Speech Act Theory, the study draws upon Systemic Functional Linguistics (SFL) (Halliday, 1978; Halliday & Matthiessen, 2014), which conceptualizes language as a resource for meaning-making within social contexts. SFL proposes three metafunctions of language:

- Ideational metafunction: representing experience and content;
- Interpersonal metafunction: establishing relationships, attitudes, and social positioning;
- Textual metafunction: organizing messages into coherent discourse.

Among these, the interpersonal metafunction is particularly relevant to pragmatic force because it explains how speakers express politeness, authority, solidarity, evaluation, and stance. In T&I, successful communication requires preserving not only ideational meaning but also interpersonal meanings that shape audience interpretation. SFL therefore provides a framework for analyzing how pragmatic force is realized linguistically and socially.

2.1.3 Communicative Competence: Appropriateness in Context

The third theoretical pillar is Communicative Competence Theory (Hymes, 1972; Canale & Swain, 1980; Bachman & Palmer, 2010). This perspective extends language ability

beyond grammatical knowledge to include sociolinguistic, pragmatic, and strategic competences.

Within this framework, pragmatic competence refers to the ability to interpret and use language appropriately according to context, audience, and communicative purpose. For translators and interpreters, communicative competence involves not only understanding linguistic meanings but also recognizing intentions, managing intercultural differences, and making context-sensitive decisions. This perspective is particularly relevant in AI-mediated environments where human professionals increasingly serve as evaluators and mediators of machine-generated communication.

2.1.4 Conceptual Model Guiding the Study

Drawing upon these three theoretical perspectives, this paper conceptualizes successful translation and interpreting as the preservation of pragmatic force across languages and cultures.

Specifically:

Theory	Contribution to This Study
Speech Act Theory (Austin, 1962; Searle, 1969)	Explains speaker intention and communicative force
Systemic Functional Linguistics (Halliday, 1978)	Explains how interpersonal meanings are realized in discourse
Communicative Competence Theory (Hymes, 1972; Canale & Swain, 1980)	Explains appropriateness and effectiveness in context

Together, these theories underpin the central argument that successful T&I should be assessed not only according to semantic accuracy but also according to the extent to which the translated or interpreted message preserves the communicative intentions, interpersonal meanings, and audience effects of the original message.

3. Understanding Pragmatic Force in Translation and Interpreting (T&I)

3.1 Analytical Approach: Literature-Informed Thematic Analysis of Classroom Practices

Although this paper is primarily conceptual, the discussion is informed by both contemporary literature and recurring observations from translation and interpreting classrooms in Vietnamese higher-education ESL/EFL contexts. To enhance analytical transparency, examples and pedagogical implications presented throughout the paper were interpreted using a literature-informed thematic analysis approach (Braun & Clarke, 2006, 2022). Rather than testing hypotheses, thematic analysis was used to identify recurring communicative challenges observed in student translations, interpretations, classroom discussions, reflective tasks, and AI-assisted learning activities.

Through iterative review of these classroom-informed observations alongside relevant literature, several recurring themes emerged, including: (1) difficulties in recognizing speaker intention; (2) challenges in interpreting conversational implicatures; (3) inappropriate rendering of politeness and interpersonal stance; (4) misinterpretation of culturally sensitive references; and (5) overreliance on AI-generated outputs without sufficient pragmatic evaluation. These themes provide a practical lens through which the concept of pragmatic force

is examined and help connect theoretical discussions to pedagogical realities in AI-mediated T&I education.

Thematic analysis is particularly appropriate because pragmatic force often manifests through patterns of communicative misunderstanding rather than isolated linguistic errors. Accordingly, the following discussion integrates theoretical perspectives from pragmatics and translation studies with representative classroom-informed examples to illustrate how pragmatic force influences translation and interpreting quality.

3.2 Defining Pragmatic Force

While linguistic accuracy focuses on the transfer of lexical, grammatical, and semantic content, successful communication depends equally on the ability to convey what speakers or writers intend to achieve through language. This communicative effect is often referred to as pragmatic force, the intended meaning, interpersonal stance, and social action associated with an utterance within a particular context.

Pragmatic force encompasses a range of communicative dimensions, including speaker intention, implicature, politeness, evaluation, emotional stance, and audience orientation. These dimensions were also among the most frequently recurring themes identified in classroom-informed observations. In particular, students often demonstrated strong lexical comprehension while encountering difficulties in recognizing implied meanings, interpersonal positioning, and culturally embedded communicative intentions. Such recurring patterns reinforce the view that pragmatic competence extends beyond linguistic knowledge and requires sensitivity to contextual and sociocultural factors.

Pragmatic competence is essential for effective communication in any language pair (Darong 2024). For example, to translate the headline “Inside the secret mission to fly Taiwanese’s president to Africa” into Vietnamese, ChatGPT may instinctively translate “president” as “tổng thống”; such a literal translation risks neglecting pragmatic considerations and broader sociopolitical sensitivities associated with cross-strait and regional diplomatic relations involving Vietnam, China, and Taiwan: the official translation of the title into Vietnamese is “nhà lãnh đạo Đài Loan” (the leader of Taiwan). This demonstrates that pragmatic force in translation extends beyond lexical equivalence to preserving communicative intentions, contextual meanings, and appropriate social implications (Dayter et al. 2023). Therefore, meaning is shaped not only by linguistic forms, but also by contextual factors, social relationships (Leech 1983), and political viewpoints, with the meaning of an utterance extending beyond its literal semantic content to include how it is interpreted within a specific communicative situation. Similar challenges emerged in classroom activities involving AI-generated translations, where students frequently accepted linguistically fluent outputs without critically examining their political, cultural, or interpersonal implications. Thematic analysis of classroom discussions suggested that such instances were less related to vocabulary deficiencies than to difficulties in evaluating context-sensitive meanings and communicative consequences.

As House (2015) argues, translation quality cannot be assessed solely in terms of linguistic equivalence because successful communication also requires attention to functional and pragmatic appropriateness. A translation that accurately reproduces lexical meaning may nevertheless fail if it does not convey the intended interpersonal relationship, level of formality, or communicative purpose. For translators and interpreters, pragmatic force is particularly important because they serve as mediators between languages, cultures, and communicative communities. Their task is not only to transfer information but also to recreate the intended

effect of the source message for a new audience. Consequently, effective T&I requires sensitivity to contextual factors that shape meaning beyond words.

One way to assess whether a T&I successfully achieves pragmatic force is by observing the audience's response rather than checking literal accuracy (Matsushita 2026). If the target audience reacts similarly to the original audience, then the T&I can be considered successful.

It is noteworthy that a translated text or interpreted speech can be regarded as pragmatically successful when it generates an effect on the target audience that is functionally equivalent to, or closely resembles, the effect of the original on its intended audience. This means that successful translation and interpreting involve more than the accurate transfer of words and meanings; they require the preservation of communicative intent, interpersonal relationships, cultural nuances, and the overall pragmatic force of the source message. Achieving this goal requires translators and interpreters to make informed decisions regarding context, culture, audience expectations, and communicative purpose.

Pragmatic force remains a central criterion for successful communication. While AI technologies may assist with rapid linguistic processing and terminology retrieval, interpreters must still rely on contextual adaptation, clarification, and ethical judgement to preserve pragmatic fidelity. Effective interpreting therefore depends on balancing linguistic accuracy with cultural and interpersonal awareness. The future of interpreting likely depends on a hybrid model in which AI supports efficiency, while human interpreters safeguard communicative trust and socio-cultural meaning (Kokorelias et al. 2026).

3.3 Pragmatic Failure in Translation and Interpreting

The importance of pragmatic force is rooted in speech act theory. Austin (1962) distinguished among three dimensions of meaning. The locutionary act refers to the literal linguistic content of an utterance, the words and sentences that are spoken. The illocutionary act refers to the speaker's intended function, such as requesting, promising, apologizing, warning, or inviting. The perlocutionary act concerns the effect the utterance has on the listener, such as persuading, reassuring, offending, or motivating. Effective T&I requires the ability to infer and reproduce illocutionary force rather than focusing exclusively on literal content. Failure to recognize pragmatic force can result in what Thomas (1983) termed pragmatic failure, defined as "a failure to understand what is meant by what is said" (p. 91). Unlike grammatical errors, pragmatic failures may occur even when every word is translated accurately. The problem lies not in linguistic form but in the interpretation of communicative intention, and in the effect to the target language audience.

Thomas (1983) distinguished between pragmalinguistic failure, which involves incorrect interpretation of linguistic strategies, and sociopragmatic failure, which arises from differing cultural expectations and social norms. This distinction was reflected in recurring classroom observations: pragmalinguistic difficulties frequently appeared when students interpreted indirect requests, suggestions, or hedging expressions literally, while sociopragmatic difficulties were more commonly observed in situations involving differing expectations regarding politeness, hierarchy, relational pronouns, and culturally appropriate forms of address. Such patterns emerged repeatedly across interpreting simulations and AI-assisted translation tasks, suggesting that pragmatic failure remains a persistent challenge even when linguistic accuracy is relatively high. Both types are highly relevant to T&I. For example, an English speaker may say "Let's have coffee some time!" as a general friendly phrase with no concrete expectations, whereas other cultures may interpret that as an opening to make concrete plans. Similar issues arise in English-Vietnamese translation and interpreting. For

example, Vietnamese relational pronouns such as anh, chị, cô, chú, or em carry interpersonal meanings related to age, status, and social relationships that are often absent in English. Students using AI-generated translations frequently reported difficulties determining the most appropriate forms of address because machine-generated outputs tended to prioritize lexical equivalence rather than relational positioning. Thematic analysis suggested that these choices often influenced the perceived politeness and interpersonal tone of the translated message.

The importance of pragmatic force becomes even more evident in AI-mediated translation and interpreting. While AI systems have become increasingly proficient at generating fluent and semantically accurate output, they frequently struggle with irony, humour, indirect requests, politeness conventions, cultural references, and implied meanings. As a result, machine-generated translations may appear accurate while failing to achieve the intended communicative effect. For example, the English expression “That's just great” may convey genuine approval or, depending on context and intonation, sarcasm and frustration. An AI system may translate the phrase literally into another language as positive praise while missing the speaker's intended criticism.

Human translators and interpreters therefore remain indispensable in identifying pragmatic nuances, resolving ambiguities, and ensuring that translated messages fulfill their intended purposes. Understanding pragmatic force is thus essential not only for translation quality but also for the effective integration of AI into contemporary T&I practice and education.

4. AI in Translating and Interpreting: Opportunities and Pragmatic Limitations

4.1 Advances in AI Tools for Translating and Interpreting

The rapid development of artificial intelligence (AI) has transformed the field of T&I. Early rule-based and statistical machine translation systems have evolved into sophisticated neural architectures capable of generating fluent multilingual output. Today, translators and interpreters routinely use machine translation (MT), computer-assisted translation (CAT) tools, automatic speech recognition (ASR), terminology management systems, and LLMs such as ChatGPT, Gemini, and Claude.

Neural Machine Translation (NMT) has significantly improved translation quality by processing entire sentences and broader contextual information rather than translating word by word. CAT tools further enhance productivity through translation memories, terminology databases, and quality assurance functions, while advances in speech recognition and synthesis have expanded possibilities for real-time multilingual communication.

According to O’Hagan (2020), these technologies have become integral to contemporary language services, reshaping professional workflows and translator competences. Rather than replacing human practitioners, AI increasingly operates within collaborative human-machine environments.

4.2 Strengths of AI in Translation and Interpreting

AI technologies offer several advantages for translation and interpreting. Their most significant strengths are speed, consistency, and scalability. Tasks that once required substantial human effort can now be completed in seconds, enabling translators to process larger volumes of text and meet demanding deadlines.

AI systems also improve terminological consistency through translation memories and terminology management tools, which are particularly valuable in legal, medical, scientific,

and business translation. In addition, contemporary NMT systems can produce highly fluent and grammatically accurate output for routine and standardized content. As Koehn and Knowles (2017) note, recent advances in NMT have generated translations that appear increasingly natural and human-like.

4.3 Limitations in Conveying Pragmatic Force

Despite their impressive capabilities, AI systems face significant limitations when dealing with pragmatic meaning that depends not on linguistic form alone but on context, intention, culture, and interpersonal relationship. These limitations are worth examining systematically, as they define precisely where human expertise remains indispensable.

The most frequently cited problem is the gap between fluency and understanding. As Koehn and Knowles (2017) caution, neural MT systems are "remarkably fluent but not necessarily accurate in meaning" (p. 28), and fluent output can create a dangerous illusion of correctness. This becomes particularly acute when the intended meaning is indirect, embedded in cultural knowledge, or deliberately ambiguous. A striking example from Vietnamese literature illustrates the point: the phrase "Mày râu nhẵn nhụi, áo quần bảnh bao" would be rendered by most MT systems as something like "clean-shaven and smartly dressed" – a positive description. In context, however, it is a reference to the villain Sở Khanh in The Tale of Kiều, and functions as a culturally loaded warning about deceptive appearances. No amount of linguistic fluency recovers what the allusion is doing.

Politeness, hierarchy, and interpersonal stance present a related but distinct challenge. Languages encode social relationships very differently, and machine translation routinely flattens these distinctions. Vietnamese pronouns are a well-documented case: a speaker's choice among anh, chị, em, bác, cô, and dozens of other forms encodes age, gender, relative status, intimacy, and institutional context simultaneously. Rendered uniformly as "I" and "you" in English, the relational texture of the original (who is deferring to whom, who is claiming authority, what kind of relationship is being performed) disappears entirely. The propositional content survives; the social meaning does not.

Conversational implicature poses a further difficulty. Human communicators routinely infer meaning that is not explicitly stated, drawing on shared knowledge, situational context, and cultural expectations. AI systems, processing language through statistical pattern-matching rather than communicative understanding, frequently miss what a speaker intends to imply rather than say. Bender and Koller (2020) put the theoretical point sharply: language models manipulate linguistic form without possessing the experiential and cultural knowledge humans draw on when constructing meaning (p. 518). A model can recognize the words of an indirect refusal, an ironic compliment, or a face-saving hedge and still render them as if they were literal.

These limitations are compounded in cross-cultural T&I, where communication regularly requires adaptation rather than transfer. Humour, political allusion, institutional register, and culturally specific norms of appropriate speech may have no direct equivalent in the target language or culture. Consider diplomatic interpreting: a speaker's careful use of hedged, non-committal language may be a deliberate political act, signalling openness without commitment, or maintaining plausible deniability. A literal rendering that preserves the hedges may read as evasive in the target culture; one that smooths them out may inadvertently commit the speaker to a stronger position than intended. Human interpreters navigate this in real time; current AI systems lack the situational awareness to do so reliably.

For these reasons, scholars increasingly advocate a human-in-the-loop model of AI-assisted T&I – one in which AI functions as a powerful support tool whose output requires human evaluation, revision, and contextual judgement. The question is not whether AI can replace translators and interpreters, but how human expertise can be deployed most effectively alongside AI: identifying pragmatic failures, resolving ambiguities, and ensuring that translated messages achieve their intended communicative effect rather than merely their linguistic form.

5. Human-in-the-Loop: Reframing Translation and Interpreting as Collaborative Practice

5.1 The Concept of Human-in-the-Loop Translation and Interpreting

The growing integration of AI into T&I has prompted a fundamental reconsideration of the relationship between human expertise and technological assistance. Rather than viewing AI as a replacement for translators and interpreters, contemporary scholarship increasingly conceptualizes T&I as a collaborative process in which humans and machines contribute complementary strengths, which can be described as human-in-the-loop translation and interpreting.

In this model, AI systems perform tasks such as generating draft translations, recognizing speech, retrieving terminology, or suggesting linguistic alternatives, while human translators and interpreters remain actively involved in evaluating, revising, and validating the output. The role of the human participant extends beyond error correction to include critical decision-making regarding meaning, context, audience expectations, and communicative effectiveness.

One of the most visible manifestations of this model is post-editing, in which machine-generated translations are reviewed and modified by human translators. Although post-editing is often associated with improving linguistic accuracy, it increasingly involves addressing deeper communicative issues that AI systems may fail to recognize. According to Vieira (2020), "post-editing requires not only linguistic but also pragmatic judgment," highlighting the need for translators to assess whether machine-generated output successfully conveys the intended communicative force. Post-editors must therefore evaluate not only what the text says but also what it means and how it is likely to be interpreted by target audiences.

This collaborative perspective reflects broader developments in translation technology. As AI systems become more capable and self-learning, the focus shifts from performing T&I manually to managing, supervising, and optimizing interactions between human expertise and machine assistance. Consequently, the value of translators and interpreters increasingly lies in areas where human cognition and social understanding remain indispensable.

5.2 The Translator and Interpreter as Decision-Maker

The human-in-the-loop paradigm redefines translators and interpreters not as passive users of technology but as active decision-makers. While AI can generate linguistic output rapidly and efficiently, it lacks the capacity to assume responsibility for communicative outcomes. Human practitioners remain accountable for ensuring that translated messages are accurate, appropriate, ethical, and effective.

O'Hagan (2020) captures this transformation succinctly by observing that "human translators are not replaced but repositioned." Rather than competing with machines, translators and interpreters assume new roles as evaluators, mediators, quality managers, and communication specialists. Their expertise becomes particularly important in situations involving ambiguity, cultural sensitivity, interpersonal relationships, and high-stakes communication.

This repositioning also highlights the importance of professional agency. Translators and interpreters routinely make decisions regarding lexical choice, register, tone, politeness, audience adaptation, and cultural references. Such decisions require contextual awareness and communicative judgment that cannot be reduced to algorithmic procedures. In AI-mediated environments, professionals must determine when machine-generated output is acceptable, when revision is necessary, and when entirely different solutions are required.

Ethical responsibility constitutes another crucial dimension of human agency. AI systems may inadvertently generate biased, misleading, culturally inappropriate, or contextually insensitive T&I. Human oversight is therefore essential to identify potential risks and ensure responsible communication. Translators and interpreters must evaluate not only linguistic quality but also the broader social, ethical and political implications of their choices. This responsibility becomes particularly significant in domains such as healthcare, law, diplomacy, education, and public communication, where misunderstandings may have serious consequences.

As Pym (2013) argues, the emergence of machine translation requires a reconceptualization of translator competence. Rather than focusing exclusively on language transfer, future professionals need skills related to evaluation, revision, technological literacy, and intercultural mediation. In this sense, technology increases rather than diminishes the importance of human expertise.

5.3 Pragmatic Mediation as a Distinctively Human Strength

Among the many competencies required in AI-assisted T&I, pragmatic mediation remains one of the most significant areas of human contribution. As discussed in previous sections, pragmatic force encompasses speaker intention, implicature, politeness, stance, and other context-dependent aspects of meaning. These dimensions often require interpretation that extends beyond the linguistic surface of a text.

Human translators and interpreters possess the ability to draw upon cultural knowledge, social experience, contextual awareness, and inferential reasoning when interpreting communicative intent. They can recognize irony, indirectness, humour, emotional undertones, and interpersonal dynamics that may not be explicitly encoded in language. This capacity enables them to adapt messages in ways that preserve communicative purpose across languages and cultures. In contrast, AI systems primarily rely on statistical patterns learned from large datasets. Although they can generate fluent and often impressive translations, they frequently struggle with pragmatic nuances that require an understanding of human intentions and social relationships. Consequently, pragmatic mediation remains a domain in which human expertise offers substantial added value.

From a communicative perspective, translators and interpreters function not merely as language converters but as meaning negotiators. Their role involves ensuring that target audiences understand messages in ways that approximate the interpretations intended for source-language audiences. This process often requires adapting tone, adjusting politeness levels, clarifying implied meanings, and making culturally and politically appropriate choices that extend beyond literal translation.

The human-in-the-loop model therefore underscores a crucial insight: the future of T&I is not a contest between humans and machines but a collaboration that combines technological efficiency with human communicative intelligence. While AI contributes speed, consistency, and linguistic support, human translators and interpreters provide the pragmatic judgment, ethical responsibility, and intercultural competence necessary for effective communication. As

AI becomes increasingly integrated into professional practice, these uniquely human capacities are likely to become even more central to T&I education, assessment, and professional identity.

If pragmatic judgment is increasingly recognized as a core human contribution in AI-mediated T&I, then training and assessment practices must evolve accordingly. The next section therefore explores how pragmatic force can be integrated into T&I pedagogy and assessment through authentic, AI-supported learning activities that reflect real-world communicative demands.

6. Pedagogical Implications for ESL/EFL Translation and Interpreting Training

The growing integration of AI into T&I requires a fundamental reconsideration of how future translators and interpreters are trained and assessed. If communicative competence in AI-mediated environments extends beyond linguistic accuracy to include pragmatic judgment, intercultural awareness, and critical engagement with technology, then educational practices must evolve accordingly. This need is particularly pressing in ESL/EFL contexts such as Vietnam, where language education is increasingly influenced by AI tools while in many institutions still remaining shaped by examination-oriented traditions and form-focused instruction. To prepare students for contemporary professional realities, T&I training should incorporate pragmatic awareness, AI literacy, authentic communicative tasks, and assessment frameworks that recognize pragmatic force as a key component of translation quality.

6.1 Integrating Pragmatic Awareness into T&I Training

A central implication of the present discussion is the need to place pragmatic competence at the heart of T&I education. While students often receive extensive training in grammar, vocabulary, and translation techniques, they may have limited opportunities to develop awareness of how meaning is shaped by context, intention, and social interaction.

Pragmatic instruction can focus on communicative features that frequently create difficulties in cross-cultural communication, including speech acts, implicature, politeness strategies, stance, register, hedging, and interpersonal positioning. Students should be encouraged to analyse not only what speakers say but also what they intend to accomplish through language. Activities may involve comparing literal meanings with intended meanings, identifying implied messages, examining politeness strategies across cultures, and evaluating how different linguistic choices influence audience interpretation.

For example, learners can compare multiple translations of the same utterance and discuss how each version affects interpersonal relationships, levels of formality, or communicative impact. Interpreting students may analyse authentic recordings to identify indirect requests, persuasive language, culturally or politically embedded meanings that require adaptation during interpretation. Such activities help students recognize that successful T&I involves more than transferring information; it requires understanding how language functions within specific social, cultural and political contexts. Developing this awareness is particularly important in AI-assisted environments, where machine-generated output may appear accurate while failing to convey intended pragmatic meanings.

6.2 AI-Mediated Classroom Practices

Rather than prohibiting AI tools, educators should incorporate them strategically into teaching and learning activities. As AI technologies become increasingly embedded in professional practice, students need opportunities to develop the skills required to use these tools critically and responsibly.

AI platforms such as ChatGPT, Google Translate, DeepL, and speech-recognition systems can serve as valuable pedagogical resources when used appropriately. However, the goal should not be to encourage dependence on technology but to foster critical evaluation and informed decision-making. As Chapelle (2003) reminds us, "Technology should support, not replace, pedagogy." The educational value of AI therefore depends on how it is integrated into meaningful learning experiences.

In our classes, one effective approach involves asking students to compare human and AI-generated translations. The students can identify strengths and weaknesses, evaluate pragmatic appropriateness, and revise machine-generated outputs to better suit specific communicative contexts. Such activities help students develop awareness of common AI limitations related to tone, politeness, audience adaptation, and cultural nuance.

Another possibility is the use of AI-generated dialogue simulations. Our students interact with AI systems acting as clients, conference participants, healthcare professionals, or business partners, thereby practicing translation and interpreting skills in realistic communicative scenarios. These activities allow the students to experiment with different strategies while receiving immediate feedback and exposure to diverse communicative situations.

In Vietnam, where opportunities for authentic interaction with English-speaking communities outside the classes may be limited, AI tools can provide valuable supplementary exposure to varied discourse types, registers, and communicative contexts. However, we would need to emphasize that AI functions as a scaffold for learning rather than a shortcut to performance. Students must learn to question, verify, and improve AI-generated output rather than accept it uncritically.

6.3 Authentic and Simulation-Based Learning Tasks

The development of communicative competence requires learning experiences that resemble real-world professional practice. Many traditional T&I exercises often focus on isolated texts or sentence-level accuracy, providing limited opportunities for students to engage with the contextual and interpersonal dimensions of communication.

According to Gulikers et al. (2004), "authentic tasks engage learners in real-world language use" (p. 69). Such tasks require students to apply knowledge and skills in contexts that closely resemble those encountered outside the classroom.

In T&I education, authenticity can be achieved through activities such as client-based translation briefs, multilingual business correspondence, public service translation projects, conference interpreting simulations, community interpreting role plays, and media translation assignments. Students can be asked to consider audience needs, communicative objectives, cultural expectations, and ethical considerations alongside linguistic accuracy. Interpreting simulations are particularly valuable because they require learners to process language in real time while responding to interpersonal dynamics and contextual cues. For example, a community interpreting role play involving a healthcare consultation may require students to manage politeness, cultural expectations, and sensitive information while ensuring accurate communication between participants.

AI technologies can further enrich these experience by generating realistic scenarios, diverse speaker profiles, and context-specific materials. When combined with human reflection and feedback, simulation-based activities help students develop the adaptive and context-sensitive decision-making skills required in professional practice.

6.4 Redesigning Assessment Beyond Accuracy

Perhaps the most significant pedagogical implication concerns assessment. If pragmatic force is central to effective communication, then T&I assessment would need to move beyond traditional measures of linguistic accuracy and incorporate criteria that evaluate communicative effectiveness. If assessment practices often prioritize lexical precision, grammatical correctness, and semantic equivalence (while these dimensions remain important), they do not fully capture the complexities of successful communication in multilingual and AI-mediated environments. Students would need to be evaluated on their ability to interpret speaker intentions, convey appropriate levels of politeness, adapt messages to audience expectations, and make contextually appropriate decisions.

Assessment rubrics might therefore include criteria such as pragmatic appropriateness, audience awareness, intercultural sensitivity, communicative effectiveness, and critical evaluation of AI-generated output. In interpreting tasks, assessors could examine how effectively students manage interpersonal relationships, respond to contextual cues, and preserve intended illocutionary force.

Such changes are particularly relevant in Vietnam, where educational traditions have often emphasized examination performance and linguistic correctness. While these priorities have contributed to strong grammatical knowledge, they may not adequately prepare students for the communicative demands of contemporary professional environments. A shift toward communicative and pragmatic assessment would better align T&I training with the realities of globalized, technology-rich workplaces.

Ultimately, the goal of T&I education should not be merely to produce accurate translators and interpreters, but to develop reflective communicators capable of working effectively with both human interlocutors and AI technologies. By integrating pragmatic awareness, authentic learning experiences, critical AI literacy, and communicatively oriented assessment, educators can better prepare students to navigate the complex linguistic and intercultural challenges of the twenty-first century.

Several Assessment Criteria can be suggested as follows:

Dimension	***Descriptor***
Accuracy	Semantic equivalence and linguistic correctness
Pragmatic Force	Recognition and transfer of intent, tone, stance, and implicature
Cultural Appropriateness	Adaptation to sociocultural and communicative norms
Interactional Alignment	Maintenance of interpersonal and communicative relationships
AI Literacy	Ability to evaluate, critique, revise, and justify AI-generated output

These can contribute to T&I education in two important ways. First, it bridges the longstanding gap between theoretical discussions of pragmatics and practical assessment procedures. Second, it can provide a model that can be readily adapted to ESL/EFL classrooms where AI technologies are becoming increasingly accessible. Assessment would focus not only

on accuracy but also on whether students successfully identify and address pragmatic shortcomings. In this way, the students are trained to become reflective communicators capable of integrating linguistic knowledge, cultural and political awareness, and technological competence.

7. Implications for Vietnam and Global Contexts

The arguments presented in this paper have significant implications for both Vietnam and the broader international T&I community. While AI technologies continue to reshape multilingual communication, their successful integration into education and professional practice depends largely on how communicative competence is conceptualized and assessed.

Vietnam represents a particularly compelling case for reform. Over the past two decades, English language education has increasingly embraced communicative approaches; however, in many institutions T&I classroom practices and assessment systems often remain strongly influenced by examination-oriented traditions. The growing availability of AI tools creates both opportunities and challenges within this context.

On the one hand, AI has the potential to democratize access to high-quality language resources. Students from diverse educational backgrounds can now access T&I assistance, conversational practice, interpreting simulations, and immediate feedback at little or no cost. In this sense, AI may function as an educational equalizer, helping bridge gaps in resources and exposure.

On the other hand, uncritical reliance on AI may reinforce surface-level learning and create a false impression of communicative competence. Students who accept machine-generated output without evaluating its pragmatic appropriateness risk overlooking the very skills that distinguish effective translators and interpreters from automated systems. Consequently, AI literacy must be accompanied by pragmatic literacy.

Teacher preparation is equally important. Educators themselves require opportunities to develop confidence in integrating AI tools into teaching and assessment. Professional development programs should therefore address not only technological skills but also strategies for fostering critical thinking, communicative competence, and human-AI collaboration.

Although this discussion draws heavily on the Vietnamese context, the issues raised are globally relevant. Educational institutions worldwide face similar challenges as AI technologies become increasingly embedded in language learning and professional communication. The need to balance technological efficiency with human communicative judgment is therefore not unique to Vietnam but represents a broader concern for translator and interpreter education in the twenty-first century.

8. Conclusion

This paper has argued that the future of T&I education requires a shift from accuracy-centred paradigms toward broader conceptions of communicative competence. While linguistic accuracy remains a necessary component of successful T&I, it is insufficient for ensuring effective communication in increasingly complex and technology-mediated environments.

Drawing on classroom practices, observations, theories of communicative competence, pragmatics, speech acts, translation studies, and AI-assisted communication, we have demonstrated that pragmatic force occupies a central position in T&I training. Meaning is shaped not only by words and grammatical structures but also by intentions, interpersonal relationships, cultural expectations, and contextual factors. Consequently, successful

translators and interpreters must be capable of recognizing and conveying communicative meanings that extend beyond linguistic form.

The analysis has further shown that contemporary AI technologies, despite their remarkable achievements, continue to encounter significant challenges in processing pragmatic dimensions of communication. Neural machine translation systems and large language models can generate fluent and often accurate output, yet they frequently struggle with implicature, politeness, humour, cultural nuance, and context-dependent meaning. These limitations reinforce the continuing importance of human expertise.

AI helps reshape professional roles through human-in-the-loop models of collaboration. In these environments, human practitioners contribute pragmatic judgment, intercultural awareness, ethical responsibility, and communicative intelligence, capacities that remain difficult to replicate technologically. The future of the profession therefore lies not in competition between humans and machines but in productive collaboration between them.

For ESL/EFL contexts such as Vietnam, training programs would need to cultivate pragmatic awareness, critical AI literacy, contextual sensitivity, and strategic decision-making alongside linguistic competence.

Ultimately, communication is a fundamentally human activity. Although technology can facilitate communication, it cannot fully replace the social, cultural, and interpretive processes through which meaning is constructed. As Halliday (1978) suggests through his social semiotic view of language, meaning emerges through human interaction rather than linguistic forms alone. Put simply, meaning is not in words but in people. In an age increasingly shaped by AI, it is precisely this human capacity for understanding, negotiating, and communicating meaning that will remain at the heart of T&I as well as communication.

As a conceptual paper, this study has several limitations, and further research is therefore needed. First, the arguments are primarily derived from own practices, theoretical literature in pragmatics, T&I studies, communicative competence, language assessment, and AI-assisted translation, rather than from original empirical collected data, although the discussion draws on classroom-informed practices and examples from ESL/EFL contexts, particularly Vietnam. These observations were interpreted through a literature-informed thematic analysis rather than a formal empirical data collection process. Consequently, the themes discussed should be viewed as illustrative and exploratory rather than statistically generalizable. Second, the rapidly evolving nature of AI technologies presents an ongoing challenge. Large language models, neural machine translation systems, and speech-processing tools continue to improve at a pace that may outstrip existing pedagogical and assessment frameworks. Consequently, some pragmatic limitations identified here in current AI systems may become less pronounced over time, while new challenges may emerge as we explore the applicability of the framework in diverse linguistic, cultural, and professional contexts.

#94 EXPLORING THE INTERPLAY OF MOTIVATION, LEARNER AUTONOMY, AND ACADEMIC PERFORMANCE AMONG ENGLISH-MAJOR STUDENTS AT HUFLIT: A MIXED-METHODS STUDY

Ma Kinh Lac Che[1],[2], Chau Hoang Anh Phan[1], Gia Bao Duong[1] & Minh Quyen Nguyen[1]

Abstract

In Vietnamese tertiary EFL education, students are expected to take responsibility for their own learning while maintaining strong academic outcomes, yet how motivation translates into performance through learner autonomy remains insufficiently examined in institutional settings such as HUFLIT. This mixed-methods study combined survey data from 145 English-major undergraduates with semi-structured interviews from 12 participants. Partial Least Squares Structural Equation Modeling examined proposed relationships, while thematic analysis documented lived experiences. Findings revealed that learner autonomy partially mediated the relationships between both intrinsic and extrinsic motivation and academic performance. Intrinsic motivation had the strongest effect on learner autonomy ($\beta = 0.618$, $t = 12.118$, $p < .001$) and a significant direct effect on academic performance ($\beta = 0.395$, $t = 5.809$, $p < .001$). Learner autonomy was the strongest direct predictor of academic performance ($\beta = 0.436$, $t = 6.141$, $p < .001$). Extrinsic motivation showed significant but weaker effects on learner autonomy ($\beta = 0.244$, $t = 3.342$, $p = .001$) and academic performance ($\beta = 0.123$, $t = 2.085$, $p = .040$). Proportionally, learner autonomy accounted for 40.5% of intrinsic motivation's total effect and 46.3% of extrinsic motivation's total effect. Qualitative analysis identified four themes: (1) internalization of extrinsic motivation, (2) autonomy as a mechanism for addressing academic setbacks, (3) incorporation of informal digital immersion, and (4) resilience strategies for managing motivational setbacks. This study situates Self-Determination Theory and Self-Regulated Learning frameworks within Vietnamese higher education, providing practical insights for cultivating autonomous learning environments that improve English language education outcomes.

Keywords: academic performance, learner autonomy, intrinsic motivation, extrinsic motivation, EFL learners, HUFLIT

1. Introduction

1.1. Background

In Vietnamese tertiary EFL education, students are increasingly expected to take greater responsibility for their own learning while maintaining satisfactory academic outcomes. This expectation is particularly relevant for English-major students, whose language development depends not only on classroom instruction but also on sustained independent practice, strategic resource use, and continuous self-monitoring beyond scheduled lessons. Within this context, motivation and learner autonomy have become central constructs in understanding how students manage their learning and achieve academic progress. Previous research has shown that motivated learners are more likely to persist through difficulty, use effective learning strategies, and engage more deeply with academic tasks (Pintrich & De Groot, 1990;

[1] *Undergraduate student, Faculty of Foreign Languages, HUFLIT*
[2] *Corresponding author; Email: kinhlacma@gmail.com*

Zimmerman & Kitsantas, 2014). From the perspective of Self-Determination Theory, intrinsic motivation reflects students' genuine interest and enjoyment in learning, whereas extrinsic motivation refers to learning driven by external outcomes such as grades, career opportunities, or social expectations (Deci & Ryan, 2000).

In language learning, both forms of motivation may influence performance, but their effects depend on whether students can translate motivation into autonomous learning behaviours, such as setting goals, monitoring progress, seeking resources, and adjusting strategies. Learner autonomy is especially important in EFL contexts because language proficiency develops gradually and requires long-term engagement. Studies in Vietnam suggest that although university students often value independent learning, they may lack the metacognitive strategies needed to practise it effectively (Dang, 2010). Cultural factors such as family expectations, achievement pressure, and career-oriented learning may also shape how Vietnamese students internalize motivation and develop autonomy (Truong, 2025). The relationship among motivation, learner autonomy, and academic performance requires further examination in specific institutional contexts such as HUFLIT, where English-major students are expected to develop both academic competence and independent learning capacity.

1.2. Problem Statement

1.2.1. Practical Problem

Third-year English-major students at HUFLIT confront graduation requirements that impose substantial independent learning demands. As an institution that combines foreign language training with information technology education, it imposes graduation requirements that are particularly demanding: English-major students must achieve Microsoft Office Specialist (MOS) certification and a minimum of IELTS 7.0 or TOEIC 780. Beyond these certification thresholds, the university explicitly expects considerable self-directed study outside scheduled contact hours. In this setting, independent learning functions as a structural precondition for academic progression. The institution, however, possesses no evidence base delineating which motivational conditions most effectively cultivate the autonomous behaviour that its requirements presuppose. Instructional decisions concerning how best to support self-directed learning are made on institutional intuition, not empirical evidence. The practical problem is twofold: HUFLIT enforces rigorous self-directed learning demands on its English majors yet lacks a corresponding framework for understanding the motivational antecedents of the autonomous conduct those demands necessitate.

1.2.2. Research Gap

The literature to date, while extensive, has not addressed these dynamics in the institutional and cultural context that HUFLIT represents.

Western universities have supplied the samples for most published work on motivation and autonomy in language learning (Noels et al., 2000; Garcia & Pintrich, 1996). Assessment practices, pedagogical norms, and the cultural meanings attached to academic success in those contexts differ in ways that limit straightforward generalization to Vietnamese higher education. Whether findings obtained with Western undergraduates can illuminate the experiences of English majors at a Vietnamese institution remains an open empirical question.

Prior studies have treated motivation and autonomy as separate lines of inquiry which lead to a further gap in methodology approach. No investigation has positioned both of these factors simultaneously within a single structural model that estimates direct effects, indirect

pathways, and mediated relationships in one analytic framework. The field has also relied predominantly on single-method survey designs, which capture statistical associations but shed little light on the subjective processes through which students navigate motivational change or develop autonomous habits (Chong & Reinders, 2025).

Vietnamese scholarship provides a foundation but not a precedent. Research within the country has confirmed the importance of self-learning in general higher education (Dang, 2010; Dao et al., 2025). None of this work, however, has examined third-year English majors at an institution where self-directed learning is structural requirement rather than a pedagogical preference. The present study was designed to address these three gaps.

1.3. Aim and Objectives

This study aims to investigate the relationships among intrinsic motivation, extrinsic motivation, learner autonomy, and academic performance among third-year English-major students at HUFLIT. It also examines whether learner autonomy mediates the relationship between motivation and academic performance and explores how students' motivational and autonomous learning experiences shape their academic development. The specific objectives are:

To identify the reported levels of intrinsic motivation, extrinsic motivation, learner autonomy, and academic performance among third-year English-major students at HUFLIT.

To examine the effects of intrinsic and extrinsic motivation on learner autonomy.

To examine the direct effects of intrinsic motivation, extrinsic motivation, and learner autonomy on academic performance.

To test the mediating role of learner autonomy in the relationships between intrinsic motivation, extrinsic motivation, and academic performance.

To explore students' experiences of motivational change, autonomous learning practices, and responses to academic difficulties.

1.4. Research Questions

Three research questions organized the investigation:

RQ1: What are the reported levels of intrinsic motivation, extrinsic motivation, learner autonomy, and academic performance among HUFLIT English-major students?

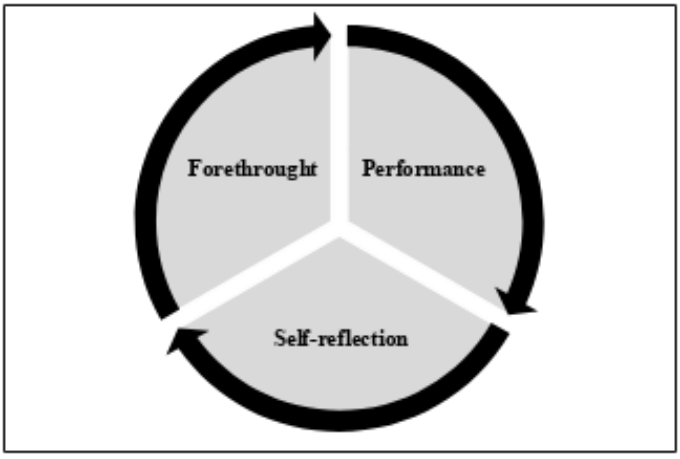
RQ2: How do intrinsic motivation, extrinsic motivation, and learner autonomy relate to academic performance among HUFLIT English-major students?

RQ3: To what extent does learner autonomy mediate the relationship between motivation and academic performance?

1.5. Significance

Theoretically, the study contributes to the literature in two respects: it extends Self-Determination Theory and Self-Regulated Learning frameworks to a Vietnamese EFL context where they have been widely cited but rarely tested with simultaneous structural modeling and qualitative corroboration, and it responds to a documented methodological gap.

The practical significance of the study is grounded in a specific institutional need. HUFLIT requires English majors to complete substantial self-directed learning beyond timetabled hours and to meet external certification benchmarks, including IELTS 7.0 or TOEIC 780, for graduation. Despite these structural expectations, the university has lacked an evidence base identifying which motivational conditions most effectively produce autonomous behaviour and improved academic outcomes.The findings supply this evidence by establishing that intrinsic motivation drives learner autonomy at more than twice the strength of extrinsic motivation and that autonomy is itself the strongest direct predictor of performance. These results carry actionable implications for HUFLIT: investment in autonomy-supportive teaching, curriculum structures that scaffold self-directed learning, and institutional acknowledgment of informal digital immersion are empirically warranted, not aspirational.



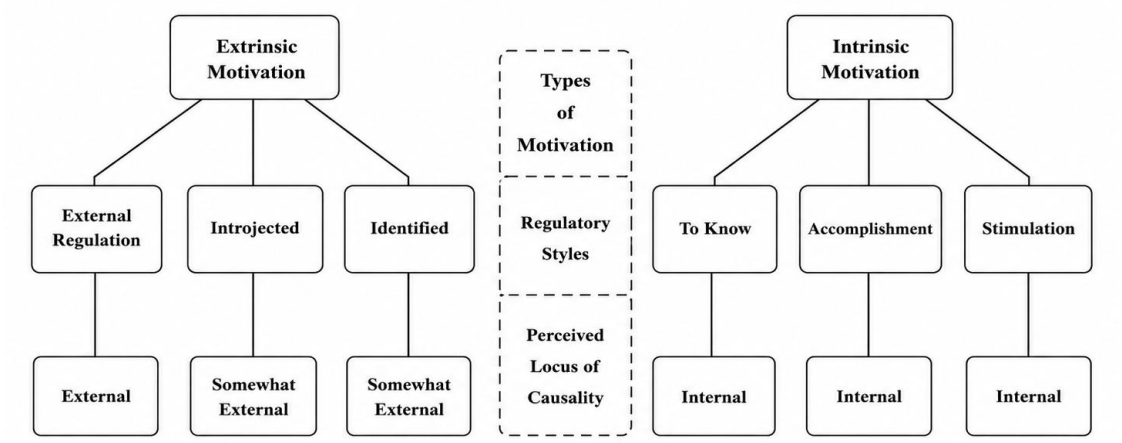
2. Literature Review

2.1. Theoretical Framework

How academic outcomes come to be shaped by motivation is a question that cannot be adequately addressed through a simple listing of variables; what is required instead is an account of the psychological mechanisms by which a learner's drive is converted into the kind of sustained effort that produces measurable achievement. This investigation has been structured around two principal theoretical traditions. Self-Determination Theory (SDT) has been drawn upon to explain where motivation originates and under what conditions it becomes internalized, while Self-Regulated Learning (SRL) theory has been employed to describe the behavioural processes through which motivation is translated into academic attainment. Where the specific circumstances of Vietnamese EFL education raise questions that are not fully addressed by these two frameworks alone, Expectancy-Value Theory and Goal Orientation Theory have been used to supplement the analysis.

Figure 1

Cyclic Phase Model of SRL (Zimmerman, 2002)



The self-regulatory process was characterized by Zimmerman (2002) as a cycle composed of three distinct phases, each of which feeds into the next and is characterized by its own set of cognitive activities. During the forethought phase, goals are established by learners and strategies are selected on the basis of what is judged to be most appropriate for the task at hand. In the performance phase, the execution of those strategies is monitored against the goals that were set, and cognitive and metacognitive techniques are deployed as circumstances

require. The self-reflection phase is where outcomes are evaluated and inefficiencies are identified, after which the cycle is repeated. What is emphasized by this model, in contrast to more passive conceptions of learning, is the position of the learner as an active agent who continuously calibrates their effort in response to the feedback generated by their own monitoring activities. It has been confirmed by Sinkkonen and Tapani (2024) that this cyclical framework continues to occupy a central position in SRL research conducted within higher education settings. It was also noted by these authors that digital learning environments have introduced challenges for which the original model was not designed, including the need to manage online resources, navigate content that is shaped by algorithmic curation, and maintain concentration in contexts that have been engineered to compete for attention.

The relevance of self-regulation to language learning has been difficult to overstate in the literature, given the manner in which proficiency tends to accumulate. Because language development proceeds slowly and unevenly, and because the demands of different tasks can vary considerably, sustained engagement over extended periods is required of learners, along with a capacity to adjust their strategies as those demands shift (Wenden, 1998). Students who make habitual use of metacognitive strategies, maintain a robust sense of efficacy, and engage in the systematic tracking of their own progress have been found to outperform those who depend on surface-level study routines (Pintrich & De Groot, 1990; Zimmerman & Kitsantas, 2014). Within formal education, self-regulation has been conceptualized as something more than a study skill; it has been positioned as a foundational mechanism through which autonomous capacity is developed, by which learners are furnished with the metacognitive infrastructure needed to direct their own progress without ongoing teacher supervision (Nakata, 2014).

Figure 2

Motivation types, regulatory styles, and perceived locus of causality

A distinction that has become central to the study of academic motivation was drawn by Deci and Ryan (2000) between behaviour that is undertaken for the inherent satisfaction it provides, which was classified as intrinsically motivated, and behaviour that is driven by outcomes separable from the activity itself, such as grades, credentials, or social recognition, which was classified as extrinsically motivated. The value of SDT for the present investigation, however, lies less in this binary distinction than in how externally regulated behaviour has been mapped by the theory along a continuum of internalization. At one end of this continuum, external regulation refers to behaviour that is maintained through the administration of rewards

or the avoidance of punishment. Further along, introjected regulation has been characterized as involving internal pressure that is rooted in guilt or self-esteem. Identified regulation is said to emerge when a person has come to consciously value an activity as personally important, and integrated regulation — positioned as the most autonomous form of extrinsic motivation — is understood to occur when externally originating values have been fully assimilated into the self, so that the behaviour in question is experienced as self-determined rather than externally imposed. The same activity, whether it involves preparing for an examination or completing a course assignment, can be powered by any of these regulatory processes, and the psychological outcomes associated with each have been shown to differ considerably.

The conditions under which internalization occurs have been specified by SDT with reference to three basic psychological needs such as autonomy, competence, and relatedness, which are understood to function as catalysts when they are satisfied (Deci & Ryan, 2000). The available evidence has been broadly consistent with this proposition. Among L2 learners, intrinsic motivation and identified regulation have been found to be predictive of effort, persistence, and actual achievement (Noels et al., 2000). Sustained gains in both engagement and academic performance have been observed when autonomy-supportive teaching practices are implemented (Reeve & Jang, 2006). Similar findings have been reported across a range of foreign language contexts (Dornyei & Csizer, 2012), and positive associations between perceived classroom autonomy and intrinsic goal orientation, task value, and self-efficacy have been identified among college students (Garcia & Pintrich, 1996).

Two additional theoretical perspectives have been used to connect these frameworks to the Vietnamese higher education context within which the present study was conducted. According to Expectancy-Value Theory (EVT), academic behaviour is shaped by students' expectations regarding their likelihood of success and the value that is attached by them to the task in question (Eccles & Wigfield, 2020). This has been considered particularly relevant in settings where English proficiency has come to function as a gateway to employment, family approval, and academic advancement (Truong, 2025). Goal Orientation Theory (GOT) has been used to distinguish between a mastery orientation, in which the development of competence is the primary objective, and a performance orientation, in which the demonstration of ability relative to others is prioritized (Pintrich & Schunk, 2002). Both perspectives have contributed to the interpretation of the data collected for this study, though neither has been assigned the central explanatory role that SDT and SRL occupy.

2.2. Prior Studies and Hypothesis Development

The theoretical traditions reviewed in Section 2.1 converge on a central proposition: motivated learners who take ownership of their learning tend to achieve more. Yet translating this general insight into a set of testable, directional predictions requires a closer look at what the empirical record actually says about each link in the chain. The evidence is not uniformly strong across all pathways, and some relationships rest on firmer ground than others. The pages that follow examine the seven relationships that together form the conceptual model tested in this study, moving from the most established connections to those for which the literature offers more qualified support.

2.2.1. Intrinsic Motivation and Academic Performance

Documentation of the positive effects of intrinsic motivation on educational outcomes existed across a wide range of settings and age groups. Students who engage with learning

material (in the context of English material) out of genuine interest, curiosity, and enjoyment tend to grasp the concept at greater depth, show persistence when faced difficulty, and deploy more sophisticated cognitive and metacognitive strategies than those whose efforts are primarily for external goals (Deci & Ryan, 2000). Early research in the classroom environment by Pintrich and De Groot (1990) showed that intrinsic value was among the strongest motivational predictors of achievement, operating partly through its influence on self-regulated strategy use. A similar pattern has been reported in the domain of second language acquisition, where intrinsically motivated learners consistently demonstrate superior effort, persistence, and attainment. Noels et al. (2000) discovered that intrinsic motivation and more self-determined forms of regulation predicted both subjective engagement and objective language outcomes. More recently, Zhou and Ahmad (2025) confirmed that learning motivation exerted a positive and significant impact on academic outcomes. At the meta-analytic level, evidence across multiple studies was synthesised by Alamer et al. (2025) and concluded that autonomous forms of motivation (intrinsic motivation and identified regulation) correlated consistently with L2 achievement, whereas controlled motivation did not. When these findings are considered alongside Zimmerman and Kitsantas's (2014) evidence that self-motivated students outperform peers who rely on external incentives, a clear empirical trend emerges: the more a student's engagement is sourced from pure interest in the subject, the stronger the academic results tend to be. Based on this evidence, the first hypothesis is proposed:

H1: Intrinsic motivation has a positive direct effect on academic performance.

2.2.2. Extrinsic Motivation and Academic Performance

Motivation that originates outside the learner's interest demonstrates a more complicated mechanism. Extrinsically regulated behaviour is directed by outcomes that are separable from the activity itself such as grades, career credentials, social approval, or the avoidance of negative consequences. SDT does not dismiss extrinsic motivation as inherently detrimental; rather, it maps extrinsic regulation onto a continuum that ranges from fully controlled compliance to fully integrated self-endorsement (Deci & Ryan, 2000). Where a student falls on this continuum matters considerably for outcomes. At the controlled end, learning tends to be shallow and engagement fragile. Vallerand and Bissonnette (1992) demonstrated that less self-determined motivational styles predicted weaker persistence and lower academic performance in a prospective study of college students.

Internalization, however, alters the dynamic considerably. When a student encounters a graduation requirement (a minimum of IELTS 7.0 or TOEIC 780 and MOS certificates) or perceives a career credential as personally meaningful, extrinsic motivation can support achievement in ways that resemble intrinsic motivation, albeit with smaller effect sizes. Nagle (2021), applying EVT to university-level Spanish learners, found that utility value, an inherently extrinsic orientation, significantly predicted both course persistence and final grades. Zhou and Ahmad (2025) reported a similar pattern: extrinsic motivation made a positive contribution to academic performance, despite having a substantially smaller coefficient than intrinsic motivation. The weight of evidence therefore suggests a direct pathway from extrinsic motivation to performance, but one that is narrower than the intrinsic route:

H2: Extrinsic motivation has a positive direct effect on academic performance.

2.2.3. Intrinsic Motivation and Learner Autonomy

Among the four constructs in the present model, the bond between intrinsic motivation and learner autonomy has attracted perhaps the most sustained theoretical attention. SDT

conceptualizes autonomy as a fundamental psychological need. Activities pursued for their inherent satisfaction should, by the theory's own logic, orient learners toward greater self-direction (Deci & Ryan, 2000). In classroom settings, this bidirectional dynamic operates when students perceive genuine choice in their academic work, they report stronger intrinsic motivation, and students who are intrinsically motivated actively seek out opportunities for independent learning. Garcia and Pintrich (1996) provided early evidence for this reciprocal pattern among college students, showing positive associations between perceived classroom autonomy and intrinsic goal orientation, task value, and self-efficacy.

More recent work has sharpened the picture considerably. Ceylan (2021) reported a significant positive correlation between learner autonomy and motivation in a sample of Turkish EFL students, with the relationship holding across multiple dimensions of autonomous learning. The argument was taken a step further through experimental manipulation: when students were given the freedom to choose whether their attendance counted toward their grade, they attended more reliably and performed better than students for whom attendance had been mandated, showing that genuine choice operates as the mechanism driving autonomous engagement (Cullen & Oppenheimer, 2024). Wang et al. (2024) extended this reasoning by demonstrating that teacher autonomy support enhanced Chinese EFL undergraduates' speaking performance indirectly, operating through satisfaction of basic psychological needs and increased classroom engagement.

Evidence from prior studies in Vietnam points in the same direction. Dang (2010) observed that English-major students who valued the language for its intrinsic properties were far more likely to engage in self-directed study than those driven solely by examination pressures or family expectations. Thi et al. (2022) surveyed EFL students across Vietnam and reached a similar conclusion that the strongest predictor of autonomous learning was whether students studied by choice, not whether they were chasing a grade. In addition, collectivist values cut both ways when students have internalized them, autonomy grows and when students comply without personal endorsement, autonomy suffers (Linh & Loi, 2024). Taken together, these findings support a strong, positive pathway from intrinsic motivation to learner autonomy. Hence:

H3: Intrinsic motivation has a positive direct effect on learner autonomy.

2.2.4. Extrinsic Motivation and Learner Autonomy

At first glance, the notion that externally driven motivation might enhance autonomous learning seems less plausible than the intrinsic case. Nevertheless, it follows logically from the internalization continuum described in SDT. When students operate under external pressures such as demands of a competitive job market, certification threshold, or even strong family expectations, they are not simply passive. These conditions can elicit behaviours that autonomy scales measure: systematic goal-setting, strategic resource use, and persistent self-monitoring. Deci and Ryan (2000) argued that satisfaction of the needs for competence and relatedness, alongside autonomy, facilitates the gradual transformation of externally regulated behaviour into personally endorsed action. Empirical support for this proposition, though less voluminous than for the intrinsic pathway, has accumulated steadily. Tao and Jing (2023) found that autonomous motivation served as a significant mediator between self-discipline and reduced academic procrastination, suggesting that behaviours initially sustained by external discipline can, over time, become internalized and self-regulated. Danilenko et al. (2018) contended that the structural features of contemporary higher education, such as modular curricula, independent project work, and digital learning platforms, create conditions under which externally prompted study gradually evolves into autonomous practice. The Vietnamese data

offer a parallel trajectory. Several studies have documented that although undergraduates initially study for instrumental reasons, many develop genuine autonomous learning routines as they progress through their degree programmes (Dang, 2010; Dao et al., 2025). None of this implies that the extrinsic pathway rivals the intrinsic one in magnitude; motivation that remains contingent on external rewards without adequate internalisation tends to yield compliance rather than authentic self-regulation. The fourth hypothesis therefore captures the more qualified prediction:

H4: Extrinsic motivation has a positive direct effect on learner autonomy.

2.2.5. Learner Autonomy and Academic Performance

The SRL framework describes the process of converting energy from motivation into measurable achievement through the mechanism provided by autonomy. In detail, autonomous learners move through phases of forethought, performance, and self-reflection (Zimmerman & Kitsantas, 2014). Language learning follows a protracted and uneven developmental trajectory; it places particularly heavy demands on this cycle, making self-regulatory competence a near-necessity for sustained improvement. The empirical case for a direct autonomy-to-performance link has been built across multiple EFL contexts. Cao and Pho (2025) documented a significant positive relationship between learner autonomy and academic performance in a tertiary EFL sample, with autonomous learners registering notably higher grades than their less self-directed peers. Nakata (2014) argued that self-regulation constitutes a foundational mechanism for developing autonomous capacity in formal schooling, precisely because it equips learners with the metacognitive tools to manage their own progress independent of teacher direction. Intervention-based studies have strengthened this case further. Ismail et al. (2023) showed that embedding self-regulated learning practices into EFL assessment design boosted both learner autonomy and self-efficacy, with downstream gains in achievement. Hsieh and Hsieh (2019) observed a similar pattern at the behavioural level: students who independently curated resources and managed out-of-class study outperformed those who relied exclusively on instructor-provided materials. In a setting such as HUFLIT, where students are expected to complete substantial self-directed work outside timetabled hours and where graduation hinges on externally benchmarked proficiency thresholds, autonomy is unlikely to be merely helpful; it is plausibly the single most important behavioural determinant of academic outcomes. The following hypothesis captures this expectation:

H5: Learner autonomy has a positive direct effect on academic performance.

2.2.6. Learner Autonomy as a Mediator of Intrinsic Motivation

The five direct relationships reviewed above, taken together, point toward a more complex structure than a simple additive model would suggest. Intrinsic motivation does not appear to influence academic performance through a single, unbroken channel. Part of its effect travels through the autonomous behaviours that intrinsic interest tends to generate. A student who genuinely enjoys English does not merely pay closer attention in lectures; they also set personal learning goals, seek out supplementary materials, practice outside the classroom, and evaluate their own development, each of which independently strengthens academic outcomes. The logic is straightforward: intrinsic interest fuels self-directed action, and self-directed action produces achievement.

Support for this mediated pathway comes from the pattern of evidence already assembled. Section 2.2.3 established that intrinsic motivation robustly predicts learner autonomy; Section 2.2.5 established that learner autonomy robustly predicts academic performance; and Section 2.2.1 confirmed that a direct route from intrinsic motivation to

performance also exists. The mediation hypothesis simply formalises what these three findings jointly entail, namely, that autonomy carries a meaningful share of intrinsic motivation's total effect. Accordingly:

H6: Learner autonomy mediates the relationship between intrinsic motivation and academic performance.

2.2.7. Learner Autonomy as a Mediator of Extrinsic Motivation

A parallel mediating logic extends to extrinsic motivation, though the mechanism differs in a theoretically important manner. When a student's primary drive is instrumental, whether a required certification, a desired career path, or a family expectation, that drive alone cannot elevate academic performance unless it translates into concrete, self-regulated activity. A student who needs IELTS 7.0 to graduate does not achieve that score simply because the requirement exists; they achieve it because the requirement prompts them to build a study schedule, seek feedback on their writing, track their listening comprehension over time, and adjust their strategies when practice test results disappoint. If they fail to develop these autonomous behaviours, the external pressure remains inert. The empirical basis for this expectation follows the same logic that underpins **H6**.

Extrinsic motivation positively predicts learner autonomy (Section 2.2.4), learner autonomy positively predicts academic performance (Section 2.2.5), and the direct, unmediated effect of extrinsic motivation on performance is comparatively weak (Section 2.2.2). Because externally sourced motivation relies more heavily on behavioural implementation than the intrinsic variety does, and no inherent enjoyment carries the learner through difficulty, a larger share of its total effect should pass through the autonomy pathway. The final hypothesis is therefore:

H7: Learner autonomy mediates the relationship between extrinsic motivation and academic performance.

2.3. Hypotheses

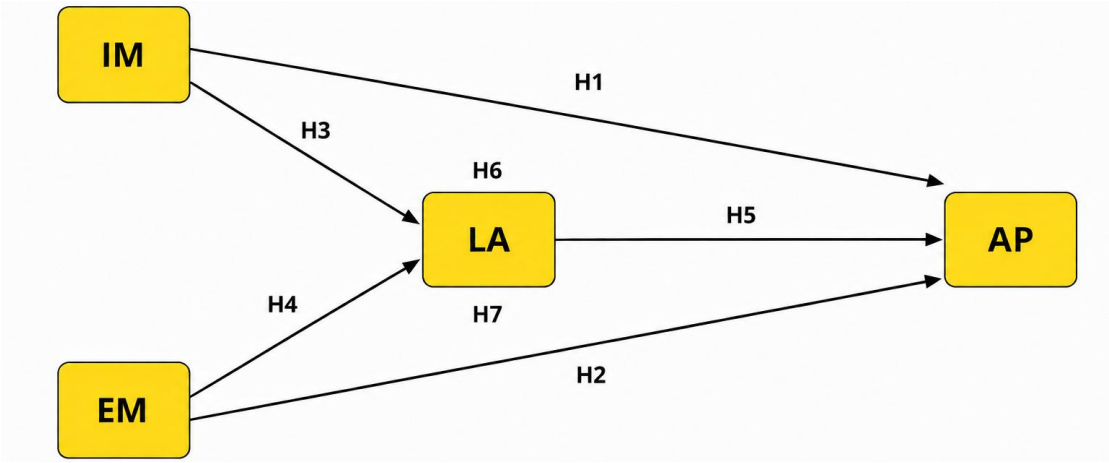
Based on the theory and evidence reviewed in Sections 2.1 and 2.2, seven hypotheses were formulated. Figure 3 presents the conceptual framework with these hypothesized relationships:

H1: Intrinsic motivation has a positive direct effect on academic performance.

H2: Extrinsic motivation has a positive direct effect on academic performance.

H3: Intrinsic motivation has a positive direct effect on learner autonomy.

H4: Extrinsic motivation has a positive direct effect on learner autonomy.



H5: Learner autonomy has a positive direct effect on academic performance.

H6: Learner autonomy mediates the relationship between intrinsic motivation and academic performance.

H7: Learner autonomy mediates the relationship between extrinsic motivation and academic performance.

Figure 3

Conceptual Framework of Motivation, Learner Autonomy, and Academic Performance

3. Methodology

3.1. Research Design

The study employed a mixed-methods explanatory sequential design (Creswell & Plano Clark, 2018). Quantitative data were collected and analyzed first, followed by qualitative data to elaborate and contextualise the quantitative results. The rationale is twofold: quantitative methods identify patterns, test structural relationships, and estimate effect magnitudes, while qualitative methods reveal the subjective experiences and contextual nuances underlying statistical associations.

3.2. Research Setting and Participants

The study was conducted at HUFLIT during the second semester of the 2025 academic year. A convenience sampling method was used to recruit participants from the population of third-year students enrolled in English-major programmes within the Faculty of Foreign Languages. Third-year students were targeted because they had completed sufficient exposure to the university's English-language curriculum to have formed relatively stable motivational orientations and autonomous learning patterns, while still remaining actively engaged in major coursework. Within this target group, participants were recruited on a voluntary basis from accessible class sections.

As shown in Table 1, most participants were female (n = 95, 65.5%). English Language Teaching represented the largest major group (n = 60, 41.4%), followed by Business English (n = 40, 27.6%). Most students reported a GPA of 2.5 or above (n = 140, 96.6%), indicating that higher-performing students may have been more likely to participate in the survey.

Table 10

Demographic Characteristics of Participants (N = 145)

Demographic	Variable	Frequency	Percentage (%)
Gender	Male	50	34.5
	Female	95	65.5
Major	English Language Teaching	60	41.4
	Business English	40	27.6

Demographic	Variable	Frequency	Percentage (%)
	Translation & Interpretation	15	10.3
	English-Chinese Bilingual	15	10.3
	Office Administration	10	6.9
	Logistics	5	3.4
GPA (Self-reported)	< 2.5	5	3.4
	2.5–3.0	58	40.0
	3.0–3.2	42	29.0
	3.2–4.0	40	27.6

The qualitative sample consisted of twelve participants selected through purposive maximum-variation sampling to ensure representation across the range of motivational profiles (high intrinsic, high extrinsic, mixed, low-moderate, and transition from extrinsic to intrinsic) and GPA levels (2.5–3.0, 3.0–3.5, and 3.5–4.0). Pseudonyms were assigned to protect participant confidentiality.

Table 11

Interview Participant Characteristics

Pseudonym	Major	GPA Range	Motivation Profile
January	Business English	3.5–4.0	High Intrinsic
February	English Language Teaching	3.5–4.0	High Intrinsic
March	Translation & Interpretation	3.0–3.5	Mixed (Internalizing)
April	English-Chinese Bilingual	3.0–3.5	High Extrinsic
May	Business English	2.5–3.0	Low-Moderate
June	English Language Teaching	3.5–4.0	High Intrinsic
July	Office Administration	3.0–3.5	Moderate Extrinsic
August	Business English	3.5–4.0	High Intrinsic
September	Translation & Interpretation	3.0–3.5	Mixed
October	English Language Teaching	3.5–4.0	Transition (Extrinsic→Intrinsic)
November	Business English	3.0–3.5	High Intrinsic
December	English-Chinese Bilingual	3.5–4.0	High Intrinsic

Note. Pseudonyms are used to protect participant confidentiality.

3.3. Research Instruments

A structured questionnaire comprising 24 items was developed to measure Intrinsic Motivation, Extrinsic Motivation, Learner Autonomy, and Academic Performance, with six items for each construct. The motivation items were adapted from Self-Determination Theory and L2 motivation research (Deci & Ryan, 2000; Noels et al., 2000; Vallerand & Bissonnette, 1992; Afzal et al., 2010). Learner autonomy items were informed by learner autonomy and

self-regulated learning studies (Dang, 2010; Gardner, 2007; Nakata, 2014; Zimmerman & Kitsantas, 2014), while academic performance items were adapted from studies on motivation, self-regulation, and achievement (Pintrich & De Groot, 1990; Alhadabi & Karpinski, 2020; Cao & Pho, 2025). All items were contextualized for Vietnamese tertiary EFL students and rated on a 5-point Likert scale. The questionnaire was piloted with 10 HUFLIT English-major students excluded from the primary sample. Cronbach's alpha values from the pilot confirmed satisfactory internal consistency for all four scales. Experts in Applied Linguistics and TESOL reviewed the items for content validity, and their feedback informed refinements to item wording for the target population.

Semi-structured interviews lasting 8 to 15 minutes were conducted with the twelve qualitative participants, either in person or via digital conferencing platforms, and were audio-recorded with participants' consent. The semi-structured interview protocol was developed based on the study's conceptual framework and prior research (Deci & Ryan, 2000; Noels et al., 2000; Dang, 2010; Gardner, 2007; Zimmerman, 2002). It focused on four areas: students' initial motivation for choosing English, factors sustaining or weakening motivation, autonomous learning behaviours, and strategies for overcoming motivational difficulties. Credibility was supported through member-checking, in which three participants reviewed summaries of their interview responses and confirmed the accuracy of the researchers' interpretations.

3.4. Data Collection Procedures

Data collection proceeded in three phases: distributing the Google Forms survey to eligible third-year English majors via Zalo groups and QR codes (open for two weeks with one reminder); inviting survey respondents to volunteer for interviews; and selecting twelve participants via maximum-variation sampling for individual interviews. All responses were anonymized.

3.5. Data Analysis

Quantitative data were analyzed in two stages. Descriptive statistics, including means, standard deviations, and frequency distributions, were computed using SPSS to characterize the sample's motivational and autonomy profiles. Partial Least Squares Structural Equation Modeling was then conducted using SmartPLS 4.0. PLS-SEM was selected over covariance-based SEM because of its suitability for predictive and exploratory research, its robustness with smaller samples, and its capacity to accommodate non-normal data distributions (Hair et al., 2019).

The PLS-SEM analysis followed the two-stage procedure recommended by Hair et al. (2019). In the first stage, the measurement model was evaluated through indicator reliability (outer loadings $\geq .7$), internal consistency reliability (Cronbach's alpha and composite reliability $\geq .7$), convergent validity (AVE $\geq .5$), and discriminant validity (HTMT $< .9$). In the second stage, the structural model was assessed through collinearity diagnostics (VIF < 3), path coefficients and significance testing (bootstrapping with 5,000 subsamples), explanatory power (R^2), effect sizes (f^2), and mediation analysis using the bootstrapped indirect effects procedure.

Qualitative data were analyzed following Braun and Clarke's (2006) thematic analysis procedures. Interview recordings were transcribed and read repeatedly to ensure familiarization

with the data. Initial codes were generated inductively from participants' responses, then grouped into candidate themes that reflected recurring patterns in students' motivational changes, autonomous learning behaviours, and coping strategies. These themes were reviewed, refined, and confirmed through member-checking to enhance credibility.

3.6. Reliability and Validity

Reliability and validity were addressed through multiple procedures. The questionnaire items were adapted from established studies on motivation, learner autonomy, self-regulated learning, and academic performance, then contextualized for Vietnamese tertiary EFL students. Content validity was strengthened through expert review in Applied Linguistics and TESOL, and wording was refined after a pilot test with 10 students. Internal consistency was assessed using Cronbach's alpha, composite reliability, and rho_A, while convergent validity was examined through outer loadings and Average Variance Extracted (AVE). Discriminant validity was evaluated using the HTMT criterion. For the qualitative phase, credibility was enhanced through repeated reading, thematic refinement, and member-checking.

4. Results

4.1. Quantitative Findings

4.1.1. Descriptive Statistics

All four variables demonstrated high mean scores, indicating that HUFLIT English-major students generally reported positive levels of motivation, learner autonomy, and perceived academic performance. Table 3 presents the descriptive statistics for all constructs.

Table 12

Descriptive Statistics for All Variables (N = 145)

Variables	***M***	***SD***
Intrinsic Motivation	3.95	0.83
Extrinsic Motivation	3.85	0.79
Learner Autonomy	3.97	0.76
Academic Performance	3.95	0.77

Note. M = Mean; *SD* = Standard Deviation

As shown in Table 3, Learner Autonomy had the highest mean score (M = 3.97, SD = 0.76), followed closely by Intrinsic Motivation and Academic Performance, both at M = 3.95. Extrinsic Motivation was slightly lower but still above the midpoint of the 5-point scale (M = 3.85, SD = 0.79). At the item level, several responses help clarify these construct-level patterns. For intrinsic motivation, the strongest item was IM4: "I genuinely love learning the English language" (M = 4.16, SD = 0.856), indicating strong personal interest in English. For extrinsic motivation, EM2: "I learn English because it will help me get a better job in the future" received the highest rating (M = 4.14, SD = 0.933), showing that career value was the most salient external driver. Within learner autonomy, LA5: "I take responsibility for my English learning because it matters to me" had the highest score (M = 4.09, SD = 0.83), suggesting that students generally perceived themselves as responsible for their own learning. For academic performance, AP1: "My English course grades reflect my learning progress" was the highest-rated item (M = 3.99, SD = 0.901). Overall, the descriptive findings indicate that students showed strong intrinsic interest, clear career-oriented motivation, a high sense of learning responsibility, and generally positive perceptions of their academic progress.

4.1.2. Measurement Model Assessment

Prior to testing the structural hypotheses, the measurement model was evaluated against four criteria established by Hair et al. (2019): indicator reliability, internal consistency reliability, convergent validity, and discriminant validity.

Overall, the measurement model demonstrated satisfactory reliability and validity. All indicators loaded strongly on their intended constructs, internal consistency was confirmed through Cronbach's alpha, rho_A, and composite reliability, and convergent validity was supported by AVE values above the recommended threshold. Discriminant validity was also established, as all HTMT values remained below 0.90. These results indicate that the four constructs: Intrinsic Motivation, Extrinsic Motivation, Learner Autonomy, and Academic Performance were measured reliably and distinctly, providing a sound basis for testing the structural model.

Indicator reliability. All 24 indicators produced outer loadings exceeding the 0.7 threshold. Loadings ranged from 0.731 for EM6 to 0.907 for IM2. Table 4 displays the complete loading matrix.

Table 13

Outer Loadings for All Indicators

	AP	**EM**	**IM**	**LA**
AP1	0.767			
AP2	0.802			
AP3	0.877			
AP4	0.894			
AP5	0.872			
AP6	0.848			
EM1		0.733		
EM2		0.775		
EM3		0.823		
EM4		0.752		
EM5		0.805		
EM6		0.731		
IM1			0.890	
IM2			0.907	
IM3			0.834	
IM4			0.873	
IM5			0.878	
IM6			0.824	
LA1				0.853
LA2				0.871
LA3				0.849
LA4				0.812
LA5				0.803
LA6				0.810

Note. All outer loadings exceed the recommended threshold of 0.7 Hair et al. (2019).

The consistently high loadings confirm that each observed variable adequately represents its respective latent construct.

Internal consistency and convergent validity. Table 5 presents Cronbach's alpha (α), composite reliability (rho_a and rho_c), and Average Variance Extracted (AVE) for all four constructs.

Table 14

Measurement Model Summary

Construct	α	rho_a	rho_c	AVE
Intrinsic Motivation	0.933	0.935	0.948	0.754
Extrinsic Motivation	0.865	0.871	0.897	0.594
Learner Autonomy	0.912	0.916	0.932	0.695
Academic Performance	0.919	0.922	0.937	0.713

Note. α = Cronbach's alpha; rho_c = composite reliability; AVE = average variance extracted.

Cronbach's alpha values ranged from 0.865 (Extrinsic Motivation) to 0.933 (Intrinsic Motivation), all substantially exceeding the 0.7 threshold. Composite reliability (rho_c) values ranged from 0.897 to 0.948. Three of the four constructs cleared the 0.9 threshold commonly associated with excellent reliability; Extrinsic Motivation landed in the good range, which is not surprising given its broader conceptual umbrella. All AVE values exceeded the 0.5 benchmark established by Fornell and Larcker (1981). Intrinsic Motivation had the highest AVE (0.754), indicating that this latent construct explains 75.4% of the variance in its six indicators. The comparatively lower AVE for Extrinsic Motivation (0.594) is theoretically consistent with the broader conceptual scope of this construct, which spans diverse external influences including grades, career prospects, parental expectations, graduation requirements, social recognition, and family obligation.

Discriminant validity. The Heterotrait-Monotrait (HTMT) ratio of correlations, presented in **Table 6**, confirmed discriminant validity for all construct pairs, with all values falling below the 0.9 threshold recommended by Henseler et al. (2015).

Table 15

HTMT Ratio Matrix for Discriminant Validity

Construct	AP	EM	IM	LA
Academic Performance (AP)	–			
Extrinsic Motivation (EM)	0.612	–		
Intrinsic Motivation (IM)	0.847	0.598	–	
Learner Autonomy (LA)	0.875	0.601	0.823	–

Note. All HTMT values < 0.9 Henseler et al. (2015).

The highest HTMT was between Academic Performance and Learner Autonomy (0.875), expected given their structural relationship, and the lowest between Extrinsic and Intrinsic Motivation (0.598), confirming their empirical distinction.

4.1.3. Structural Model Assessment

Collinearity among predictor constructs was evaluated; all inner VIF values fell well below the threshold of 3, confirming that multicollinearity does not bias the regression estimates (Table 7).

Table 16

Inner VIF Values for Predictor Constructs

Endogenous Construct	Predictor	VIF	Status
Learner Autonomy	Intrinsic Motivation	1.456	No collinearity
Learner Autonomy	Extrinsic Motivation	1.456	No collinearity
Academic Performance	Intrinsic Motivation	1.523	No collinearity
Academic Performance	Extrinsic Motivation	1.489	No collinearity
Academic Performance	Learner Autonomy	1.612	No collinearity

Note. VIF < 3 indicates no problematic multicollinearity Hair et al. (2019).

The structural model was tested using bootstrapping with 5,000 subsamples. Table 8 presents the standardised path coefficients, standard errors, *t*-values, *p*-values, and 95% confidence intervals for all five direct-effect hypotheses.

Table 17

Structural Model Path Coefficients and Hypothesis Testing

H	Path	β	*SE*	*t*	*p*	95% CI	Status
H1	IM → AP	0.395	0.068	5.809	$< .001$	[0.262, 0.528]	Supported
H2	EM → AP	0.123	0.059	2.085	.040	[0.007, 0.239]	Supported
H3	IM → LA	0.618	0.051	12.118	$< .001$	[0.518, 0.718]	Supported
H4	EM → LA	0.244	0.073	3.342	.001	[0.101, 0.387]	Supported
H5	LA → AP	0.436	0.071	6.141	$< .001$	[0.297, 0.575]	Supported

Note. IM = Intrinsic Motivation; EM = Extrinsic Motivation; LA = Learner Autonomy; AP = Academic Performance; Bootstrapping = 5,000 subsamples.

All five direct-effect hypotheses were supported (Table 8). The IM → LA path was the largest coefficient in the model ($\beta = 0.618$), approximately 2.5 times the size of EM → LA ($\beta = 0.244$). Learner Autonomy was the strongest direct predictor of performance ($\beta = 0.436$), exceeding the direct effect of Intrinsic Motivation ($\beta = 0.395$). Extrinsic Motivation's direct contribution was modest ($\beta = 0.123$).

Figure 4

Structural Model Path Coefficients

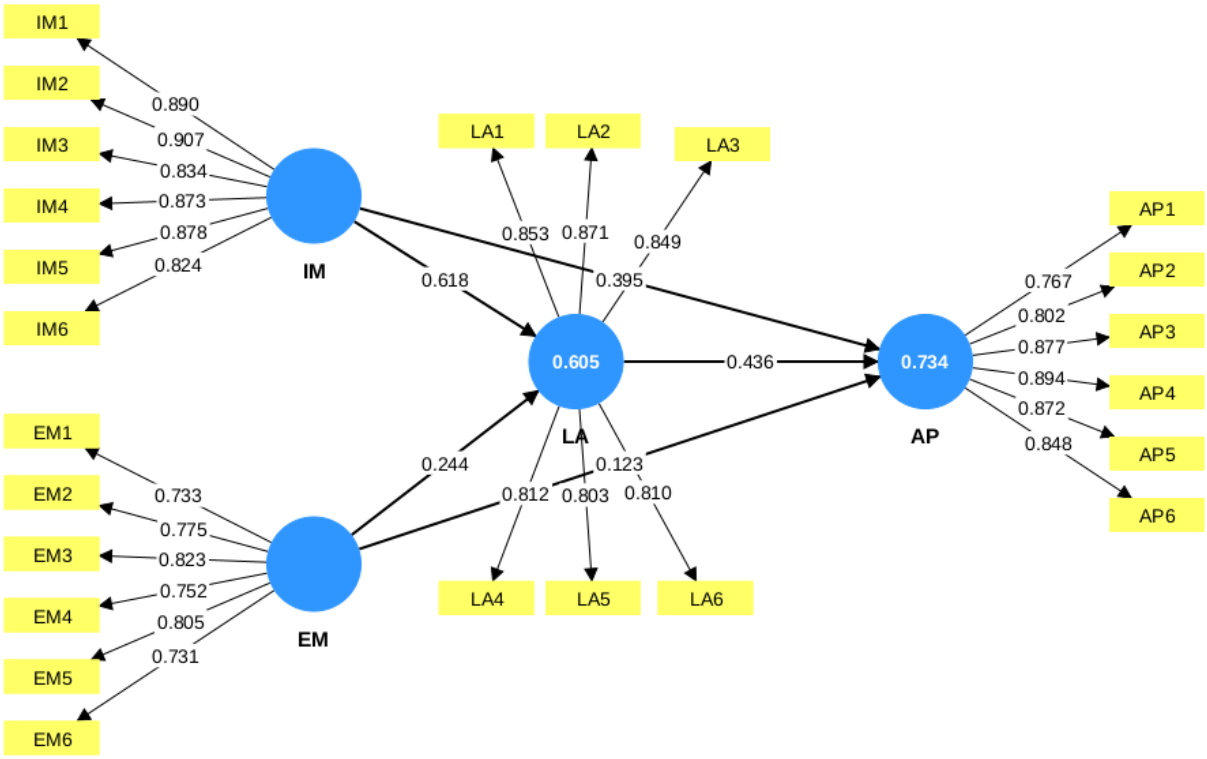


Figure 4 shows the standardized path coefficients and R^2 values for the endogenous constructs. The model explained 73.4% of the variance in Academic Performance ($R^2 = 0.734$; adjusted $R^2 = 0.728$) and 60.5% of the variance in Learner Autonomy ($R^2 = 0.605$; adjusted $R^2 = 0.600$).

Table 18

Effect Sizes (f^2) for Path Relationships

Path	f^2	Effect Size	Interpretation
IM → LA	0.684	Large	Substantial impact
LA → AP	0.282	Medium	Meaningful impact
IM → AP	0.245	Medium	Meaningful impact
EM → LA	0.106	Small	Limited impact
EM → AP	0.036	Small	Limited impact

Note. f^2 = Effect Size; thresholds: 0.02 = small, 0.15 = medium, 0.35 = large Cohen (1988).

The effect size for IM → LA ($f^2 = 0.684$) considerably exceeded Cohen's (1988) threshold for a large effect, and this effect size was approximately 6.5 times larger than that of EM → LA ($f^2 = 0.106$).

Table 19

R^2 Values for Endogenous Constructs

Construct	R^2	Adj. R^2	Predictors	Interpretation
Academic Performance	0.734	0.728	LA, IM, EM	Substantial

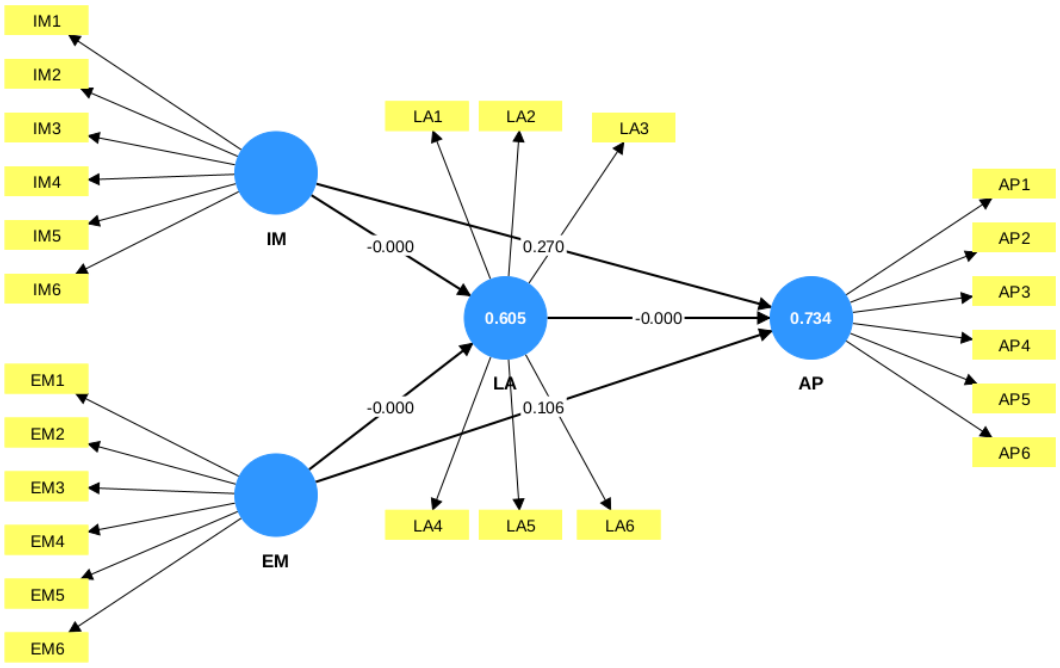
Construct	R^2	Adj. R^2	Predictors	Interpretation
Learner Autonomy	0.605	0.600	IM, EM	Moderate to Substantial

Note. R^2 values indicate proportion of variance explained; adjusted R^2 accounts for model complexity.

The combined predictors explained 72.8% of the variance in Academic Performance (adjusted $R^2 = 0.728$) and 60.0% of the variance in Learner Autonomy (adjusted $R^2 = 0.600$). Both values exceed benchmarks for substantial explanatory power in social science research Hair et al. (2019).

Table 20

Indirect Effects and Mediation Analysis



H	Mediation Path	Indirect β	*SE*	*t*	*p*	95% CI	VAF	Status
H6	IM → LA → AP	0.270	0.054	4.981	< .001	[0.163, 0.375]	40.5%	Supported
H7	EM → LA → AP	0.106	0.038	2.789	.006	[0.032, 0.188]	46.3%	Supported

Note. N = 145; bootstrapping = 5,000 subsamples; Mediation proportion = Indirect Effect / (Direct Effect + Indirect Effect).

Both mediation hypotheses were supported, indicating partial mediation. Learner Autonomy accounted for 40.5% of intrinsic motivation's total effect on performance (β_indirect = 0.270, p < .001) and 46.3% of extrinsic motivation's total effect (β_indirect = 0.106, p = .006). The higher proportion for extrinsic motivation indicates that external drivers depend more heavily on self-regulated learning behaviours to translate into academic outcomes.

Figure 5

Specific Indirect Effects through Learner Autonomy

Both indirect paths in Figure 5 were significant: intrinsic motivation through learner autonomy (β = 0.269, t = 4.981, p < .001) and extrinsic motivation through learner autonomy (β = 0.106, t = 2.789, p = .006). Although intrinsic motivation produced the larger absolute indirect effect, the mediated proportion was higher for extrinsic motivation (46.3% vs. 40.5%), indicating that external drivers depend more heavily on autonomous learning behaviours to affect performance.

4.2. Qualitative Findings

Thematic analysis of the twelve semi-structured interviews yielded four overarching themes, summarised in Table 12.

Table 21

Qualitative Themes and Key Findings

Theme	Core Finding	Supporting Hypotheses
Motivational Transition	Students evolve from external to internal motivation through internalization	H2, H4, H6, H7
Autonomy as Self-Regulation	Autonomy involves strategic help-seeking, metacognitive strategies, and resource curation	H3, H4, H5
Informal Immersion	Daily English media consumption bridges classroom and real-world proficiency	H1, H3, H6
Resilience Strategies	Students employ diverse coping mechanisms to recover from motivation fluctuations	H1, H2, H7

Theme 1: Motivational Transition.

The first theme concerns students' gradual movement from externally driven motivation to more internalized forms of engagement. Many participants reported that their initial reasons for learning English were strongly shaped by grades, family expectations, career plans, or the desire to meet academic requirements. However, by the third year, these external reasons had often become more personally meaningful. Rather than studying English only to satisfy external demands, students increasingly described learning as part of their own academic growth and future identity.

October clearly illustrated this shift: "In my first year, I mostly studied English because I cared about my GPA and did not want to fall behind. Later, I began to feel that improving my English was something I wanted for myself, not only something I had to do for school." Similarly, March explained, "Grades and teacher feedback still motivate me, but they are no longer the only reasons. I want to improve my English because I can see how it helps me become more confident and prepared for my future work." These accounts suggest that external motivators did not disappear; rather, they were gradually internalized and connected to students' personal goals.

Several participants also described motivation as a combination of internal interest and external discipline. For example, August stated, "My interest in English keeps me engaged, but external expectations also remind me to stay disciplined when I feel tired or distracted." This pattern is consistent with Self-Determination Theory, which argues that extrinsic motivation can support learning when external goals become personally valued. Overall, the theme shows that HUFLIT English-major students' motivation is not fixed but develops over time through the interaction between academic pressure, personal interest, and future-oriented goals.

Theme 2: Autonomy as Self-Regulation

The second theme reveals that learner autonomy among HUFLIT English majors was not a solitary or passive trait but an active repertoire of coordinated self-regulatory strategies. Students consistently described a structured approach to independent learning: they would first exhaust their own resources before seeking external help, and they deployed a range of metacognitive tools to monitor and direct their own progress.

Technology played a central role in this self-regulatory system. February, for instance, was deliberate in choosing which tools to engage: "I use lots of AI tools, but I don't use tools like ELSA, I use ChatGPT because it gives me lots of nuances in the words, in the word choice, word use, the meaning of the word, and also it diversified my structures." His use of artificial intelligence was not indiscriminate but tightly targeted at refining lexical precision and syntactic variety, a pattern that reflects the selective resource deployment characteristic of self-regulated learners. A different kind of resourcefulness emerged in November's strategy, which he called stage-skipping: "During that intermediate phase where I didn't know what to study, I deliberately sought out more advanced materials. By doing so, I could identify exactly what foundational knowledge I was lacking before tackling those advanced concepts. From there, I formulated a tailored roadmap to patch up those knowledge gaps." Rather than following a linear progression, he repurposed advanced content as a diagnostic instrument to locate his own weaknesses.

The sequential logic of independent work followed by strategic help-seeking appeared consistently across interviews. October captured the principle succinctly: "When encountering difficult vocabulary or confusing grammar structures, my first reflex is to play 'detective'. I look it up in dictionaries like Oxford or Cambridge, Google it, or search on language forums to solve the problem independently. If it takes too much time and I am still stuck, I will then ask my top-performing classmates or message the lecturer directly for help." This two-stage approach, in which learners maximized their own effort before turning to external sources, aligns closely with the forethought, performance, and self-reflection phases described in Zimmerman's (2002) cyclic model of self-regulated learning. The consistent pattern across participants indicates that autonomous learning, as practised by these students, was a deliberate and systematic process rather than an unstructured pursuit of independent study.

Theme 3: Informal Digital Immersion

The third theme captures how English had become embedded in students' daily lives through self-initiated exposure to digital media, functioning as a deliberate supplement to formal instruction. Participants described a range of informal immersion practices that they pursued independently of coursework, and they articulated clear reasons for separating these activities from academic obligations.

For some, informal media consumption doubled as both a learning objective and a motivational anchor. June explained, "One more thing that made me excited is that learning English will help me to understand movies, songs, and videos without subtitles." The prospect of unaided comprehension served as a tangible benchmark of progress, pulling her engagement forward. Others embedded English so thoroughly into daily routines that it ceased to feel like study at all. "I always search in English," January reported. "Try to expose yourself to English by searching in English. Try to do everything in English so you get used to it. You don't feel strange when you encounter new words or like you are in a scenery where you can only speak English." In her account, English had become a default operating medium rather than a subject to be mastered.

October went further, arguing that the motivational power of informal immersion depends on keeping it separate from academic demands: "I would advise you to spend 15-20 minutes every day consuming English content that you genuinely love -- whether that's watching vlogs, reading comics, or listening to podcasts. Just make sure it has absolutely nothing to do with your school textbooks. It will nurture your learning inspiration in the long run." This deliberate partitioning preserved the intrinsic enjoyment of the language and insulated it from the performance pressures of formal coursework. Across all accounts, informal immersion was consistently framed as a conscious pedagogical choice rather than passive entertainment. Students selected content, monitored their comprehension, and adjusted their practices over time, positioning these activities as an extension of, rather than a departure from, their formal language education.

Theme 4: Resilience Strategies

The fourth theme documents the diverse coping strategies that students employed to recover from periods of diminished motivation. Every participant reported experiencing motivational lapses, with common triggers including disappointing test results, heavy academic workloads, stalled progress, and competing personal demands. The strategies they described fell into four broad clusters: turning toward the language for relief, reaching forward through goal recall, responding structurally through planning, and turning outward toward social support.

The most vividly articulated strategy involved converting motivational setbacks into a matter of personal identity. July internalized this outlook into a phrase she repeated to herself: "I have a slogan to my mind at that time that you must learn, you must learn for yourself. If you don't eat, you cannot die. But if you don't study, you will die. So it becomes my go-to slogan." Framing learning as existential rather than optional transformed it from a task into a self-defining commitment. Others favoured a more pragmatic reset. May explained, "To overcome this, I usually take a short break then I make a simple study plan and start again." Her approach combined regulated rest with small, achievable targets that restored a perceived sense of agency over her circumstances.

Temporary disengagement from formal study was another recurring pattern, though its logic was counterintuitive: recovery came not from working harder but from stepping away. October recalled, "I put the theoretical textbooks aside for a few days. I found my inspiration again by watching English YouTube channels and podcasts about topics I actually enjoy, like psychology or movie reviews. It reminded me of my original reason for loving English, which gave me the momentum to get back on track with my university studies." By reconnecting with the intrinsic pleasure of the language through self-selected content, she replenished the motivational energy that academic routines had depleted. Across the sample, resilience did not appear to be a fixed trait but a set of strategies that students refined through repeated experience. Several participants noted that recovery from motivational lows became easier over time, suggesting that the capacity to bounce back from difficulty may consolidate into a durable disposition across successive cycles of challenge and recovery. The presence of multiple strategy types within individual participants further indicates that resilient students did not rely on a single coping mechanism but drew flexibly from a personal repertoire depending on the nature and severity of the motivational setback.

5. Discussion

The structural model accounted for 73.4% of the variance in academic performance ($R^2 = 0.734$; adjusted $R^2 = 0.728$) and 60.5% of the variance in learner autonomy ($R^2 = 0.605$; adjusted $R^2 = 0.600$), indicating that the motivation-autonomy-performance framework explains a substantial proportion of student outcomes in this context. This section synthesizes the quantitative and qualitative findings along three thematic lines, closing with an integrated assessment.

5.1. Intrinsic Motivation as the Primary Driver

As the results have shown, intrinsic motivation dominated the model by a considerable margin. Its effect on learner autonomy ($\beta = 0.618$, $t = 12.118$, $p < .001$, $f^2 = 0.684$) was more than two and a half times that of extrinsic motivation ($\beta = 0.244$, $t = 3.342$, $p = .001$, $f^2 = 0.106$). The direct path from intrinsic motivation to performance ($\beta = 0.395$, $t = 5.809$, $p < .001$, $f^2 = 0.245$) reached roughly three times the corresponding extrinsic route. This indicates that genuine interest in English functions as the primary driver of academic outcomes in this sample.

Interview data provide insight into the mechanisms underlying these coefficients. August stated that genuine interest in English eliminated the need for external prompting: “When you really like something, you don’t need anyone to tell you to do it. I automatically search for materials, watch videos, and practice without being assigned." This self-initiating quality is consistent with SDT’s claim that intrinsically motivated behaviour arises from its own satisfaction (Deci & Ryan, 2000). January described a similar mechanism in which long-standing exposure to English-language media established a perception of the language as accessible, generating a positive feedback loop between competence and continued engagement. October described a different trajectory, in which intrinsic motivation emerged not as an initial disposition but as an acquired orientation through the reorganization of her learning around authentic materials.

The disparity between the two coefficients (ratio exceeding 2.5 to 1) carries a practical implication. If the objective is to develop autonomous learners, instructional effort concentrated on cultivating genuine interest is likely to yield greater returns than effort directed at strengthening external incentives. The qualitative data suggest that interest cultivation is an environmental condition rather than a single intervention: participants who reported strong intrinsic motivation described exposure to authentic materials, instructors who modelled enthusiasm, and the gradual recognition that English could serve personal interests beyond the prescribed curriculum.

5.2. The Conditional Value of Extrinsic Motivation

Extrinsic motivation produced significant but substantively weaker effects. The EM → AP direct path reached significance ($\beta = 0.123$, $t = 2.085$, $p = .040$, $f^2 = 0.036$), as did the EM → LA path ($\beta = 0.244$, $t = 3.342$, $p = .001$, $f^2 = 0.106$); both were classified as small effects. The mediation results qualify this interpretation. Learner autonomy accounted for 46.3% of extrinsic motivation's total effect on academic performance, a higher proportion than the 40.5% observed for intrinsic motivation. The observation of higher proportion for extrinsic motivation reflects its smaller total effect, which translates to externally driven factors depend more heavily on the self-regulatory behaviours to produce measurable outcomes. When career requirements or institutional deadlines push students to set goals, monitor progress, and self-evaluate, those self-regulatory routines become the operative mechanism through which performance improves. The small direct effect of EM on AP further supports this interpretation;

absent the behavioural mediation of autonomy, extrinsic motivation carries limited independent force.

The qualitative evidence also points to variability in how external motivators function depending on their level of internalization. March offered a measured characterization by acknowledging that "grades and feedback are encouraging" yet emphasized that his primary drive was "to improve my English for myself, not just for school." This duality reflects SDT's internalization continuum in Figure 2. Students who remained nearer the controlled end of this continuum derived less benefit, while those who had achieved identified or integrated regulation, who could describe a career ambition as personally meaningful, were more likely to activate the autonomy pathway. This model aligns with Permzadian and Shen (2024), who found that expectancy-value constructs predicted outcomes largely through self-regulatory behaviour. In Vietnam, utility value served as the strongest motivational predictor because career-oriented goals, once internalized, drive sustained autonomous effort (Truong, 2025). A practical implication follows: where career pragmatism constitutes a central value, the evidence supports helping students connect external requirements to goals they personally value.

5.3. Learner Autonomy as the Key Mechanism

Among the three dependent variables, learner autonomy was the strongest direct predictor of academic performance ($\beta = 0.436$, $t = 6.141$, $p < .001$, $f^2 = 0.282$), surpassing the direct influence of intrinsic motivation. Autonomy functioned as the mechanism through which both forms of motivation channelled approximately 40 to 46 percent of their total effect, confirming the partial mediation hypothesized in **H6** and **H7**.

Qualitative data clarify the behaviours through which this mediation operates. October's systematic process of consulting dictionaries and online searches before approaching classmates or lecturers, February's use of ChatGPT to refine "nuances in word choice," and November's "stage-skipping" technique, which used advanced materials diagnostically, all exemplify the self-regulatory behaviours that Zimmerman's cyclic SRL model describes. These findings confirm that the forethought, performance, and self-reflection phases theorized as universal are observable among Vietnamese English majors. The data also reveal culturally inflected patterns: students frequently positioned autonomous behaviour as a compensatory response to instructional limitations, and informal immersion functioned as an extension of formal learning. This suggests that SRL in this context operates partly as a culturally adaptive mechanism enabling learners to bridge gaps between institutional resources and personal learning needs.

A tension in the autonomy data merits acknowledgement. The quantitative findings returned an LA mean of 3.97, the highest among all four constructs, yet several interview participants described significant discrepancies between their intentions and day-to-day execution (April's gaming distractions, September's lapses in focus, October's periods of feeling "overwhelmed, demotivated, and honestly, quite lazy"). These admissions do not invalidate the LA scores, as self-report instruments measure perceived autonomy rather than objectively observed behaviour. They do suggest that future research employing behavioural measures would strengthen claims about autonomous learning behaviour in this population.

5.4. Integrated Assessment

The structural model's explanatory power provides empirical support for the theoretical integration of SDT and SRL as a framework for understanding academic outcomes among

Vietnamese English majors. One contribution of the present study is the magnitude of the observed effects relative to benchmarks from Western EFL research. The large effect size for the IM → LA path ($f^2 = 0.684$) indicates that intrinsic motivation makes a particularly strong contribution to autonomy in this sample. This pattern is consistent with prior research linking self-determined motivation, self-regulation, and achievement (Noels et al., 2000; Zimmerman & Kitsantas, 2014). In a Vietnamese setting where teacher-centred instruction has historically constrained self-direction, strong intrinsic interest may function as a disproportionately powerful catalyst. SDT predicts that autonomy-supportive conditions amplify intrinsic engagement, and the present data are consistent with this prediction.

A further contribution concerns the mediation analysis. The finding that EM depends more heavily on the autonomy pathway (46.3%) than IM does (40.5%) refines SDT's internalization continuum by quantifying the differential dependence. Investing in intrinsic interest development strengthens performance through dual channels, direct cognitive engagement and indirect autonomy-driven learning. Relying predominantly on external incentives places heavier demand on the simultaneous cultivation of self-regulatory skills.

The qualitative data supply a developmental dimension that the structural coefficients alone cannot convey. The four interview themes outline a trajectory in which external pressures are progressively internalized, autonomous behaviours undergo iterative refinement, English becomes woven into daily life through self-selected media, and the capacity to recover from motivational setbacks consolidates into a durable disposition. This trajectory is not self-executing. The interviews indicate that it depends on exposure to effective teachers, access to authentic materials, opportunities to experience competence, and an institutional culture in which independent learning is treated as a baseline expectation. Where those enabling conditions are present, the statistical chain from motivation through autonomy to performance takes concrete form as a developmental pathway.

6. Conclusion

6.1. Summary of Findings

This study examined the interplay of motivation, learner autonomy, and academic performance among third-year English-major students at HUFLIT. Across the sample, students reported moderately high intrinsic motivation, a well-developed sense of ownership over their English learning, and broadly favourable perceptions of their academic progress. The structural model confirmed that the three predictors together captured the core motivational architecture of achievement in this population, yet beneath the uniformly positive self-reports a clear hierarchy of influence emerged.

Learner autonomy stood at the centre of the system. It was the strongest direct predictor of academic performance and served as the primary conduit through which both forms of motivation flowed toward achievement. Intrinsic motivation proved the more powerful of the two motivational sources, driving autonomy at more than double the strength of extrinsic motivation and exerting a meaningful direct effect on performance in its own right. Extrinsic motivation, while significant, depended proportionally more heavily on the autonomy pathway: although its absolute indirect effect was smaller than that of intrinsic motivation, a larger share of its total effect on performance was mediated through learner autonomy. In practical terms, this means that career ambitions and certification pressures at HUFLIT, where graduation requires IELTS 7.0 or TOEIC 780 alongside the Microsoft Office Specialist credential, translate into better grades only when students convert those external demands into concrete, self-regulated action.

The qualitative evidence showed that students did not simply study more; many had constructed systematic repertoires of autonomous practice that included setting specific learning goals, monitoring their own progress, selecting materials matched to their needs, integrating English-language media into daily routines, and deploying adaptive strategies to recover from motivational lulls. A recurrent gap between students' perceived autonomy and their day-to-day discipline suggested that HUFLIT English majors may overestimate their self-directed capacity, while individual lecturers surfaced repeatedly in interviews as pivotal figures whose influence on both motivation and autonomy fell outside the quantitative model. Taken together, the findings indicate that academic success for HUFLIT English majors depends not on being motivated or autonomous in isolation, but on building a self-reinforcing cycle in which genuine interest in the language fuels self-directed behaviour, and self-directed behaviour, in turn, deepens both competence and motivation over time.

6.2. Limitations

Several limitations constrain interpretation. The cross-sectional design prevents causal inference; data collected at a single time point cannot establish whether intrinsic motivation precedes autonomy development or whether the relationship is reciprocal. The reliance on self-report instruments introduces potential common-method bias, reflected in uniformly high means and the possibility of ceiling effects.

Academic performance was operationalised through self-reported perceived GPA and self-assessed proficiency rather than objective institutional records, a choice that reflects the theoretical commitments of the study. Within both SDT and SRL, self-evaluation and perceived competence function as motivational constructs in their own right rather than mere proxies for objective outcomes. An institutional GPA captures only final results, whereas perceived performance additionally encompasses the learner's sense of progress, self-appraisal, and academic self-concept, dimensions that are central to the frameworks guiding this research. The resulting limitation is therefore specific: our findings cannot speak to how motivation and autonomy relate to institutionally recorded grades. Future studies should address this by triangulating self-report measures with objective GPA data and standardized proficiency indicators.

6.3. Future Directions

Longitudinal designs tracking students across multiple semesters would permit examination of causal direction and developmental change. Incorporating objective performance measures (official GPA records, standardised test scores) and behavioural indicators would strengthen the evidentiary basis for claims about the autonomy-performance relationship. The qualitative findings regarding teacher influence suggest that future quantitative models should include instructor-related variables as potential moderators. The discipline gap between self-reported autonomy and acknowledged inconsistency warrants investigation through methods pairing self-report scales with time-use diaries or experience sampling. Comparative studies across multiple Vietnamese institutions and across Southeast Asian contexts would help clarify which patterns are institution-specific and which reflect more general features of motivation and autonomy development in collectivist educational cultures.

Acknowledgment

This study was developed from a student research project for the course Project 02: Scientific Research Methods. The research team sincerely thanks Dr. Tran Quang Bao Phuc for his guidance and feedback. The team also expresses appreciation to the Board of the Faculty

of Foreign Languages, HUFLIT, and the third-year English-major students who supported and participated in the study.

During the preparation of this manuscript, an LLM was used for language polishing and proofreading. The tool was used to improve phrasing, grammatical accuracy, and stylistic consistency. No AI tool generated research content, analyzed data, formulated interpretations, or produced the qualitative findings. All intellectual content, including the research design, data collection, statistical modelling, thematic analysis, and substantive argumentation, represents the original work of the authors. The authors reviewed all AI-assisted revisions and accept full responsibility for the accuracy and integrity of the final manuscript.

Bionote

Ma Kinh Lac Che is an undergraduate student in the English Language programme at HUFLIT. His research interests center on the role of motivation in language learning and its measurement through structural equation modeling, particularly the application of quantitative methods to explore how intrinsic and extrinsic motivation shape academic outcomes in Vietnamese higher education.

Chau Hoang Anh Phan, also an undergraduate English Language student at HUFLIT, focuses on learner autonomy and self-regulated learning practices among tertiary EFL students. Her contribution to this study centers on understanding how students develop independent learning behaviours and how these behaviours translate into academic achievement.

Gia Bao Duong is an undergraduate English Language student at HUFLIT whose work combines quantitative and qualitative approaches. His research examines the lived experiences of English learners in Vietnamese university settings, using mixed methods to capture both the statistical structure and the subjective reality of language learning.

Minh Quyen Nguyen, an undergraduate English Language student at HUFLIT, is primarily interested in academic performance assessment and the psychological factors that influence English language achievement. His role in this study involved identifying the motivational and behavioural predictors that most strongly contribute to student success in EFL contexts.

.

#98 BEYOND THE PROMPT: A METACOGNITIVE ANALYSIS OF STUDENT AI INTEGRATION IN HIGHER EDUCATION

Hien Ngoc Nguyen Le[1]

Abstract

This study examines how third-year students at Vietnam Aviation Academy (VAA) utilize Generative Artificial Intelligence (GenAI) tools like ChatGPT and Google Gemini in their learning to enhance their linguistic capacity. As these tools become increasingly universal, there is a growing demand to understand how students in high-stakes English for Specific Purposes (ESP) programs can capitalize on Artificial Intelligence (AI)'s power to navigate their learning autonomy and maximize their language acquisition. Grounded in Flavell's (1979) metacognition theory, this study employed a convergent parallel mixed-methods design combining a structured survey of 62 students with their open-ended written responses. The current quantitative results highlighted a pronounced regulatory paradox: students planned AI use deliberately for lower-order tasks, characterized by vocabulary support and grammatical correction, yet they seldom verified AI outcomes against their course materials and adjusted their strategies for subsequent tasks. Reflexive thematic analysis based on four key themes (i.e, form-focused comfort zone, verification impasse, dependence-aware ambivalence, and scaffolding hunger) in which the last theme emerged inductively from data rather than the theoretical framework. AI integration offers two strands: students' cognitive offloading is not a knowledge deficit but an ecological adaptation to learning pressure as students use AI to encounter the threats of deadlines and academic competition. The paper concludes with pedagogical implications for integrating AI from an unstructured oracle into a disciplined cognitive mirror in ESP programmed at VAA.

Keywords: metacognitive regulation, generative artificial intelligence, cognitive offloading, aviation English, student perceptions.

1. Introduction

The proliferation of generative artificial intelligence (GenAI) has radically reshaped the realm of higher education and global language learning. As such, in the setting of English for Specific Purposes (ESP), the demand for maximizing the efficient acquisition of technical terminology and standardized communication is critical, and the integration of AI tools like ChatGPT and Gemini at the tertiary level has become indispensable. Existing research confirms that AI can accelerate dynamic learning ecosystems where students can exploit instant feedback and personalize their learning paths (Alshammari & Alhamazany, 2026; Olaide et al., 2024), and these benefits drive high adoption and form strong trust among second language (L2) learners (Kılıçkaya & Kic-Drgas, 2025).

Despite the remarkable benefits of AI adaptation in education, AI poses a pedagogical concern when it erodes students' learning autonomy and cognitive competence (Misiejuk et al., 2026). Current research warns that unstructured AI use can trigger cognitive offloading and metacognitive disengagement (K. Fan & Gao, 2026; Vendrell & Johnston, 2026; Wang et al., 2025), noting that over-reliance on AI-generated output can replace students' self-monitoring skills. Similarly, Qu et al. (2025) conducted a meta-analysis grounded on Bloom's taxonomy, indicating that although GenAI has positive effects on lower-order outcomes with vocabulary

[1] *Vietnam Aviation Academy, Ho Chi Minh City, Vietnam, Email: hienlnn@vaa.edu.vn*

memorization and grammatical exercises, it has limitations in fostering higher-order skills such as analysis, evaluation, and critical thinking when students' scaffolding is low. In the same vein, Vendrell and Johnston (2026) indicate a prevalent phenomenon of fluency heuristic when students conflate their AI-generated outcome with their true mastery: students tend to uncritically accept AI's output and ignore the necessary process of reflective trial-and-error to form their understanding ((Tomisu et al., 2025). Notably, although AI is beneficial in consolidating learners' learning trust, it can impair their performance due to metacognitive overload (McCarthy et al., 2018)–a state when students feel overwhelmed with managing AI prompts and hallucinations, driving them to withdraw effortful critical thinking and lean toward passive cognitive offloading (Jingjing et al., 2026). The pedagogical challenge, therefore, is nothing about whether AI is allowed in class, yet how AI regulations can be cultivated without triggering either blind trust or exhausting students' necessary vigilance for hallucination prevention.

These tensions are crucial for VAA students, as they still face a severe intrinsic cognitive load: while managing uneven entry-level English proficiency, they must master the same amount of technical aviation terminology within demanding coursework. It was also observed that under unguided conditions, students may use Gen AI extensively without proper cognitive evaluation, leading to an inability to detect context-specific errors or algorithmic hallucinations and placing them on the brink of cognitive offloading. While a growing number of international studies have investigated student perceptions of GenAI use largely in Western contexts such as the United States, Germany, and Finland (Ketzer-Nöltge & Rüger, 2025; McCarthy et al., 2018; Misiejuk et al., 2026), no study has examined how ESP students in developing countries in Southeast Asia, for example, Vietnam, adapt strategic self-regulation in dealing with cognitive offloading caused by extensive AI integration in learning. This constitutes a combined contextual and empirical gap for this study. To address this gap, the present study employed a convergent parallel mixed methods design to examine the metacognitive awareness, AI usage behavior, and self-regulated learning patterns of VAA students. The study was set to third-year aviation English students at a single institution during the second semester and the study is guided by three research questions:

RQ1. To what extent do third-year VAA students demonstrate metacognitive awareness of generative AI tools in learning aviation English?

RQ2. What are their prevailing usage configurations and attitudes toward generative AI tools in learning aviation English?

RQ3. How do these students perceive and navigate the metacognitive tension between AI-driven task efficiency and the potential loss of autonomous language-learning skills?

By generating localized empirical evidence, this study proposes concrete, evidence-based principles for educators to scaffold metacognitive AI adoption into disciplined cognitive reflection, transitioning students from surface-level query and paste behaviors to deep self-regulated learning.

Scope and delimitations. This study is anchored in four core respects. First, for participant cohort, the study prioritizes on third-year students of aviation English majors at Vietnam Aviation Academy (VAA)- as this group carrying the heaviest simultaneous load of general and safety-critical technical English- compared to other cohorts of students or disciplines. Second, as for educational tool, the study concentrates on assistance of generative AI in students' daily academic use, specifically with ChatGPT and Google Gemini though they are not licensed completely at the level of universities. Third, regarding timeframe: the survey

was administered on 7 and 8 April 2026, at the end of a semester that ran from late December 2025 to early April 2026, a cross-sectional window that allows the researcher to capture learning habits. Lastly, for measurement, the study is based on self-report about how students perceive and use AI in their everyday study, hence capturing their metacognitive awareness and regulation of AI use rather than objectively observing their behavioral error tracking of AI.

2. Literature Review

Extensive research on AI empowered education shows that AI offers both opportunities and challenges in the setting of teaching and learning at tertiary level, concurrently holding the potential to foster students' metacognitive, self-regulated learning. It is noted that without careful instruction of AI use, AI can pose severe pedagogical threats due to extensive reliance on AI's output, weakening critical thinking among students. To comprehensively unpack these complexities, the current literature is organized by three primary subthemes: (1) AI affordance in ESP learning, (2) metacognitive awareness in AI-assisted learning, (3) the risks of unstructured use of AI, (4) ambivalent engagement of AI

2.1. AI affordances in ESP learning

A number of studies have been undertaken to explore why L2 learners leverage GenAI's power to maximize their learning paths, in which AI chatbots are frequently mentioned as cognitive and motivational scaffold (Dahri et al., 2024; Jingjing et al., 2026). Functionally, Ai tools are designed to deliver instant, personalized feedback, they are great resources to mitigate students' anxiety and adapt explanation to their capacity accordingly (Alshammari & Alhamazany, 2026; Karmazinuk & Helik, 2026). In collaborative work, chatbots operates as conversational partners that explicitly foster affective reinforcement to producing language (Kılıçkaya & Kic-Drgas, 2025). Among benefits, the aspect of trust formation is highlighted when the AI integration rate is increasing with long-term research, demonstrating that institutional support and perceived utility cultivate a trong intention to use AI for self-regulated learning (Dahri et al., 2024). In the realm of ESP learning, AI affordances offer relief from defining burdens- processing complex technical texts, navigating complex academic materials- operating as a psychological safety net that mitigates technostress and prevent cognitive overload (Misiejuk et al., 2026; Shen & Tao, 2025) however, adoption and satisfaction are measured far more frequently in this research tradition rather than what learners actually use AI, which is where metacognition becomes theoretically and practically valuable.

2.2. Metacognitive awareness in AI-assisted learning

In the context of AI-mediated language learning, metacognitive awareness has emerged as a key referee to position whether generative AI serves as a learning scaffold or a cognitive crutch. Empirically, scholars concur that effective metacognitive regulation, which encompasses three main processes from planning to monitoring and finally evaluating projects, can directly reduce students' writing anxiety but significantly enhance their self-efficacy (Shen & Tao, 2025). Teng (2025) also demonstrated that when EFL learners are cultivated with metacognitive awareness, they can proactively plan, monitor, and evaluate ChatGPT feedback productively, thereby managing their cognitive load more effectively and developing more diverse, adaptive task strategies. In other words, high-metacognitive learners generally utilize AI as a "cognitive mirror" to deepen their reflections (Tomisu et al., 2025) and externalize their thought processes (Wang et al., 2025), whereas students with lower metacognitive awareness are prone to "fluency heuristic," in which GenAI leads students to mistake surface-level polish for factual accuracy and abandon critical self-reflection (Vendrell & Johnston, 2026). Consequently, these students are in favor of "metacognitive laziness" (Y. Fan et al., 2025) and

passive cognitive offloading. Under this circumstance, Rogti and Ouarniki (2026) suggested AI-powered scaffolding can strengthen students' language acquisition only when explicitly trained. This recognition matters for the present study as ESP learners, driven by heavy academic workload, need to know how to proactively plan AI usage not to maximize immediate tasks without critical monitoring while preserving their deep, autonomous learning

2.3. The risks of unstructured use of AI

A wealth of research highlighted that unstructured GenAI use generates high cognitive costs; thus, this study identifies three primary AI-generated risks: cognitive offloading, fluency heuristic, and cognitive overload. First of all, the most significant of these risks is known as "cognitive offloading." Raitskaya and Tikhonova (2025) caution that AI can trigger the phenomenon of cognitive offloading—that is, when students uncritically accept AI-generated ideas and neglect necessary evaluation of authenticity and quality (Misiejuk et al., 2026; Qu et al., 2025); heavy reliance on this act is associated with lower critical thinking performance (Gerlich, 2025) . Consequently, students frequently fall into a state of "illusion of mastery" where they conflate the AI's proficiency with their genuine capacities, drifting students away from learning autonomy (Raitskaya & Tikhonova, 2025). Critically, scholars concur with AI risks, yet diverge on its mechanism. For instance, Vendrell and Johnston (2026) determine another risk related to the fluency heuristic: when students are flavor in surface-level polish of AI-generated output over factual accuracy, they tend to skip verification stages prior to submission. Tomisu et al. (2025) identify another risk of unstructured AI use in lost trial-and-error when AI as oracle routinely supplies the correct solutions, making students lose their drive to observe and adjust their mistakes. This elimination of desirable difficulties cultivates a notion that Fan et al., (2025) describe as a passive state of "metacognitive laziness". Conversely, scholars including Jingjing et al., (2026), and McCarthy et al.,(2018) mentioned the different sets of risks: demanding that students frequently monitor AI outputs results in metacognitive overload and technostress. According to Fan and Gao (2026), these threats are conditional, and AI-mediated support can be detrimental for learners when used without proper guidance. Despite the convergence on risks, researchers have mostly investigated risks of unstructured configuration of AI use separately, while in general cohorts it is unclear how such AI -generated risks compound in ESP settings where undetectable terminology errors are safety-relevant.

2.4 Ambivalent engagement of AI

The growing body of research consistently reports positive effects of AI such as mitigating students' linguistic anxiety and building self-efficacy, for most of which GenAi is usually mentioned as a psychological safety net (Shen & Tao, 2025; Zhai & Nezakatgoo, 2025). This consensus, however, captures only a half of learners' experience perceptions. Ketzer-Nöltge and Rüger (2025) hold that the very students who used to praise AI for its usefulness (i.e., saving time and streamlining tasks) turn out to voice serious concerns (fearing its risks) about their overdependence and skill loss within academic integrity, diminishing independent thought. Indeed, students cannot identify states of "loving or hating AI" as they experience an affective paradox where they feel both simultaneously. This reflects two distinct dimensions of AI integration in education, yet they do not contradict each other. Beyond this, it is crucial to understand a central question unexamined: whether worries about AI discipline students' self-regulation and learning behaviors when enthusiasm and worry coexist and how students perceive and navigate their own fear of losing autonomous language learning skills.

Despite the increasing number of studies investigating learners' metacognition and AI adoption, significant gaps still remain. It is observed that most studies are conducted in Western

contexts such as Finland, Germany, and the United States (Ketzer-Nöltge & Rüger, 2025; McCarthy et al., 2018; Misiejuk et al., 2026), yet none investigates how these mechanisms can shape the metacognitive configuration for ESP learners in developing Southeast Asian countries, specifically in Vietnam's ESP programs. Under the intense curricular pressure, third-year students majoring in aviation at VAA frequently carry a heavy learning load caused by dense terminology and uneven entry-level proficiency, driving students to tensions between AI adoption for lower-order efficiency and metacognitive offloading. Furthermore, existing empirical studies have relied on single-strand quantitative designs, specifically SEM-based surveys (K. Fan & Gao, 2026; Shen & Tao, 2025), analysis of logs (Misiejuk et al., 2026) and experiments (McCarthy et al., 2018; Sun et al., 2025) while there are some notable mixed methods research from Dahri et al. (2024), Teng, (2025a), (2025b) and Wang et al. (2025) who conducted their studies in EFL cohorts outside Southeast Asia, leaving no study that has mapped awareness, usage configuration, perceptions, and concerns about AI in Vietnam. Beyond this, this study employs a convergent mixed-methods approach that allows the author to integrate statistical analysis with students' own written accounts, thereby providing a more cohesive understanding of how Vietnamese ESP students navigate AI integration. This study also addresses the need for offering contextual and cultural insights by investigating four variables—learners' knowledge and regulation of their own cognition that is formulated by theoretical framework of Flavell (1979).

3. Theoretical Framework: Metacognition in AI-Assisted Learning

This study is grounded in Flavell's (1979) theory of metacognition, which describes how learners understand and control their own thinking through two interconnected components: metacognitive knowledge – what learners know about persons, tasks and strategies- and metacognitive regulation- which encompasses the active monitoring and evaluation of their learning progress during and after a task. Originally, Flavell (1979) introduced metacognition to explain how learners "know about knowing", the concept of metacognition has since been integrated into models of self-regulated learning, evolving a standard analytical lens in EFL and educational technology research (Teng, 2025a; Wang et al., 2025). The introduction of generative AI fundamentally reshapes both components: metacognitive knowledge and metacognitive regulation. For the construct of metacognitive knowledge, under the AI integration in learning, it now encompasses an accurate understanding of what AI can and cannot perform, involving its linguistic fluency, hallucinations, and blind spots related to domain-specific content. Regarding metacognitive regulation, it also requires learners to proactively verify machine outputs compared with their own developing knowledge- which is a rigorous demand that the previous study skills do not insist. Notably, when knowledge is present without self-regulation, the learners may recognize AI-generated errors without procedures to detect these errors- which is also the precise configuration that this study investigates.

Figure 1 illustrates the study's conceptual framework which is anchored by the theory of metacognition of Flavell (1979). This theory grounds four measured constructs: metacognitive awareness of AI- shaping both usage configurations and attitudes that contributes to metacognitive tensions between valued efficacy and feared autonomous loss. In turn, tensions can help define the pedagogical scaffolding for educators (see Fig. 1).

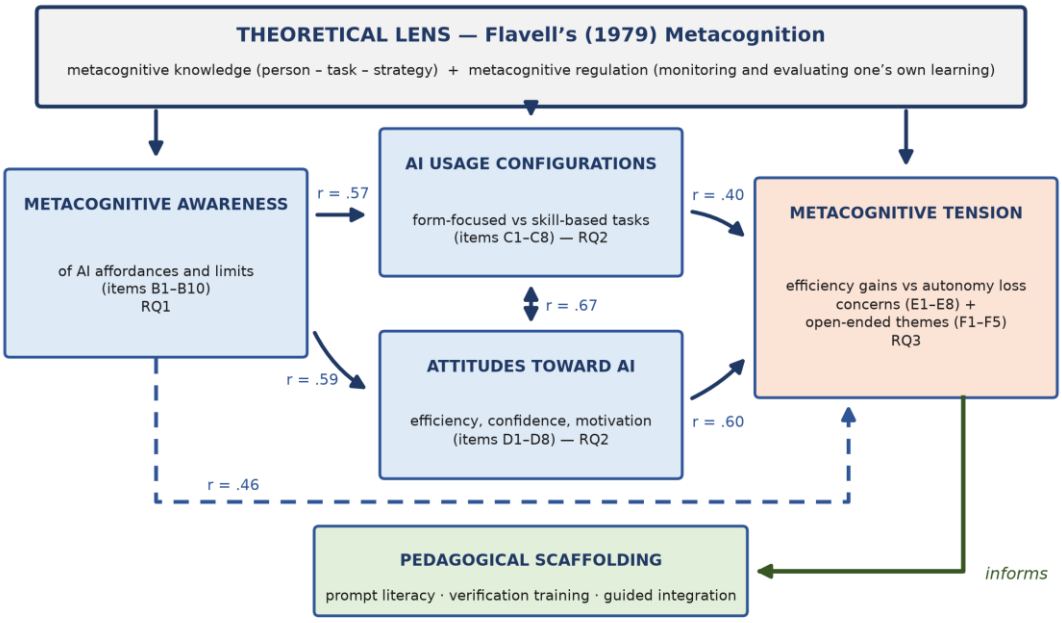

Figure 1. Conceptual framework: Flavell's (1979) metacognition applied to AI-assisted aviation English learning, with the study's four constructs, research questions, and observed inter-construct correlations (all $p < .01$).

Metacognition is considered as an effective framework for this study, which conceptualizes on four grounds that corresponds to the criteria of explanatory match, contextual relevance and scholarly credibility. First, regarding explanatory fit: the phenomenon under investigation- which is centric on students who frequently delegate cognitive work to AI while consciously being aware of consequences like deteriorating critical thinking ability for tasks- is at its core an issue of self-regulation. Meanwhile, strategic self-regulation is the primary mediator to address AI-triggered cognitive offloading in L2 learning (Misiejuk et al., 2026; Wang et al., 2025). Second, this framework aligns with conceptual requirement with two components connect directly into the study's measures. As for metacognitive knowledge, it is operationalized as awareness of AI's affordances and limits while metacognitive regulation is captured in stages ranging from verification, adjustment, to appraisal behaviors which are assessed by usage, attitude, and concern scales. For the branch of knowledge regulation division, it is set to measure the core analytical distinction between declarative awareness and evaluative competence (Teng, 2025a). Third, the paradigm has a contextual relevance as the theory concerns internal cognitive processes not just focusing on culturally specific behaviors, hence its applications come from Asian EFL settings comparable to Vietnam (Shen & Tao, 2025; Teng, 2025b; Wang et al., 2025), and it extends to a domain of ESP where verifying one's own understanding is safety relevant. Fourth, as for scholarly credibility, it is acknowledged that cognitive load theory explains the mental cost of dense aviation English that students must carry, and technology acceptation models (TAM) can elaborate on technological adoption in education (Dahri et al., 2024), yet it is not in focus. Self-determination theory illuminate motivation ((Zhai & Nezakatgoo, 2025), but not mentioning the knowledge -verification stage at the heart of this study. Therefore, cognitive load, acceptance and motivation serve as contextual condition while metacognition carries analytical work. Driven by this model, the research questions examine students' metacognitive

knowledge of AI, the usage configurations and attitudes towards how AI is enacted, and the tension that may occur when regulation falters under efficiency pressure.

4. Methodology

This study was part of larger mixed-methods research conducted at an institution, Vietnam Aviation Academy (VAA), in Ho Chi Minh City during the second semester of the academic year, specifically from late December 2025 to April 2026. At that time, GenAI became an everyday tool across Vietnamese higher education. By that time, tools like ChatGPT and Google Gemini became embedded in how students read, wrote, and practiced English, yet there was not any formal instruction or pedagogical guidance on when and how far students rely on them. Although AI technology constantly evolves, the questions related to this strategy—what students know about their AI use in their daily learning, how they configure it for their study, and how they weigh its benefits against risks—still remain both timely and significant to explore. This research focused on third-year students, aviation English majors, as they carry a heavy language load due to dense terminology. While newer data may reveal additional insights to the field, the patterns observed from this study remain relevant today. By focusing on this critical timeframe, the current dataset allows a cohesive analysis of students' metacognition in the conditions where the reliance on AI use is high or low.

4.1. Research Design

The study adopted a convergent mixed methods design (Creswell & Creswell, 2018) that was implemented though a single bilingual (English-Vietnamese) instrument to collect quantitative and qualitative data in parallel. The instrument contains 34 Likert-scale items measuring the four constructs in Figure 1, paired with five open-ended questions eliciting students' own perceptions about autonomous AI use, efficiency gains, challenges, higher-order effects and curricular suggestions for educators. The quantitative strand was set to address the first and second research questions; meanwhile the open-ended questions helped to deepen the third research questions, and the two strands are merged as a cohesive interpretation to evaluate convergence.

4.2. Research Context and Participants

The current study was conducted among third-year students at Vietnam Aviation Academy (VAA), ho Chi Minh City, during the second semester of the academic year in the aviation English program. These students indeed undergo double load of learning: developing general English while maintaining safety-critical aviation terminology and communication protocols. The survey was distributed to the cohort via Google Forms and collected 80 submissions, yet after data cleaning, only 62 unique responses were retained. Most respondent were aged from 18 to 23 (M = 19.5, SD = 1.3; six did not report a usable age); the male number was 30, leaving 27 as females, and 5 preferred not to mention. As for sef-assessed proficiency, candidates were clustered at B1–B2 (n = 32) and A1–A2 (n = 26), with 4 students at C1–C2; for AI habitual use, 41 of 62 students reported using AI for their study at least 3 times to 4 times per week (at 66%), while the remaining 21 used it one to two times per week. From the survey, it indicated that ChatGPT dominated at 82% while Google Gemini accounted for 79%, followed by AI Google Translation (45%), Grammarly (19%), Microsoft Copilot (16%), DeepL (10%), and Quill Bot (6%). Table 1 summarizes the sample's characteristics.

Table 1

Participant Characteristics (N = 62)

Characteristic	**n**	**%**
Gender		
Male	30	48
Female	27	44
Prefer not to say	5	8
English proficiency (self-assessed)		
Beginner (A1–A2)	26	42
Intermediate (B1–B2)	32	52
Advanced (C1–C2)	4	6
Frequency of AI use for English		
1–2 times per week	21	34
3–4 times per week	16	26
5–6 times per week	8	13
Daily (7+ times per week)	17	27

Note. N = 62. Age M = 19.5, SD = 1.3 (range 18–23); six respondents did not report a usable age. Percentages are rounded and may not total 100.

4.3. Instrument

The questionnaire comprised six primary sections: section A collected demographic and usage frequency of AI in their study, while section B measures metacognitive awareness of AI with 10 items (e.g., "I can identify when AI-generated English content contains errors or inappropriate language") that had adapted from operationalization's of metacognitive awareness in AI-assisted EFL learning studies from Teng (2025) and Wang et al., 2025). As for section C, it was set to measure students' usage configurations across eight tasks types, including vocabulary, grammar support to speaking activities and aviation-specific simultaneous test such as drafting Air Traffic Control (ATC) communications, translating technical safety manuals, and developing scripts for cabin crew role-play scenarios and video projects. Section D with 8 items were to gauge student attitudes toward AI functionalities – which are usefulness, confidence, motivation for AI collaboration- while section E focused on AI-triggered- concerns with 8 items ranging from accuracy, dependence, autonomous loss, ethics. Systematically, all items from section B to E were based on five-point Likert scales (agreement scales for sections B, D and E, and a frequency scale from never to very often for section C), whereas section F devoted for the open-ended questions where students could present both in Vietnamese and English (see Appendix A). the bilingual format was a deliberate choice as it ensured that students with limited constraint of English could express their own thinking deeply and accurately.

4.4. Data Cleaning

The questionnaire was distributed to the full third-year cohort from 2 classes via Google Forms, and the export contained 80 rows. Every row was screened before analysis. Eighteen

rows repeated the submission timestamp of an earlier row to the millisecond, appeared out of chronological order at the end of the export and differed from the earlier row in 0 to 8 fields. They were treated as repeated submissions and removed, keeping the earlier row of each pair, and no values were changed. An earlier version of this paper retained 17 of these rows and excluded one unique submission, reporting N = 78; all analyses in this version were re-run on the 62 unique submissions. Six free-text age entries could not be interpreted and were treated as missing. The wording of awareness item B5 was overwritten in the data export and was restored from the original questionnaire. All Likert responses were converted into their numeric values ranging from 1 to 5 for data analysis.

4.5. Data Analysis

Quantitative analysis followed three steps rigorously. Firstly, the researcher assessed the internal consistency of each scale by using Cronbach's alpha and corrected item-total correlations (Table 2). Subsequently, the researcher profiled each construct and item with their descriptive statistics before checking their inferential contrasts: paired samples t-tests compared declarative with evaluative awareness and form-focused with skill-based usage. Pearson correlations were used to examine the relationships among the four core constructs. For open-ended responses, they were subjected to analyses through reflective thematic analysis, following Braun and Clarke (2012) six-phase framework and reflecting a constructivist stance. Codes and themes accordingly were developed inductively from data; for example, with Vietnamese's responses, the research was analyzed in the original and translated only for reporting to keep their true nuances of interpretation, and, in line with the reflexive approach, themes are reported without prevalence counts; 55 respondents gave at least one substantive written response. Because many responses were brief, the themes are exploratory and are used mainly to explain and illustrate the quantitative results. At the final stage, the two strands were combined through side-by-side comparison of each quantitative construct with its corresponding qualitative theme (Creswell & Creswell, 2018), the phase that convergences and divergence between numbers and the narratives become visible.

4.6 Trustworthiness and ethics

The findings of four scales indicated that they are highly reliable. As shown in Table 2, all alphas exceeded 0.90 and every corrected item and total correlation exceeded 0.71, meaning that there was excellent. The item set was suitable for factor analysis, Kaiser–Meyer–Olkin = .84 and Bartlett's test of sphericity $\chi^2(561) = 3010.8$, $p < .001$. A principal-axis extraction returned a single dominant factor per scale on which all standardized loadings were high (.72 to .97), and the average variance extracted (AVE = .67–.86) and composite reliability (CR = .94–.98) exceeded the conventional .50 and .70 thresholds, confirming convergent validity. Discriminant validity was supported by the Fornell–Larcker criterion: the square root of each construct's AVE (.82–.92) exceeded that construct's correlations with the other three constructs (Table 5). However, all items were worded in the same direction and many students chose the same answer across items, so these high values may partly reflect uniform responding rather than construct quality alone, and the validity indices and correlations should be read with caution.

Table 2

Reliability and Validity of the Four Scales (N = 62)

Scale (construct)	Items	α	Item–total range	Loading range	AVE	CR
B. Metacognitive awareness	10	.97	.84–.92	.85–.93	.80	.98
C. Usage configurations	8	.94	.75–.85	.77–.89	.67	.94
D. Attitudes	8	.98	.88–.95	.89–.97	.86	.98
E. Concerns	8	.95	.71–.89	.72–.91	.72	.95

Note. Alphas computed on the cleaned sample after removal of duplicate submissions.

For the qualitative strand, the researcher maintained and audit trail linking of every theme to its coded excerpts and rigorously checked all translations of Vietnamese's quotations against the originals. Participants, who were voluntary and anonymous, were offered a consent form to clearly explain the purpose of this research, and submission of the questionnaire also constitutes consent. No identifying information was collected, and all quotations are reported without identifiers.

5. Results

This section devotes for presenting the results in accordance with three main research questions that are categorized into 5 subsections: section 1 focusing on metacognitive awareness of research question 1 (RQ1), section 2 for identifying usage configurations and attitudes of VAA students, (RQ2) section 3 addressing quantitatively concerns associated with student attitudes (RQ3), section 4 presenting qualitative themes and section 5 integrating the strands together.

5.1. RQ1: Metacognitive Awareness

First, the research looked at how VAA students perceived what AI chatbots could and could not do to facilitate them in study (RQ1). From this, it indicated that although VAA students' awareness of AI benefits and perils were at moderate level on average (M=3.54, SD=1.16), yet the ten-item trajectory revealed more information than the mean, in which students concurred the most for understood the strengths and imitations of AI-generated content (B2, M=3.74). whereas they least agreed with the two items that require applying that knowledge—being able to spot errors in AI output (B8, M=3.37) and considering AI suggestions critically rather than just accepting them (B10, M=3.37). To test this difference directly, a comparison was made between each student's average score on the three declarative items (B1-B3, M=3.60) with their average score on the three evaluative items (B4,B8,B10, M=3.44), $t(61) = 2.08$, $p = .042$, $dz = 0.26$. ultimately, these findings reveal a critical disconnect: although VAA students recognize AI's fallibility, they lack the evaluative confidence to detect AI-generated errors in practice.

Table 3

Construct and Selected Item Descriptives (N = 62)

Construct / item	M	SD
B. Metacognitive awareness (10 items)	**3.54**	**1.16**

B1 Understand what AI can and cannot do	3.48	1.41
B2 Aware of strengths and limitations of AI content	3.74	1.30
B3 Plan the specific help needed before using AI	3.58	1.33
B4 Can evaluate whether AI output is accurate/appropriate	3.58	1.19
B5 Monitor own understanding when using AI	3.63	1.26
B6 Reflect on how AI affects learning progress	3.58	1.27
B7 Know when to rely on AI vs. other resources	3.60	1.30
B8 Can identify errors in AI-generated content	3.37	1.22
B9 Adjust AI use to what works best	3.50	1.29
B10 Think critically rather than accept AI suggestions	3.37	1.27
C. Usage configurations (8 items)	**3.48**	**0.92**
C1 Vocabulary support	3.58	1.11
C2 Writing revision	3.66	0.97
C3 Grammar checking and correction	3.69	1.03
C4 Translation (Vietnamese–English)	3.55	1.15
C5 Reading comprehension support	3.58	1.06
C6 Pronunciation practice and feedback	3.26	1.12
C7 Speaking practice	3.08	1.21
C8 Aviation-specific terminology and protocols	3.42	1.05
D. Attitudes (8 items)	**3.75**	**1.11**
D1 Positive attitude toward AI for English	3.81	1.17
D2 AI useful for improving English skills	3.76	1.17
D3 AI makes learning more efficient / saves time	3.79	1.15
D4 AI increases confidence in using English	3.61	1.18
D5 AI increases motivation to learn English	3.76	1.18
D6 AI helps achieve better grades	3.82	1.17
D7 AI provides personalized support	3.79	1.19
D8 Would recommend AI to other students	3.68	1.28
E. Concerns (8 items)	**3.68**	**0.95**
E1 Concern about accuracy of AI content	3.60	1.06
E2 Worry AI use may be cheating / dishonesty	3.69	1.06
E3 Fear of becoming too dependent on AI	3.82	1.03
E4 AI may prevent developing autonomous skills	3.58	1.11

E5 Worry AI weakens critical thinking	3.68	1.05
E6 Concern about privacy and data security	3.69	1.15
E7 Uncertain about ethical implications	3.68	1.10
E8 Worry about culturally inappropriate output	3.66	1.17

Note. All items scored 1–5. Full item wording appears in Appendix A.

5.2. RQ2: Usage Configurations and Attitudes

The study subsequently proceeded to investigate students' AI reconfiguration and their AI toward them (RQ2). Although majority of students (66%) admitted that they frequently used AI for their English study at least 3 times per week, their use of AI is not uniform across tasks. For instance, the rates were varied for form-focused tasks including grammar checking (M = 3.69), writing revision (M = 3.66), vocabulary support (M = 3.58), and translation (M = 3.55). Notably, as for skill focused group: pronunciation, aviation-specific terminology, and speaking practice gained the least common use with M = 3.26, M = 3.42, and M = 3.08 respectively, VAA students fairly use AI for reading support (M=3.58). A paired samples t test comparing the composite means reveals that students scored significantly higher on form-focused tasks, ranging from C1 to C4 with M=3.62 than on skill-based tasks, ranging from C5 to C8 with M= 3.33. This means a moderate effect size ($t(61) = 3.84$, $p < .001$, $dz = 0.49$; see Table 4), hence this discrepancy illustrates a paradoxical pedagogical challenge within the aviation English curriculum. Specifically, students at least likely use AI to practice speaking although they recognize the significance of oral proficiency in their professional field.

Table 4

Paired-Samples t Test: Form-Focused versus Skill-Based AI Usage (N = 62)

Comparison	**M_1 (SD)**	**M_2 (SD)**	**ΔM [95% CI]**	**t(61)**	**p**	**dz**
Form-focused (C1–C4) vs. skill-based (C5–C8)	3.62 (0.97)	3.33 (0.96)	0.29 [0.14, 0.44]	3.84	< .001	0.49

Note. M_1 = form-focused configurations (C1–C4); M_2 = skill-based configurations (C5–C8). ΔM = mean difference; dz = Cohen's dz for paired samples. Items scored 1–5.

Out of the for constructs, attitudes towards AI were the most favorable (M = 3.75, SD = 1.11) as students believed that AI can enhance their learning motivation (D5, M = 3.76), while helping them gain better grades (D6, M = 3.82), and providing support that is suited to each individual needs (D7, M = 3.79). The two strands- AI usage and student attitudes- have a strong association and they are consistent with the study's conceptual framework (Figure 1), in which awareness, use, and attitude reinforce one another.

Table 5

Pearson Correlations Among the Four Constructs (N = 62)

Construct	**1**	**2**	**3**	**4**
1. Metacognitive awareness	—			

2. Usage configurations	.57	—		
3. Attitudes	.59	.67	—	
4. Concerns	.46	.40	.60	—

Note. All correlations are statistically significant at $p < .01$. Construct scores are respondent means across scale items (1–5).

5.3. RQ3: The Tension Between Efficiency and Autonomy

Concerns about AI were almost as high as attitudes (M=3.68, SD=0.95). Specifically, the fear that students endorsed most strongly was the feelings of becoming overly dependent on AI and losing the ability to learn on their own (E3, M = 3.82), which was observed as one of the highest-rated items in the survey, level with the most positive attitude items. Worries about weakened critical thinking (E5, M=3.68), reduced autonomous learning (E4, M=3.58), and the accuracy of AI output (E1, M=3.60) followed. The key result for RQ3 is that attitudes and concerns rose together rather than trading off against each other: the two were positively correlated ($r = .60$, $p < .001$), meaning the students who valued AI most were often the same students who worried about it most. In fact, 52% of respondents scored 3.5 or higher on both attitudes and concerns at once. The cohort is therefore not divided into enthusiasts and skeptics; most students hold both feelings together, experiencing the tensions between efficiency and autonomy within themselves. The size of this correlation partly reflects uniform responding, since it fell to $r = .25$ among the 22 students who varied their answers across the questionnaire; the more robust observation is that most students were high on both scales.

Table 6

Cross-Tabulation of Attitudes and Concerns (N = 62)

	Concerns high (≥ 3.5)	**Concerns low (< 3.5)**	**Total**
Attitudes high (≥ 3.5)	32	9	41
Attitudes low (< 3.5)	8	13	21
Total	40	22	62

Note. Cell entries are counts of respondents. The 32 students high on both constructs represent 52% of the sample—the "ambivalent engagers" described in the text.

5.4. RQ3 (Qualitative): Four Interconnected Themes

To understand these patterns from the students' own point of view, we analyzed their answers to the five open-ended questions (55 students gave substantive written responses). Four themes emerged, and together they tell a connected story: students settle into a comfortable routine of form-focused use ***(Theme 1)***; when they suspect the AI's outputs are wrong, and they have no way to check them ***(Theme 2);*** students lack the ability to verify errors, leaving them openly ambivalent about becoming dependent on AI ***(Theme 3);*** and they request the institution to teach them how to use it well ***(Theme 4).*** Table 7 summarizes the themes, their sub-themes, and the quantitative construct each one helps explain.

Table 7

Thematic Map of Open-Ended Responses (n = 55 substantive respondents)

Theme	Sub-themes	Linked construct
1. Form-focused comfort zone	on-demand lexico-grammatical repair; low-anxiety conversational rehearsal	C (usage); D (efficiency, confidence)
2. Verification impasse	suspicion without a checking procedure; prompt-communication breakdowns	B (evaluative gap); E1 (accuracy)
3. Dependence-aware ambivalence	gratitude–worry coexistence; conditional "if abused" framing	D × E correlation; E3 (dependence)
4. Scaffolding hunger	requests for prompt training and rules; aviation role-play proposals	Pedagogical implications

Note. Themes were developed through reflexive thematic analysis and are reported without prevalence counts. Quotations are verbatim; those marked (VN) are translated from Vietnamese.

Theme 1: *The form-focused comfort zone.* Qualitative responses revealed that students overwhelmingly rely on AI to repair language forms (for instance, translating, checking grammar, and editing essays) as AI can outperform it, and especially without feeling judged. One student mentioned this typical habit: "outside class, i use AI to talk about my daily life in English, then use AI to transform my idea to a more academic version" On the same vein, another highlighted AI's efficiency as a time-saver, saying "Thay vì mất hàng giờ tìm kiếm tài liệu, AI có thể tóm tắt nội dung bài đọc, tạo danh sách từ vựng từ một video YouTube hoặc soạn nhanh các bài tập" ["Instead of spending hours searching for materials, AI can summarise a reading, make a vocabulary list from a YouTube video or quickly prepare exercises"] (VN) Additionally, a notable subgroup of respondents utilized AI to practice speaking in a low-pressure environment, and deliberately regarding AI as a peer for human interaction. It is true that while AI offer "comfort zone" for students by providing fast, personalized and low-anxiety support to students, they paradoxically raise a significant pedagogical concern. Such fear is largely about the usage patterns that students constructed with AI, heavily lowering cognitive abilities where, previous research also emphasizing, the transformative educational benefits of AI are least impactful.

Theme 2: *The verification impasse*. Regarding their challenges, the majority of students claimed that they experienced doubt without a viable method for resolution, hence accepting AI to err and even leading them to wrong answer without noticing. While they may suspect that AI was incorrect, they lacked strategies to verify its output effectively. One respondent described this uncertainty directly: "Một khó khăn là AI không phải lúc nào cũng chính xác 100%, nên đôi khi tôi không chắc câu trả lời có đúng hay không" ["One difficulty is that AI is not always 100% accurate, so sometimes I am not sure whether the answer is right or not"] (VN). Another wrote, "One challenge I face is that AI sometimes gives incorrect or unclear answers. I also feel that I may rely too much on AI instead of thinking by myself. Therefore, I need to check the information carefully and use AI wisely," yet students kept confirming that they remained unable to articulate exactly how conduct this verification. In these open-ended responses, a small subset of participants traced these difficulties back to their own prompting skills, noting "tôi gặp khó khăn trong việc sử dụng các câu lệnh để AI có thể hiểu rõ được vấn đề mà tôi đang gặp phải" ["I have difficulty using prompts so that AI can clearly understand

the problem I am facing"] (VN). This theme is to represent the qualitative manifestation of the evaluative gap in the qualitative survey, specifically shedding more light on the question items B8 and B10, as they received the lowest awareness scores, indicating that precise evaluative weakness in their own words.

Theme 3: *Dependence-aware ambivalence*. As for the higher-order impacts of AI in student's metacognition, VAA candidates acknowledged that AI can extend their ideas if used as a support tool, although AI can weaken their cognitive capabilities if students are overly reliant on it. One student wrote, "Over-reliance: i might become too lazy and stop thinking for myself if i use AI too much." Another explained this mechanism: "AI cung cấp nhiều góc nhìn khác nhau cho một vấn đề, giúp học cách so sánh, đối chiếu và đánh giá. Tuy nhiên, nếu lạm dụng quá có thể mất đi khả năng tự suy luận, dễ trở nên lười biếng" ["AI offers many perspectives on a problem, which helps with learning to compare, contrast and evaluate. However, overusing it can take away the ability to reason for oneself and easily make one lazy"] (VN). Interestingly, many students framed this risk conditionally by stating that "if students are too lazy to think for themselves and let AI do all the brainstorming, they are using AI in the wrong way" in the open-ended responses, students may project the danger onto a hypothetical careless student. Finally, this theme acts as the qualitive embodiment of the attitude-concern correlation in the survey since enthusiasm and worry are not held by different students but voiced by the same ones.

Theme 4: *Scaffolding hunger.* The most practical finding that the study raised is that student fail to advocate for reduced AI integration; rather, they explicitly request formal instruction from educators and institutions on how to utilize AI more ethically and responsibly. Their recommendations clustered around three primary requests: training in prompt formulation, structured boundaries for AI use and AI allowance in aviation learning context. Regarding prompt trainings, students suggested "Nên học cách prompt cho AI tối ưu trong việc hỗ trợ học tập" ["We should learn how to prompt AI optimally to support studying"] (VN), while students with a need for structure boundaries also claimed "AI should be integrated as a guided support tool in a blended learning model, with clear rules and training, so students can use it effectively without becoming dependent." Third, when it comes to AI application for ESP in teaching and learning, one member insisted "Aviation role-play: use AI to simulate realistic situations, like conversations bewteen [sic] pilots and ATC." Therefore, students intuitively articulated a demand for properly guided AI integration in higher education as a coherent pedagogical instruction.

5.5. Integration of Strands

Collectively, the two main strands converge in the same direction at every step of framework. Specifically, the gap between form-focused and skill-based use ($dz = 0.49$) is depicted in Theme 1's comfort zone, while the evaluative awareness gap- scored the lowest- is presented in Theme 2's verification impasse. Next, Theme 3's ambivalence devotes for the mutual relationship between attitudes and concerns, leaving the last theme- Theme 4 for naming the remedy—training in prompting and verification, clear rules, and aviation-specific practice—which turns the study's diagnosis into its practical recommendations.

6. Discussion

The overarching objective of this research was to investigate the ways how third-year students majored in aviation English truly comprehend, practically apply and navigate their concerns regarding GenAI in their learning path. The synthesized results reveal a notable paradox: students form solid declarative knowledge, limit their reliance on AI primarily to

form-focused mechanism, and articulate profound concerns, whereas they fundamentally lack the evaluative strategies and they request institutional frameworks to convert this awareness into regulated, ethical integration. There are four critical insights representing as follow.

6.1. Awareness Is Declarative, Not Yet Evaluative

The moderate awareness scores conceal a significant matter that students recognize that AI may make mistakes due to its limitations, yet they cannot detect those limits in specific outputs. This adds necessary nuance to Teng's (2025) optimistic view of metacognitive awareness in AI-assisted writing, demonstrating that although students can acknowledge AI's flaws, it does not guarantee that students can have the operational ability to verify its output or whether AI hallucinates. Compared with Flavell's (1979) terms, VAA students possess metacognitive knowledge without the corresponding regulation, which further explains that this dynamic directly mirrors the "expertise paradox" and the challenge of "trust calibration" identified by Stockwell and Wang (2025). Therefore, to properly establish trust in AI, a user must possess the expertise that AI is used to supplement and facilitate them rather than lead them. As students are still acquiring language proficiency, they undeniably lack linguistic expertise to independently evaluate the AI's hallucination, leading them to trust AI system blindly under uncertainties (Stockwell & Wang, 2025). In the settings of ESP, this distinction is not merely academic as an unverified term can cause a real-world hazard. When students described "I don't know how to verify the answers"- indicating verification impasses- it identifies the exact evaluative skills that Vietnam Aviation Academy must target.

.*6.2. The Comfort Zone Confirms the Lower-Order Bias—With an Aviation Irony*

Rather skill-based configurations, students have significant preferences for form-focused replicates, at the level of everyday use, the meta-analytic finding reveals that AI can be reliable at lower-order outcomes (Qu et al., 2025). Naturally, students will gravitate toward grammar repair and translation tasks as these applications provide an immediate, verifiable feelings and anxiety free environment (Zhai & Nezakatgoo, 2025). This perfectly aligns with recent findings that AI chatbots can serve as a non-judgmental linguistic safety net to help mitigate language apprehension for students. Students, though preferring comfort within this lower-order zone, may risk sever cognitive offloading, since they habitually bypass the deeper thinking engagement for advanced communication. This situation, therefore, creates a profound irony that while speaking is known as the exact skill for their aviation processional, students in this cohort treat it with the least skills practiced with AI. Furthermore, the students who adopted AI for conversational practice demonstrate that the configuration is technologically friendly, yet AI is simply not pedagogical scaffolded into the majority's repertoire, ultimately leaving them trapped in dilemma of mechanical fixed rather than authentic conversational rehearsal.

6.3. Ambivalent Engagement, Not Adoption Versus Resistance (RQ3)

The strongest and least expectation from this quantitative finding is the positive correlation between attitudes and concerns ($r = .60$), with half scoring high on both aspects. The acceptance literature tends to show the opposite poles of enthusiasm and worry (Dahri et al., 2024); such data illustrate the both factors - enthusiasm and worry- are rising together, echoing Ketzer-Nöltge and Rüger's (2025) observation that students are holding sophisticated metacognitions regarding AI's costs though appreciating its benefits. As for the fear of over dependance on AI, the highest rated concern among the survey's top items overall serves not as brake on students' AI use but as a running commentary along it. Theme 3 helps show how they manage to use AI psychologically: some feel guilty when overusing AI for most of their

tasks, but they have to do it due to heavy workload survival. To manage their sense of guilt over relying on AI, students use conditional framing- as they identify that AI is only harmful if abused- projecting the risk of laziness for careless students rather than themselves. In their open-ended responses, VAA students recognized that the dense terminology makes it too demanding for them to verify AI output , and they are short of practical strategies to fix this issue. Hence, students, although aware of AI's hallucination, lack necessary verification skills to audit it, unable to gain better study habits. Beside this unresolved tensions exhausts students' metal resources, hance leaving students falling into technostress and metacognitive overload (Jingjing et al., 2026; McCarthy et al., 2018).

6.4. Implementation

This study offers implication extracted from theme 4. First, for prompt and verification skill, it is crucial to set up short, explicit training sessions for students to teach them how to construct prompts and critically cross check AI output against course materials, characterizing glossaries, and authoritative aviation references, converting the verification impasse into a routine. Then, guided configuration shift is a must for students. Specifically, this study suggests that instructors must design well structures tasks that AI use up the skill ladder that students frequently avoid – the most obvious application for this is to establish AI-simulated pilot–controller dialogues – which also align with the cognitive mirror principle of transitioning AI as a partner that elicits rather than hinder their own thinking (Tomisu et al., 2025; Vendrell & Johnston, 2026). Finally, it is recommended that clear institutional rules should be applied to establish explicit usage guidelines, legitimizing AI as a supportive tool rather than strictly constraining it in education. The current absence of such legislation feeds both unguided misuse and digital anxiety. By contrast, clear institutional scaffolding is like a leverage to ensure that AI tool acceptance translates into strategic self-regulation (K. Fan & Gao, 2026), effectively buffering students against language learning apprehension and technostress (Shen & Tao, 2025). Since these measures directly impact the survival needs that students articulated, adoption resistance is eradicated naturally.

6.5. Limitations and Future Research

While the research offers critical insight into student's metacognition development with AI integration, its limitations must be acknowledged. The sample comes from only one institution with one cohort of third year aviation English students (N=62), so generalization beyond English for Specific Purpose (ESP) requires caution. All quantitative measures are self-reported, and evaluative competence may need behavioral testing to gauge error detection tasks with seeded hallucinations. The study employed cross-sectional design, unable to track how ambivalence resolves- whether it turns into regulation or into resignation- over time. The qualitative strand consists of writing open-ended responses, which are broader but shallower than interviews, while follow-up interviews could probe the conditional framing – identified in Theme 3. Finally, the high alpha alphas (ranging from 0.94 to .98) may indicate some item redundancy within scales, hence future versions of the instrument could be shortened to ensure information fulfilment. Finally, longitudinal designs paring usage logs with proficiency outcomes would identify whether the form-focused comfort zone can retard higher-order growth like what the offloading literature predicts.

7. Conclusion

This study was anchored on Flavell's (1979) metacognition theory, combined with mixed methods to map how third-year students at VAA know, use and form concerns about GenAI in their study path. The findings compose a single coherent picture: students have

awareness of strengths and weaknesses of GenAI, and their use is habitual, focusing on a form-focused comfort zone. Besides, VAA students have positive attitudes toward AI chatbots due to being shadowed by fear of dependence. For the open-ended responses, they helped trace the mainstream mechanism related to certain results: unable to verify AI output, students heavily rely on AI's suggestions, this acting on their own misgivings, and their well-articulated ambivalence. Geographically, the study contributed to empirical evidence in an under researched Southeast Asian, specifically in the realm of English for Specific Purpose (ESP), and aviation specific practice. The current study highlighted that the barriers to healthy AI incorporation in education are not derived from students' ignorance or resistance but from an unmet institutional guidance to evaluate how to use them more properly. Programs that allow scaffolding the needs can transform an unstructured oracle into a disciplined cognitive mirror before comfort zone of AI turns into dependence.

Acknowledgments

The author expresses sincere gratitude to the administration and third-year aviation English students at the Vietnam Aviation Academy for their invaluable participation and support. Special thanks are owed to Dr. Thu Le for her expert instructional guidance, which significantly shaped the methodological rigor of this study.

Bionote

Hien Ngoc Nguyen Le is an English language education lecturer at the Vietnam Aviation Academy. With extensive teaching experience across prominent Vietnamese higher-education institutions, her research interests focus on educational technology integration, specifically the impact of AI-powered assistance on metacognitive regulation and self-regulated learning in English for Specific Purposes contexts.

Appendices

Appendix A: Survey Instrument

The instrument was administered bilingually (English and Vietnamese); only the English stems are reproduced here. Items in Sections B, D and E used a five-point agreement scale (1 = strongly disagree, 2 = disagree, 3 = neutral, 4 = agree, 5 = strongly agree), and items in Section C used a five-point frequency scale (1 = never, 2 = rarely, 3 = sometimes, 4 = often, 5 = very often). No items were reverse-keyed. Participation was voluntary and anonymous; informed consent was obtained on the opening screen.

A.1. Section A — Participant information

A1. Age (years).

A2. Gender: Male / Female / Prefer not to say / Other.

A3. How would you rate your current English proficiency level? Beginner (A1–A2) / Intermediate (B1–B2) / Advanced (C1–C2).

A4. How often do you use AI tools (e.g., ChatGPT, Gemini) for learning English per week? 1–2 times / 3–4 times / 5–6 times / Daily (7+ times).

A5. Which AI tools do you use for learning English? (check all that apply)

A.2. Section B — Metacognitive awareness of AI (10 items)

B1. I understand what AI tools can and cannot do when helping me learn English.

B2. I am aware of the strengths and limitations of AI-generated content for language learning.

B3. Before using AI tools, I think about what specific help I need (e.g., vocabulary, grammar, writing feedback).

B4. I can evaluate whether the English language output from AI tools is accurate and appropriate.

B5. I actively monitor my understanding when using AI tools to learn new English concepts.

B6. I reflect on how AI assistance affects my English learning progress.

B7. I know when to rely on AI tools and when to use other learning resources (e.g., teachers, textbooks, peers).

B8. I can identify when AI-generated English content contains errors or inappropriate language.

B9. I adjust my use of AI tools based on what works best for my English learning goals.

B10. I think critically about AI suggestions rather than accepting them without question.

A.3. Section C — AI usage by task type (8 items)

Stem: "How often do you use AI tools for the following activities?"

C1. Vocabulary support (e.g., finding word meanings, synonyms, example sentences).

C2. Writing revision (e.g., improving essays, reports, or assignments).

C3. Grammar checking and correction.

C4. Translation between Vietnamese and English.

C5. Reading comprehension support (e.g., summarizing texts, explaining difficult passages).

C6. Pronunciation practice and feedback.

C7. Speaking practice (e.g., conversation simulation, dialogue generation).

C8. Learning aviation-specific English terminology and communication protocols.

A.4. Section D — Attitudes toward AI (8 items)

D1. Overall, I have a positive attitude toward using AI tools for learning English.

D2. AI tools are useful for improving my English language skills.

D3. Using AI tools makes learning English more efficient and saves me time.

D4. AI tools help me feel more confident in using English.

D5. AI tools increase my motivation to learn English.

D6. I believe AI tools can help me achieve better grades in English courses.

D7. AI tools provide personalized learning support that meets my individual needs.

D8. I would recommend AI tools to other students learning English.

A.5. Section E — Concerns about AI (8 items)

E1. I am concerned about the accuracy of English language content generated by AI tools.

E2. I worry that using AI tools for assignments might be considered cheating or academic dishonesty.

E3. I am concerned that I might become too dependent on AI tools and lose my ability to learn independently.

E4. Using AI tools might prevent me from developing important autonomous learning skills.

E5. I am worried that relying on AI tools will weaken my critical thinking skills in English.

E6. I have concerns about the privacy and security of my data when using AI tools.

E7. I am uncertain about the ethical implications of using AI for academic work.

E8. I worry that AI tools might provide culturally inappropriate or contextually incorrect English language suggestions.

The five open-ended questions in Section F are reproduced in Appendix B.

Appendix B: Open-Ended Questions

The five open-ended questions followed the Likert sections of the questionnaire. Each question was presented in English and Vietnamese, and students could answer in either language. The written responses were analysed through reflexive thematic analysis (Section 4.5) and form the qualitative strand reported in Section 5.4.

F1. How do you typically use AI tools for autonomous (self-directed) English learning outside of class? Please describe specific examples.

F2. In what ways have AI tools helped you learn English more efficiently? What specific time savings or learning gains have you experienced?

F3. What challenges or difficulties have you encountered when using AI tools for learning English?

F4. How do you think using AI tools affects your development of higher-order language skills (e.g., critical thinking, creative writing, complex communication, analytical reading)?

F5. What suggestions do you have for how AI tools should be integrated into the English curriculum at Vietnam Aviation Academy? What guidelines or support would help students use AI more effectively?

#99 AI-POWERED GAME-BASED VOCABULARY PRACTICE FOR ENHANCING VOCABULARY RETENTION AMONG YOUNG VIETNAMESE EFL LEARNERS: A QUASI-EXPERIMENTAL STUDY

Trang Trinh Khanh Lien[1], Chi Ho Phuong Nguyen[2]

Abstract

This quasi-experimental study examined whether Blooket-supported game-based vocabulary practice enhanced vocabulary retention among young Vietnamese EFL learners. Eighty-two A2-level learners aged 10–11 at a private language centre in Ho Chi Minh City participated in an eight-week intervention. The experimental group (n = 42) used Blooket for repeated vocabulary retrieval, while the control group (n = 40) received conventional teacher-led review, textbook exercises, oral repetition, and written practice. Pre-test and post-test scores were analysed using paired-samples and independent-samples t-tests, and classroom observations were used to contextualise the learning process. The experimental group improved from M = 5.26 to M = 7.31, $t(41) = 14.59$, $p < .001$, with a very large effect size (Cohen's $d = 2.25$), and outperformed the control group on the post-test. Observation data indicated that repeated retrieval, immediate feedback, peer support, and teacher scaffolding contributed to the gains. The findings support the use of Blooket as a supplementary review tool, provided that game-based practice is followed by speaking and writing tasks that promote productive vocabulary use.

Keywords: AI-powered learning, Blooket, game-based vocabulary practice, vocabulary retention, young EFL learners

1. Introduction

1.1. Background and Context

Vocabulary knowledge is essential to English comprehension and production, yet young EFL learners often have limited opportunities to revisit and use new words beyond the classroom. In many Vietnamese language-centre classes, vocabulary review still relies heavily on teacher explanation, textbook exercises, oral repetition, and short written tasks. These practices remain useful, but they may not provide sufficient active retrieval, immediate feedback, or sustained participation for children aged 10–11. Digital game-based platforms may help address this need by increasing the frequency and intensity of vocabulary practice.

This context matters because private language centres serve a substantial number of Vietnamese children who study English in addition to their mainstream schooling. These learners frequently encounter short lesson periods, mixed-ability classes, and limited English

[1] *Corresponding author, Graduate Student, Faculty of Foreign Languages, Ho Chi Minh City University of Foreign Languages and Information Technology, Ho Chi Minh City, Vietnam; Email: MES24155@ms.huflit.edu.vn*

[2] *Lecturer, Faculty of Foreign Languages, Ho Chi Minh City University of Foreign Languages and Information Technology, Ho Chi Minh City, Vietnam*

exposure outside class. Evidence from this setting can therefore inform teachers who must combine curriculum coverage with motivating, time-efficient vocabulary recycling.

1.2. Problem Statement

Although Blooket is increasingly used to make vocabulary lessons more engaging, classroom enthusiasm does not by itself demonstrate durable learning. Existing studies have often emphasised motivation, enjoyment, or general perceptions, while fewer have compared measurable vocabulary retention outcomes among young Vietnamese EFL learners. It also remains unclear which classroom processes, including repeated retrieval, immediate feedback, peer interaction, and teacher scaffolding, help explain any observed gains. Without such evidence, teachers may adopt game-based tools primarily for their entertainment value without knowing how to integrate them effectively into vocabulary instruction.

1.3. Research Gap

Previous Blooket research has largely focused on university students, older learners, or broad measures of motivation and acceptance (Huynh, 2024; Pham & Ly, 2023; Quyen & Nguyen, 2025; Thu & Dan, 2023). Fewer studies have examined vocabulary retention as the principal outcome among children aged 10–11 in Vietnamese language-centre settings. In addition, limited research has combined pre-test/post-test comparisons with classroom observations to explain how game-based practice operates during instruction. This study addresses these gaps by comparing Blooket-supported and conventional vocabulary review and by using observation data to interpret the quantitative results.

1.4. Research Objectives

The study aimed to:

(1) determine whether Blooket-supported vocabulary practice improves young learners' vocabulary retention;

(2) compare the vocabulary gains of learners receiving Blooket-supported practice with those receiving conventional instruction;

(3) use classroom observations to explain the learning processes associated with the outcomes;

(4) identify practical conditions for effective classroom implementation.

1.5. Research Questions

RQ1. To what extent does Blooket-supported game-based vocabulary practice improve young EFL learners' vocabulary retention compared with conventional vocabulary instruction?

RQ2. How do classroom observations help explain the vocabulary-learning gains observed after the intervention?

RQ3. What pedagogical conditions support the effective integration of Blooket into young EFL vocabulary classrooms?

1.6. Research Hypotheses

H0: There is no statistically significant difference between the vocabulary gains of learners receiving Blooket-supported practice and those receiving conventional vocabulary instruction.

H1: Learners receiving Blooket-supported practice demonstrate significantly greater vocabulary gains than learners receiving conventional vocabulary instruction.

1.7. Scope and Delimitations

The study was delimited to 82 A2-level learners aged 10-11 at one private language centre in Ho Chi Minh City. It examined an eight-week vocabulary intervention using intact classes, with vocabulary retention measured through immediate pre-tests and post-tests. The study focused on Blooket as a supplementary review tool and did not evaluate all language skills, long-term delayed retention, or generative artificial-intelligence tutoring. Classroom observations were limited to the experimental group and were used to contextualise implementation rather than to represent all Vietnamese language-centre classrooms.

1.8. Significance of the Study

The study contributes context-specific evidence on the use of game-based vocabulary practice with young Vietnamese learners. It is practically relevant to teachers and language-centre managers because it identifies not only whether learners improved but also how pacing, feedback, grouping, and follow-up tasks influenced implementation. The findings may support more purposeful decisions about when and how Blooket should be used in vocabulary lessons.

2. Literature Review

2.1. Vocabulary Retention and Repeated Retrieval

Vocabulary retention refers to learners' ability to remember and retrieve lexical items after initial learning. Vocabulary is central to language learning because it supports comprehension and production in listening, speaking, reading, and writing (Nation, 2001). However, knowing a word is not limited to memorizing its meaning; it also includes knowledge of form, use, collocation, and context (Schmitt, 2010). Therefore, vocabulary retention should be understood as the ability to access and use words after repeated learning experiences.

Repeated exposure and retrieval are important for vocabulary development. Learners need to encounter words several times in different contexts to strengthen lexical knowledge (Laufer & Goldstein, 2004; Webb & Nation, 2017). For young EFL learners, repetition should not be purely mechanical because monotonous drills may reduce attention. Instead, vocabulary practice should include interaction, feedback, and meaningful participation, which are suitable for young learners' cognitive and affective characteristics (Cameron, 2001; Pinter, 2006).

2.2. Game-Based Vocabulary Practice

Game-based learning can make vocabulary review more active and engaging. Gamification refers to the use of game elements, such as points, challenges, rewards, and competition, in non-game learning contexts (Deterding et al., 2011; Kapp, 2012). In vocabulary lessons, these elements may encourage learners to review words repeatedly and participate more actively.

However, games do not automatically lead to learning. Their effectiveness depends on instructional design and classroom management (Hamari et al., 2014; Subhash & Cudney, 2018). In vocabulary teaching, game-based activities are useful when they help learners notice word forms, retrieve meanings, receive feedback, and reuse target vocabulary. Therefore, the game should support the learning objective rather than distract students from it.

2.3. Blooket Interface and Vocabulary Practice

Blooket provides a wide range of game modes that integrate learning tasks with playful competition (Huang, 2022). Each mode introduces different challenges and rewards, giving learners multiple opportunities for repeated practice and motivation:

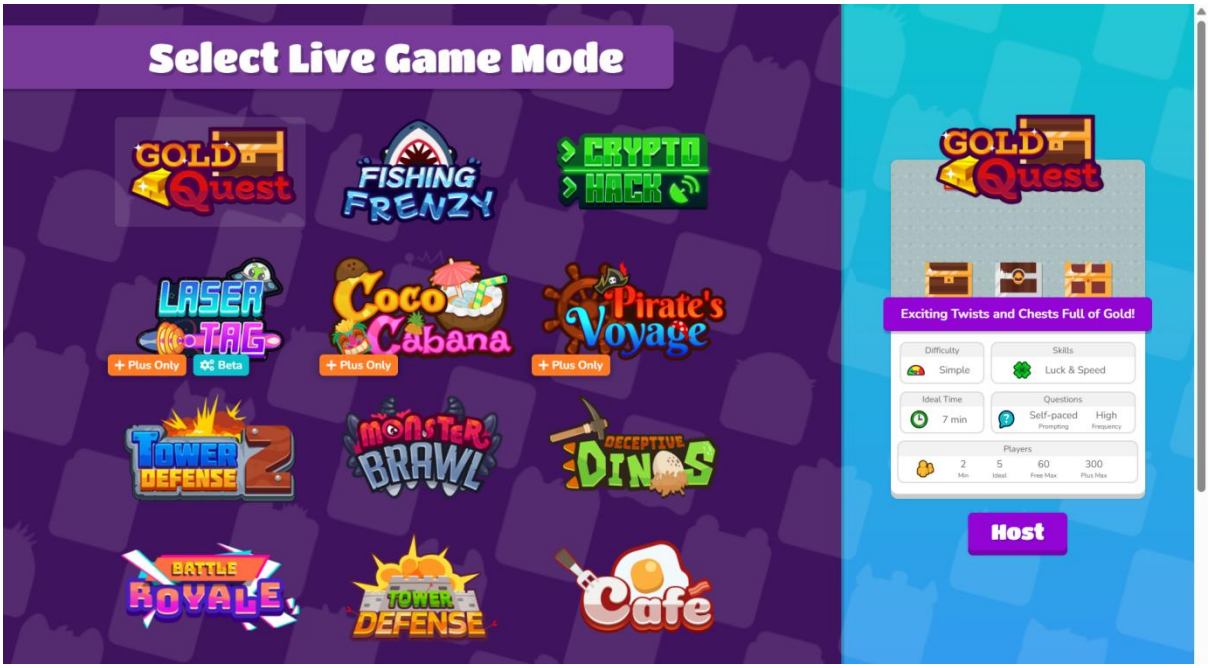

Figure 1

The live game mode options on Blooket

Gold Quest: Players answer questions correctly to open treasure chests, which may contain points or special items, including the ability to steal scores from other players.

Crypto Hack: Learners choose passwords and attempt to "hack" other players' accounts by answering questions and guessing their passwords correctly to gain currency.

Fishing Frenzy: Players catch fish of different weights by responding accurately, with heavier catches yielding higher points.

Blook Rush: Participants can attack or defend. Correct answers allow players to reduce opponents' shields or add protection for their team.

Battle Royale: Learners compete individually or in teams, eliminating others through correct responses until a winner remains.

Tower Defense: Players build and upgrade towers to defend against waves of enemy "blooks," while answering questions to strengthen their defenses.

Café: Students role-play as café staff, answering questions to earn points that are exchanged for serving dishes.

Factory: Players acquire different units that produce resources at varying rates, with correct answers helping them optimize their factories.

Racing: Participants compete to be the fastest to answer all questions correctly, with progress visualized as a race.

Classic: The simplest format where learners answer questions in sequence, similar to a traditional quiz but enhanced with playful animations.

From the teacher's side, Blooket provides automated scoring, instant feedback, response tracking, and class performance data. These features can help teachers identify difficult vocabulary items and plan follow-up instruction. In this study, Blooket is described as AI-powered only in this cautious operational sense, not as a fully adaptive or generative AI system. This view is consistent with research suggesting that automated feedback and learning analytics can support more responsive teaching (Chen et al., 2020; Hwang et al., 2020; Zawacki-Richter et al., 2019).

2.4. Blooket-Supported Vocabulary Retention

Blooket may support vocabulary retention in three main ways. First, it provides repeated encounters with target words through several rounds of gameplay, which is important for vocabulary learning (Nation, 2001; Webb & Nation, 2017). Second, it encourages active retrieval because learners need to choose or recall answers during the game. Third, it gives immediate feedback, allowing learners to notice and correct errors quickly.

Previous studies have reported that Blooket can increase learners' enjoyment, motivation, and classroom participation (Huynh, 2024; Pham & Ly, 2023; Quyen & Nguyen, 2025; Thu & Dan, 2023). Some studies have also found positive effects on vocabulary learning outcomes (Phupunna & Hongsamsibkao, 2024; Sinaga et al., 2025; Sulistyanto & Asyhar, 2024). Nevertheless, enjoyment should not be equated with durable vocabulary learning. Teachers still need to connect Blooket activities with lesson objectives, post-game review, and meaningful vocabulary use.

2.5. Conceptual Framework

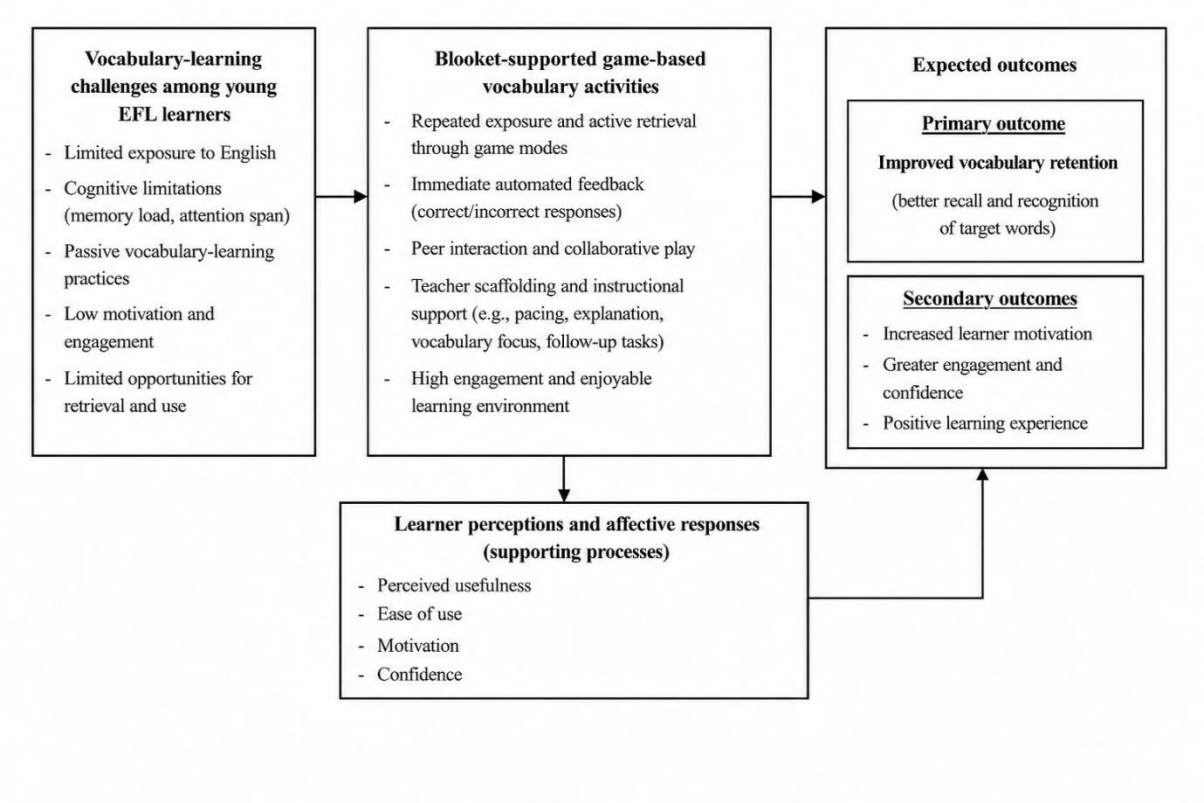

Figure 2

Conceptual Framework of Blooket-Supported Vocabulary Learning among Young EFL Learners

The conceptual framework illustrates how Blooket-supported game-based vocabulary activities may address common vocabulary-learning challenges among young EFL learners. These challenges include limited exposure to English, cognitive limitations, passive vocabulary-learning practices, low motivation, and insufficient opportunities to retrieve and use target words. This context is particularly relevant because young learners require repeated, engaging, and appropriately scaffolded practice to sustain attention and strengthen vocabulary retention.

Blooket-supported activities are proposed to address these challenges through repeated exposure, active retrieval, immediate automated feedback, peer interaction, and teacher scaffolding. Repeated game rounds provide learners with opportunities to encounter and retrieve target vocabulary, while immediate feedback helps them recognise and correct errors. Peer interaction and collaborative play may further support participation, whereas teacher scaffolding, including appropriate pacing, explanation, vocabulary focus, and follow-up tasks, ensures that game participation remains connected to the learning objectives.

The primary expected outcome is improved vocabulary retention, particularly better recall and recognition of target words. Increased motivation, engagement, confidence, and positive learning experiences are treated as secondary outcomes. Learner perceptions and affective responses, including perceived usefulness, ease of use, motivation, and confidence, are included as supporting processes that may help explain learners' participation in Blooket-based activities. However, these factors are not presented as statistically tested mediating variables.

The framework does not assume that Blooket alone produces vocabulary gains. Instead, it proposes that its educational value emerges from the interaction between game-based features, learner responses, peer participation, and teacher guidance. This framework therefore guides the interpretation of both the vocabulary-test results and the classroom-observation evidence in the present study.

3. Methodology

3.1. Research Design

The study used a quasi-experimental classroom design. This design was appropriate because the research was conducted in a real language-centre setting where random assignment of individual learners was not feasible, so intact classes were used (Cook & Campbell, 1979). Quantitative data from vocabulary pre-tests and post-tests were used to examine vocabulary retention outcomes. Classroom observation data were used to contextualize how learners participated during Blooket-supported activities and how teacher scaffolding shaped the implementation.

This paper focuses specifically on vocabulary retention outcomes. Questionnaire and interview data are not foregrounded because the purpose of the paper is to examine measurable vocabulary learning gains and classroom implementation rather than learners' general perceptions of Blooket.

3.2. Context and Participants

The research was conducted at Minds Connect Academy, a private English language centre in Ho Chi Minh City, Vietnam. This setting was selected because private language centres provide substantial supplementary English instruction to Vietnamese children but remain underrepresented in research on game-based vocabulary learning. The participants were 82 A2-level learners aged 10–11, assigned by intact class to an experimental group (n = 42) and a control group (n = 40). The experimental group comprised three classes, coded as SE.9, SE.10, and SE.11 for reporting purposes. Both groups studied the same target vocabulary over the same eight-week period.

The experimental group practiced vocabulary through Blooket-supported game-based activities. The control group received conventional vocabulary instruction, including teacher explanation, textbook-based practice, oral repetition, short written exercises, and classroom review without Blooket. Both groups completed vocabulary pre-tests before the intervention and vocabulary post-tests after the intervention.

3.3. Intervention Procedure

The intervention lasted eight weeks. In the experimental group, Blooket was used as a supplementary vocabulary review tool after the teacher had introduced or practiced the target words. The 42 learners in the experimental condition participated through three separate classes: SE.9, SE.10, and SE.11. Although the classes were organized separately for normal centre scheduling, they followed the same intervention focus, target vocabulary, and general teaching procedure.

Blooket activities were designed to recycle weekly vocabulary through repeated game rounds. Learners were required to recognize meanings, select correct answers, and respond under time constraints. The teacher also used Blooket results and classroom observations to identify vocabulary items that needed further explanation or review. After the game rounds, learners completed short follow-up tasks, such as oral responses, sentence practice, or controlled speaking activities, to extend vocabulary use beyond recognition-level practice. The control group learned the same vocabulary topics through conventional classroom procedures, including teacher-led review, workbook practice, oral repetition, and short written exercises. This comparison made it possible to examine whether the Blooket-supported condition produced stronger vocabulary retention outcomes than regular instruction over the same period.

3.4. Instruments and Data Analysis

The main instruments for this paper were vocabulary pre-tests and post-tests. The tests were adapted from Cambridge-aligned A2 Flyers practice materials and administered under similar classroom conditions. Descriptive statistics were used to compare mean scores and standard deviations. Paired-samples t-tests were used to examine within-group gains from pre-test to post-test. Independent-samples t-tests were used to compare vocabulary performance between the experimental and control groups.

Classroom observations were conducted in the three experimental classes, SE.9, SE.10, and SE.11. Observation notes focused on attention, participation, peer interaction, teacher support, game pacing, and observable vocabulary recall. These qualitative data were not used to make broad claims about perceptions. Instead, they were used to explain how Blooket-supported practice operated during classroom vocabulary review.

3.5. Ethical Considerations

Written permission to conduct the study was obtained from the management of the language centre. Because all participants were minors aged 10–11, parents or legal guardians

were informed about the study through the official parent communication groups before data collection. The notice explained the purpose of the study, the classroom procedures, the voluntary nature of participation, the academic use of the data, and the measures used to protect participants' privacy. Parents or legal guardians were given the opportunity to decline their child's participation.

Learners also received an age-appropriate explanation of the study and provided verbal assent before participating. Participation was voluntary, and learners could decline or withdraw without any effect on their grades, class standing, or access to regular classroom activities. Learners' names were removed from the dataset and replaced with codes, while classroom observation records used the class codes SE.9, SE.10, and SE.11. Electronic data were stored in password-protected folders accessible only to the researcher.

No formal institutional ethics approval number was issued for this centre-based study. In addition, no separate written parental consent form was collected. The study therefore relied on centre authorisation, parental notification with an opt-out opportunity, learner assent, anonymisation, and data-protection procedures. These procedures are reported transparently and are acknowledged as a limitation of the study.

4. Results

4.1. Control Group Vocabulary Results

The descriptive statistics for the control group's vocabulary pre-test and post-test scores are presented in Table 1.

Table 1

Descriptive Statistics of the Control Group's Pre-test and Post-test Scores

	N	Range	Minimum	Maximum	Mean	Std. Deviation	Variance
CG_Vocabulary_Pre_Test	40	6.00	3.00	9.00	5.575	1.412	1.994
CG_Vocabulary_Post_Test	40	6.00	3.00	9.00	6.075	1.509	2.276

As shown in Table 1, the control group showed a small increase in vocabulary performance after the eight-week learning period. The mean score rose from 5.575 (SD = 1.412) in the pre-test to 6.075 (SD = 1.509) in the post-test. The minimum and maximum scores remained unchanged at 3.00 and 9.00 respectively. These results suggest that learners who received conventional vocabulary instruction made some progress, but the improvement was modest.

Table 2

Test of Normality for the Control Group's Vocabulary Pre-test and Post-test Scores

	Shapiro-Wilk		
	Statistic	df	Sig.
CG_Vocabulary_Pre_Test	.953	40	**.097**
CG_Vocabulary_Post_Test	.957	40	**.136**

As presented in Table 2, the Shapiro-Wilk significance values for the control group were greater than .05 for both the pre-test (p = .097) and the post-test (p = .136). Therefore, the control group's vocabulary scores met the assumption of normality.

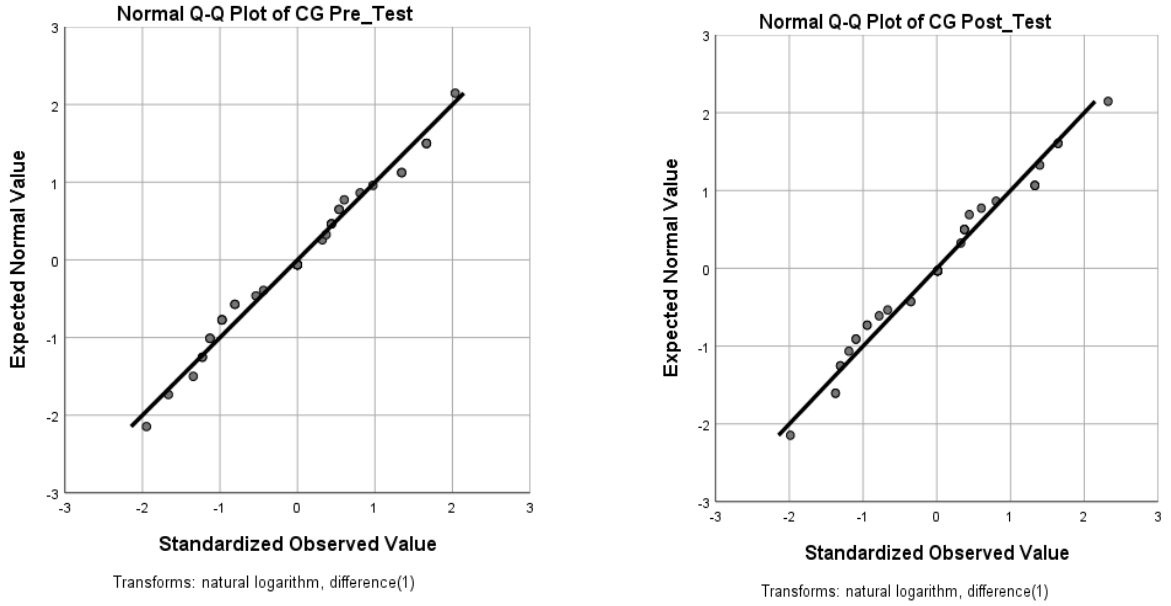

Figure 3

Normal Q-Q Plots for the Control Group's Vocabulary Test Results

The Normal Q-Q plots in Figure 3 also support this conclusion because the data points generally follow the diagonal line. Taken together, the statistical and graphical checks indicate that the control group's pre-test and post-test scores were suitable for parametric analysis.

4.2. Experimental Group Vocabulary Results

The descriptive statistics for the experimental group's vocabulary pre-test and post-test scores are presented in Table 3.

Table 3

Descriptive Statistics of the Experimental Group's Pre-test and Post-test Scores

	N	Range	Minimum	Maximum	Mean	Std. Deviation	Variance
EG_Vocabulary_Pre_Test	42	9.00	1.00	10.00	5.261	2.084	4.344
EG_Vocabulary_Post_Test	42	7.00	3.00	10.00	7.309	1.675	2.804

As shown in Table 3, the experimental group showed a clear increase in vocabulary performance after the Blooket-supported intervention. The mean score increased from 5.261 (SD = 2.084) in the pre-test to 7.309 (SD = 1.675) in the post-test. The minimum score also increased from 1.00 to 3.00, while the maximum score remained 10.00. The higher mean score and lower standard deviation in the post-test suggest that learners not only improved overall but also became more consistent in their vocabulary performance.

Table 4

Test of Normality for the Experimental Group's Vocabulary Pre-test and Post-test Scores

	Shapiro-Wilk		
	Statistic	**df**	**Sig.**
EG_Vocabulary_Pre_Test	.972	42	.378
EG_Vocabulary_Post_Test	.954	42	.090

As presented in Table 4, the Shapiro-Wilk significance values were greater than .05 for both the pre-test (p = .378) and the post-test (p = .090). This indicates that the experimental group's vocabulary scores were normally distributed and met the assumption required for a paired-samples t-test.

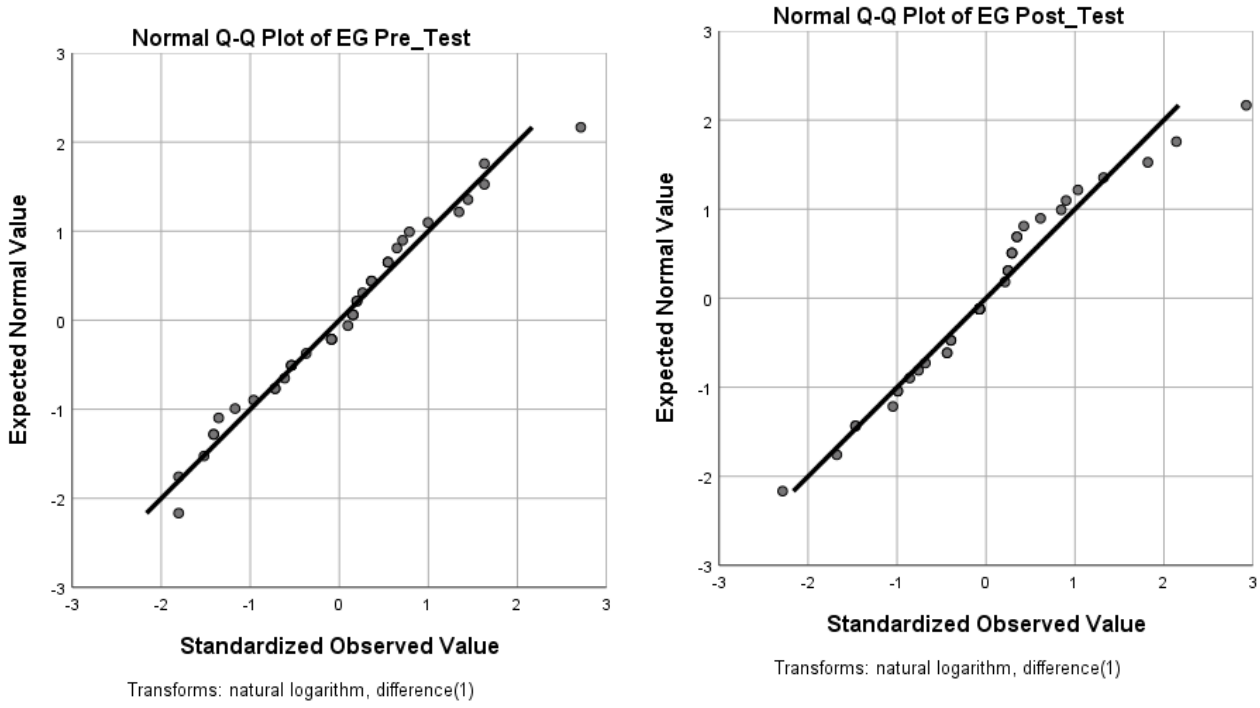

Figure 4

Normal Q-Q Plots for the Experimental Group's Vocabulary Test Results

The Q-Q plots in Figure 4 further confirm the normality assumption because the observed values are generally aligned with the diagonal reference line. Therefore, both the pre-test and post-test scores of the experimental group were appropriate for parametric comparison.

4.3. Between-Group Comparison of Pre-test Scores

Before the intervention, both groups completed the vocabulary pre-test to determine whether their initial vocabulary knowledge was comparable. The control group had a mean score of 5.58 (SD = 1.41), while the experimental group had a mean score of 5.26 (SD = 2.08).

Table 5

Descriptive Statistics for the Control and Experimental Groups' Pre-test Scores

Group	N	Range	Minimum	Maximum	M	SD
Control group	40	6.00	3.00	9.00	5.58	1.41

Group	N	Range	Minimum	Maximum	M	SD
Experimental group	42	9.00	1.00	10.00	5.26	2.08

Because Levene's test was significant, F = 5.827, p = .018, the unequal-variances result was interpreted. The independent-samples t-test indicated no statistically significant difference between the pre-test scores of the control and experimental groups, t(72.37) = 0.80, p = .427. Therefore, the two groups began the intervention with comparable vocabulary knowledge.

Table 6

Independent-Samples t-test for Vocabulary Pre-test Scores

Variance assumption	Levene F, p	t (df)	p	Mean difference (SE)	95% CI
Equal variances assumed	5.827, .018	.792 (80)	.554	.313 (.395)	[-.473, 1.099]
Equal variances not assumed	—	.800 (72.373)	.427	.313 (.392)	[-.467, 1.094]

4.4. Between-Group Comparison of Post-test Scores

After the intervention, both groups completed a vocabulary post-test with the same format and level of difficulty as the pre-test. The experimental group obtained a higher mean score (M = 7.31, SD = 1.67) than the control group (M = 6.08, SD = 1.51). An independent-samples t-test was conducted to determine whether this difference was statistically significant.

Table 7

Independent-Samples t-test for Vocabulary Post-test Scores

Variance assumption	Levene F, p	t (df)	p	Mean difference (SE)	95% CI
Equal variances assumed	.507, .479	-3.501 (80)	.001	-1.235 (.353)	[-1.936, -.533]
Equal variances not assumed	—	-3.510 (79.761)	.001	-1.235 (.352)	[-1.934, -.535]

Levene's test was not significant, F = 0.507, p = .479, indicating that the equal-variances assumption was met. The independent-samples t-test showed a statistically significant difference between the post-test scores of the two groups, t(80) = -3.50, p = .001. The experimental group scored significantly higher than the control group, with a mean difference of 1.23 points. This result supports the conclusion that the Blooket-supported condition produced stronger vocabulary outcomes than conventional review during the eight-week intervention.

4.5. Paired-Samples T-test Results for the Experimental Group

After confirming the normality of the experimental group's test scores, a paired-samples t-test was conducted to determine whether the increase from pre-test to post-test was statistically significant. This analysis directly addressed whether Blooket-supported game-based vocabulary practice contributed to measurable vocabulary gains after the eight-week intervention.

Table 8

Results of the Paired-Samples T-test for the Experimental Group

	Mean	N	Std. Deviation	Std. Error Mean
Pre-test	5.26	42	2.08	.32
Post-test	7.31	42	1.67	.26

	Mean Difference	Std Error Mean	95% CI		t	df	Sig. (2-tailed)	Effect Size (Cohen's *d*)
			Lower	Upper				
Post-test - Pre-test	2.05	.140	1.69	2.27	14.59	41	< .001	2.25

The paired-samples t-test showed that the experimental group made a statistically significant improvement in vocabulary performance. As shown in Table 8, the mean score increased from 5.26 (SD = 2.08) in the pre-test to 7.31 (SD = 1.67) in the post-test. The mean gain was 2.05 points, and the test result was statistically significant, $t(41) = 14.59$, $p < .001$. This indicates that students performed significantly better after the Blooket-supported vocabulary practice than before the intervention.

The effect size was very large (Cohen's d = 2.25), suggesting that the observed gain was not only statistically significant but also educationally meaningful. However, this result should be interpreted as evidence that Blooket-supported practice was effective as part of the classroom vocabulary review cycle, rather than as evidence that the platform alone caused all improvement.

According to Cohen's (1988) conventional interpretation, effect sizes of approximately 0.20, 0.50, and 0.80 may be considered small, medium, and large respectively. The value obtained in this study was well above the large-effect threshold, which supports the practical value of integrating Blooket into vocabulary review when it is guided by teacher explanation, feedback, and follow-up practice.

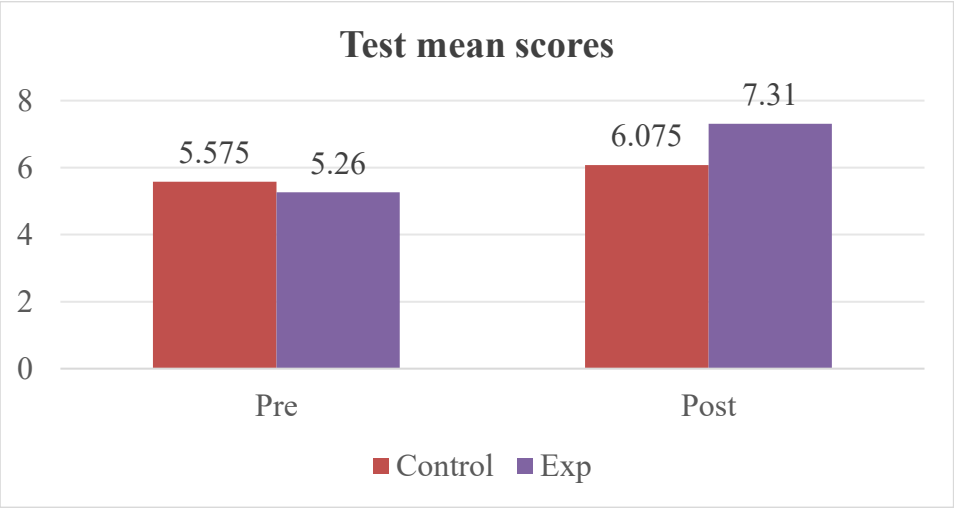

Figure 5

Comparison of Mean Pre-test and Post-test Scores

As illustrated in Figure 5, both groups improved from pre-test to post-test, but the increase was much larger in the experimental group. The control group increased by 0.50 points, whereas the experimental group increased by approximately 2.05 points. This pattern is consistent with the paired-samples t-test result and suggests that Blooket-supported vocabulary practice provided stronger support for vocabulary retention than conventional review alone.

4.6. Classroom Observation

Classroom observations were used to contextualize the quantitative test results and to explain how the Blooket-supported vocabulary practice operated during the intervention. The observations focused on students' attention, participation, peer interaction, vocabulary recall, teacher support, and classroom atmosphere in the experimental group at Minds Connect Academy.

The experimental group consisted of 42 learners divided into three centre-based classes, coded as SE.9, SE.10, and SE.11 for observation purposes. Each class received the same Blooket-supported vocabulary review procedure during the eight-week intervention. The observation checklist was created to capture critical elements of implementation, such as teacher facilitation, student engagement, interactions, pace, and vocabulary recall. During the observed lessons, Blooket was used mainly to review and recycle vocabulary previously introduced by the teacher.

In Class SE.9, students showed high engagement during Blooket vocabulary activities. After a brief teacher-led review, learners completed repeated game rounds and frequently discussed answers with peers. Several students participated more readily than during conventional review, and many were able to reuse target words in short, controlled speaking tasks after the game.

In Class SE.10, scores and leaderboards helped most learners maintain attention. However, some lower-proficiency learners struggled with faster-paced game modes. The teacher responded by pausing the activity, clarifying difficult words, adjusting the pace, and encouraging peer support. This observation suggests that Blooket was most effective when the teacher actively regulated pacing and provided timely scaffolding.

In Class SE.11, learners were placed in mixed-ability groups to reduce pressure and encourage cooperation. Students supported one another with pronunciation, word meanings, and answer selection. This grouping appeared to broaden participation and supported vocabulary recall during the speaking activities that followed the game.

Overall, the observations were consistent with the quantitative improvement. Repeated retrieval, immediate feedback, peer interaction, and sustained attention appeared to support vocabulary learning. At the same time, the observations showed that Blooket worked best as guided supplementary practice rather than as a substitute for teacher explanation or follow-up speaking and writing tasks.

5. Discussion

The findings indicate that Blooket-supported vocabulary practice was associated with stronger learning gains than conventional review in this classroom context. The two groups did not differ significantly at pre-test, $t(72.37) = 0.80$, $p = .427$, but the experimental group achieved a significantly higher post-test score than the control group, $t(80) = -3.50$, $p = .001$. Within the experimental group, the mean increased from $M = 5.26$ to $M = 7.31$, $t(41) = 14.59$, $p < .001$, with a very large effect size (Cohen's $d = 2.25$). Because the study used intact classes

rather than random assignment, these findings should be interpreted as strong classroom-based evidence rather than a universal causal claim.

The observed gains are consistent with research emphasising repeated encounters and active retrieval in vocabulary learning (Nation, 2001; Webb & Nation, 2017). Blooket required learners to retrieve target meanings several times within a short period, while immediate feedback allowed them to notice and correct errors during practice. These features likely made vocabulary recycling more intensive than in conventional review alone.

Classroom observations clarified how the intervention operated. Learners remained attentive, discussed answers, supported peers, and responded to teacher feedback. The benefit therefore appeared to arise from the interaction of technology and pedagogy rather than from the game format alone. Teacher explanation before play, monitoring during activities, and follow-up language use were central to the instructional sequence.

The observations also showed that game modes were not equally accessible to all learners. Faster-paced competition increased excitement for some students but placed additional pressure on lower-proficiency learners. Teachers should therefore adjust timing, pause for clarification, use mixed-ability grouping, and select modes according to learners' needs rather than assuming that speed and competition are universally motivating.

Blooket was particularly effective for recognition and recall, but these outcomes do not automatically represent productive vocabulary knowledge. Learners still require opportunities to pronounce words, build sentences, answer questions, and use vocabulary in speaking or writing. Game-based review should therefore be followed by tasks that move learners from rapid answer selection to meaningful language production.

The term AI-powered should also be interpreted cautiously. In this study, it refers to automated scoring, immediate feedback, response tracking, and teacher-accessible performance data, not to generative or fully adaptive artificial intelligence. These functions supported instructional decisions, but they did not replace teacher judgement, lesson design, or classroom management.

The study adds context-specific evidence from a Vietnamese private language centre, a setting in which learners often have limited exposure to English outside class and teachers must use lesson time efficiently. The findings suggest that Blooket can enrich conventional vocabulary instruction when it is integrated into a structured cycle of explanation, retrieval, feedback, collaboration, and productive follow-up practice.

6. Pedagogical Recommendations

The pedagogical recommendations are directly based on the findings of the study. Because the test and observation findings suggested stronger support for vocabulary review and recall than for productive sentence use, teachers should introduce or review target words before the activity and follow each game with short speaking or writing tasks. These tasks may include sentence construction, picture description, dialogue completion, or pair questioning so that learners can move from recognition and recall to productive vocabulary use.

Because the classroom observations showed that fast-paced modes were difficult for some lower-proficiency learners, teachers should select game modes according to learners' proficiency levels and processing speed. Slower or team-based formats may be more appropriate for mixed-ability classes. Mixed-ability grouping and peer support can also reduce pressure and encourage wider participation.

During gameplay, teachers should monitor common errors, pause when learners experience difficulty, and provide further explanation of challenging vocabulary. Blooket response data can also be used to identify items that require additional review. As the findings showed that the effectiveness of Blooket depended on teacher guidance, the platform should be used as a supplementary tool rather than as a replacement for explicit vocabulary instruction.

Language-centre managers should provide teachers with practical guidance on selecting suitable game modes, controlling activity pacing, protecting learner data, and aligning Blooket activities with curriculum objectives. Such support can help ensure that game-based activities remain inclusive, purposeful, and connected to meaningful language learning.

7. Limitations and Future Research

The study was conducted with intact classes at one private language centre, which limits generalisability and does not provide the control associated with random assignment. The intervention lasted eight weeks and used an immediate post-test, so the results do not establish long-term retention. Classroom observations were conducted only in the experimental group and were interpreted by the teacher-researcher, creating possible observer and expectancy bias. The study also focused mainly on recognition and recall rather than broader productive vocabulary knowledge. Future research should include multiple sites, delayed post-tests, independent observers, and tasks measuring sentence-level and communicative vocabulary use.

The study did not use a separate written parental consent form. Instead, parents or legal guardians were informed through the official parent communication groups and were given the opportunity to decline their child's participation. Although this procedure was consistent with the centre's usual communication practices, the absence of documented individual parental consent limits the strength of the study's ethical documentation. Future studies involving minors should obtain formal written informed consent from parents or legal guardians before data collection.

8. Conclusion

This study examined the effects of Blooket-supported game-based practice on vocabulary retention among young Vietnamese EFL learners. The experimental group achieved substantially greater gains than the control group, and observation data linked these gains to repeated retrieval, immediate feedback, peer support, and teacher scaffolding.

Blooket should nevertheless be treated as a supplementary instructional tool rather than a replacement for systematic vocabulary teaching. Its value depends on appropriate pacing, inclusive grouping, teacher mediation, and follow-up speaking and writing activities. Used in this way, Blooket can provide an engaging and instructionally purposeful form of vocabulary recycling for young EFL learners.

Acknowledgments

The author would like to express sincere gratitude to Dr. Nguyen Ho Phuong Chi and Assoc. Prof. Dr. Nguyen Ngoc Vu for their valuable guidance, academic support, and encouragement throughout the research process. This paper was developed as part of a larger research thesis conducted during the author's Master's program in English Language Studies at Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT). The author also wishes to thank the students at Minds Connect Academy for their participation and support during the classroom implementation.

#100 CREATING ENGLISH-RICH LEARNING ENVIRONMENT BEYOND THE CLASSROOM

Pham Thi Bich Tien[1]

Abstract

This paper addresses a persistent gap in Vietnamese university students' English-speaking development: the disconnect between classroom-based instruction and real-world communicative competence. While prior TESOL research has examined out-of-class learning broadly, this study contributes a distinctively integrated, multi-level intervention framework tailored to the Vietnamese university context, combining psychological safety design, task-based output routines, and institutional alignment mechanisms. Through thematic analysis of recurring barriers documented in the SLA literature, three interlocking themes are identified: psychological inhibition, methodological passivity, and structural disconnection. Based on these themes, the paper proposes a coordinated system of solutions across four levels — individual, peer group, institutional, and community — and presents an 8-week implementation roadmap grounded in evidence-based principles of output-driven language learning. The paper concludes that an English-rich environment beyond classroom activities can effectively support learners in transforming input knowledge into communicative output, thereby building confidence and sustainable speaking development.

Keywords: English-rich environment, beyond classroom, 8-week implementation roadmap, speaking development

1. Introduction

1.1 Background of Study

The era of globalization and rapid digital advancement has positioned English as an indispensable skill for university students. Beyond its role in accessing academic materials, scholarly resources, and research publications, English proficiency has a direct bearing on students' professional futures, shaping their performance in internships, job interviews, and daily workplace communication. Furthermore, English functions as a gateway through which students can engage with academic conferences, seminars, and international exchange programs, ultimately fostering their ability to thrive in diverse and multicultural settings. Given these realities, developing English competence should not be confined to fulfilling classroom obligations or meeting course requirements. Rather, it must be understood as a lifelong, ongoing journey that continues well beyond the boundaries of formal instruction.

Yet in practice, English learning in many universities remains largely confined to the classroom. This gives rise to a significant imbalance between the limited hours of formal language instruction and the far longer stretches of daily life in which English goes largely unused. Without sufficient opportunities to apply the language in authentic, real-world contexts, students easily fall into what is commonly referred to as “learning without using.” Many can follow English videos or comprehend written texts to a reasonable degree yet find

[1] *Faculty of Business Administration, Email: tienptb@huflit.edu.vn*

themselves at a loss when required to speak on the spot, respond swiftly in live conversations, or articulate their thoughts clearly under the natural pressure of real communication. Compounding this challenge is the psychological barrier that many learners face, the fear of making errors and the anxiety of being evaluated by others, which can silence students even when they genuinely have something to say. Consequently, their spoken communication skills progress slowly, not necessarily due to a complete absence of exposure, but rather because meaningful, consistent practice of English as a living, active skill remains critically lacking.

It is for this reason that adopting an approach centered on building an English-rich learning environment beyond the classroom is both highly reasonable and practically sound. Language acquisition, by its very nature, depends on repeated exposure and meaningful use across a wide variety of contexts. When English is encountered only within classroom hours, learners are unlikely to receive sufficient input to develop authenticity and informality in the language, or enough authentic interaction to cultivate the confidence and fluency that real communication demands. On the other hand, when students take deliberate steps to create a rich English learning environment outside the classroom, English gradually becomes woven into the fabric of their everyday lives.

1.2. Problem Statement

Despite the recognized importance of English proficiency in academic and professional contexts, a substantial gap persists between classroom-based language instruction and the communicative competence that students are expected to demonstrate in real-world settings. Many university students complete years of formal English education yet continue to struggle with spontaneous speaking, interactive conversation, and confident oral expression. This gap is not simply a product of inadequate teaching within the classroom; rather, it reflects a systemic absence of structured, meaningful English use outside of formal instruction. The lack of an English-rich extracurricular environment means that students have insufficient opportunities to reinforce, apply, and internalize the language skills they acquire in class. Without deliberate efforts to extend English learning beyond the classroom, students' speaking proficiency and willingness to communicate are unlikely to develop to the level required for academic success and professional readiness.

1.3. Research Objectives

This study aims to achieve the following objectives:

1. To identify the key barriers that prevent university students from practicing English outside the classroom, with particular focus on speaking proficiency and willingness to communicate.
2. To examine the theoretical foundations of extracurricular language learning environments and their role in second language acquisition.
3. To propose a structured, multi-level system of practical strategies for building an English-rich learning environment beyond the classroom.
4. To design a feasible 8-week implementation roadmap that enables students to progressively develop their speaking skills and communicative confidence through extracurricular engagement.

1.4. Research Questions

This study is guided by the following research questions:

1. What are the primary obstacles that hinder university students from using English outside the classroom, particularly in terms of speaking and communication?
2. How can theoretical principles of second language acquisition inform the design of an extracurricular English-rich learning environment?
3. What multi-level strategies, encompassing individual habits, peer interaction, institutional support, and community engagement, can effectively enhance students' English speaking proficiency and willingness to communicate beyond the classroom?
4. How can these strategies be structured into a coherent and practical implementation plan suitable for university students?

1.3. Hypotheses

Based on the research objectives and questions above, this study proposes the following hypotheses:

- H1: University students who are exposed to a deliberately constructed English-rich environment outside the classroom will demonstrate greater improvement in speaking proficiency compared to those who rely solely on classroom instruction.
- H2: Students who engage in structured extracurricular English activities, such as English-speaking clubs, media consumption in English, and peer conversation practice, will report higher levels of willingness to communicate in English.
- H3: A multi-level approach to building an extracurricular English environment, incorporating individual, peer, institutional, and community dimensions, will be perceived by students as more feasible and motivating than single-level interventions.

1.4. Scope and Delimitation of the Study

This study focuses specifically on non-English-major university students whose English learning is primarily delivered through general English courses as part of their academic program. The central concern of this paper is the development of speaking proficiency and willingness to communicate (WTC) in English, rather than the full spectrum of language skills (reading, writing, listening). While reading, listening, and writing activities may be discussed as supporting components of an English-rich environment, they are treated as subsidiary to the primary focus on oral communication.

The proposed strategies and implementation roadmap are designed for application within a Vietnamese university context, drawing on the specific sociolinguistic and institutional realities that characterize English learning in Vietnam. Accordingly, the findings and recommendations of this study may not be directly transferable to other educational or cultural contexts without appropriate adaptation.

This study does not constitute an empirical investigation. No primary data was collected through surveys, interviews, or experiments. The paper is theoretical and propositional in nature, drawing on established second language acquisition theory and relevant literature to construct a reasoned framework of recommendations. Consequently, claims regarding the

effectiveness of the proposed strategies are inferential rather than empirically validated, and future empirical studies are recommended to evaluate the hypotheses presented herein.

1.5. Organization of the Study

This paper is organized into the following chapters: Chapter 1 (Introduction) introduces the background, problem statement, research objectives, research questions, hypotheses, and scope of the study. Chapter 2 (Theoretical Foundation) presents a review of relevant literature on second language acquisition and extracurricular language learning. Chapter 3 (Thematic Analysis of Barriers in the University Context) proposes the multi-level system of strategies for building an English-rich environment beyond the classroom. Chapter 4 (Solutions) outlines the 8-week implementation roadmap. Chapter 5 (Conclusion, Recommendations, and Implementation Roadmap) provides the conclusion and recommendations for future research.

2. Theoretical Foundation

The Concept of a Language Learning Environment

In research on language teaching and learning, the notion of a "language learning environment" is not limited to physical classroom space. Instead, it is understood as an overall system of interacting factors that influence how learners acquire and use a language. A language learning environment includes five key components: resources, interacting with people, learning activities, language-use norms, and motivation (Dörnyei, 2005; MacIntyre & Vincze, 2017).

First, resources refer to the sources of input that learners can access, such as reading materials, videos, podcasts, textbooks, online posts, and academic documents. When resources are diverse and appropriate to learners' proficiency levels, students are more likely to sustain interest and encounter the target language across multiple contexts (VanPatten, 1996; Ellis, 2003).

Second, interacting people are individuals who provide real "dialogue partners" for learners. These can include classmates, instructors, event organizers, members of an online community, or speakers encountered in digital spaces. When learners interact with others, language becomes functional and meaningful; it is used to achieve communication goals rather than to complete exercises (Swain, 1985, 1995).

Third, learning activities are the tasks and interactional practices in which learners take part. An environment is truly "rich" only when learners do not rely solely on passive consumption (e.g., watching or reading) but also engage in purposeful activities such as discussion, responding to others, presenting, asking questions, writing, and producing language-based outputs (Ellis, 2003; Swain, 1985).

Fourth, language-use norms refer to how language is used in real situations, including politeness levels, contextual phrasing, appropriate word choices, and language patterns depending on relationships between speakers. When these norms are reflected in learning situations, learners gradually develop more accurate and natural communicative competence (Swain, 1985; Ellis, 2003).

Finally, motivation determines whether learning efforts can be sustained. Motivation may come from academic needs, career goals, or the sense of personal progress. Effective language learning environments often support motivation by enabling learners to experience success in incremental steps, which is closely related to learners' L2 confidence and willingness to communicate (MacIntyre et al., 1998; Horwitz et al., 1986).

The Role of Learning Beyond the Classroom

Learning English outside the classroom plays a crucial role because it provides opportunities that classroom time often cannot cover adequately. First, out-of-class learning increases the frequency of exposure to real language. While classroom instruction is limited by schedules, students' daily lives and online environments offer continuous streams of language through social media, academic posts, videos, news, and everyday interactions (VanPatten, 1996; Dörnyei, 2005).

Second, learning beyond class enables students to develop skills in a situational and integrated manner. Instead of practicing skills in isolation, learners can connect listening, reading, speaking, and writing to meaningful contexts. For instance, listening to discipline-related podcasts may support note-taking and later writing tasks; participating in online group discussions may improve learners' ability to respond and negotiate meaning; reading short research summaries may provide language input for writing paraphrases or abstracts (Ellis, 2003; Swain, 1985).

Third, learning outside helps reduce fear of making mistakes and increases confidence. When learners are offered a psychologically safe space to experiment with language, sometimes in informal settings such as clubs, discussion groups, or learning journals, they experience less pressure to be judged for errors. As a result, learners begin to use English as a communication tool rather than only as an object for testing (Horwitz et al., 1986; MacIntyre & Vincze, 2017).

Principles for Creating an Effective Language Learning Environment

Based on foundational ideas in modern language education, an effective language learning environment can be built on the following principles:

- Comprehensible input: Learners should receive language input at a level that is challenging but manageable (VanPatten, 1996). Krashen's (1982) Input Hypothesis similarly argues that acquisition occurs when input is slightly beyond the learner's current competence. Selecting contextually appropriate content is therefore essential to sustaining both comprehension and motivation.
- Meaningful interaction: Learners need opportunities to interact so that they can clarify meaning, negotiate communication, confirm information, and respond. Long's (1983) Interaction Hypothesis demonstrates that modified interaction, where communication breakdowns are negotiated, provides learners with comprehensible input and feedback essential for development. Without interaction, learners may remain confined to passive comprehension (Swain, 1985; Ellis, 2003).
- Pushed output: A rich environment does not only provide input; it must also promote output. Swain's (1985, 1995) Output Hypothesis argues that when learners are required to produce language to express precise meaning, they notice gaps in their interlanguage, test hypotheses about the target language, and develop greater syntactic control. Output thus strengthens both accuracy and communicative confidence.
- Continuity and gradual difficulty increase: Exposure and practice should be maintained regularly to avoid learning only during peak periods. As learners become comfortable with a certain level of tasks, difficulty should gradually

increase, for example, by extending task length, increasing processing speed, or raising task openness (Skehan & Foster, 1999; Ellis, 2009).

- Task-based learning: Learners make better progress when they engage in tasks with clear goals and tangible outcomes. Ellis (2003, 2009) identifies task-based language teaching as particularly effective because it creates conditions where language use is purposeful, meaningful, and authentically communicative, precisely the conditions absent from traditional classroom-bound instruction.
- Purposeful learning: Learning objectives should be individualized and connected to concrete needs. When learners understand why they are learning, intrinsic motivation improves and effort becomes more consistent (Dörnyei, 2005; MacIntyre et al., 1998).

From these principles, it can be concluded that creating an English-rich environment beyond the classroom is not merely an extracurricular or symbolic activity. It should be treated as an intentional educational design that includes appropriate input, meaningful interaction, required output, task-based goals, and continuous follow-up.

Thematic Analysis of Barriers in the University Context

A thematic analysis of the barriers facing Vietnamese university students in developing English speaking proficiency reveals three interrelated themes: psychological inhibition, methodological passivity, and structural disconnection. These themes do not operate in isolation; rather, they form a mutually reinforcing cycle that this paper terms the non-use loop. Each theme is discussed below with reference to empirical and theoretical evidence.

Theme 1: Psychological Inhibition – Fear, Anxiety, and Performance Pressure

The most immediate and visible barrier is the cluster of psychological factors that suppress learners' willingness to communicate (WTC). Horwitz and Cope (1986) identified foreign language classroom anxiety (FLCA) as a distinct, complex psychological construct tied specifically to language learning contexts. Their research demonstrated that FLCA comprises three components: communication apprehension, test anxiety, and fear of negative evaluation, all of which are routinely activated in speaking situations.

In the Vietnamese university context, this anxiety is compounded by sociolinguistic factors. Many students have been educated in a predominantly grammar-translation tradition, in which accuracy is prioritized over fluency and errors carry social consequences (Nguyen, 2011). Consequently, speaking in English becomes associated not with communication but with evaluation and potential embarrassment. MacIntyre et al.'s (1998) situational model of WTC demonstrates that when learners anticipate negative outcomes, such as social judgment or loss of face, their communicative intention decreases, even when linguistic knowledge is sufficient.

A further dimension is the performance-oriented mindset: learners focus on producing error-free language rather than prioritizing communicative effectiveness. This leads to over-monitoring, cognitive overload, and disfluency under time pressure. The result is not a language deficit but a confidence deficit; learners know but cannot deploy what they know under real communicative conditions.

Theme 2: Methodological Passivity – Input without Output

The second theme concerns the predominance of receptive, input-focused learning strategies among university students. Common patterns include watching English videos,

reading online content, and memorizing vocabulary, all of which are valuable but insufficient if not accompanied by productive output.

Swain's (1985, 1995) Output Hypothesis provides the theoretical foundation for understanding why input-heavy methods are insufficient. Comprehensible output, language produced by the learner to convey meaning, serves three key functions: it forces learners to notice gaps in their interlanguage; it provides opportunities to test linguistic hypotheses; and it promotes automaticity through repeated production practice. None of these functions is activated through passive reception alone.

Empirical evidence supports this view. Izumi (2002) found that learners who produced output after reading showed significantly greater noticing of target forms than those who read alone. Similarly, Kowal and Swain (1994) demonstrated that collaborative output tasks led learners to reflect on their language use in ways that input tasks did not. These findings suggest that students who rely predominantly on input activities are systematically depriving themselves of the cognitive processes most essential for speaking development.

A further methodological issue is the absence of long-term, cyclical planning. Learning tends to be concentrated around exam periods, with extended intervals of minimal practice, a pattern inconsistent with what is known about distributed practice and memory consolidation (Dörnyei, 2005). Without a structured schedule, even motivated learners struggle to convert knowledge into durable communicative competence.

Theme 3: Structural Disconnection – The Gap between Classroom and Real-World Use

The third theme addresses a systemic problem: the structural absence of pathways connecting classroom learning to authentic out-of-class practice. Many universities treat extracurricular English activities as optional add-ons rather than integrated components of the learning pathway. This creates a situation in which classroom instruction ends without a bridge to the contexts where communicative competence must ultimately function.

Benson (2011) argues that out-of-class language learning is not merely supplementary but constitutive of communicative competence; learners require autonomous, self-directed engagement with the language in authentic contexts to develop the flexibility and confidence that classroom interaction alone cannot produce. However, autonomy does not emerge spontaneously; it requires institutional scaffolding, structured task design, and accessible feedback mechanisms (Little, 2007).

In Vietnamese universities specifically, structural disconnection is exacerbated by large class size, limited contact hours, and the absence of systematic co-curricular English programming. Students may be aware that they need more practice but lack the institutional framework, the tasks, feedback channels, and social structures, that would make sustained out-of-class practice feasible and motivating.

Synthesis: The Non-Use Loop and the Case for an Integrated Intervention

These three themes are not independent; they interact to form a self-reinforcing cycle. Psychological inhibition reduces learners' willingness to engage in speaking practice. Methodological passivity means that even when students do study, they generate insufficient output to build confidence or automaticity. Structural disconnection ensures that no institutional mechanism intervenes to break the cycle. Together, these themes explain why many Vietnamese university students can comprehend English but cannot produce it fluently under communicative pressure. This thematic analysis thus establishes the rationale for a multi-level intervention that simultaneously addresses all three themes: psychological safety design

(Theme 1), output-driven task structures (Theme 2), and institutional alignment mechanisms (Theme 3). The solutions proposed in Chapter 4 (Solutions) are each mapped to these themes, ensuring that recommendations are grounded in the identified evidence base rather than general prescription.

Solutions

Individual Solution: Build a Micro Roadmap and Daily Output Routines

(Addresses Themes 1 and 2)

Rather than waiting for external conditions to emerge, students should begin with personal habits. The key approach is to design a micro-learning roadmap, a short but sustainable plan that students can maintain daily. Evidence from research on deliberate practice (Ericsson et al., 1993) and distributed learning (Dörnyei, 2005) consistently shows that frequent, low-intensity practice is more effective for skill development than infrequent, high-intensity study sessions.

A practical cycle can follow three steps grounded in Swain's (1985) input-output model: (1) receive comprehensible input at a slightly challenging but manageable level, (2) process the input to generate active language through output (speaking or writing), and (3) reflect on or record feedback to consolidate progress. For example, a 25–30-minute session may include listening to a short clip or discipline-related podcast for 8–10 minutes, followed by writing or recording a three-to-five-sentence summary, then practicing a one-minute spoken response. The crucial point is not how much content is studied, but that each session produces a language output product. With output appearing consistently, learners gradually overcome reticence, because they discover they can complete small tasks daily, and small repeated efforts build confidence over time.

To address Theme 1 directly, students should adjust their self-evaluation criteria. Research on WTC (MacIntyre et al., 1998) demonstrates that learners' communicative confidence is strongly shaped by their perception of success in prior speaking attempts. Adopting a “speak to practice” orientation, accepting that errors will occur and be corrected iteratively, is therefore not merely motivational advice but an evidence-based strategy for increasing WTC.

A helpful mechanism is keeping a voice journal using fixed sentence frames (e.g., “From what I heard…,” “The main point is that…,” “In my opinion, … because …”). Research on formulaic language (Wray, 2002) confirms that such frames reduce cognitive load, freeing attentional resources for meaning-making rather than grammatical monitoring.

Finally, motivation can be maintained through simple progress tracking. Dörnyei (2005) identifies self-efficacy, learners' belief in their own capacity to succeed, as one of the strongest predictors of sustained language learning effort. A brief daily learning diary (input received, output produced, errors noticed, next practice target) operationalizes this by making progress visible and directional.

Group/Community Solution: Create a “Safe Space for Speaking” with Task-Based Interaction

(Addresses Themes 1 and 2)

Lasting improvement in communicative competence typically requires interaction with others. Vygotsky's (1978) concept of the Zone of Proximal Development (ZPD) and its application in collaborative language learning (Swain & Lapkin, 1998) provide theoretical

justification: learners develop more effectively when collaborating with peers who can provide support slightly beyond their current independent capacity.

Groups should operate with clear norms from the outset: (1) treat errors as data for learning rather than failures; (2) provide feedback as suggestions for improvement rather than evaluation; (3) rotate speaking roles to ensure equal participation; and (4) run activities with tasks and time limits. These norms directly address the fear of negative evaluation identified in Theme 1.

A suitable mechanism is the task-based learning cycle (Ellis, 2003): (1) warm-up with accessible questions, (2) task execution (group discussion, role-play, peer interviews, debates requiring reasoned justification), and (3) end-of-session output (a one-to-two-minute speaking segment or a short written paragraph). Critically, feedback should operate on two levels: first on meaning (whether the main point is clear), then on language (vocabulary, structures, and recurring errors). Lyster and Saito's (2010) meta-analysis of oral feedback in classroom SLA found that corrective feedback, particularly recasts and prompts, significantly promotes L2 development, with the greatest effects when feedback is explicit and focused on specific linguistic targets. Two-level feedback respects this evidence by prioritizing communication before correction.

A buddy system can further reduce anxiety. Because partners are familiar, social risk is reduced and speaking becomes more natural. Scripts aligned with academic and career needs (e.g., presenting a study project, describing research habits, introducing skills) ensure that practice is purposeful rather than merely social.

University Solution: Align Classroom Learning with Out-of-Class Practice

(Addresses Theme 3)

Universities must create structural alignment mechanisms that connect in-class activities with out-of-class practice, directly addressing Theme 3. Without institutional scaffolding, even motivated students lack the frameworks to make sustained extracurricular practice feasible.

First, universities should embed an input-task-feedback cycle in each course. Rather than assigning generic homework, instructors should assign output-oriented tasks directly aligned with classroom input: summarizing a reading in English, recording a one-minute presentation, writing a short counterargument, or participating in structured group discussions. Little's (2007) research on learner autonomy demonstrates that structured task design is essential for enabling self-directed learning; autonomy does not emerge spontaneously but must be scaffolded through clear task parameters and feedback.

Second, universities should provide accessible learning spaces and channels: flexible practice rooms, an academic library with appropriate materials, or an online platform for submitting speaking and writing outputs. Standardized rubrics assessing clarity of meaning, appropriateness of vocabulary, and improvement over time reframe evaluation as developmental rather than purely summative, a shift supported by Hattie and Timperley's (2007) influential meta-analysis demonstrating that feedback oriented toward learning goals (rather than grades) produces significantly greater achievement gains.

Third, periodic events with clearly defined language objectives, such as English Speaking Day, discipline-based academic club activities, and mid-semester mini-presentations, should follow a gradual ladder design: beginners can start with very brief tasks (30-second speaking), then progressively increase length and interactional complexity. This scaffolded

approach prevents newcomers from experiencing overwhelming demands that would reinforce Theme 1 barriers.

Finally, universities should implement mechanisms to recognize progress, such as incremental participation credit, certificates, or tracked "hours of purposeful use," to integrate out-of-class learning into the official curriculum rather than treating it as optional.

Community/Partner Solution: Extend English Output to Authentic Contexts

(Addresses Themes 1, 2, and 3)

To make English genuinely serve academic and professional development, learners must experience English in contexts approximating real-world use. This addresses all three themes simultaneously: authentic contexts reduce the artificial performance pressure of Theme 1, generate genuine communicative output beyond Theme 2's passive reception, and extend the structural reach of the institution beyond Theme 3's classroom walls.

Effective approaches involve activities with real communicative purposes: alumni career talks, mock interviews with professionals, and collaborative projects with organizations (writing service brochures, producing academic communication content, editing project proposals). These generate authentic output; students must communicate to achieve project goals, not merely to satisfy academic requirements. Research on task authenticity (Ellis, 2003) consistently shows that learners demonstrate greater effort, more complex language use, and higher motivation when tasks have purposes beyond the classroom.

Community settings also support informal interaction: language exchange sessions with international residents or visitors, and community seminars on local topics (environment, culture, history) with English discussion segments. When students recognize that they are speaking to address factual issues or share genuine opinions rather than to complete assignments, communicative motivation increases significantly, consistent with self-determination theory's emphasis on autonomy and purpose as drivers of intrinsic motivation (Deci & Ryan, 1985, as cited in Dörnyei, 2005).

To ensure quality, universities and partners should provide task frameworks in advance: topic, product criteria, time allocation, and feedback guidance. This structure prevents learners from facing overly demanding situations without support, especially for students who are psychologically hesitant to make mistakes. Meanwhile, evaluation should focus on progress rather than final performance only, encouraging participation from students at all proficiency levels.

Conclusion, Recommendations, and Implementation Roadmap

5.1. Conclusion

This paper has argued that the limitations in Vietnamese university students' English speaking skills are not primarily linguistic in origin. Through thematic analysis, three interlocking barriers were identified: psychological inhibition (Theme 1), methodological passivity (Theme 2), and structural disconnection (Theme 3). These themes interact to form a non-use loop in which reduced speaking leads to lower confidence, which further reduces speaking practice.

The study's primary contribution to the existing TESOL literature lies in three areas. First, while prior research has examined individual barriers (anxiety, input-output imbalance, institutional constraints) in isolation, this paper provides an integrated thematic analysis that demonstrates how these barriers mutually reinforce one another, and therefore why single-level

interventions have limited effectiveness. Second, the proposed multi-level solution framework is explicitly mapped to the identified themes, ensuring that each recommendation is evidence-grounded rather than prescriptive. Third, the study situates this framework specifically within the Vietnamese university context, a setting characterized by large class sizes, grammar-translation traditions, face-saving cultural norms, and limited co-curricular infrastructure, thereby filling a gap in contextually specific intervention design for Southeast Asian EFL learners.

The theoretical foundation of this paper, drawing on Swain's Output Hypothesis, MacIntyre et al.'s WTC model, Long's Interaction Hypothesis, and Ellis's task-based learning framework, supports the view that effective out-of-class learning environments must coordinate exposure, output tasks, psychological safety, and feedback mechanisms. Future research should empirically evaluate the hypotheses proposed in Chapter 1 (Introduction) through quasi-experimental designs, examining whether the multi-level intervention framework produces measurable improvements in speaking proficiency and WTC compared to control conditions.

Recommendations by Stakeholder Group

Recommendations for Students (Individual Level)

- Design a micro-learning roadmap: each learning session (20–30 minutes) should produce at least one speaking/writing output (1–5 sentences, or a 30–60 second recording), consistent with output-driven SLA principles (Swain, 1985).
- Shift the goal from “speaking perfectly” to “speaking to practice,” prioritizing communicative intent, supported by WTC research demonstrating that perceived competence, not actual accuracy, most strongly predicts speaking engagement (MacIntyre et al., 1998).
- Use sentence frames to reduce cognitive load and speaking anxiety (Wray, 2002).
- Track progress through behavioral indicators: number of recordings/speaking attempts, frequency of repeated errors, and improvement in clarity of meaning.

Recommendations for Learning Groups/Clubs (Group Level)

- Design activities using the task-based learning cycle: warm-up → task execution → end-of-session output (Ellis, 2003).
- Establish two-layer feedback: content clarity first, then language accuracy, consistent with Lyster and Saito's (2010) finding that focused, staged feedback maximizes uptake without increasing anxiety.
- Apply a buddy system and rotate speaking roles to ensure equal practice opportunities for all members.

Recommendations for Universities (Institutional Level)

- Embed an out-of-class practice cycle in each course: in-class input → output-based tasks → product submission → rubric-based feedback (Hattie & Timperley, 2007).
- Build accessible submission and feedback channels to reduce the psychological cost of evaluation (Horwitz et al., 1986).

- Organize periodic speaking events (e.g., speaking day, mini presentations, academic-club seminars) with a gradual ladder design, brief, low-stakes tasks first, increasing in length and complexity (Skehan & Foster, 1999).

Recommendations for Communities and Partners (External Level)

- Create activities with authentic communicative purpose (career talks, mock interviews, academic communication projects) (Ellis, 2003).
- Provide clear task frameworks in advance (time limits, expected products, feedback criteria).
- Base evaluation on progress, not only final performance, to encourage broad participation.

Sample Implementation Roadmap (8–10 Weeks)

The following roadmap is designed for a club, speaking-support module, or group intervention program. It is organized around the three identified themes and follows the principle: psychological safety (Theme 1) + output tasks (Theme 2) + structural connection (Theme 3) + gradual extension to authentic contexts.

Week 1: Establish Psychological Safety and Speaking Norms (Theme 1)

- Individual: begin a voice journal (2–3 times/week), 30–45 seconds using sentence frames.
- Group: agree on feedback norms; run a "round-robin" activity (30 seconds per learner on a familiar topic).
- Output: one personal recording plus two-layer peer feedback.

Week 2: Build Basic Output Chains (Theme 2)

- Individual: complete three "listen → summarize (3–5 sentences) → speak (60 seconds)" cycles.
- Group: implement a buddy system with scripted Q&A (self-introduction, learning goals).
- Output: each pair submits a short, recorded dialogue.

Week 3: Increase Task Complexity (Theme 2)

- Group: discussion tasks with a "claim-reason-example" structure.
- Feedback: rubric focusing on two main criteria, clarity of meaning and appropriateness of vocabulary.
- Output: one-to-two-minute speaking segment per group.

Week 4: Integrate Course Content into Speaking Tasks (Theme 3)

- University/Instructor: assign speaking output tasks aligned with in-class content.
- Individual: record a one-to-two-minute talk and write an 80–120-word summary.
- Output: products submitted for rubric-based feedback.

Week 5: Develop Fluency through Re-telling (Themes 1 and 2)

- Individual: re-telling practice, listen to a previous clip and retell it with targeted improvement (1–2 aspects).
- Group: role-play academic situations (challenging an idea, reporting project progress).
- Output: Version 1 and Version 2 re-tellings within the same week.

Week 6: Move to Academic-Style Speaking (Theme 2)

- Group: mini-debate or seminar-style discussion with assigned roles.
- Feedback: introduce an "error log" to identify and target recurring group-level errors.
- Output: two-to-three-minute presentation or debate segment.

Week 7: Connect to Authentic Contexts (Themes 3 and 4)

- Invite an alumni speaker or professional staff member for a structured Q&A in English.
- Learners complete mock interviews based on a provided question set.
- Output: recorded answers plus a brief self-reflection on improvement.

Week 8: Consolidate and Evaluate Progress (Themes 1–3)

- Individual: produce a "before-after" reflection comparing early and final recordings.
- Group: deliver a consolidated topic presentation; receive rubric-based feedback.
- Final output: three-to-five-minute speaking performance plus a four-week self-practice plan.

If extending to 10 weeks, add two weeks for "guided freer speaking tasks" and a one-peer-coaching cycle between groups.

In short, the core strategy is to engineer an environment and routine in which speaking becomes a repeated, supported, and purpose-driven practice.

#105 EXPLORING FIRST-YEAR ENGLISH-MAJORED STUDENTS' PERCEPTIONS OF PEDAGOGICAL TRANSLANGUAGING IN AN EMI CONTEXT

Thinh Tien Vu[1], Cam Diem Nhi Hoang[2]

Abstract

The rapid expansion of English as a Medium of Instruction (EMI) has highlighted the complex roles of the native language (L1) and the target language (L2) in academic learning. Pedagogical translanguaging has emerged as a strategic method to support student comprehension within these environments. This study investigated how English-major students perceived teachers' pedagogical translanguaging practices and identified the specific practices most and least valued in EMI classrooms. The participants included fifty first-year English-majored students at a public university in Vietnam. Employing a quantitative research design, the data were collected via a structured questionnaire and analysed using descriptive statistics. The results indicated that students generally hold positive perceptions of pedagogical translanguaging across three primary dimensions: Stance, Design, and Shift. Furthermore, the three most frequently reported practices involve using Vietnamese to clarify difficult concepts, explaining complex academic content bilingually, and supporting vocabulary and grammar acquisition through both languages. These findings suggest that pedagogical translanguaging is perceived as a useful instructional approach that helps to facilitate learning in EMI contexts.

Keywords: English Medium of Instruction (EMI), English-majored Students, Pedagogical Translanguaging, Student Perceptions, Translanguaging practices

1. Introduction

English holds an unparalleled position in global internationalisation and has increasingly been adopted as the medium of instruction in educational settings (Liu, 2021). In recent years, English as a Medium of Instruction (EMI) at universities has been significantly growing as an educational phenomenon. It is increasingly attracting researchers' attention, particularly those in applied linguistics (Macaro, 2019). Alongside this development, for decades, foreign language teaching has been guided by the principle that teachers should use only the target language (TL) and avoid the native language (L1) unless necessary (Littlewood & Yu, 2009). Due to ongoing debates surrounding bilingual language use in EMI classrooms, a new and developing teaching and learning method called Translanguaging, especially Pedagogical Translanguaging, has emerged as a framework that reconceptualises the use of the native language (L1) in the foreign language classroom by arguing that the use of L1 alongside the target language is considered a functional language practice (Sapitri et al., 2018).

Translanguaging has emerged as a response to EMI programs for non-native English learners, addressing challenges such as monolingual bias and the difficulties faced by learners

[1] *Corresponding author, PhD candidate, School of Languages, International University - VNU HCM, HCMC, Vietnam;* vtthinh@hcmiu.edu.vn
[2] *BA, School of Languages, International University - VNU HCM, HCMC, Vietnam*

with low English proficiency (Nguyen, 2022). According to Fang et al. (2022), Translanguaging, in both practice and pedagogy, has attracted growing interest for its recognition of the linguistic resources and cultural capital of both teachers and learners.

A study by Zumor (2019) conducted in an EMI environment found that the language barrier was a significant factor in student failure. This language barrier creates an immediate academic crisis for Vietnamese first-year English-majored students, who are suddenly forced to shift to a completely English-speaking environment. In practice, Iversen (2019) stated that students with low-level language proficiency often use translanguaging as a supplementary tool to understand the content of a text or lesson. This led to the emergence of translanguaging as the most intuitive and optimal problem-solving method, given its benefits. The use of translanguaging promotes students' metacognitive and critical-thinking abilities, while providing cognitive support (García & Wei, 2014). There is a significant gap in empirical and contextual research, as previous literature has focused primarily on teachers' perspectives, completely neglecting quantitative data on the perceptions of first-year English-majored students regarding the use of pedagogical translanguaging in EMI environments within a Vietnamese context. This indicates that research on students' perceptions of pedagogical translanguaging is extremely useful at this stage.

This research explored first-year English-majored students' perceptions of pedagogical translanguaging in an EMI context and identified the practices most and least valued by students in EMI classrooms. Other student groups (second-year to fourth-year students) were intentionally excluded from this study because first-year students face the greatest language shock during the first semester of the transition to English-language instruction at the university level. Theoretically, it not only contributed to the limited body of research on pedagogical translanguaging in teaching and learning within EMI environments but also shifted the focus from teachers to students. In practical terms, this study offers a deeper understanding of learners' experiences of pedagogical translanguaging in the EMI context. Therefore, teachers and curriculum designers can know how students engage with translanguaging activities, thereby supporting more effective pedagogical decisions in EMI classrooms. To fulfil the purpose of the study, the paper was conducted to answer the following research questions:

1. How do first-year English-majored students perceive teachers' pedagogical translanguaging practices in EMI classes?
2. Which pedagogical translanguaging practices are most and least valued by first-year English-majored students in EMI classrooms?

2. Literature Review

2.1. EMI Context

EMI has emerged as a rapidly expanding global phenomenon, with its demand spreading worldwide only over the past two decades (Romanowski, 2020). Macaro (2019) defined EMI (English Medium of Instruction) as the provision of instruction in contexts where English is not the commonly used language. Dearden (2014) suggested EMI as the implementation of using English to teach academic subjects in countries or jurisdictions where the mother tongue (L1) of most of the population is not English. In this study, EMI is the use of English to teach academic subjects in countries such as Vietnam, where the majority of the population speaks a language other than English.

Beyond promoting internationalisation and globalisation, EMI has been shown to benefit students whose first language is not English, as it helps develop their English proficiency, prepares them for the job market, and enables them to access abundant academic resources in English to succeed in higher education (Almatrafi, 2023).

In Vietnam, EMI programs may be implemented with MOET approval when institutions meet requirements related to teaching staff, facilities, and resources, or when they collaborate with qualified international partners (Vu et al., 2025).

2.2. Perception

In the field of education, André et al. (2020) argued that students' perceptions of actual classroom activities can be more important than what outsiders observe, because students' perceptions guide their own learning behaviour, based on their own understanding. In this study, perception refers to the beliefs or opinions held by first-year English-majored students, based on how things seem.

2.3. Translanguaging

The concept of translanguaging is understood as a method of using language to integrate other linguistic resources, guided by pedagogical principles, to fully exploit students' multilingual abilities (Romanowski, 2020). In general, translanguaging refers to allowing students to draw on their native language repertoires to support learning in a target-language classroom (Khairunnisa & Lukmana, 2020). According to Nguyen (2022), translanguaging is viewed from two perspectives: a sociolinguistic one, which describes the fluid language practices of communities, and a pedagogical one, where teachers and students collaboratively create spaces that embrace diverse language use to support creative and critical learning.

In the context of education, translanguaging refers to the strategic and purposeful use of learners' language by teachers to support the learning process by leveraging learners' full linguistic resources, which are collectively stored (Barahona, 2020).

Translanguaging, beyond educational contexts, is mentioned by Sahib (2019), who claims that it has occurred outside the classroom. However, in this study, the focus is on the educational context, thereby omitting spontaneous translanguaging.

2.4 Translanguaging and Code-Switching

Sahib (2019) claimed that translanguaging and code-switching share certain similarities, such as both involving the use of students' first language to support second-language learning in the classroom and both entailing shifting between languages during communication. However, Cahyani et al. (2016) clarified that translanguaging differs from code-switching in that it is not simply a conversion between two separate monolingual languages but rather combines the two languages into a unified whole to achieve effective communication.

This study focuses solely on translanguaging practices, as they provide a more comprehensive and holistic framework for understanding multilingual meaning-making in EMI classrooms.

2.5. Pedagogical Translanguaging

Translanguaging pedagogy has increasingly attracted attention as it facilitates teaching and learning while allowing both learners and teachers greater flexibility in their language use for expression (Romanowski, 2020). Moraczewska (2024) stated that translanguaging pedagogy intentionally draws on students' existing linguistic resources to support knowledge construction and active participation in meaning-making.

Specifically, in this study, pedagogical translanguaging refers to the intentional classroom practice in which a teacher actively values students' full linguistic repertoires as a fundamental right, designs lessons that purposefully connect home languages to ensure complete comprehension and flexibly utilises spontaneous language shifts during interactions to support meaningful learning.

Cenoz and Gorter (2021) stated some characteristics of pedagogical translanguaging. First, this approach offers a wide range of practices and activities that draw on elements from the entire linguistic repertoire. It has different functions, such as gaining a deeper understanding of academic texts, accessing more information, developing metalinguistic awareness, and reinforcing skills through coordinated activities across different languages. Second, it can be applied to more programmes and a wide range of students at all levels of education (Cenoz & Gorter, 2021).

2.5.1. Benefits of Pedagogical Translanguaging

In the educational context, translanguaging is viewed as a scaffolding strategy but a holistic meaning-making process of language and learning (Pantalleresco, 2021). Baker and Wright (2011) emphasised four educational advantages of translanguaging in the classroom. First, he asserted that translanguaging helps learners better understand the subject matter through interdependence and language transfer between their native language (L1) and the target language (TL). Baker and Wright claimed that L1 offers learners greater comfort and a sense of safety. It is the strongest language, which can help develop skills in TL. These two benefits align well with the first dimension of the framework of García et al. (2017), which focuses on the Teacher's Stance. The third advantage mentioned by Baker and Wright (2011) is that multilingualism facilitates communication between school and family, especially when parents do not understand the target language their child is being taught. Finally, integrating both languages in the classroom allows learners to develop their second-language skills while learning the subject matter.

2.5.2. Disadvantages of Pedagogical Translanguaging

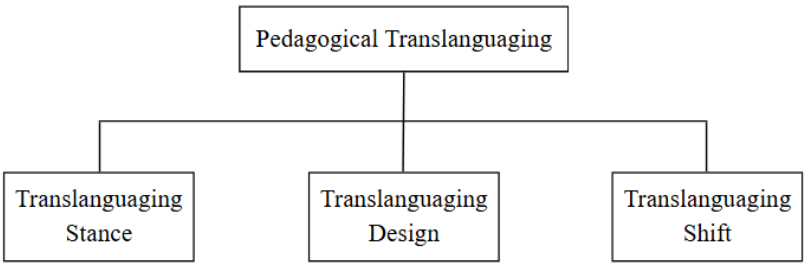
Allard (2017) found that participants had negative attitudes toward translanguaging because it distracted them and reduced their ability to absorb knowledge in the target language, leading them to prefer English-language instruction.

The overuse of the mother tongue in the classroom can hinder students' language development, as they have not been adequately exposed to the target language (Yuvayapan, 2019).

Furthermore, translanguaging can lead to some misunderstandings between languages, as students may misuse vocabulary by relying on inappropriate Vietnamese equivalents (Bui & Nguyen, 2014).

2.5.3. Translanguaging Practices

Regarding pedagogical translanguaging practices, Cenoz and Gorter (2021) stated that they aimed to activate prior multilingual knowledge in different forms. There are five



pedagogical purposes in this study: explaining concepts, checking comprehension, localising content, reinforcing instructions, and building relationships (Fang & Liu, 2020).

2.6. Conceptual framework

This study employed a pedagogical framework of García et al. (2017), which formulated three components: translanguaging Stance, translanguaging Design, and translanguaging Shift.

Figure 1

Pedagogical Translanguaging framework by García et al. (2017)

To be more specific, the Stance refers to "teacher's belief that a bilingual student has one holistic language repertoire that he or she draws on at school" (Turnbull, 2017, p.1). The Design involves the deliberate integration of students' native and school languages into classroom activities, while the Shift represents the emergence of unplanned, spontaneous translanguaging, with the teacher making immediate decisions that demonstrate flexibility and a willingness to support students' voices (Moraczewska, 2024).

In general, these three dimensions will be used in this study to address the two research questions mentioned above.

2.7. Previous studies

Several previous studies have explored subjects' perceptions of translanguaging in various countries worldwide, including students and teachers. Romanowski (2020) conducted research to explore students' and teachers' perceptions of translanguaging in EMI classrooms in Poland. Almatrafi (2023) conducted a study of Saudi EFL students to investigate their perceptions of pedagogical translanguaging in English-Medium Instruction. Both studies found that teachers and students had a positive outlook on classroom translanguaging. However, they mostly focus on teachers, who actively apply translanguaging in their teaching, neglecting in-depth research on students, who are the direct recipients of this practice.

In the Vietnamese context, the use of translanguaging has recently attracted researchers' attention; however, it remains understudied. A study conducted by Pham and Vu (2023) examined EFL secondary school teachers in both public and private schools in Hanoi. With a convergent mixed-methods study, the results showed that most teachers had positive attitudes toward translanguaging. They acknowledged its role in scaffolding students' learning, particularly for cognitive functions such as explaining grammar and vocabulary. Moreover, Ngo (2025) conducted research on EFL Learners' Perceptions of translanguaging in English classes at an HCM English Centre and found that students with lower levels of competence are more receptive to its use.

However, there is still little research on EMI in the university setting, where students' perspectives are considered important. In general, very few studies have sought to gather perspectives from linguistics students on how they perceive the use of translanguaging at the university level. These shortcomings in previous studies, along with the lack of research in the Vietnamese context, serve as inspiration for this study, which explores first-year English-majored students' perceptions of pedagogical translanguaging in an EMI context. This study is significant to conduct to enrich the literature on translanguaging.

3. Methodology

3.1. Study design

The study employs a quantitative design to investigate students' perceptions of teachers' translanguaging practices in EMI classrooms. Rahman (2016) noted that an advantage of quantitative research is that quantitative results can potentially be generalised to the entire population or to a smaller population group.

3.2. Participants

The study sample consisted of 50 first-year English Linguistics and Literature students at an EMI university in Ho Chi Minh City. The participants were recent high school graduates who were gradually adapting to a teaching and learning environment conducted entirely in English. Therefore, many first-year students may feel overwhelmed by the amount of information they receive in English.

Altheyab and Alalwi (2022) reported that EMI implementation can yield disappointing results, especially for students whose English proficiency is not yet sufficient. More specifically, linguistics students were selected because the research aimed to understand their perceptions of teachers' pedagogical translanguaging practices in light of the changing language-learning environment.

The study was conducted after first-year students of the 2025-2026 cohort had completed their first semester. In their first semester of university, students who had spent sufficient time in an EMI environment were able to recognise the pedagogical translanguaging techniques instructors used to support learning.

3.3. Sampling

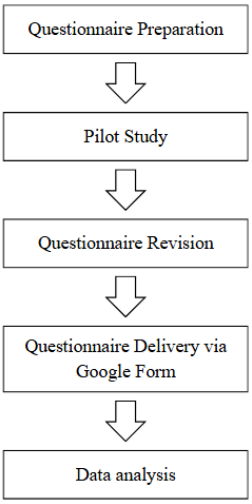
This study utilises a non-probability purposive sampling method to ensure that all participants are first-year English-majored students experiencing the phenomenon under study. The purposive sampling technique involves selecting candidates across a broad spectrum relating to the topic of study (Etikan, 2016). The primary goal of targeted sampling is to focus on specific characteristics of the population of interest, thereby increasing the possibility of collecting the desired data (Rai & Thapa, 2015).

In this study, participants had to be first-year English majors studying in an EMI environment with pedagogical translanguaging applied by the instructors.

3.4. Instruments

A structured questionnaire was designed to collect data on first-year English majors' perceptions of pedagogical translanguaging in EMI classrooms. The questionnaire is based on the theoretical framework of pedagogical translanguaging proposed by García et al. (2017), encompassing three components: Stance, Design, and Shifts.

The first section gathered demographic information about participants. The second section included 15 Likert-scale items rated on a 5-point scale (1 = Strongly Disagree, 5 = Strongly Agree) regarding students' perceptions of the three dimensions mentioned above. To be specific, items B1-B3 were used to explore student perceptions of Translanguaging Practices – dimension Stance; items B4-B9 were used to explore the dimension Design; and items B10-B15 were used to examine the dimension Shift. The third section comprised 3 questions, which aimed to explore overall perceptions of teachers' pedagogical translanguaging.



The questionnaires were conducted via Google Forms because it enables reaching many participants within a limited time. It ensures anonymity, encouraging more honest and objective responses. Besides, the digital format minimises data-entry errors and facilitates automatic sorting and export to SPSS for statistical analysis. Additionally, Google Forms is more cost-effective and accessible, as students can conveniently complete the questionnaire using their personal devices.

3.5. Data collection

As illustrated in Figure 2, the data collection process began with selecting a research topic, followed by the development of a structured questionnaire and a study outline. The questionnaire was based on the conceptual framework grounded in the García et al. (2017) study, which includes three dimensions: Stance, Design, and Shift.

Figure 2

Data collection procedure

A pilot survey was conducted to assess the clarity, validity, and reliability of the instrument. The questionnaire was pilot-tested with 16 first-year English-majored students and demonstrated strong internal consistency and acceptable reliability (Cronbach's alpha = .93). The questionnaires were conducted via Google Forms, which were cost-saving and easy to analyse. Pilot feedback led to minor changes in question wording to improve clarity. For

example, the previous statements I wrote: "My teachers *show openness* to students using Vietnamese to clarify or negotiate meaning." The pilot respondents hesitated to rate this item because of the phrase "show openness." Therefore, I changed it to "My teachers *allow students to use Vietnamese* to clarify or negotiate meaning," which helps the statement be clearer for participants to rate.

For the main data collection stage, a consent form was included at the beginning, outlining participants' rights and ethical considerations. After collecting responses, the internal consistency of the main dataset was evaluated using Cronbach's alpha coefficients to ensure instrument reliability. The overall questionnaire demonstrated high reliability with an alpha value of .95, while the individual subscales for Stance, Design, and Shift yielded acceptable internal consistency values of .83, .89, and .83, respectively. These values suggested that the adapted instrument was reliable for further descriptive statistical analysis. After reliability was checked, the researcher conducted a descriptive statistical analysis. Sloman (2010) stated that the most used descriptive analysis approach for research purposes involves recording behaviour and environmental events through continuous or interval recording procedures. Therefore, this technique is appropriate in this research.

3.6. Data analysis

After completing the online survey, responses were exported directly from Google Forms to Google Sheets. The dataset was then transferred to Microsoft Excel for initial screening, during which inappropriate submissions were checked and invalid responses removed to ensure data reliability.

The data were analysed using IBM SPSS Statistics Version 26 (SPSS) for quantitative analysis. The mean (M) and standard deviation (SD) were calculated for each item. SPSS was chosen because it is widely used in quantitative research in applied linguistics and education.

Descriptive statistics were used to summarise participants' perceptions of pedagogical translanguaging. This procedure may address how students perceive teachers' PT practices and which PT practices are most frequently used in EMI classrooms.

4. Results

4.1. Students' perceptions of pedagogical translanguaging in EMI classes

The descriptive statistical analysis indicates a positive tendency toward pedagogical translanguaging in EMI classes. The overall mean for the 21 items was 4.16 (SD = 0.88), suggesting that the strategic use of Vietnamese alongside English is a beneficial instructional approach.

Table 1 presents the four mean scores for pedagogical implementation.

Table 22

Students' perceptions of pedagogical translanguaging in EMI classes (N = 50)

Dimension	Mean	SD
Stance	4.0	0.91

Design	4.20	0.91
Shift	4.24	0.84
Overall	4.20	0.86
Total	4.16	0.88

The Shift dimension received the highest mean score (M = 4.24), followed closely by Design (M = 4.20), indicating that the implementation of pedagogical translanguaging in EMI classrooms is an appreciably recognised and valued practice among the participants.

4.2. Overall students' perceptions

Table 2 below shows a general view of students' perceptions of pedagogical translanguaging in EMI classes. The overview of students' perceptions of pedagogical translanguaging in EMI classrooms was evaluated using three main items (C1-C3). The overall mean score was 4.20 (SD = 0.86), indicating that students responded positively to the implementation of pedagogical translanguaging in EMI classrooms.

Table 23.

Overall perceptions

No.	Item	Mean	SD
C1	Pedagogical translanguaging helps me learn more effectively in EMI classes	4.24	0.92
C2	Pedagogical translanguaging has had a positive impact on my learning experience in EMI classes	4.18	0.80
C3	Pedagogical translanguaging practices should be applied in future EMI classes	4.18	0.87
	Overall Mean	4.2	0.86

Both C2 and C3 received a mean score of 4.18. These statistics show that students view pedagogical translanguaging as useful to their learning. Item C1 has the highest mean of 4.24 (SD = 0.92), indicating that first-year students consider pedagogical translanguaging a helpful approach in EMI classrooms.

4.3. Perceptions of the teacher's Stance

Regarding the first dimension, Stance (Table 3), the data collected from questions B1-B3 reveal most respondents' perception that their teachers positively support the use of Vietnamese in EMI classes.

Item B1 received the highest mean score of 4.20 (SD = 0.81), indicating that many students reported that their teachers allow the use of Vietnamese to enhance understanding and clarify meaning during lessons. Moreover, respondents agreed that their teachers view the use

of Vietnamese in class as part of the EMI learning environment, emphasising the vital role of pedagogical translanguaging in the classroom.

Table 3.

Perceptions of the Teacher's Stance

No.	Item	Mean	SD
B1	My teachers respond positively when Vietnamese is used to support understanding in class	4.20	0.81
B2	My teachers allow students to use Vietnamese to clarify negotiating meaning	3.98	0.94
B3	My teachers view the use of Vietnamese in class as part of the EMI learning environment	3.84	0.99
	Overall Mean	4.01	0.91

4.4. Perceptions of the teacher's Design

The second dimension concerned the teacher's Design of pedagogical translanguaging, as shown in Table 4. The teacher's Design was measured using six items (B4-B9), each reflecting a different aspect of learners' perceptions of teachers' pedagogical translanguaging in lessons.

Table 24.

Perceptions of the Teacher's Design

No.	Item	Mean	SD
B4	It helps me learn better when my teacher intentionally uses both Vietnamese and English to explain complex academic content.	4.48	0.68
B5	It helps me learn better when my teacher designs activities that allow discussion in both Vietnamese and English.	4.22	0.93
B6	It helps me learn better when my teacher encourages group work using both Vietnamese and English.	4.14	0.7
B7	It helps me learn better when my teacher allows students to ask and answer questions using both Vietnamese and English.	4.12	0.94
B8	It helps me learn better when my teacher uses Vietnamese to support understanding of materials in English (slides, textbooks, tasks).	4.14	1.03
B9	It helps me learn better when my teacher integrates students' life experiences into lessons through both Vietnamese and English.	4.08	0.92
	Overall Mean	4.19	0.89

Item B4 had the highest mean score of 4.48 (SD = 0.68). This showed that students strongly agreed that intentional bilingual explanation effectively facilitated their understanding of complex academic content, and the low standard deviation indicated that this perception was consistent across participants. This was followed by B5 (M = 4.22), B6 and B8 (M = 4.14), and B7 (M = 4.12), suggesting that implementing a multilingual approach in EMI classes helps students better understand the lessons.

In contrast, item B9 has the lowest mean at 4.08 (SD = 0.92), revealing that some students may view the integration of personal life experiences as less relevant to their learning.

4.5. Perceptions of the teacher's Shift

Regarding students' perceptions of the teacher's shift from item B10 to B15, as shown in Table 5, the statistics showed high overall scores, indicating that first-year students valued the spontaneous shift between English and Vietnamese during classes.

Item B10 had the highest mean of 4.50 (SD = 0.68), indicating that students learn better when their teacher uses Vietnamese to clarify difficult concepts in lessons. Additionally, item B13 has a high mean of 4.38 (SD = 0.86), indicating that students strongly value the use of both Vietnamese and English to explain unfamiliar vocabulary and grammar. This was followed by B13 (M = 4.38), B14 (M = 4.26), B12 (M = 4.16), and B11 (M = 4.10), suggesting that the flexibility between using the target language and the native language enhances students' comprehension and creates a safer environment for first-year students.

In contrast, item B15 had the lowest mean at 4.06 (SD = 0.98), suggesting that some students may disagree with the use of PT for their learning.

Table 25.

Perceptions of the teacher's Shift

No.	Item	Mean	SD
B10	It helps me learn better when my teacher uses Vietnamese to clarify difficult concepts.	4.50	0.68
B11	It helps me learn better when my teacher allows Vietnamese support while I try to answer in English.	4.10	0.95
B12	It helps me learn better when my teacher adjusts language use depending on students' proficiency levels.	4.16	0.77
B13	It helps me learn better when my teacher explains unfamiliar vocabulary or grammar using both Vietnamese and English.	4.38	0.86
B14	It helps me learn better when my teacher allows spontaneous discussions in Vietnamese and English during class to ensure complete comprehension.	4.26	0.83
B15	It helps me learn better when my teacher responds flexibly to students' questions by using both Vietnamese and English.	4.06	0.98
	Overall Mean	4.24	0.84

5. Discussion

5.1. RQ1: How do first-year English-majored students perceive teachers' pedagogical translanguaging practices in EMI classes?

Results from the questionnaire revealed that first-year English-majored students hold a positive perception of pedagogical translanguaging in the EMI context. The overall mean score of 4.14 indicates that integrating Vietnamese and English is a supportive tool that enhances students' understanding and fosters a supportive learning environment.

5.1.1 Perceived Teacher's Stance

Regarding the stance dimension, many respondents revealed that their teachers responded positively when Vietnamese was used to support comprehension in class (M = 4.20). This finding aligns with Pantalleresco (2021)'s research, which showed that teachers' acknowledgement of learners' L1 facilitates understanding and fosters a comfortable classroom environment. The teachers' view of Vietnamese as an essential component of the EMI learning environment received a high mean score (M=3.84), highlighting a shift toward the "meaning-making" process, in which L1 serves as a crucial tool for facilitating learning and understanding of the target language within a specific context (Liu, 2021). This practice helps narrow the gap between high- and low-proficiency students and first-year students, especially those with limited English proficiency, ensuring that all learners are accessible to the target knowledge (Pantalleresco, 2021).

5.1.2. Perceived Teacher's Design

Within the design dimension, participants perceived the teachers' intentional use of both Vietnamese and English to explain complex academic content as an effective scaffolding strategy that facilitates comprehension during cognitively demanding tasks. This result aligns with the suggestion by Alasmari et al. (2022) that using the mother tongue reinforces learning by clarifying complex concepts and terminology. Furthermore, many students expressed interest in activities that allowed discussion in both Vietnamese and English (M = 4.22). This result supports Pantalleresco's (2021) view that L1 not only facilitates meaning negotiation but also enhances the transition to the target language.

In contrast, some first-year students with high English proficiency expressed different views about using Vietnamese to aid understanding of English learning materials, such as slides, textbooks, and exercises (M = 4.14, SD = 1.03). This difference may be due to the overuse of L1 in the EMI environment, as noted by Phuong and Dang (2022). They found that over-reliance on the mother tongue can reduce learners' motivation to learn. While the mother tongue is a valuable pedagogical tool, its effectiveness depends more on the appropriate context used than on uncontrolled use (Phuong & Dang, 2022).

5.1.3. Perceived Teacher's Shift

Regarding the shift dimension, the collected data show that most learners agreed with teachers' use of Vietnamese to clarify difficult concepts (M = 4.50). This result aligns with the research of Liu et al. (2022), which found that translanguaging activities help create a sense of "safety" in the classroom, reducing learner anxiety and promoting collaborative learning. In the same vein, many participants agreed that using both Vietnamese and English to explain unfamiliar vocabulary and grammatical structures helps them learn better (M = 4.38). This could help address problems related to limited language proficiency in an EMI environment. The use of translanguaging in teaching can be seen as a bridge to close the language gap and

ensure equitable access to academic content. Almatrafi (2023) holds similar ideas, arguing that translanguaging helps lower-level learners feel more confident in participating and fully utilising their language skills.

However, not all participants supported teachers' flexible language switching. In contrast, some students reported that teachers' language switching could distract from their acquisition of the target language. This perceptual phenomenon may be due to differences in language proficiency among freshmen. Furthermore, the collected data indicate a negative view of allowing students to answer questions in both languages, which contrasts with findings from Nguyen's (2022) study, which argued that bilingualism improved communication effectiveness, reduced anxiety, and increased classroom engagement.

5.2. RQ2: Which pedagogical translanguaging practices are most and least valued by first-year English-majored students in EMI classrooms?

When ranked in descending order, the highest-rated practices were associated with the Shift aspect, followed by several selected practices within the Design aspect, all averaging above 4.3.

Specifically, the highest-rated item was B10 (*"It helps me learn better when my teacher uses Vietnamese to clarify difficult concepts")* (M = 4.50), which belongs to the Shift dimension. This was closely followed by B4 (*"It helps me learn better when my teacher intentionally uses both Vietnamese and English to explain complex academic content")* (M = 4.48), which belongs to Design dimension, and B13 *("It helps me learn better when my teacher explains unfamiliar vocabulary or grammar using both Vietnamese and English")* (M = 4.38), which belong to the Shift dimension. Overall, these highly ranked items highlight the crucial role of teachers' explanatory activities, particularly those that involve the flexible use of language within context to facilitate student comprehension.

Regarding item B10, in the context of EMI, where first-year students' English proficiency is diverse, students with lower proficiency are more likely to rely on their mother tongue (L1) to meet cognitive and linguistic demands in their studies. The importance of using L1 as a resource for comprehension in bilingual environments is supported by Cenoz and Etxague (2013). From that perspective, teachers' immediate use of Vietnamese serves as an essential scaffold to bridge the comprehension gap in real time.

Items B4 and B13 belong to the Design and Shift dimension. These two practices were identified by Nguyen et al. (2025) as the most common pedagogical functions of pedagogical translanguaging. Both B4 and B13 receive the highest mean scores because explanation plays a crucial role in ensuring students' comprehension in EMI. L1 not only enhances comprehension but also reduces cognitive load and anxiety in the classroom. This view is supported by As Yen and Danh (2022), who claimed that incorporating the native language can shorten explanation time and create a safe learning environment for students.

On the other hand, the two lowest-rated items were B2 and B3, which related to teachers' stance toward the use of Vietnamese in EMI classrooms. One possible explanation is that students enrolled in EMI classrooms often expect to study in a predominantly English environment. Some even associate this EMI environment with a learning condition like English immersion or study abroad programs, which helps to boost their language competence (Surtees, 2016). The above-mentioned viewpoint resonates with what Breeze and Roothooft (2021, p. 206) have found that some students might perceive the use of L1 as "dangerous territory",

reducing their exposure to English. This finding suggests that students may value a balance between maintaining the full English learning environment and strategically using Vietnamese for pedagogical purposes.

6. Conclusion and implications

This study sheds light on how first-year English-majored students perceived teachers' pedagogical translanguaging in EMI contexts. Overall, learners perceived pedagogical translanguaging as a useful tool to support comprehension. Additionally, students view the implementation of pedagogical translanguaging practices as a positive approach. Among the three dimensions (Stance, Design, Shift), the most valued translanguaging practices aligned with the "explaining concepts" pedagogical purpose.

The findings carry practical implications. The study can help teachers, schools, and educational institutions understand the potential of pedagogical translanguaging to support learning. Specifically, teachers will know how to design and implement lesson plans and activities suitable for students at varying levels. Schools and educational institutions can develop and deepen their understanding of pedagogical translanguaging.

Besides, the study has some limitations. A sample of 50 participants from one university may limit the generalizability of the findings, as it may not represent other educational settings in Vietnam. Besides, this study focuses solely on English majors, neglecting the perspectives of non-English majors. Future researchers should conduct research over longer periods, across diverse contexts, and with more varied participants to broaden the understanding of pedagogical translanguaging in EMI. Moreover, future studies should employ a mixed-methods approach rather than a quantitative approach alone to gain a deeper understanding of pedagogical translanguaging use in the context of EMI.

In conclusion, pedagogical translanguaging provides a promising approach to students' learning in an EMI environment. With appropriate instructional practices, this strategy has the potential to foster learners' comprehension, aligning with effective teaching and learning.

Acknowledgements

First and foremost, we would like to extend our thanks to International University, VNU HCM, and the School of Languages for providing us with all the necessary conditions to conduct this study. We would also like to extend our heartfelt appreciation to all the students who participated in this study. Your honest responses and the valuable time you contributed to this research played a significant role in its success. We are also deeply grateful to the teachers who kindly permitted us to enter their classrooms to collect data. We also sincerely thank the conference chairs and reviewers for their constructive feedback on earlier versions of this article.

Thinh Tien Vu is head of the Testing board and vice dean of the School of Languages, International University – VNU HCM. He received his M.A. in TESOL from the University of Canberra, Australia, and is currently a PhD candidate in English Language Studies and Teaching at NIDA, Thailand. He has 25 years of experience in teaching academic English, ESP, test preparation, and TESOL courses, and more than 12 years of experience in the roles of course/program designer and developer, academic trainer, and manager. His current research interests include EMI, Applied methodologies, Autonomy development, Assessment and Testing, Education management, and TELL.

Cam Diem Nhi Hoang is a senior undergraduate in English Linguistics and Literature at International University – VNU HCM. She currently teaches English to young learners and adults while actively engaging in academic inquiry. Her research interests involve EMI, teaching strategies, and the integration of 21st-century skills into language education.

#106 THE USE OF ARTIFICIAL INTELLIGENCE TOOLS IN ESSAY WRITING AMONG FIRST-YEAR ENGLISH MAJORS

Nguyen Phuong Thao[1]

Abstract

The use of Artificial Intelligence among students in their learning process has been attracting significant attention and investigation. The current study, accordingly, is an attempt to delve into the use of AI tools among first-year English majors to deeper understand the role of these tools in their essay writing process and the perceived effects on students' English writing skills. Data obtained from 60 questionnaires revealed that AI tools, ChatGPT and Google Gemini in particular, have become an integral part of the students in their essay writing across all stages, among which vocabulary, grammar, and ideas assistance are highly appreciated. In addition, the students tend to rely on AI tools in the writing process and generally believe on the positive short-term and long-term effects of AI tools on their English writing skills.

Keywords: Artificial Intelligence, first-year, English majors, essay writing

1. Introduction

1.1. Background of the study

The educational sector has been witnessing radical changes since the introduction of Artificial Intelligence (AI). The new technology has revolutionized the way students learn and provided them with brand new learning experiences through the use of AI tools. Almost in no time, these tools have become an integral part of students' learning process, making them students' new study companions.

1.2. Problem statement

Students majoring in English, accordingly, have utilized these tools in various academic tasks and purposes including word definition, pronunciation, examples along with translation and grammar-checking. In addition, in terms of academic courses, it is English writing that they seek support from these artificial companions the most as writing skills seem to be demanding to students generally. Furthermore, as observed by the researcher, the integration of AI tools in the student's writing process, especially in English essay writing, is becoming more and more common, which causes some concern regarding the writing competence of English majors.

1.3. Research objectives

Therefore, the current study is an attempt to explore first-year English-majors' practice of using AI tools in their English essay writing. Besides, their opinions concerning their levels of dependence on AI tools and their belief on the short-term and long-term impacts of these tools on their English writing ability can be revealed.

To achieve those aims, the following questions are to be addressed:

[1] *Faculty of Foreign Languages, HCMC University of Foreign Languages and Information Technology (HUFLIT), thaonp@huflit.edu.vn*

1. What are students' patterns of using AI tools in English essay writing?
2. What are students' opinions regarding their dependence on AI tools during their English essay writing process?
3. What are students' opinions regarding the short-term and long-term impacts of AI tools on their English writing ability?

2. Literature review

2.1. Students' patterns of using AI tools in English essay writing

2.1.1. The frequency of using AI tools in English essay writing

Research shows that AI tools are no longer occasional references but have become integral components of the English writing process for most university students in Vietnam, and English majors are no exceptions. In terms of essay writing, the reliance of students on these tools are universal, with AI being employed throughout the entire writing process on a frequent level (Bui & Tong, 2025; Lai & Trinh, 2025; Le, 2025). A study conducted at Can Tho university even found that 100% of English-majored participants utilize AI for their essay writing (Ho et al., 2024).

2.1.2. The AI tools used in English essay writing

Among the tools available, ChatGPT is the most dominant among students. Its popularity stems from its ability to simulate human-like conversations and provide instant feedback on a wide array of subjects**,** which facilitate students' idea generation, brainstorming, and content organization (Ho et al., 2024; Lai & Trinh, 2025; Pham, 2024; Tran, 2025). For more specific writing purposes, a range of tools are also employed including Quillbot (for paraphrasing), Grammarly (for grammar, spelling, and punctuation checks), Claude and Gemini (for content generation and searching for information) (Bui & Tong, 2025; Bui et al., 2022; Jen & Salam, 2024; Nguyen et al., 2025; Tran et al., 2025).

2.1.3. Stages of the essay writing process in which AI tools are employed

Moreover, AI tools are integrated across nearly all stages of the English essay-writing process, especially during the initial phrases where students need to establish a clear direction for their work. Accordingly, AI tools are most used for idea generation and brainstorming purposes, closely followed by defining topics, information seeking, outlining and structuring (Ho et al., 2024; Jen & Salam, 2024; Lai & Trinh, 2025; Le, 2025; Nguyen, 2025; Tran, 2025; Tran et al., 2025). In the drafting stage, AI provides students with sample paragraphs and essays, vocabulary enhancement, translation and paraphrasing (Bui et al., 2022; Bui & Tong, 2025; Lai & Trinh, 2025; Le, 2025; Ho et al., 2024; Nguyen et al., 2025; Tran et al., 2025). In the final stages, AI tools are used as automated evaluation systems to polish the work by checking grammar and mechanics, coherence and clarity and ensure it meets academic standards (Bui & Tong, 2025; Ho et al., 2024; Lai & Trinh, 2025; Le, 2025; Nguyen, 2025; Nguyen et al., 2025; Tran et al., 2025).

2.1.4. Students' treatment of AI-generated output

Students generally treat AI-generated essays as a supplementary resource or a writing companion rather than a final product. Therefore, they do not typically accept AI output blindly; instead, they critically assess the accuracy, relevance, and specificity of the information provided using different methods (Lai & Trinh, 2025; Nguyen et al., 2025; Tran et al., 2025). Besides, rather than directly copy-pasting content, the majority of students use AI

output as a trigger for brainstorming or a template to be modified by rephrasing AI-generated text to align it with their personal writing style and to avoid being flagged by plagiarism detection software (Tran et al., 2025). Importantly, most students emphasize that while AI can assist with structure and grammar, the development of core arguments and final organization remains their individual responsibility (Bui & Tong, 2025).

2.2. Students' opinions regarding their dependence on AI tools during their English essay writing process

University students demonstrate a complex relationship with AI, with a small percentage claiming high or full dependence while a much larger majority expresses a significant fear of becoming over-reliant.

According to study at a Hanoi university, 9,6% of the English majors admitted always using ChatGPT for academic writing while 4,3% of them heavily relied on AI tools to complete all their writing assignments (Lai & Trinh, 2025). Significantly, 45% of interviewed students at Thu Dau Mot University acknowledged a dependence on AI-generated answers, sometimes failing to critically evaluate the output (Nguyen et al., 2025). Also in this study, a significant positive correlation between the frequency of AI usage and the recognition of over-reliance was found.

The other students, who do not consider themselves currently dependent, often self-identify as being at high risk for it. A study by Bui and Tong (2025) pointed out that the single highest risk associated with AI tools was dependence on technology, cited by 79.8% of students. In other studies, the fears of overreliance on AI and its possible consequences including lower independent writing ability, diminished problem-solving skills and critical thinking erosion are prevalent among students (Bui & Tong, 2025; Lai & Trinh, 2025; Ho et al., 2024; Tran et al., 2025). To prevent themselves from the possible risks, students struggle to treat AI as a companion or guide as a specific strategy (Le, 2025; Tran et al., 2025).

2.3. Students' opinions regarding the short-term and long-term impacts of AI tools on their English writing ability

While being consistent regarding the benefits given by AI tools in the short term, students are deeply divided on how these tools impact their long-term writing skills. For the immediate, short-run benefits, it is widely believed that AI tools generally enhance their writing ability by reducing anxiety, boosting motivation, giving useful feedback, enhancing their English abilities, assisting them in better paragraph and essay planning and keeping track of their own progress (Le, 2025; Nguyen, 2025). Students, however, express uncertainty regarding long-term retention of the new academic vocabulary or grammatical mastery they gained through AI assistance and long-term dependency, which may result in cognitive and skill erosion (Bui & Tong, 2025; Lai & Trinh, 2025; Tran et al., 2025).

3. Methodology

3.1. Participants

The population of this study comprises of 60 HUFLIT first-year English majors who were taking English Essay Writing course, which the researcher was in charge of.

3.2. Research instruments

Questionnaire is the major research instrument employed in this study. The questionnaire is written in English and is divided into three main parts exploring different aspects regarding first-year English majors' practice of using AI tools in English essay writing

and their opinions concerning dependence level and the short-term and long-term impacts of these tools on their English writing ability. Different question types are utilized across the question items to provide the researcher with varying levels of details, accuracy, and meaningful insights into the investigated issues.

In addition, classroom observation is included. The researcher during teaching sessions recorded students' practice of using AI tools in their essay writing process to recognize their usage patterns and level of dependence on these tools.

3.3. Data collection and analysis

The data was collected within two weeks, after which SPSS was employed in the analysis process. The findings, accordingly, were presented in the forms of tables.

4. Findings

4.1. From questionnaires

4.1.1. Students' patterns of using AI tools in English essay writing

Table 1

The frequency of using AI tools in essay writing

AI usage	Frequency	Percent
Always	6	10%
Often	34	56.7%
Rarely	1	1.7%
Sometimes	19	31.7%

Table 2.

AI tools used in essay writing

AI Tools	Percent
ChatGPT	75%
Grammarly	20%
QuillBot	3.3%
Google Gemini	66.7%
Other	11.7%

As shown in Table 1, AI tools are frequently incorporated in the students' English essay writing process as more than two thirds of the investigated English majors use them on a regular basis. Among the tools available, ChatGPT is the dominant, which is closely followed by Google Gemini (Table 2).

Table 3.

Essay writing stages with AI support

Writing Stages	Percent

Brainstorm	55%
Create outlines	48.3%
Write first draft	26.7%
Check grammar and vocabulary	81.7%
Revise and edit	51.7%
Cite	13.3%

Table 4.

Students' essay writing process

Essay writing process	Frequency	Percent
I rarely or never use AI in my writing process.	1	1.7%
I write first, then use AI to improve or correct my writing.	26	43.3%
I use AI to generate ideas, then write the essay mostly by myself.	7	11.7%
I use AI to create an outline, then develop it on my own.	17	28.3%
I use AI to generate a full draft, then revise and edit it.	3	5%
I use AI throughout the entire writing process.	5	8.3%
Other	1	1.7%

The students tend to use AI tools mainly for checking grammar and vocabulary. The other purposes include brainstorming ideas, revising and editing, and creating outlines (Table 3). In addition, as revealed by Table 4, the most common procedure in writing an English essay, as applied by almost half of the participants, is making their own essay first, after which AI tools are used for polishing purpose. The second common procedure, applied by 28.3% of the students, is using AI for outline developing, after which the essay is written by the students themselves.

Table 5.

Revision frequency after using AI tools

	Minimum	Maximum	Mean	Std.Deviation
Revision frequency	2	5	3.9	0.72952

Table 6.

Revised aspects after using AI tools

Revised aspects	Percent
I correct grammar and vocabulary based on AI feedback	70%
I rewrite sentences to make them sound more natural	55%

I reorganize ideas or paragraph structure	36.7%
I simplify or clarify ideas	23.3%
I combine my own ideas with AI-generated content	41.7%
I remove parts I think are incorrect or unnatural	20%
I make only minor changes	1.7%
Other	3.3%

Tables 5 shows that students' revision of their own essay after seeking AI assistance is a frequent practice (M=3.9, SD=0.72952). They do this in different ways, among which correcting grammar and vocabulary mistakes is the most common, closely followed by rewriting sentences and reorganizing the ideas and paragraphs (Table 6).

4.1.2 Students' opinions regarding their dependence on AI tools during their English essay writing process

Table 7.

Students' dependence on AI tools during essay writing process

	Minimum	Maximum	Mean	Std.Deviation
AI Dependence	2	5	3.45	0.832

Table 8.

Students' claim of their final essay

Claim of Authority	**Frequency**	**Percent**
Completely my own work	11	18.3%
Mostly my work with some AI assistance	22	36.7%
A combination of my work and AI	24	40%
Mostly AI-generated	1	1.7%
Completely AI-generated	2	3.3%

As presented in Table 7, on average, students tended to agree that they depend on AI tools during the English essay writing process (M=3.45. SD=0.832). However, with more than three fourths of the participants claiming that the final essay is either mostly their work with AI assistance or a combination of their work and AI, the first-year English majors do not generally believe AI is the primary author of their essays (Table 8).

Table 9.

The relationship between students' AI usage frequency and dependence level

			AI Usage Frequency	**Dependence**

Spearman's rho	AI Usage Frequency	Correlation Coefficient	1.000	.367
		Sig. (2-tailed)		.004
	Dependence	Correlation Coefficient	.367	1.000
		Sig. (2-tailed)	0.004	

Nevertheless, the correlation analysis shown in Table 9 suggests that more frequent AI use is associated with greater perceived dependence on AI. Therefore, while students generally maintain a sense of authorship, increased AI use may lead to increased reliance on AI tools during the writing process.

4.1.3. Students' opinions regarding the short-term and long-term impacts of AI tools on their English writing ability

Table 10.

Students' claim of their writing skills improvement after using AI tools

	Minimum	Maximum	Mean	Std.Deviation
Writing skills improvement	2	5	3.7667	0.72174

Table 11.

Improved aspects after using AI tools

Learn from AI Tools	**Percent**
New vocabulary	70%
Grammar structures	70%
Essay organization	46.7%
Idea development	71.7%
Nothing significant	5%
Other	1.7%

As indicated in Table 10, students generally perceived that AI tools contributed positively to the improvement of their English writing skills in the short term (M=3.7667, SD=0.72174). The most improved aspects include idea development, vocabulary, grammar, and essay organization (Table 11).

Regarding the long-term effects of AI tools, data from the open-ended question unfolded similar attitudes from the participants as they tend to believe that AI tools are good for their English writing skills along the way. However, many of them emphasized that these benefits come from the appropriate use of these tools only since misuse or over-dependence may bring about significantly harmful impacts.

4.2. From observation

During English essay writing sessions in the classroom, it was recorded that AI tools, ChatGPT and Google Gemini in particular, are frequently used by the first-year English majors

of the two classes the researcher was in charge of. Even though the students were encouraged to brainstorm ideas themselves, many were stuck in the process and had to seek for AI assistance. In addition, AI tools like ChatGPT are acted as their encyclopedia where they inquire all aspects related to the essay including the topic-related knowledge, vocabulary and grammar, etc.

More importantly, the level of dependence on AI tools varies greatly according to the English proficiency of students. Those who are good at English, especially at English writing skills, rarely ask for AI support. They tend to use these tools only at the final stage of the process when they want their essay to be polished. The relatively weak students, meanwhile, heavily depend on AI tools, otherwise their essays would be full of mistakes and irrelevant ideas.

5. Discussion

5.1. Students' patterns of using AI tools in English essay writing

There are similarities between the students in the current study with the students in previous research regarding the practice of using AI tools in English essay (Bui & Tong, 2025; Lai & Trinh, 2025; Le, 2025). They generally use a range of AI tools on a regular basis during English essay writing process for different purposes and do revise their own essay after receiving AI feedback.

However, there are quite several differences. Firstly, although ChatGPT continues to be the first choice of the students, Gemini is gaining its popularity considerably as the percentages of the students using ChatGPT and those using Gemini are quite close. Secondly, while the students in other studies tend to utilize AI in their very first stage of essay writing, which is ideas generation and brainstorming, the Huflit first-year English majors prioritize vocabulary and grammar aspects (Ho et al., 2024; Jen & Salam, 2024; Lai & Trinh, 2025; Le, 2025; Nguyen, 2025; Tran, 2025; Tran et al., 2025). And it is also vocabulary and grammar mistakes that they tend to revise firstly after seeking AI feedback.

Besides, this study points out the procedure the students apply in their English essay writing, which has been under little investigation among previous research. The most common procedure is where students make their own essays first, after which they seek for AI polish. Another alternative is where AI was the one to generate the outlines from which the students develop the whole essays themselves.

5.2. Students' opinions regarding their dependence on AI tools during their English essay writing process

The students' self-report of their dependance on AI tools during essay writing process pointed out a comparatively clear-cut answer compared to what research has consistently pointed out. The first-year English majors tend to admit their dependence on AI tools during the English essay writing process, yet interestingly, most students do not regard AI as the primary author of their essays. However, the current study confirmed the positive correlation between the frequency of using AI tools and the levels of dependence, which Nguyen et al.(2025) previously figured out.

5.3. Students' opinions regarding the short-term and long-term impacts of AI tools on their English writing ability

On the one hand, the participants' views on the short-term effects are in line with findings from relevant research. They generally appreciate the AI assistance which lead to their

English writing improvement, especially on ideas, vocabulary and grammar aspects (Bui & Tong, 2025; Nguyen, 2025; Nguyen et al., 2025; Pham, 2024).

On the other hand, while the students in previous research express uncertainty regarding long-term retention of the new academic vocabulary or grammatical mastery they gained through AI assistance and the general writing improvement, the participants in this study are quite positive about such effects. However, like students in those research, the prospects of long-term dependency, which may result in cognitive and skill erosion, still concern them to a certain extent (Bui & Tong, 2025; Lai & Trinh, 2025; Tran et al., 2025). Hence, though showing positive attitude about the long-term impacts, many of the students insist that in order to bring about these benefits, the right use of AI tools must be guaranteed, otherwise the bad consequences are likely to happen.

6. Conclusion

AI tools, especially ChatGPT and Gemini, have become integral components of the English essay writing process among first-year English majors. They use these tools on a regular basis yet treat them as a supplementary resource or a writing companion rather than a final product to be submitted without modification. In English essay writing procedure, AI is often acted either as polishing tools after students have finished their own essays or as an outline generator from what students develop their own writing.

Grammar and vocabulary are the two main language areas that are of great importance to first-year English majors as they are repeatedly report to be not only students' main purposes for seeking AI assistance but also the language areas they get improved the most in the short term along with idea development, and accordingly making necessary changes in their final essays. Regarding the long-term effects of AI tools on their English writing ability, students remain a positive attitude, yet many insist that these benefits only present if students use AI tools in the right way, otherwise critical thinking skills and autonomy will be negatively affected.

Though tending to admit their dependence on AI tools during the process of English essay writing, the students generally claim their authorship of the final essay. However, given the fact that a positive correlation between the frequency of using AI tools and dependence was figured out, and students' reliance on these tools, especially those with low English proficiency, is confirmed by classroom observation, strategies to help students use AI tools effectively without becoming over-dependent is of utmost importance. First and foremost, teachers need to make sure that there is an unplugged writing session when students need to brainstorm and make the first draft on their own. Pair work, groupwork and whole class teaching may find themselves helpful at this stage as these collaborative activities support all students in the writing process, especially those with low English proficiency. AI assistance may follow afterwards for better ideas, organization, vocabulary or grammar, yet the essence of the essay, which is the students' original outline, should be preserved. Furthermore, students should take note of what they have learned from AI to ensure both short-term and long-term writing improvement.

Despite having gained insight into the use of AI tools in the process of English essay writing among first-year English majors, this study has a quite small population and a limited number of research instruments used. Therefore, future research should include more participants and incorporate a variety of tools to enhance validity and generalization. Besides, future research could investigate more about AI usage in English writing among students of

different English levels, from which strategies to maximize AI tools' positive effects on students can be suggested.

#107 THE INTRINSIC MOTIVATION OF GENERATION Z AT COFER IN VIETNAM'S SHIFTING ESL CONTEXT

Le Nguyen Hoang Nam[1]

Abstract

In 2023, Vietnam formally redesignated English as a Second Language, raising important questions about what drives Generation Z learners in this new context. This study examined the intrinsic motivation of 83 students at the College of Foreign Economic Relations (COFER), where many engaged extensively with English independently, yet hesitated to speak in class. This study applied thematic analysis of structured written interviews, based on established theories such as Self-Determination Theory (Deci & Ryan, 1985), Dörnyei's L2 Motivational Self System (2009), Norton's Identity Investment Framework (2000), and the Willingness to Communicate model (MacIntyre, Clément, Dörnyei, & Noels, 1998). Using these frameworks, the analysis identified five connected themes. These are enjoyment-driven engagement, identity investment, digital media as an intrinsic motivational space, autonomous learning orientation, and the motivational-communicative gap. The findings indicate that students were considerably more intrinsically motivated than previously expected, with English closely linked to their ambitions, identities, and digital experiences. However, foreign language anxiety remained a significant barrier, and no direct link was found between high motivation and willingness to communicate face-to-face. The paper proposes implications for pedagogical practice, AI integration in learning environments, and student assessment within Vietnam's evolving ESL context.

***Keywords**:* Self-Determination Theory; L2 Motivational Self System; digital informal learning; willingness to communicate; foreign language anxiety; thematic analysis

1. Introduction

Following a 2023 policy change in Vietnam, English has been formally redesignated as a Second Language (ESL), moving away from its prior classification as a Foreign Language (EFL). The significant impact of motivation on second language acquisition is widely recognized (Gardner, 1985; Dörnyei, 2009). Traditionally, pragmatic and extrinsic elements have been dominant influences in Vietnamese educational contexts (Nguyen & Habók, 2021; Le & Nguyen, 2023).

However, this perspective is becoming less reflective of Generation Z learners, who were born between 1997 and 2012 (Seemiller & Grace, 2016). Gen Z learners frequently engage with English content on platforms such as TikTok and YouTube without institutional encouragement (Sockett, 2014). Despite a growing interest in Vietnamese language studies, the intrinsic motivation of this generation requires further investigation. Existing research has relied predominantly on large-scale quantitative surveys of general undergraduate or English-

[1] *Faculty of Foreign Languages, College of Foreign Economic Relations (COFER), Ho Chi Minh City, Vietnam, Email: lnhnam@cofer.edu.vn*

major populations (Nguyen & Habók, 2021; Thu & Lee, 2024). Therefore, the intrinsic motivations of 83 Gen Z students enrolled at the College of Foreign Economic Relations (COFER) were explored to address this gap. Thematic analysis was conducted with guidance from Self-Determination Theory (Deci & Ryan, 1985), the L2 Motivational Self System (Dörnyei, 2009), Identity Investment (Norton, 2000), and Willingness to Communicate (MacIntyre, Clément, Dörnyei, & Noels, 1998). Building upon these theoretical frameworks, this study seeks to address the following research questions:

RQ1. What intrinsic motivational themes - including enjoyment, identity investment, and digital media engagement - characterize Gen Z students' English learning experiences at COFER?

RQ2. How do these students perceive Vietnam's shift in ESL policy, and how does it interact with their intrinsic motivation?

2. Literature Review

2.1. Intrinsic Motivation and Self-Determination Theory

This study adopts Self-Determination Theory (SDT; Deci & Ryan, 1985, 2000) as its central theoretical framework. SDT proposes a motivational spectrum extending from amotivation through varied forms of extrinsic regulation to full intrinsic motivation (Ryan & Deci, 2000). Internalization is understood as the procedure wherein externally controlled actions are progressively converted into self-governed behaviors (Deci & Ryan, 2000). Within existing scholarly works (Le & Nguyen, 2023; Nguyen, 2022; Thu & Lee, 2024), Vietnamese learners' motivation has been examined predominantly through survey instruments administered to general undergraduate or English-major cohorts, with career-related instrumentality frequently foregrounded. These inferences have generally been derived from quantitative measures. Rahaman (2025) argues that this positivist orientation has left the social and structural dimensions of language learning underexamined, and advances investment as a sociological counterpart to the psychological construct of motivation. Nevertheless, the multifaceted motivational contexts of digitally active younger learners are often not comprehensively captured by such methodologies. An early Vietnamese exception is Tran (2007), whose qualitative study of thirty English majors found intrinsic concerns — interest, passion and inspiration — to be more salient than the institutional and linguistic needs emphasised in the surrounding literature. Accordingly, this study adopts a qualitative methodology to illuminate dimensions that survey-based research has tended to overlook.

2.2. Dörnyei's L2 Motivational Self System

Dörnyei's (2009) L2 Motivational Self System (L2MSS) reconceptualizes language acquisition as an identity-driven process. The L2MSS consists of the Ideal L2 Self, the Ought-to L2 Self, and the L2 Learning Experience. The Ideal L2 Self holds particular motivational significance: a clear and emotionally resonant ideal self-image has been shown to predict learning effort more powerfully than conventional instrumental motivation (Dörnyei, 2009). This result is supported by Dörnyei and Ushioda (2011). Digital environments are recognized to have a considerable effect on the evolution of this aspirational self-image for Gen Z learners. Within the Vietnamese setting, the key motivational effects of Ideal L2 Self orientations, which are associated with desired career goals and international interaction, were identified by Thu and Lee (2024), even amidst significant societal expectations. Despite this, identity-based motivation has not been sufficiently explored within Vietnamese EFL research, a gap that this study seeks to address.

2.3. Identity Investment in Digital Spaces

Norton's identity investment theory (2000; 2013) has prompted a reconceptualization of language learning as a socially constructed endeavor of self-formation. Within this framework, learner investments are understood to extend beyond linguistic codes to encompass their aspired future selves. Investments are made in the pursuit of an ideal social identity, integration into communities of practice, and projections into imagined futures.

Subsequently, this framework has been broadened into digital realms by Darvin and Norton (2015). Streaming services and social media platforms are now regarded as primary sites for identity investment among contemporary learners. For Vietnamese Gen Z students, English in these digital environments is not perceived as a mere school subject but as a vehicle for self-expression. Multifaceted identities are constructed online, particularly by individuals who may experience a lack of recognition within traditional classroom settings.

Evidence from Vietnamese higher education lends support to this phenomenon. Thu and Lee (2024) found the Ideal L2 Self to be the strongest predictor of intended learning effort among Vietnamese undergraduates, outweighing externally imposed obligation. Working within Darvin and Norton's expanded model, Rahaman (2025) further demonstrates how imagined identity and group membership shape commitment to English in an Asian EFL setting marked by uneven access to resources. This convergence of identity and autonomy is directly witnessed in COFER's Gen Z learners.

2.4. Willingness to Communicate and Foreign Language Anxiety

The WTC model proposed by MacIntyre et al. (1998) views communication as an active, shifting process influenced by a mix of personal confidence, intrinsic motivation, and broader attitudes. Crucially, this framework points out that the link between wanting to learn and actually speaking is rarely perfect. A learner can be deeply motivated on an intrinsic level, yet still lack the readiness to initiate a conversation. Foreign language anxiety, first characterised by Horwitz, Horwitz and Cope (1986) as a distinct situation-specific anxiety comprising communication apprehension, test anxiety and fear of negative evaluation, can suppress communication in ways that mirror the behavioural restrictions imposed by classroom-based anxiety (Peng, 2014). Cao and Philp (2006) similarly found that willingness to communicate varied with the interactional context of the classroom: learners participated less readily in whole-class settings than in small groups or pairs, and identified group size, familiarity with interlocutors and self-confidence among the factors shaping that decision. This pattern is directly relevant to the findings of the present study.

2.5. Digital Informal Learning and Gen Z Learners

Digital environments host dynamic learning ecosystems that exist beyond institutional control. Sockett's 2014 work on Online Informal English Learning (OILE) conceptualized this, with streaming platforms and music communities being examples. Out-of-class technology use of this kind is documented in Lai's (2017) study of Hong Kong learners, which shows such use to be sustained by learners themselves and shaped by an interaction of psychological and sociocultural factors rather than by institutional direction. Contributors to Dressman and Sadler's (2019) handbook further emphasise that informal digital spaces especially promote self-governed participation, attributable primarily to the lack of institutional restrictions that often impede self-motivated learning.

This trend is particularly evident among Gen Z, for whom digital literacy is regarded as an inherent attribute rather than a learned skill (Seemiller & Grace, 2016). The same authors

report a propensity for investigative, self-directed learning that bypasses traditional pedagogical methods. In Vietnam, these generational traits converge with a vibrant digital setting where English has become an integrated element of daily cultural exchange, rather than simply a separate academic subject.

3. Methodology

3.1. Research Design

Within Vietnam's developing ESL context, the inherent drive of Gen Z college students to learn English was examined through qualitative research. Due to difficulties in quantifying subjective interpretations and personal narratives, a qualitative method was deemed suitable for investigating motivational experiences during English language acquisition (Creswell & Poth, 2018). This study employs thematic analysis, conducted utilizing the six-phase framework of Braun and Clarke (2006). Meaning patterns within the qualitative data are systematically identified, analyzed, and interpreted through this framework. Therefore, a richer understanding of the motivational factors influencing Gen Z students was sought.

3.2. Research Context

The research was conducted at the College of Foreign Economic Relations (COFER) in Ho Chi Minh City. As a vocational institution, COFER offers expertise in economics, foreign languages, and international trade, drawing students from across Southern Vietnam, primarily from Ho Chi Minh City and adjacent provinces. This study chose COFER as its primary setting for two main reasons. First, the institution treats English not merely as a standard language requirement, but as a crucial condition for graduation and future career success. Second, its student body represents the typical urban Gen Z in Vietnam: they are tech-savvy, highly driven, and actively balancing local traditions with global trends.

3.3. Participants

Eighty-three Gen Z students from COFER, participating in the 2025–2026 academic year, were included in the sample. A variety of disciplines were represented, with Logistics (n=33) and E-commerce (n=26) being the most prevalent. Business Administration, Finance and Accounting, and Import/Export were represented by smaller numbers (n=11, n=11, and n=2, respectively). The second-year cohort constituted the largest group (n=60), followed by third-year (n=13) and first-year students (n=10). Limited English proficiency was commonly reported among participants. Fifty participants reported a basic proficiency level, 29 reported intermediate, and only four indicated upper-intermediate or higher. These results are considered representative of the language skills generally observed in Vietnamese university students outside specialized language programs.

3.4. Data Collection Instrument

Data were collected through a structured written interview comprising 16 open-ended questions administered in Vietnamese to maximize participants' expressive capacity and minimize linguistic barriers to self-disclosure. Questions were sequenced to elicit rich, reflective narrative responses across five motivational dimensions: enjoyment and intrinsic engagement, identity investment, digital media engagement, autonomous learning orientation, and perceptions of Vietnam's ESL policy shift. Representative questions included: "Tell me about a time you used or learned English simply because you enjoyed it, not because of any pressure. How did you feel?"; "If there were no grades or requirements, would you still learn English on your own? Why?"; and "Use ONE sentence to describe your relationship with

English." The structured written interview was administered online via Google Forms between 26 March and 2 April 2026, and participation was entirely voluntary.

3.5. Data Analysis

The study adopted Braun and Clarke's thematic analysis. Working with 83 Vietnamese responses required a careful approach; therefore, the initial coding for both surface and latent meanings took place entirely in the original language. English translations were reserved solely for essential quotes during the final write-up.

The coding process yielded five distinct themes. On one hand, the data highlighted enjoyment-based engagement, identity investment, and the tendency to treat digital media as an intrinsic motivational environment. On the other hand, it revealed a stark disconnect between feeling motivated and actual communication, despite a strong orientation toward autonomous learning. To contextualize these specific behaviors, the results were mapped against Norton's identity framework, SDT's motivational continuum, Dörnyei's Ideal L2 Self, and the WTC model.

3.6. Positionality and Trustworthiness

The researcher's role as a lecturer at COFER, with direct pedagogical experience with the participant population, affords interpretive advantages; however, this positioning also raises potential concerns regarding reflexivity. To enhance the trustworthiness of the analysis, several measures were undertaken. Member checking was approximated through informal follow-up discussions with a subset of participants to verify the accuracy of theme interpretations. Thick description (Geertz, 1973) was employed throughout the Findings section to ensure that the analytical claims are grounded in participants' own words rather than imposed interpretive frameworks. Additionally, the researcher maintained a reflexive journal throughout the analysis process to monitor and document potential biases arising from his institutional positioning.

4. Results

Thematic analysis of structured written interviews from 83 Gen Z students at COFER revealed five intrinsic motivational themes. Although extrinsic pressures were present, intrinsic orientations emerged as the dominant motivational force. Presented below are the themes and example quotations from participants, translated from Vietnamese.

Theme 1: Enjoyment-Driven Engagement

Among the collected data, a prominent theme was the role of enjoyment as a key motivator in English language learning. Experiences with English were often driven by intrinsic engagement, detached from academic needs or external pressures. This aligns with Deci and Ryan's concept of pure intrinsic motivation, as evidenced by a significant number of participants.

Participants consistently described positive affective states, joy, excitement, pride, and comfort when recounting experiences of voluntary English use. One participant captured this quality of effortless engagement particularly vividly:

> *"I felt happy and relaxed, as if I were discovering something new rather than 'studying'. […] After that, I realised that when I learn because I like it, I take things in faster and remember them far longer."*

One participant observed that the exhilaration of gameplay overshadowed the acquisition of 40 vocabulary words in a single hour. This experience stood in stark contrast to conventional study methods. Joy was also expressed by individuals upon comprehending foreign film dialogue without subtitles, resulting in substantial pride and satisfaction. A powerful drive to continue learning was cultivated by such instances of sudden comprehension, where formerly difficult content became understandable independently. Significant advancements in understanding yielded gratification.

Notably, enjoyment in this theme was not passive but generative. Participants described a self-sustaining motivational cycle in which pleasurable experiences with English prompted further voluntary engagement. As one second-year student reflected:

> *"I realized that when I learn because I enjoy it, everything becomes lighter and more interesting. There's no sense of being forced just excitement and motivation from within. That was the first time I truly felt the joy of learning for myself."*

Theme 2: Identity Investment

The second theme emphasizes the considerable personal investment made by participants in English. It is viewed as essential for their desired professional and social identities. English was portrayed by many not as a neutral tool, but as integral to their envisioned selves. This aligns with Norton's identity investment concept (2000) and Dörnyei's Ideal L2 Self construct (2009), reflecting the deep motivational significance of identity-based frameworks in this context.

Participants frequently articulated aspirational self-images in which English proficiency was inseparable from their envisioned futures:

> *"English is not just communication for me it is a bridge that connects me to international friends and opens up opportunities I couldn't access otherwise."*

> *"I want to apply to foreign companies because I believe the environment shapes your character and working style. That's why I actively learn English not just to get a job, but to become the kind of person I want to be."*

The investment in English was regarded by many participants as closely tied to aspirations of global inclusivity and cultural engagement, along with a desire to connect with communities beyond Vietnam. It was noted by one participant that, "While exploring TikTok and witnessing people from diverse countries communicating seamlessly in English, a longing to be part of that world arises within me. This drive significantly enhances my motivation for learning, surpassing any academic accomplishments."

Notably, identity investment in this theme did not yield uniformly positive outcomes. Several participants reported experiencing anxiety related to their identities due to perceived discrepancies between their current abilities and their envisioned Ideal L2 Self. One metaphor effectively illustrated this tension: "English and I are familiar, yet we have not developed a mutual affinity."

Theme 3: Digital Media as Intrinsic Motivational Space

Within the COFER framework, digital platforms like TikTok and YouTube are considered pivotal sites where intrinsically motivated English engagement is observed among Generation Z learners. It was reported by a significant number of participants that English-language digital content is voluntarily sought after outside of formal instruction. This behavior

is motivated by curiosity, enjoyment, and a desire for communities and content inaccessible in Vietnamese.

Digital platforms were characterized by participants not merely as educational tools, but rather as environments fostering genuine and enjoyable interactions where the acquisition of English emerged organically from these experiences. One individual remarked, “English content on TikTok and YouTube captivates me not for study purposes, but for enjoyment. Over time, I became aware of my natural progress in pronunciation and vocabulary.” Other participants noted, “Each instance of comprehending a joke in an English video without translation fills me with joy. This sense of achievement motivates my continued engagement with the content.”

Social media platforms were recognized as important motivational environments that facilitated the observation of genuine English usage by native speakers. One participant noted, "The sight of individuals my age, or even younger, speaking English fluently as if it were their native language inspires both admiration and a desire to achieve the same proficiency." This highlights the powerful influence of authentic interactions on language learning aspirations.

Within this theme, the importance of AI tools, particularly ChatGPT, was underscored. It was indicated by numerous participants that AI was being utilized as a conversational companion for voluntary English practice, instead of for academic purposes. Conversations with ChatGPT afforded participants the ability to make errors without embarrassment, resembling the support of a patient and non-judgmental practice partner.

Theme 4: Autonomous Learning Orientation

Participants demonstrated a robust inclination toward self-governed English acquisition, irrespective of imposed requirements or external encouragement. The vast majority of participants affirmed that they would continue learning English even without grades or formal requirements. Many articulated a nuanced understanding of English as a pursuit of personal significance, rather than merely a duty imposed by institutions.

Participants described a wide range of autonomous learning strategies from passive exposure through music and film to active self-study through vocabulary apps, AI-assisted writing practice, and self-initiated speaking exercises:

> *"If there were no grades, I would still learn English. For me, it's not just a subject it's a tool that helps me connect with the world and understand things I couldn't access otherwise."*

> *"I roleplay in my head, imagining I'm traveling abroad and speaking English on my own. It's my way of practicing without anyone knowing."*

Several participants demonstrated what SDT theorists would recognize as integrated regulation the highest form of extrinsic motivation internalization, in which English learning has become so personally meaningful that it is experienced as an expression of the self rather than an external requirement:

> *"Learning English is part of who I am now. I don't think of it as studying anymore, it's just something I do because I want to grow."*

Theme 5: The Motivational-Communicative Gap

The fifth and theoretically vital theme involved a paradox in participant motivation. High intrinsic motivation for English learning was identified. However, a significant reluctance

to participate in genuine, face-to-face English communication was consistently indicated by participants. This motivational-communicative discrepancy, where learning motivation did not easily become a willingness to communicate, became one of the most widespread and emotionally significant trends throughout the data.

Participants described a range of anxiety-inducing situations in which their intrinsic motivation was effectively neutralized by fear of negative evaluation, embarrassment at pronunciation errors, and perceived inadequacy in real-time communication:

"I know English, and English knows me but we don't get along."

"We are two parallel lines that can never meet."

"I have everything but not English."

More concretely, participants described specific situations in which anxiety overrode motivation:

"When I'm with foreign customers at work, I suddenly can't remember anything. I know what I want to say in my head, but I can't get the words out. I feel so ashamed."

"In class, I prepared what I wanted to say but when the teacher called on me, I froze. Everyone was looking at me and I just went blank."

Significantly, the motivational-communicative gap was not experienced as a motivational endpoint but as a source of productive tension for many participants. Several described shame and communicative failure as catalysts for renewed intrinsic engagement:

"After that embarrassing moment, I went home and practiced for hours not because anyone told me to, but because I refused to feel that way again."

Looking at these results through MacIntyre et al.'s WTC framework reveals a complex emotional layer for Vietnamese Gen Z learners. For this demographic, the jump from feeling motivated to actually communicating is heavily influenced by their emotions. Interestingly, foreign language anxiety does not act strictly as a roadblock here. In certain situations, this anxiety actually drives them to work harder and sustains their intrinsic motivation to learn.

Perceptions of Vietnam's ESL Policy Shift

Participants were also asked directly what they made of English becoming a Second Language in Vietnam, and whether this changed their motivation. Almost all responded. Their accounts converged on a reading of the policy as raising the stakes attached to English rather than as changing how English is taught. Many described the redesignation as an inevitable consequence of international integration, and a recurring formulation was that English would cease to be an advantage and would instead become a requirement.

Many said the shift would raise their motivation, though the increase was not uniformly comfortable. Several named pressure directly, and a recurring concern was the fear of being left behind. For some participants, the policy changed the character of their motivation rather than its intensity:

"It shifts my motivation from studying to pass exams towards studying in order to live and work, because English then becomes a compulsory survival skill rather than a choice."

"Those who are not yet good at it may feel they are being 'left behind'."

In answering this item, participants spoke about opportunity, requirement and social standing. They did not raise classroom routines, assessment formats or teaching practice.

5. Discussion

The findings of this study reveal a motivational landscape among Gen Z students at COFER that is richer, more complex, and more intrinsically oriented than existing Vietnamese EFL research would suggest. This section discusses the five identified themes in relation to the theoretical frameworks outlined in the Literature Review, draws connections across themes, and addresses the study's two research questions.

5.1. Intrinsic Motivation as the Dominant Orientation

Within the motivational narratives of the participants, the consistent dominance of intrinsic motivation has been identified as the most theoretically significant finding. This finding directly challenges prevailing characterizations of Vietnamese learners. With the vast majority of participants indicating willingness to learn English independently of academic requirements, the data suggest that Gen Z students at COFER have already developed what SDT theorists would recognize as identified or integrated regulation forms of self-determined motivation in which English learning is experienced as personally meaningful and congruent with the self rather than externally imposed (Deci & Ryan, 2000).

Despite the impact of external elements, the original finding retains its significance. Extrinsic and intrinsic motivations are understood to function simultaneously across regulatory levels, as recognized by SDT's motivational continuum. For numerous individuals, external pressures were seen to serve as an interim mechanism of introjected regulation, offering temporary support. Intrinsic motivation was observed to coexist with, and at times enhance, deeper motivational internalization rather than being overshadowed by external pressures. This interplay is particularly highlighted in Theme 5, where efforts in self-directed learning were often revitalized by shame and communication breakdowns instead of being diminished.

5.2. Identity as a Motivational Engine

Identity investment's motivational role emerges through aspirational self-images, desires for global connection, and narratives of English as a vehicle for self-expression. The explanatory strength of Norton's identity investment framework and Dörnyei's Ideal L2 Self construct is thus validated within the Vietnamese Gen Z context. Participants did not merely want to learn English; they wanted to become the kind of person who speaks English fluently, confidently, and naturally, a vision of the self that is simultaneously aspirational and motivationally generative.

The vocational context of COFER adds a dimension that Thu and Lee's (2024) L2MSS research did not fully address: Ideal L2 Self orientations appear to operate motivationally not only among language majors but across disciplines such as logistics, e-commerce, and business administration. This suggests a broader relevance of identity-based motivation than previously documented in Vietnamese undergraduate settings. Darvin and Norton's (2015) claim that digital platforms have become primary sites for identity investment was borne out clearly in the data. Several participants described watching TikTok creators their own age speak English effortlessly and feeling simultaneously inspired and unsettled. That tension fed directly into their motivation to close the gap between who they are now and who they wish to become.

5.3. Digital Media as a Transformative Motivational Environment

A key finding is that a large majority of participants described English as feeling more accessible and motivating through social media and AI, identifying digital media as a significant source of intrinsic motivation. This finding supports and expands Sockett's (2014) Online Informal Learning of English framework. TikTok, YouTube, music streaming, online gaming, and AI conversational tools are demonstrated to function as motivational ecosystems where intrinsic engagement with English is sustained, rather than mere supplementary resources.

Particularly noteworthy is the role of AI tools, especially ChatGPT, as low-anxiety communicative practice environments. Participants who described using AI as a conversational partner were effectively creating conditions that MacIntyre et al. (1998) identify as optimal for WTC development: low evaluative threat, high communicative control, and personally meaningful interaction. This suggests that AI-mediated English practice may serve as a critical bridge between participants' high intrinsic motivation and their low willingness to communicate in face-to-face contexts a pedagogical implication with significant practical relevance.

5.4. The Motivational-Communicative Gap: A Critical Pedagogical Challenge

The principal innovative contribution of this research lies in the identification and characterization of a motivational-communicative disparity. A systematic disconnect between participants' inherent drive to interact with English and their limited readiness to communicate in genuine, interpersonal scenarios is highlighted. This disparity, vividly illustrated in participants' figurative self-portrayals, implies that inherent motivation, while essential, is insufficient to generate communicative behavior when foreign language anxiety serves as a conflicting emotional influence.

This finding corroborated and expands upon existing willingness-to-communicate research. Peng's (2014) demonstration that classroom anxiety supersedes motivational elements in interpersonal communicative situations is mirrored here. However, an important refinement is added by the current study: the motivational-communicative disparity is not perceived as an unyielding obstacle but as a dynamic, emotionally intricate arena. Within this space, shame, anxiety, and inherent motivation interact in manners that can, under propitious circumstances, yield renewed motivational involvement.

Several participants described how humiliating communicative setbacks had paradoxically revitalized their self-guided learning. This suggests that the disparity, while problematic, is not motivationally inactive. This dynamic is consistent with Cao & Philp’s (2006) finding that willingness to communicate fluctuates significantly across contexts. It is suggested that pedagogical interventions aimed at diminishing evaluative threat through collaborative, low-stakes speaking exercises, AI-mediated practice, and identity-affirming classroom environments may prove more efficacious in bridging the motivational-communicative disparity than conventional communicative language teaching methodologies that prioritize accuracy and formal evaluation.

5.5. Vietnam's ESL Policy Shift and Its Motivational Implications

Vietnamese students have shown significant interest in updated ESL instruction policies. When asked directly what they made of the redesignation, participants most often described it as raising the stakes attached to English: it would cease to be a competitive advantage and become a condition of ordinary participation in study and work. Many said this would raise their motivation, although several also named pressure, and a recurring concern

was the fear of being left behind. English is no longer viewed as just a subject studied for exams. Instead, it is seen as a powerful tool for achieving personal development and expertise.

Participants discussed the redesignation in terms of opportunity, requirement and pressure rather than in terms of classroom practice. Ushioda (2011) cautions against superficial adherence to top-down policy directives. Fundamental pedagogical change may not be elicited solely through institutional acknowledgment. For optimal motivational impact, policy revisions must be implemented alongside modified assessment methods. Teacher training and classroom practices should also be adjusted accordingly.

For learners, a supportive educational setting is ultimately required, instead of merely imposed regulations. In this environment, autonomy should be cultivated, and communicative experimentation should be embraced. Individual expression must be validated. Otherwise, improvements, even those well-intended, risk being superficial. Their presence is only noted in formal documentation, and their fulfillment in real classroom settings is unmet.

Whether the 2023 redesignation ultimately reshapes classroom practice remains to be seen. What the data make clear, however, is that the motivational groundwork among Gen Z learners at COFER already exists. These students are not waiting to be motivated by policy; they arrived with it. The more pressing question for educators and institutions is not how to spark engagement, but whether the learning environment is structured in ways that allow that engagement to surface, grow, and translate into communicative confidence.

6. Conclusion

Vietnam’s 2023 shift toward an ESL framework prompted a closer look at what truly motivates the current generation of learners. By analyzing 83 COFER students, this research highlights five distinct areas: enjoyment-based engagement, identity investment, reliance on digital media, autonomous learning, and a visible gap between feeling motivated and speaking out. These results challenge the traditional view of Vietnamese students as purely instrumentally driven. Rather than focusing on grades or institutional policies, the participants showed a strong desire to learn based on their future self-image.

The study makes three principal contributions. Initially, the prevailing depiction of Vietnamese EFL learners as instrumentally driven is contested. The presence, and indeed dominance, of intrinsic orientations among Gen Z students at COFER is showcased, as understood through SDT's motivational spectrum. Second, it establishes digital media spaces as autonomous motivational ecosystems, not merely supplementary tools, extending OILE and identity investment frameworks into the Vietnamese Gen Z context. Subsequently, the motivational-communicative gap is pinpointed and theorized as a unique attribute of this learner group's motivational profile. Notable implications for research and pedagogy are suggested.

Several limitations of this study warrant acknowledgment. First, the sample was drawn exclusively from one institution, COFER, which serves a predominantly urban, career-oriented student population in Ho Chi Minh City. As such, the findings may not be fully transferable to learners in rural areas, different institutional contexts, or other Vietnamese universities with distinct pedagogical cultures. There are also methodological constraints to consider. The reliance on self-reported written interviews provided deep personal insights, but participants might still have tailored their answers, especially knowing the researcher is a faculty member at the same institution. Furthermore, this research represents a cross-sectional snapshot taken in March 2026. It cannot measure how student motivation might fluctuate across different academic years or adapt as the new ESL policy takes deeper effect. To build on this work,

subsequent studies should consider longitudinal tracking, mixed methods, or expanding the sample to other universities. This would help confirm how widely these motivational trends apply across Vietnam's changing educational landscape.

From a pedagogical perspective, the incorporation of students' digital activities into curriculum design is necessitated by these findings. Furthermore, AI should be leveraged as a supportive space for communication. Assessment cultures that value experimentation and acknowledge learner identity, rather than strict evaluation, ought to be prioritized. Forthcoming research endeavors should implement longitudinal, multi-site, or mixed-methods approaches. Motivational development throughout university can then be observed. Furthermore, interventions for the motivational-communicative gap should be evaluated.

The intrinsic motivational resources that Gen Z brings to English learning already exist within them. The challenge for educators and policymakers is not to manufacture motivation from nothing, but to recognize, appreciate, and actively cultivate the intrinsic resources that these learners carry into every classroom, every digital screen, and every encounter with the English language.

Bionote

M.A. Le Nguyen Hoang Nam is currently lecturing at the Faculty of Foreign Languages, College of Foreign Economic Relations (COFER), in Ho Chi Minh City, Vietnam. Second language motivation is at the core of his research, coupled with Gen Z learner identity. Digital informal learning and the evolving ESL context within Vietnam are also explored. Qualitative and identity-based frameworks are employed in his work. The shaping of intrinsic motivation and autonomous learning within Vietnamese university students through digital environments is examined.

#110 AI-SUPPORTED WRITING SCAFFOLDING AND PERCEPTIONS OF ACADEMIC INTEGRITY AMONG EFL JUNIORS AT HUFLIT

Anh Tuan Nguyen Le[1], Ngoc Huyen Thai Thi[2], Minh Chau Diep[3]

Abstract

This research explores how EFL Juniors at HUFLIT view academic integrity as they utilise AI-assisted writing scaffolds for their academic writing course (Introduction to Research Methods – Project 2). Generative artificial intelligence tools have been integrated into institutions of higher education; however, this has also created a conflict over whether there is a benefit or detriment to using these tools for educational purposes and to promote the authenticity of authorship. Data were collected through questionnaires, reflective papers, and semi-structured interviews. Descriptive statistics and thematic analysis were used to identify patterns of AI use, perceptions of academic integrity, and recommended practices for responsible AI use. The results indicate that most EFL Juniors see AI as an advantageously useful writing scaffold tool in terms of helping them create ideas, organise content and enhance vocabulary, ultimately creating greater confidence in their ability to write well. Nonetheless, caution needs to be taken regarding the possibility of too much dependence upon AI, and the effect it could have on students' writing skills. In addition, this research provides a practical understanding of how to integrate AI functionality into their teaching practices to develop their EFL Juniors' writing skills while remaining true to the principles of academic integrity.

***Keywords*:** AI-assisted writing, Project 2, EFL Juniors, mixed-methods approach, teaching practices

1. Introduction

1.1. Study background

The higher education landscape as we know it today is likely to undergo a radical transformation by 2025. This transformation will be driven by the deployment of advanced AI tools in the capacity of always-on online tutors and allocation analytics tools that provide personalised feedback to the learners (Kestin et al., 2025). The use of AI tools will allow for processing and generating content in a variety of formats, from text, code, and images, which in turn, will provide multiple ways of meeting the linguistic needs of learners from different backgrounds, such as those of multilingual communities who need help creating a sophisticated language base (Nyaaba, 2023). According to Quad C (2025), more than 80% of all university students around the globe have used some type of GenAI to help themselves learn through summarising materials, generating concepts, and even outlines; consequently, AI literacy will be

[1]*Corresponding author, Bachelor of Foreign Languages, Ho Chi Minh City University of Foreign Languages - Information Technology, HCMC, Vietnam; Email: tuannguyen03012004@gmail.com*
[2]*Bachelor of Foreign Languages, Ho Chi Minh City University of Foreign Languages - Information Technology, HCMC, Vietnam; Email: thaithingochuyen.470dt@gmail.com*
[3]*Lecturer, Faculty of Foreign Languages, Ho Chi Minh City University of Foreign Languages - Information Technology, HCMC, Vietnam; Email: chaudm@huflit.edu.vn*

an essential skill to get hired nowadays. As powerful as AI technologies are when it comes to assisting people in writing and researching, there were multiple discussions about how the rise in usage of such software jeopardises academic integrity and makes it hard to discern what is considered original work by humans and not generated by algorithms. Despite having beneficial aspects in writing, such as taking care of most of the mental processes involved and giving confidence to authors of any works, AI technologies bring risks associated with over-relying on them and producing misleading or non-existent references to the literature (Salleh et al., 2025). Thus, the aim here would be to have an open discussion between us as educators and our students concerning the values of academic integrity.

1.2. Problem statement

The employment of AI generational tools can also help students structure their research paper for the very first time. Indeed, according to Project 2 in the Introduction to Research Methods course at HUFLIT, AI tools show that one of the main problems in the process of writing is connected with maintaining the integrity of their papers while benefiting from the support provided by the AI technology. The EFL Juniors have faced the problem of cognitive overload since they should understand research terminology and use precise linguistic structures simultaneously. As a result, many of the EFL Juniors turn to AI tools for various purposes, including generating ideas, structuring the outline, and polishing language. Nevertheless, it is important to admit that there is a great difference between the technical skills of working with these tools and the overall knowledge of the capabilities of AI. In other words, the students can hardly distinguish the inherent ethical limitations of writing and be critical about the content produced with the help of AI. There are also several preliminary findings related to the fact that, despite the fact that the students believe that AI will motivate them and help them to cope with writing anxiety, there is no established framework regulating the process of applying this tool in the university. Moreover, there is a high risk of students relying too much on AI and, therefore, handing their teachers their papers without giving any credit for the information taken from them. Thus, without knowing whether the students perceive AI as scaffolding or a violation of academic integrity, the professor cannot be sure about the proper educational process.

1.3. Research objectives

The main purpose of this study is to analyse systematically how the subjective experience and behaviours of EFL Juniors using AI tools affect their role as cognitive and linguistic helpers in doing academic writing tasks at HUFLIT. The current study focuses on the attitudes of students toward the capability of AI in fostering rather than compromising the integrity principles, as well as assisting in maintaining balance between appropriate and inappropriate use of AI to avoid "*AI-giarism*". Furthermore, the current study explores the particular steps they take while using AI, including brainstorming topics for research papers, changing sentences to make them better in English, making sure the reasoning behind them is sound, or even coming up with a first draft, which they revise afterwards.

1.4. Delimitations

The research is only conducted among EFL Juniors at HUFLIT who are enrolled in the Introduction to Research Methods (Project 2) class. About the technological scope of the inquiry, the study considers only the use of AI-based writing assistance such as brainstorming, structuring,

and text editing, without considering AI tools for speaking, listening, and reading skills. Moreover, the scope of the research will be restricted to an examination of the perception of academic integrity and AI assistance among undergraduates. This means that the empirical efficiency of AI tools about writing, language proficiency, and academic performance will not be evaluated. Finally, the scope of analysis of the research will be confined to a descriptive mixed-methods approach, whereby only descriptive statistics will be used for quantitative data, while inductive thematic analysis will be used for qualitative interview transcripts.

1.5. Research questions

In response to these research purposes, the current study is expected to answer the following three research questions:

1. In what way do EFL Juniors employ AI tools in scaffolding Project 2 academic writing tasks?

2. What are the perceptions about the academic integrity of EFL Juniors when using AI tools for Project 2 academic writing?

3. What strategies could be proposed to foster academic integrity?

2. Literature Review

2.1. Theoretical framework

Vygotsky (1978) conceptualises the Zone of Proximal Development (ZPD) as the difference between a learner's independent capacity and their potential achievement under expert guidance. The concept provides the theoretical basis for instructional scaffolding. In the case of EFL Juniors, AI tools function as digital scaffolds by providing real-time feedback and adaptive prompts. These interventions assist students in managing demanding academic tasks, such as the organisation of research methods, thereby facilitating performance that exceeds their current independent level (Nordlof, 2014). Recent studies suggest that AI integration within the ZPD framework can improve writing skills through personalised assistance and the promotion of self-regulation, while remaining consistent with standards of academic integrity (Gayed et al., 2025).

The Technology Acceptance Model (TAM), proposed by Davis (1989), posits that technology adoption is primarily influenced by perceived usefulness and perceived ease of use. Perceived usefulness refers to the user's belief that a system will enhance their performance, while perceived ease of use concerns the effort required to use the system. Within AI-assisted writing, perceived usefulness encompasses student beliefs regarding improvements in idea generation, text coherence, and grammatical accuracy. Perceived ease of use reflects the extent to which students find the interface and operational requirements of these tools manageable. While the TAM has been refined over time, recent applications examine the relationship between technology acceptance and student perceptions of academic integrity.

2.2. AI-Supported Scaffolding in Academic Writing

The integration of AI tools has significantly changed how academic writing is approached, primarily by offering structured scaffolding that assists students at various stages of the process. Generative models like ChatGPT are notable for providing immediate feedback, which helps

students brainstorm and organise their thoughts more effectively (Khalifa & Albadawy, 2024). These applications now serve critical functions across several research dimensions, including idea generation, content structuring, literature synthesis, and data management, alongside improvements in communication and ethical editing (Khalifa & Albadaway, 2024). Despite their educational benefits, the growing prevalence of AI also presents substantial risks to academic integrity, particularly when students lack clear ethical frameworks or institutional guidance. One prominent concern is the possibility of undetectable plagiarism, as AI systems produce fluid, original-appearing text that often bypasses traditional detection tools (Fowler, 2023). Furthermore, an over-reliance on these technologies may compromise critical thinking and independent writing skills, as students may prioritise automated content over the deep cognitive engagement necessary for academic growth (Richards et al., 2024). Finally, the lack of transparency in AI-generated work poses a challenge for assessment, making it harder for educators to evaluate the actual effort and knowledge a student has acquired (Bjelobaba et al., 2024).

2.3. Academic Integrity in AI-Supported Writing

The rise of AI-assisted plagiarism has become a pressing issue within the academic community (Chan, 2023). This practice, which involves submitting AI-generated or heavily modified content without proper disclosure, has significantly blurred the distinction between independent authorship and automated assistance. As generative models grow more sophisticated, their ability to produce coherent, contextually appropriate academic prose makes them increasingly difficult to distinguish from human work, thereby challenging long-standing definitions of plagiarism (Torres-Diaz et al., 2025). For EFL Juniors, the concept of academic integrity in an AI-supported environment is often nuanced and occasionally contradictory, reflecting a balance between pedagogical utility and ethical responsibility. Many of these students have begun to view integrity not merely as the absence of plagiarism, but as a broader commitment to transparent practice, original thought, and intentional learning. Research suggests that these learners generally regard AI as a valuable asset for linguistic development, particularly for refining grammar, broadening vocabulary, and facilitating the initial stages of idea generation.

2.4. Pedagogical Strategies for Maintaining Academic Integrity

Research suggests that while AI tools can improve grammatical accuracy and help structure early drafts, integrating them without clear pedagogical guidance risks fostering an over-reliance on automated outputs. This dependency may, in turn, impede the development of higher-order writing skills, particularly critical analysis and complex argumentation (Aljuaid, 2024). To counter this, educators are encouraged to adopt process-oriented frameworks that require students to document their use of AI, making their creative choices more transparent and accountable. At the same time, institutional clarity is vital; vague or inconsistent standards often result in unintentional academic misconduct (Bui & Tong, 2025). Guidelines must therefore explicitly distinguish between acceptable assistance and prohibited practices, such as presenting AI-generated text as one's own. This is especially important given that AI-driven paraphrasing can easily obscure the origins of an idea, raising the risk of plagiarism when sources are not properly cited (Hernandez et al., 2024).

3. Methodology

3.1. The participants

The participants in this study were 176 EFL Juniors enrolled in the Introduction to Research Methods (Project 2) course at HUFLIT during the 2025–2026 academic year. The cohort represents a variety of academic specialisations. The selection of this specific course was based on its role in the undergraduate curriculum, which marks the transition from initial data collection in Project 1 to the development of more complex academic discourse in Project 2. In particular, data were collected through a questionnaire with various question types and in-depth interviews to obtain data that could provide rich insights into these findings.

3.2. Research Design

This study employs a descriptive mixed-methods design and is guided by research questions. The aim is to describe students' use of AI, perceptions of academic integrity, and practical recommendations, rather than to examine causal relationships between variables. A mixed-methods approach was employed, combining descriptive statistics and thematic analysis to provide a triangulated empirical view of this research. Specifically, these materials were meticulously designed to ensure methodological solutions, ethical compliance, and, ultimately, the research goal that aims to examine AI-supported scaffolds and learning motivation towards undesirable behaviours such as dishonesty relevant to academic integrity among EFL Juniors at HUFLIT.

3.3. Instruments

3.3.1. Questionnaire

The primary instrument was a 17-item online questionnaire for EFL Juniors. The questionnaire was intended to collect EFL Juniors' perceptions of AI-based learning assistance associated with academic integrity in Project 2. All 17 questions were split into four sections, corresponding to the objectives of the study and the three research questions.

- Section one, Background Information (Questions 1 to 3), was focused on collecting the respondents' gender information, frequency of AI tool application, and familiarity with AI learning assistance.
- Section two, AI usage to scaffold Project 2 writing (Questions 4 to 6), explored particular types of AI assistance, its impact on particular aspects of writing, and associated advantages and potential risks.
- Section three, perceptions of academic integrity, including citation awareness and plagiarism awareness when applying AI tools to Project 2 writing (Questions 7 to 14) via the commonly-used 1-to-5 scale.
- Finally, the fourth section (Questions 15 to 17) contained one multiple-choice question on EFL Juniors' suggestions for maintaining academic integrity while employing AI tools, in addition to two open-ended ones encouraging students to share more insights about responsible utilisation of AI tools.

3.3.2. In-depth interview

In-depth interviews were conducted with 6 EFL Juniors (each participant lasted about 10 minutes) to enrich the findings obtained through surveys with the help of EFL Juniors with practical and detailed perspectives on their perceptions of academic integrity in an AI-based context:

- Section 1 (Research Question 1): Questions 1 and 2 address the manner in which EFL Juniors employ AI tools to scaffold particular Project 2 academic writing assignments, along with any challenges involved in this process.
- Section 2 (Research Question 2): Questions 3, 4, and 5 aim to examine students' perceptions of academic integrity, namely, how they manage the balance between personal writing and AI assistance and establish ethical boundaries.
- Section 3 (Research Question 3): Questions 6 and 7 provide information on students' recommendations regarding practical guidelines for upholding academic integrity.

3.4. Data analysis

For an in-depth analysis of the data collected, both descriptive statistics and thematic analysis were used and connected with the main research questions. For the process of analysis of the data in the descriptive statistics, IBM SPSS Statistics was used to analyse the survey data. Variables were recoded using numbers (0 – No; 1 – Yes) for demographic variables and multiple response items to be able to measure frequency and percentages to define popular types of application use and their distribution under RQ1. Additionally, the data obtained on the Likert scale, both from the structured matrix and open-ended questionnaires, were analysed via the mean and standard deviation measures in order to assess the level of students' ethical awareness (RQ2) and preferences (RQ3). In connection with that, the data from the open-ended questionnaire and the semi-structured interviews were subjected to the inductive thematic analysis. The guide for conducting the semi-structured interviews was based on the concepts of academic integrity and technological literacy developed by McCabe (2005) and Selber (2004). It was fully translated into English and then transcribed. Qualitative data were classified into several themes in order to determine deeper perceptions of students about over-reliance (RQ2) and their curriculum suggestions (RQ3), keeping their anonymity intact (P1-P6).

4. Results

4.1. Demographic information

Table 1

Survey Respondents' Demographic and Behavioural Statistics

		1. Gender	2. How often do you use these AI tools for Project 2 writing?	3. What is your familiarity level with the concept of "AI-supported scaffolding" in academic writing?
N	Valid	176	176	176
	Missing	0	0	0

Table 2

Frequency Distribution of Respondents by Gender

		Frequency	Percent	Valid Percent	Cumulative Percent
alid	Female	121	68.8	68.8	68.8
	Male	55	31.3	31.3	100.0
	Total	176	100.0	100.0	

The demographic characteristics of the 176 students who took part in this study have been outlined in Table 1. No data were missing in the analysis because all respondents provided answers to all questions asked. Speaking about gender balance within this group of students in Table 2, one can note that females made up to 68.8%, whereas males made up 31.3%. Such a distribution of genders is characteristic of the demographic data of students studying in language departments of universities.

4.2. EFL Juniors' employment of AI tools

Table 3

Frequency of AI Tools Usage in Project 2

		Frequency	Percent	Valid Percent	Cumulative Percent
alid	Always (weekly or more)	60	34.1	34.1	34.1
	Never	1	0.6	0.6	34.7
	Often (once a month or more)	52	29.5	29.5	64.2
	Rarely (once a semester or less)	8	4.5	4.5	68.8
	Sometimes (a few times per semester)	55	31.3	31.3	100.0
	Total	176	100.0	100.0	

The current data points out the high popularity of the use of AI tools among Project 2 students. According to Table 3, the percentage of those who stated to "*always use*" such technologies was equal to 34.1%. Furthermore, 29.5% of respondents said that they used AI tools "*often*", meaning that they used them once a month or even more often. In turn, another 31.3% said that they "*sometimes*" used the discussed technology – a few times per semester. Only 4.5% of students stated to use these technologies "*rarely*" and just 0.6% stated "*never*". Thus, it becomes clear that more than 94% of students use AI.

Anonymously labelled as P1-P6, student testimonies indicate a careful matching of particular technologies to individual assignments. At the initial cognitive phase, students use

conversational engines to collaborate actively in their processes. As corroborated by P1, "*my team worked with several AI tools like ChatGPT, Gemini, Deepseek, and also NotebookLM. We also use Grammarly… ChatGPT and Gemini are kind of common, and we mainly use them for brainstorming"*. In this respect, P6 supports P1's assertion, claiming that "*actually, I use AI as a brainstorming partner. Instead of a blank space, I use it to break down the complex requirements of the project*". Once the process of writing unfolds, students turn to using technologies for formatting ideas, changing vocabulary, and polishing the language. For instance, according to P3, "*the main role of AI is to help me in arranging and arranging of ideas... After I used AI to help me, I think I know how to write better, as well as how to write more clearly*". Similarly, P4 regularly applied precise prompts to external databases, revealing, "*I will give AI a topic... and then I will ask AI to help me connect complex structures to make my research more logical... It will give me more complex words and sentences... to help me write more logically*". Lastly, for superficial corrections, students used special editing engines to avoid technical errors. Thus, P2 emphasized, "*I would use my AI to organise my ideas and for revising graphs, because I'm always making spelling mistakes*". Likewise, P5 highlighted, "*I often use AI specifically to see if I make any mistakes... or to correct the grammatical errors*". In sum, these testimonies illustrate that undergraduates widely apply various AI technologies in order to organize, paraphrase, and improve their assignment

Table 4

Types and Frequency Distribution of AI Tools Utilized by EFL Juniors

		Responses		Percent of Cases
		N	Percent	
AI tools used by EFL Juniors[a]	ChatGPT	159	30.9%	90.3%
	Gemini	143	27.8%	81.3%
	Quillbot	90	17.5%	51.1%
	Copilot	40	7.8%	22.7%
	Google Translate	70	13.6%	39.8%
	ZeroGPT	1	0.2%	0.6%
	Grammarly	2	0.4%	1.1%
	Grok	4	0.8%	2.3%
	Claude	3	0.6%	1.7%
	NotebookLM	1	0.2%	0.6%
	Perplexity	2	0.4%	1.1%

	Total	515	100.0%	292.6%

From Table 4, it is evident that the students rely heavily on generative AI tools. The most preferred tools among students include ChatGPT, used by 90.3% of them, and Gemini, used by 81.3%. Other commonly used paraphrasing and translation tools include Quillbot (used by 51.1% of students) and Google Translate (used by 39.8%). Other less common but still popular AI tools among the students include Copilot, with 22.7% usage. On the other hand, some specialised AI tools like Grok (only used by 2.3% of students), Claude (used by 1.7% of them), Grammarly (by 1.1%), Perplexity (used by 1.1%), NotebookLM (0.6%) and ZeroGPT (0.6%) remain infrequently used by the group.

Anonymised as P1 to P6 for privacy reasons, the transcripts of the interviews show that conversational models and text rewriter platforms are the most visited among the students' research routines. In terms of high-frequency brainstorming and conceptual setup, conversational platforms like ChatGPT and Gemini act as the main foundations of the research activities. According to P1, the following explanation was offered: "*my team worked with several AI tools like ChatGPT, Gemini, Deepseek, and also NotebookLM. We also use Grammarly, and each one supports a different part of our writing process. ChatGPT and Gemini are kind of common, and we mainly use them for brainstorming"*. This heavy dependence on particular software brands for structuring layouts and draft creation is a frequent trend among multiple individual research processes. For instance, P2 admitted, "*I usually use Chattivity [ChatGPT] to do it... Sometimes I feel burnt out sometimes. So sometimes I just throw it on AI to write it for me*". Also, P4 described their systematic distribution of instructions across engines and conversational rewriters during complex task execution: "*I will give AI a topic that I want... and then I will ask AI to help me connect complex structures to make my research more logical*". Lastly, for simple mechanical proofreading and polishment of a draft, automation editors become frequently applied in the final stage. As stated by P1, "*Grammarly to check grammar, punctuation, and sentence clarity*". At the same time, both P5 and P6 relied extensively on the software for similar functions. In particular, P6 added, "*I use it for, um, finding those advanced vocab for my paragraph*".

Table 5

EFL Juniors' Evaluation of AI Features for Project 2 writing

		Responses		Percent of Cases
		N	Percent	
AI features evaluated by EFL Juniors[a]	Grammar and style correction	134	38.0%	77.5%
	Paraphrasing existing text	89	25.2%	51.4%
	Content idea brainstorming	90	25.5%	52.0%
	Reference and citation formatting	40	11.3%	23.1%
	Total	353	100.0%	204.0%

a. Dichotomy group tabulated at value 1.

As per the detailed feature usage statistics in Table 5, "*Grammar and style correction*" is the most frequently selected function, being chosen by 77.5% of the participants (i.e., comprising 38.0% of all feature usage responses). Besides surface-level edits, undergraduates extensively use cognitive features to support their text creation process. Namely, 52.0% of the students use "*Content idea brainstorming*", while another highly selected cognitive feature is "*Paraphrasing existing text*" at 51.4%. At the same time, fewer students utilise technical features in the context of academic writing management, since "*Reference and citation formatting*" is chosen by 23.1% of the respondents.

In the in-depth interview, P1 and P6 focused their review of the examined platforms primarily on high-level cognitive and brainstorming features, using conversation-based tools as interactive assistants to break down the complexity of required research structures. Thus, P1 found the examined services to be highly efficient in assisting users with "*brainstorming, outlining, grammar checking, and revision*", while P6 explained their use of the mentioned platforms, saying, "*Actually, I use AI as a brainstorming partner. Instead of a blank space, I use it to break down the complex requirements of the project, too. Um, and this would actually help me a lot, uh, for the paragraph cohesion*". Further discussing structural layout and synthesis functions, P3 and P4 viewed the organisational capabilities of AI features positively, as they helped them with organising "*the arrangement and arranging of ideas... after I used AI to help me, I think I know how to write better, as well as how to write more clearly*". On the other hand, P4 valued the connection-making capabilities of AI features as follows: "*I will ask AI to help me connect complex structures to make my research more logical... It will give me more concise sentences... as well as more complex words and sentences*". Finally, concerning language-polishing and text-refining features, P2 and P5 were looking for capabilities that eliminated surface-level errors from texts. As P2 stated, "*The one thing that makes me choose AI software is revising graphs, because I'm always making spelling mistakes*", while P5 stated that they used AI-based tools "*specifically to see if I make any mistakes... [and] to correct the grammatical errors, or to correct the weird sentences*".

Table 6

Evaluation of AI Benefits of AI-Supported Writing

		Responses		Percent of Cases
		N	Percent	
AI benefits evaluated by EFL Juniors[a]	Improved writing structure	106	20.7%	60.2%
	Quick grammar error reduction	116	22.7%	65.9%
	Creative idea suggestions	127	24.9%	72.2%
	Time savings in research	113	22.1%	64.2%
	Increased writing confidence	49	9.6%	27.8%
	Total	511	100.0%	290.3%

Based on the specific benefits provided in the table above, cognitive and creativity help is the first benefit mentioned by most respondents. Particularly, the highest percentage of people

mentioned "*Creative idea suggestions*" as the main advantage, with 72.2% (24.9% overall response percentage) mentioning this benefit specifically. Practical and structural help are also among the best advantages identified by the participants. Thus, the second highest rate was "*Quick grammar error reduction*" (65.9%), followed by "*Time savings in research*" (64.2%), and "*Improved writing structure*" (60.2%). At the same time, psychological help is relatively less widespread; only 27.8% chose "*Increased writing confidence*".

For the in-depth interview, in terms of cognitive development, it is clear that participants noted that communication with AI helped them diversify their views on the subject and improve their analysis of particular issues. Thus, P1 noted that comparison of the two models helped him obtain mental clarity since platforms like DeepSeek became useful for "*if I wanted another perspective or a different explanation of some point*". P2 obtained similar cognitive help when he was learning to navigate a quantitative tool; thus, according to him, AI helped because "*I'm still using AI to learn how to use the analyser tool like SPSS... I have learned a way to use AI more effectively*". For language-driven enhancement, software served as a good linguistic scaffold that improved the academic quality of the text. For example, P1 stated that he was able to use "*more advanced vocabulary which makes me sound more academic*", whereas P4 enjoyed "*more concise sentences... as well as more complex words... to help me write more logical sentences*". Moreover, P6 mentioned that the analysis of the AI's work helped him express himself better: "*By seeing how AI can help me to rephrase... I learned how to express my ideas*". Finally, in terms of workflow optimisation, AI was seen as convenient and efficient enough for time savings and structural improvements. P3 noticed that AI helped him improve both his skills and writing, making him "*know how to write better, as well as how to write more clearly*"; P4 agreed with this statement but focused on the time aspect: "*It will give me quick answers, as well as save me time*".

4.3. EFL Juniors' Perceptions of Academic Integrity

Table 7

Perceptions of Academic Integrity Awareness when Using AI Tools

	Mean	Std. Deviation	N
AI tools increase my awareness of proper citations	3.84	.945	176
AI tools helped me distinguish between acceptable AI assistance and academic cheating.	3.71	.895	176
AI tools raise my awareness of plagiarism risks	3.97	.871	176

Table 8

Reliability Statistics for the Scale

Cronbach's Alpha	N of Items
.637	3

Table 9

Cronbach's Alpha Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
AI tools increase my awareness of proper citations	7.68	2.150	.440	.548
AI tools helped me distinguish between acceptable AI assistance and academic cheating.	7.81	2.305	.425	.567
AI tools raise my awareness of plagiarism risks	7.55	2.261	.474	.501

Descriptive measures in Table 7 show that there is high student agreement regarding the effectiveness of AI as a means to enhance ethical awareness. Indeed, the last item demonstrates the highest level of consensus among the group members: Students strongly agree that AI increases their awareness of plagiarism risks (M = 3.97, SD = .871). This result is followed by the item that AI boosts students' awareness of citing practices (M = 3.84, SD = .945) and helps to differentiate between permissible and forbidden types of assistance (M = 3.71, SD = .895). In addition, the overall internal consistency of this 3-item sub-scale is verified in Table 8, returning a Cronbach's Alpha value of .637. While moderate, this meets acceptable research thresholds for a concise behavioural sub-scale. Finally, the item-total statistics in Table 9 prove that all three variables correlate well with the overall scale, as corrected item-total correlations remain safely above .40. Removing any of the items would lower the overall Cronbach's Alpha to values between .501 and .567, confirming that keeping all three statements provides the most reliable measurement framework.

Table 10

Academic Integrity's Risks and Challenges

	Mean	Std. Deviation	N
AI for editing or paraphrasing in Project 2 is a violation of academic integrity	3.39	1.036	176
Over-reliance on AI tools may reduce my independent writing skills	3.99	.881	176
It is sometimes difficult to distinguish between my own ideas and AI-generated content.	3.82	.943	176
Reliance on AI tools for scaffolding in Project 2 increases the risk of unintentional academic dishonesty.	3.96	.824	176
Using AI-supported scaffolding in Project 2 provides an unfair advantage over peers who do not use it, affecting academic integrity.	3.73	1.004	176

Table 11

Reliability Statistics for the Scale

Cronbach's Alpha	N of Items
.686	5

Table 12

Cronbach's Alpha Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
AI for editing or paraphrasing in Project 2 is a violation of academic integrity	15.51	6.571	.409	.653
Over-reliance on AI tools may reduce my independent writing skills	14.91	7.615	.293	.694
It is sometimes difficult to distinguish between my own ideas and AI-generated content.	15.07	6.823	.428	.642
Reliance on AI tools for scaffolding in Project 2 increases the risk of unintentional academic dishonesty.	14.94	6.882	.522	.607
Using AI-supported scaffolding in Project 2 provides an unfair advantage over peers who do not use it, affecting academic integrity.	15.16	5.990	.574	.572

In Table 10, as for the hidden risks associated with the use of AI writing aids, the participants demonstrate that they are very much aware of this factor. In this regard, participants show the highest level of agreement with the item related to concern that excessive reliance on AI tools may hinder the development of students' independent writing skills (M = 3.99, SD = .881). In addition, the statement that reliance on scaffolding provided by AI tools can contribute to unintentional academic dishonesty (M = 3.96, SD = .824). Furthermore, it appears to be fairly difficult for students to distinguish between original ideas and AI-generated content (M = 3.82, SD = .943). Moreover, it is worth mentioning that participants agree that using AI tools provides a competitive advantage in relation to peers who do not employ such means (M = 3.73, SD = 1.004). At the same time, the item with the lowest level of student agreement indicates that there are doubts whether editing and paraphrasing constitute academic dishonesty (M = 3.39, SD = 1.036).

The overall internal consistency for this 5-item sub-scale is verified in Table 11, which shows a Cronbach's Alpha value of .686. This coefficient indicates an acceptable level of reliability for an undergraduate perceptual survey, proving that the grouped questions reliably measure the negative ethical concerns and academic anxieties felt by students. Looking deeper into the scale dynamics, the item-total metrics in Table 12 show a generally solid relationship among the items, except for the second item, which displays a lower corrected item-total

correlation of .293. Despite this weak link, removing this item would actually decrease the scale's alpha to .694 when considering its theoretical importance to skill loss, while deleting strong items like the fourth and the fifth item would drop the reliability score down to .607 and .572, respectively.

Concerning empirical distortion, the transcripts demonstrate numerous conflicts associated with severe algorithmic errors. For example, P1 reports encountering issues with the reliability of information provided by AI, claiming that "*AI did not always give me reliable information because sometimes it gave me references that looked real, but when I checked them, they were actually inaccurate or invalid*". This problem is echoed by another participant, who reports that AI-based tools often fabricate academic reality, as P4 states that the software "*provided inaccurate information as well as information it made up, and that cost me time to double-check it before including it in my paper*". Speaking about agentic erosion, the transcript analysis reveals instances where students resort to over-reliance on AI owing to excessive academic burden. Specifically, P2 reports that he/she was unable to independently draft papers during particularly busy weeks at university: "*Sometimes I feel burnt out… So sometimes I just throw it on AI to write it for me*". Moreover, P3 notes that it is easy to relinquish cognitive control: "*I realised that AI also understands. Sometimes, it understands better than me, so I let it do it*". Finally, in terms of structural unfairness, participants report concerns with regard to the ethical implications of AI writing and the mechanical nature of language generation. Thus, P1 warns that an unedited submission leads directly to "*plagiarism*", whereas P3 mentions that copying prompts allows one to gain unfair advantages in the process of writing papers, as "*it's not fair because that effort is just to copy a prompt and give it to AI to write. It's not the actual sentence that you use your talent to write*".

4.4. EFL Juniors' Strategies Recommendation to Maintain Academic Integrity

Table 13

Recommended Strategies for Maintaining Academic Integrity

		Responses		Percent of Cases
		N	Percent	
AI strategies to support students[a]	Clear of AI usage guidelines	109	18.4%	61.9%
	Examples of acceptable AI use	110	18.5%	62.5%
	AI citation instructions	99	16.7%	56.3%
	Ethical discussions implementation	105	17.7%	59.7%
	Teachers feedback	107	18.0%	60.8%
	AI ethics training	64	10.8%	36.4%
Total		594	100.0%	337.5%

From Table 13, it is evident that students prioritise pragmatic institutional and mentor guidance rather than training workshops. The most popular approach is to provide "*Examples of acceptable AI use*" (62.5% of the participants). Another top-rated strategy is to introduce "*Clear of AI usage guidelines*" (61.9%). Moreover, students' top preferences include direct teacher guidance, such as "*Teachers feedback*" (60.8%) and "*Ethical discussions implementation*" (59.7%). Additionally, students are in need of instructions on AI citation (56.3%). Formal structured approaches, such as AI ethics training, are not as popular and are preferred by 36.4% of the students. The provided statistics prove that pragmatic examples, clear guidelines, and direct teacher feedback are required by the students for maintaining their academic integrity.

Table 14

Quality of Students' Recommendations

		EFL Juniors' recommendation				Total
		No Opinion	Apprehensive Perspective	Pragmatic Perspective	Visionary Perspective	
Male	Count	12	2	28	13	55
	% within Gender	21.8%	3.6%	50.9%	23.6%	100.0%
Female	Count	12	7	74	28	121
	% within Gender	9.9%	5.8%	61.2%	23.1%	100.0%
Total	Count	24	9	102	41	176
	% within Gender	13.6%	5.1%	58.0%	23.3%	100.0%

Analysing the details of the percentage distribution in Table 14, the most noticeable trend is the preference of both genders for the "*Pragmatic Perspective*". Both the male and female subgroups demonstrate this preference at the highest percentages, 50.9% and 61.2%, respectively. Secondly, one can see the gender neutrality of the "*Visionary Perspective*" category as it also presents itself at almost equal rates, namely, 23.6% of the male respondents and 23.1% of the female respondents. Only minor differences exist among the other categories; the number of "*No Opinion*" responses among males is higher than the number of responses among females by 11.9%, and the "*Apprehensive Perspective*" is equally insignificant within both gender subgroups at 3.6% and 5.8%.

Regarding in-depth interviews, none of the participants was in favour of an outright ban on technologies in the classroom but advocated instead an educational model that would utilise AI technology as an aid to education under strict supervision. Thus, P2 stated, "*You cannot ban your students from using AI… what we can do is show them the appropriate way to use it*". Similarly, P3 agreed and mentioned that it was essential to understand that it was up to students to apply AI properly and with proper supervision of the teachers, who observed whether it helped or harmed the process. P1 added, "*without the rules, students may misuse AI or become too dependent*". Moreover, the students suggested strict checking rules and oral explanations to ensure their

personal accountability in using this technology. As for P2, he shared his department's policy according to which "*we have a rule that every paper, when checking the plagiarism point and academic similarity point, must be under 3%. This is a way you can ensure academic fairness and integrity*". Lastly, P6 suggested performing an oral verification test by stating, "*be honest about using AI for editing. And so actually, if you can't explain the paper… in two minutes without AI. So it's not your paper… You need to rewrite it again*".

5. Discussion

5.1. EFL Juniors' employment of AI tools

Both the survey and interview findings suggest that the use of AI tools has become a common practice among EFL Juniors, as more than 94% of participants use these solutions several times throughout a semester. Specifically, EFL Juniors consistently employ a number of different applications depending on the stage of writing a paper. High-level cognitive activities are performed using such solutions as ChatGPT (90.3%) and Gemini (81.3%), as both of these conversational models are used by students for topic brainstorming and idea generation. Literature analysis and text refinement are facilitated using source-focused applications like NotebookLM and automated rewriting software such as Quillbot (51.1%) and translation applications (39.8%). Finally, mechanical activities, such as proofreading for grammar and other errors, are aided using proofreading software like Grammarly. The most highly appreciated benefits of such digital scaffolding are related to creative thinking (72.2%) and considerable time-saving during research (64.2%). The combined use of conversational models for concept generation and automated software for surface editing generally aligns with Wood, Bruner, and Ross' (1976) theory of cognitive scaffolding, which suggests that temporary tools enable the performance of complicated activities beyond one's reach. Moreover, the extremely high use of ChatGPT and Gemini in this study corroborates the findings of Fetzer et al. (2025), according to whom generative models have swiftly become indispensable cognitive partners of university students around the globe.

5.2. EFL Juniors' Perceptions of Academic Integrity

According to the results, although the findings suggest that participants were generally aware of the automated help provided by technologies, their inner ethical guidelines are extremely strong. In fact, EFL Juniors view the submission of fully unedited AI content as an extremely unethical practice and would not import raw data to AI to automatically analyse it due to security reasons associated with data breaches. In order to preserve their unique voice and not rely too much on technologies, participants do their best to achieve the right balance by viewing AI tools merely as an assistant and rewriting suggestions made by it instead of blindly copying. Nevertheless, excessive university workload causes significant academic burnout in participants and, sometimes, forces them to step outside their boundaries and use AI-generated text to make things easier. Another problem identified in the course of data analysis pertains to AI hallucinations because students frequently encounter the issue of fabricated academic citations that cannot be considered valid or accurate. This behaviour pattern under the conditions of academic pressure corresponds to the situation fraud concept introduced by Sujeewa et al. (2020), which states that under high pressure (in the case of the study, it relates to academic burnout) and opportunities for unethical actions (in this situation, uncontrolled use of AI), ethics breaks down quite easily. Moreover, participants' concerns related to overdependence and lack of skills

correspond to the prediction made by Selwyn (2014) regarding the de-skilling of learners using automated educational systems.

5.3. EFL Juniors' Strategies Recommendation to Maintain Academic Integrity

Mixed-methods data gathered provide compelling support for a learning approach that involves explicit guidance, practical examples, and verification by humans, not prohibitions that will only prove ineffective through technology. First, in the questionnaire, students mainly request examples of acceptable use of AI (62.5%), guidelines provided by departments (61.9%), and feedback provided by teachers (60.8%). Importantly, however, thematic analysis obtained in interviews offers further insight into why the survey respondents feel that way and provides an explanation of how these approaches may be employed. In particular, interviews conducted with P1 and P3 indicate that vague policies do not work; hence, departments should set clear boundaries between editing and text generation. In order to ensure personal responsibility, participants have recommended spending at least one or two classes on AI education (P2, P5) and using automated checking along with verification by a two-minute oral defence (P6).

6. Conclusion

6.1. Major findings

Based on the findings obtained from the study employing a mixed method approach, it can be concluded that the role of artificial intelligence in facilitating the academic writing process of EFL Juniors in HUFLIT is a vital one, which is deeply rooted in their writing processes. Quantitative data indicate that almost all of EFL Juniors frequently employ different conversational models, including ChatGPT and Gemini, as well as automated editing programs, including QuillBot and Grammarly, in completing their research work. All those technological products function as efficient learning assistants that effectively alleviate the feeling of language anxiety, help save time, and enhance paragraph flow through proposing new vocabulary and more complex sentence structures. Nevertheless, the quick technological advancement poses many threats related to the integrity of students' work. They encounter many technical problems, such as AI hallucinations which invent totally fictional citations, as well as suffer from severe academic burnout that sometimes results in over-dependence on technology. Overall, despite the fact that EFL Juniors use various platforms to enhance linguistic abilities, they keep solid boundaries, not letting technology substitute their thoughts.

6.2. Implications

The results of this study provide essential pedagogical implications that are relevant for the future of higher education in the time of generative AI technologies. Firstly, for the teacher, the normalisation of these tools across society calls for a transition from strict policing to practical classroom guidance. The teacher must be transparent and teach students about AI literacy through specific lectures and exercises showing examples of acceptable help from AI and unacceptable content creation. In addition, interactive oral defence sessions must be introduced to check students' ability to learn independently. Secondly, from the perspective of curriculum design, the results imply the need for a total revamp of syllabi in terms of process rather than product evaluation. Curriculum designers must include AI literacy lessons in academic writing classes and focus on assessment criteria based on critical editing and verification of sources. Finally, for institutions, the fact that restrictive approaches do not work becomes clear. Universities need to

have a strong honour code based on such elements as data privacy rules and clear examples of AI usage both in class and in assignments.

6.3. Limitations

Apart from providing an accurate and comprehensive analysis of the data, however, this study comes with additional limitations that have to be taken into account upon interpretation of its findings. First and foremost, data were gathered exclusively within the framework of one department of one institution, namely the Faculty of Foreign Languages at HUFLIT. Given the fact that this study focuses solely on a limited sample of 176 EFL Juniors in Vietnam, there is a possibility that the observed characteristics in terms of frequency of use, awareness, etc., would differ greatly for students who pursue education in other fields, such as business, law, engineering, etc., as well as students who take EFL courses at other institutions. Secondly, since the research is based solely on survey questions and voluntary in-depth interviews, social desirability bias can be considered an inherent limitation of the current study. Some participants could intentionally provide responses that would indicate less frequent AI use or adherence to rules concerning dishonesty at universities in order not to be penalised academically. Lastly, since this study only adopts the descriptive and cross-sectional approach, it is only possible to have a fleeting picture of student attitudes at one particular moment in time. Thus, we will not be able to make any causal connection between the variables, nor will we be able to observe their dynamic development through time.

6.4. Future research

With respect to extending the empirical conclusions obtained from the present research, three essential methodological recommendations for further research in the field of educational studies are to be mentioned. First, future research should involve longitudinal research to reveal whether a continued use of artificial intelligence tools during four years of college studies helps or hinders the development of an independent proficiency in English grammar and vocabulary, as well as critical thinking. Second, further studies need to carry out cross-university comparisons, employing more varied multi-university samples. Specifically, it would be helpful to identify whether differences in university policy on using AI tools affect students' perceptions of academic integrity to different extents among various academic disciplines. Third, further investigation needs to conduct experiments, comparing the effect of different technological tools on EFL Juniors and their academic integrity. In particular, more research should focus on studying the unique effects of different software ecosystems in influencing the process of students; in particular, the automated literature mapping tools (Connected Papers, Research Rabbit, Litmaps) that help in synthesising texts, as well as statistical packages (SPSS, Stata, and JMP). Future studies may extend the present findings by employing more advanced statistical techniques or approaches. Future studies may develop and validate more comprehensive measurement scales through exploratory factor analysis (EFA) and confirmatory factor analysis (CFA) to structurally analyse the actual underlying dimensions of digital literacy, ethical boundaries, and automated scaffolding dependencies in language learners.

Biodata

Nguyen Le Anh Tuan is an accomplished alumnus of Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT), having successfully graduated from the Faculty of Foreign Languages, majoring in Translation and Interpretation. Driven by a profound academic curiosity, he possesses a strong passion for conducting empirical research and writing scientific papers centered on modern educational technology.

Thai Thi Ngoc Huyen is a dedicated alumnus of Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT). She graduated from the Faculty of Foreign Languages, majoring in Pedagogy. Deeply passionate about the field of education, she has

committed herself to developing effective teaching methods that inspire and motivate language learners.

Ms. Diep Minh Chau holds a Master's degree in TESOL from the University of Canberra, Australia. She is currently a permanent lecturer at HUFLIT, specializing in English Language Teaching (ELT), and has also taught at the Vietnam USA Society English Centers (VUS) for over sixteen years. She is deeply committed to teacher training for English Language Teaching and English for Young Adults programs. Additionally, she serves as an academic advisor for pedagogy students at HUFLIT, guiding them through their teaching internships at high schools.

#113 CHALLENGES AND PEDAGOGICAL RESPONSES IN TRANSITIONING TO ESL-ORIENTED TEACHING: A MIXED-METHODS CLASSROOM CASE STUDY IN A VIETNAMESE UNIVERSITY

Huỳnh Thị Thùy Dung[1]

Abstract

The transition from English as a Foreign Language (EFL) to ESL-oriented teaching has become a key direction in Vietnamese higher education, driven by national policies emphasizing communicative competence. However, implementing this shift remains challenging in contexts where traditional, form-focused instruction persists. This study examines ESL-oriented teaching in a Vietnamese university through a mixed-methods case study conducted in two General English classes (n = 82). Guided by three research questions, the study investigates students' perceptions of ESL-oriented teaching, teacher adaptation during the EFL–ESL transition, and the challenges and opportunities emerging in classroom practice. Data were collected over 12 weeks using questionnaires, classroom observations, and teacher reflective journals. Findings show that students held moderately positive perceptions of ESL-oriented teaching, particularly regarding its usefulness for communication. However, affective barriers such as low confidence, fear of mistakes, and reluctance to participate limited engagement. Teacher adaptation was mainly reflected in scaffolding and task-based instructional redesign. Despite initial difficulties, student engagement and speaking confidence gradually improved. The study concludes that the transition to ESL-oriented teaching is gradual and context-dependent, highlighting the central role of teacher agency in mediating pedagogical change and the need for sustained scaffolding and supportive classroom environments.

Keywords: ESL transition, teacher agency, classroom challenges, student engagement, communicative teaching, case study

1. Introduction

1.1. Background

Across many EFL contexts, developing learners' communicative competence is still a challenge, even after long-term curriculum reforms. In many classrooms, teaching is still focused on grammar and exams, which creates a gap between policy and real practice. Communicative Language Teaching (CLT) and Task-Based Language Teaching (TBLT) are widely used to improve interaction and meaningful use of language (Ellis, 2003; Long, 2015). However, how they work in class often depends more on context than on theory alone (Burns & Richards, 2021).

Recent studies therefore focus more on teachers as key actors in reform. Teachers do not only follow methods but also adjust them based on their classroom situation. This is often explained through teacher agency, which refers to teachers' ability to make decisions in real

teaching contexts (Priestley et al., 2015; Tao & Gao, 2021). In Vietnam, English reform under the National Foreign Languages Project (2025-2035, vision 2045) promotes communicative competence. However, in higher education, implementation is still uneven because of many classroom constraints that affect teachers' practices (Dang et al., 2024; Ngo, 2024).

1.2. Problem Statement and Research Gap

Despite strong policy support for communicative teaching, the shift from traditional EFL to more ESL-oriented instruction in Vietnamese universities is still difficult. Previous studies point to common problems such as exam pressure, limited classroom interaction, and institutional constraints (Nguyen et al., 2023). More recent work suggests that teacher agency plays an important role in how reforms are implemented in real classrooms (Tao & Gao, 2021; Ngo, 2024). However, there is still limited classroom-based evidence, especially studies using multiple data sources to capture what actually happens in teaching practice.

Although communicative language teaching and teacher agency have been studied separately, less is known about how teacher agency shapes the transition from EFL to ESL-oriented instruction in real classroom contexts in Vietnamese higher education. This study addresses this gap by examining both teacher adaptation and student responses through a mixed-methods classroom case study.

1.3. Research Objectives

This study examines ESL-oriented teaching in a Vietnamese university classroom. It aims to:

- explore students' views on ESL-oriented teaching;
- look at how the teacher adapted from EFL to ESL-oriented instruction;
- identify main challenges and opportunities in using communicative teaching.

1.4. Delimitations

This study was carried out in one university classroom over a semester. It focuses on one teacher and one student group, using classroom observation, teacher reflection, questionnaires, and informal feedback. The results are specific to this context and are not meant to be generalised widely.

1.5. Research Questions

RQ1. How do students perceive ESL-oriented teaching in a Vietnamese university classroom?

RQ2. How does the teacher adapt instruction during the transition from EFL to ESL-oriented teaching?

RQ3. What challenges and opportunities emerge during this implementation?

2. Literature Review

2.1. The Shift From EFL to ESL-Oriented Teaching

In recent years, the difference between English as a Foreign Language (EFL) and English as a Second Language (ESL) has gained more attention in language teaching. EFL usually focuses

on learning English for exams and classroom use, while ESL-oriented teaching emphasizes real communication and interaction. This change is linked to globalization and the increasing use of English in international settings.

In Vietnam, the move toward ESL-oriented teaching has been driven by national goals related to global integration, employability, and educational reform. As a result, English teaching has gradually shifted from grammar-based instruction toward more communicative and learner-centered approaches. However, this transition remains uneven across institutions and classrooms, as it requires not only curriculum change but also substantial pedagogical adjustment at the classroom level. This macro-level shift provides the policy background of the present study, which assumes that curriculum reform is not directly implemented but mediated through classroom actors, particularly teachers.

2.2. Pedagogical Implications of ESL-Oriented Teaching

The shift toward ESL-oriented teaching requires changes in how classrooms are run. Communicative Language Teaching (CLT) and Task-Based Language Teaching (TBLT) are often linked to this approach because they focus on real communication and meaningful use of language. Previous studies show that these methods can improve students' interaction and engagement. Ellis (2003) notes that task-based teaching helps develop communicative competence through real communication, while Nunan (2004) stresses the need for tasks that match real-life use of English. However, most of these studies focus more on teaching principles than on how teachers actually adapt them in real classrooms.

Willis (1996) further proposes a structured framework for task implementation, including pre-task preparation, task cycle, and post-task language focus. Such frameworks illustrate how communicative pedagogy can be operationalised in classroom settings. However, as classroom realities vary, these pedagogical models are often adapted rather than directly applied. This adaptation process is central to the present study's conceptual framework, which views pedagogical practice as being shaped by teacher interpretation and contextual constraints.

2.3. Challenges and Opportunities in Transitioning to ESL-Oriented Teaching

Despite the benefits of ESL-oriented teaching, previous studies still report many challenges, especially in EFL contexts. Common issues include exam pressure, rigid curricula, and limited space for communicative activities (Vu & Nguyen, 2021). Teacher-related factors such as lack of training, limited resources, and difficulty managing interactive tasks also make implementation harder (Lam et al., 2021). In addition, students' past experience with teacher-centered learning can lead to low confidence, speaking anxiety, and low participation.

However, although previous studies have identified both the challenges and the potential benefits of ESL-oriented teaching, relatively little attention has been paid to how university teachers experience the transition in specific institutional contexts. In particular, limited research has examined how lecturers navigate the shift to ESL-oriented teaching, the challenges they encounter during implementation, and the practical strategies they employ to address these challenges in Vietnamese higher education. Addressing this gap is important for understanding how pedagogical reforms can be effectively implemented in local educational settings.

2.4. Conceptual Framework and Research Gap

Although previous studies have pointed out many challenges in ESL-oriented teaching, there are still few classroom-based studies showing how these challenges are handled in real teaching practice. In particular, not much attention has been given to how teachers understand, adjust, and respond to pedagogical change in their actual classrooms.

Figure 1

Conceptual Framework of ESL-Oriented Teaching Implementation in a Vietnamese University Classroom

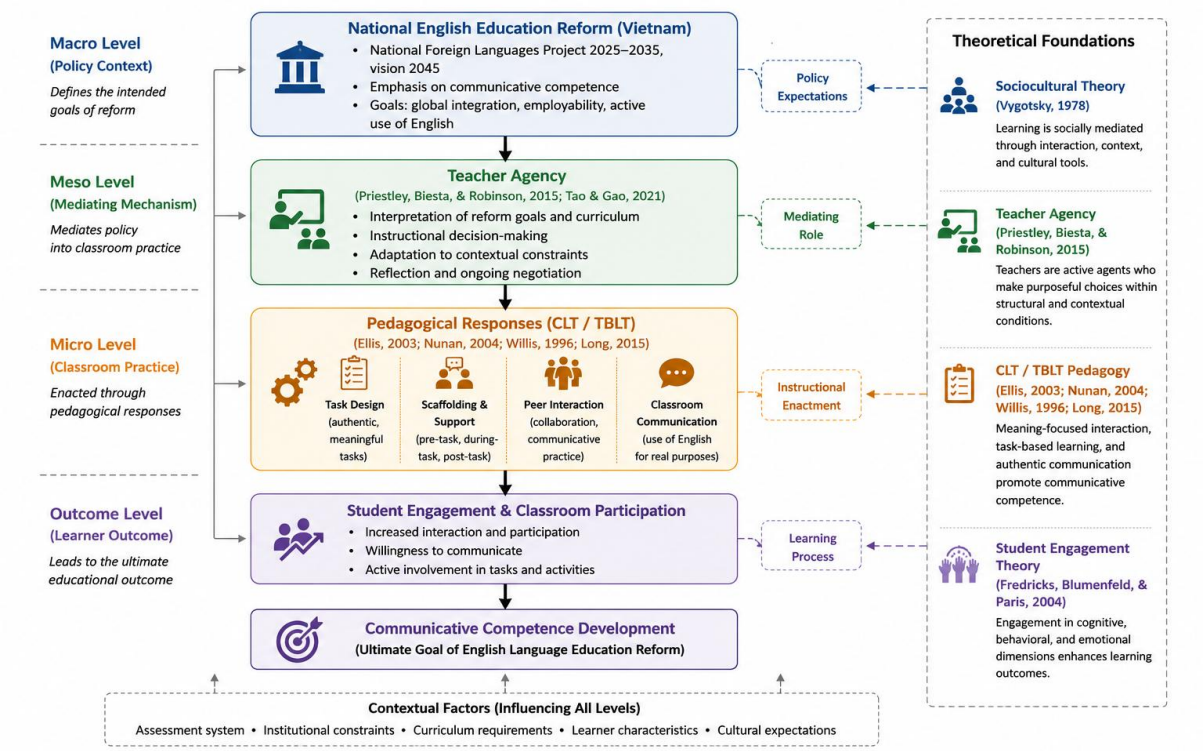

Figure 1. Conceptual framework of ESL-oriented teaching implementation in a Vietnamese university classroom.

Grounded in this gap, the present study adopts a process-oriented conceptual framework. At the macro level, national English education reform in Vietnam promotes communicative competence as an intended outcome of policy. However, the implementation of this goal is not direct but mediated through classroom practice.

At the meso level, teacher agency plays a central role in this mediation process. Teachers interpret reform expectations and make pedagogical decisions based on contextual constraints. These decisions are reflected in their adaptation of CLT and TBLT through task design, scaffolding strategies, and classroom interaction patterns (Priestley, Biesta, & Robinson, 2015; Tao & Gao, 2021).

At the micro level, these pedagogical responses influence student engagement and participation, which in turn contribute to communicative competence development (Richards, 2006). This suggests a dynamic relationship between policy, teacher practice, and learner outcomes.

Therefore, the three dimensions of this framework directly inform the research questions of the study. Student perceptions of ESL-oriented teaching reflect the micro-level learner experience. Teacher adaptation during instructional transition represents meso-level teacher agency in practice. Finally, the challenges and opportunities emerging from classroom implementation illustrate the interaction between contextual constraints and pedagogical possibilities. Together, these dimensions provide an integrated lens for examining ESL-oriented teaching in a Vietnamese university context.

3. Methodology

3.1. Research Design

This study used a mixed-methods case study design, combining both qualitative and quantitative data to better understand the shift from EFL to ESL-oriented teaching. The case study was chosen to explore classroom practice, teacher adaptation, and student responses in one specific context.

In addition, a reflective practice component was incorporated, as the teacher-researcher continuously evaluated and adjusted instructional strategies throughout the implementation process. This design aligns with the study's aim to examine pedagogical change as a situated and dynamic process.

3.2. Research Context and Participants

3.2.1. Context

The study was conducted at Ho Chi Minh City University of Foreign Languages – Information Technology (HUFLIT), Vietnam. The institution provides General English courses for non-English major students as part of its foundational curriculum.

3.2.2. Participants

The participants were 82 first-year non-English major students from two General English classes. They were 18-19 years old and had mixed English levels, from elementary to pre-intermediate. Both classes used the same curriculum and were taught by the same teacher to keep instruction consistent. Most students had experienced teacher-centered, grammar-focused learning in high school, with little practice in real communication. Convenience sampling was used because both classes were taught by the researcher during the semester.

3.2.3. Participant demographics

Table 1

Participant Demographics

Variable	**Category / Mean**
Gender	Male: 36 (43.9%) / Female: 46 (56.1%)
Age	18-19 years old
CEFR level	A1-A2 (majority), some A2+
Major	Non-English majors (Business, IT, Tourism, etc.)
Years learning English	7-10 years (mean ≈ 8.5 years)

3.3. Instructional Procedures

The shift to ESL-oriented teaching was carried out over about 12 weeks. During this period, traditional teaching was gradually changed to include more communicative and task-based activities. Lessons were redesigned to focus on real-life communication and student interaction, such as role-plays, pair and group discussions, problem-solving tasks, and speaking activities linked to students' daily situations. The teaching followed a task-based structure (Willis, 1996), including pre-task, task, and post-task stages. To support the change, the teacher used simple strategies like scaffolding language, giving clear instructions, organizing group work, and creating a supportive classroom atmosphere to reduce anxiety and encourage participation.

3.4. Data Collection

Data were collected from three sources to ensure triangulation:

3.4.1. Classroom observations

Used to document student engagement, interaction patterns, and participation during ESL-oriented tasks.

3.4.2. Teacher reflective journals

Used to record instructional decisions, classroom challenges, and ongoing pedagogical adjustments.

3.4.3. Student questionnaire

A structured questionnaire was administered to 82 students after the intervention.

- **Total items:** 15 items
- **Scale:** 5-point Likert scale (1 = Strongly Disagree to 5 = Strongly Agree)
- **Sections:**
  - Student engagement (5 items) (Fredricks et al., 2004)
  - Speaking confidence (5 items) (Woodrow, 2006)
  - Perceptions of ESL-oriented teaching (5 items) (Richards, 2006)

The questionnaire was adapted from previous validated instruments in studies on communicative language teaching and learner engagement (e.g., Fredricks et al, 2004; Woodrow, 2006; Richards, 2006). A pilot study with 10 students (not included in the main sample) was conducted to ensure clarity and appropriateness of items. Minor wording adjustments were made based on feedback.

3.5. Validity and Reliability

3.5.1. Validity

Content validity was ensured through expert review by two specialists in applied linguistics and TESOL. They evaluated the questionnaire in terms of clarity, relevance, and alignment with research objectives. Minor revisions were made based on their feedback. A pilot test was also conducted to identify ambiguous wording and improve item clarity.

3.5.2. Reliability

Internal consistency was tested using Cronbach's Alpha. All values were above .80, showing good reliability (Hair et al., 2019). The overall questionnaire had a reliability of $\alpha = .87$, which is considered high. The subscale results were as follows:

- Engagement: $\alpha = .84$
- Speaking confidence: $\alpha = .86$
- Perception of ESL teaching: $\alpha = .85$

3.6. Data Analysis

Quantitative and qualitative data were analyzed separately and then integrated for interpretation.

3.6.1. Quantitative analysis

Quantitative data from the questionnaire were analyzed using IBM SPSS Version 26. Descriptive statistics (means and standard deviations) were used to describe students' responses. Paired-samples t-tests were then used to compare students' engagement, speaking confidence, and willingness to participate before and after the intervention. The significance level was set at $p < .05$. When normality assumptions were not met, the Wilcoxon signed-rank test was used instead.

3.6.2. Qualitative analysis

Qualitative data from classroom observations, reflective journals, and open-ended questionnaire responses were analyzed using thematic analysis following a structured coding procedure:

3.6.2.1. Open coding

Initial coding of raw data to identify meaningful units related to teaching practices, student responses, and classroom interaction.

3.6.2.2. Axial coding

Grouping of codes into categories based on relationships and patterns (e.g., engagement, anxiety, scaffolding strategies).

3.6.2.3. Theme development

Emergence of broader themes such as:

- Student engagement transformation
- Teacher adaptation strategies
- Classroom interaction dynamics
- Implementation challenges

3.6.2.4. Cross-checking/ triangulation

Themes were cross-validated across data sources (observations, reflections, questionnaires) to ensure consistency.

3.6. *Ethical Considerations*

Participation in the study was voluntary. Students were informed of the purpose of the study, and all questionnaire responses were collected anonymously. The data were used solely for research purposes, and participants' confidentiality was maintained throughout the study.

4. Results

4.1. Overview of Findings

The findings combine both quantitative data (questionnaires) and qualitative data (classroom observations, teacher reflection, and student feedback) to answer the three research questions. They are organized by research question. First, the quantitative results are presented to show general trends in students' responses, followed by qualitative findings to explain these results in more detail. Using both types of data helps give a clearer and more complete picture of the shift toward ESL-oriented teaching.

4.2. Students' Perceptions of ESL-Oriented Teaching (RQ1)

This section presents findings related to students' perceptions of ESL-oriented teaching based on questionnaire data and supporting qualitative evidence.

4.2.1. Quantitative results

Table 2 presents descriptive statistics of students' perceptions.

Table 2

Item-Level Results of Students' Perceptions of ESL-Oriented Teaching (n = 82)

Item	Mean	SD
I enjoyed participating in communicative tasks.	3.84	0.73
ESL-oriented activities increased my classroom engagement.	3.81	0.69
I was willing to communicate with classmates in English.	3.55	0.71
I felt more confident speaking English.	3.39	0.77
The communicative tasks were useful for real-life communication.	3.96	0.61

Among the five questionnaire items, students rated the usefulness of communicative tasks highest (M = 3.96, SD = 0.61), showing that they saw clear practical value. In contrast, speaking confidence was the lowest (M = 3.39, SD = 0.77), suggesting that emotional barriers still existed. This means students liked communicative activities, but they were still not fully confident when speaking English. Overall, students had positive views of the ESL-oriented approach, but still felt some hesitation in oral communication.

4.2.2. Qualitative results

Theme 1: Initial anxiety and low confidence

Codes:

- nervousness when speaking
- fear of mistakes
- avoidance of speaking tasks

Representative quotes:

"I feel nervous when I have to speak English in front of others." (Student feedback)

"Many students remained silent during early speaking activities." (Observation, Week 2)

Qualitative data from classroom observations and student feedback showed that anxiety and fear of making mistakes were the main problems at the beginning of the implementation. This helps explain the low score for speaking confidence (M = 3.41). At the same time, students still viewed ESL-oriented teaching positively, especially in terms of task usefulness and classroom engagement. This shows that positive attitudes existed, but were still affected by emotional barriers. Overall, both quantitative and qualitative results consistently indicate that students were generally positive about ESL-oriented teaching, even though affective challenges remained.

4.3. Teacher Adaptation During the Transition (RQ2)

This section reports how the teacher adapted instruction from EFL to ESL-oriented teaching based on qualitative data.

Theme 2: Scaffolding as a key adaptive strategy

Codes:

- providing model sentences
- vocabulary support
- step-by-step instructions
- guided practice

Representative quotes:

"After providing sample expressions, students participated more actively." (Observation, Week 6)

"Clear scaffolding helped students understand the task better." (Reflective journal)

Teacher scaffolding played a crucial role in supporting students' transition to communicative learning. It reduced cognitive difficulty and increased participation.

Theme 3: Task-based restructuring of classroom activities

Codes:

- role-play tasks
- group discussions
- real-life communication tasks
- peer interaction

Representative quotes:

"Students worked in groups to solve real-life communication tasks." (Observation, Week 7)

The teacher gradually moved from form-focused teaching to task-based learning, following ESL-oriented principles. This change was mainly seen in how the teacher used scaffolding and redesigned classroom activities to be more communicative and task-based. Overall, the shift happened step by step, not suddenly. Scaffolding and task redesign were the two main ways the teacher adapted instruction.

4.4. Challenges and Opportunities in Implementation (RQ3)

4.4.1. Qualitative evidence

This section presents both difficulties and positive outcomes during the transition.

Theme 4: Affective and behavioral challenges

Codes:

- fear of mistakes
- low participation
- dependence on teacher
- silence in group work

Representative quotes:

"Some students waited for the teacher instead of continuing the task independently." (Observation, Week 4)

"I am afraid of speaking incorrectly." (Student feedback)

Affective barriers and prior learning habits limited student participation, especially in the early stages of implementation.

Theme 5: Uneven participation in group work

Codes:

- dominant students
- passive group members
- language switching to Vietnamese

Representative quotes:

"Only one or two students actively led the discussion in each group." (Observation, Week 5)

Participation inequality was observed in group tasks, particularly in larger classes where teacher monitoring was limited.

Theme 6: Pedagogical opportunities and improvement

Codes:

- increased engagement over time
- more voluntary participation

- improved interaction
- growing confidence

Representative quotes:

"More students started participating in discussions in later weeks." (Observation, Week 8)

"I feel more confident speaking with my group now." (Student feedback)

Despite initial challenges, ESL-oriented teaching gradually improved student engagement and interaction. Structured tasks and scaffolding contributed to increased willingness to communicate.

4.4.2. Quantitative evidence of improvement

Table 3

Pre-Post Comparison of Student Engagement

Variable	Pre Mean (SD)	Post Mean (SD)	t	p	Cohen's d
Willingness to speak	2.95 (.70)	3.78 (.72)	6.42	<.001	0.71
Active participation	3.01 (.68)	3.85 (.70)	6.87	<.001	0.76
Speaking confidence	2.88 (.72)	3.62 (.74)	5.98	<.001	0.66

Paired-samples t-tests revealed statistically significant improvements across all three indicators.

- Willingness to speak: $t(81) = 6.42$, $p < .001$
- Participation: $t(81) = 6.87$, $p < .001$
- Speaking confidence: $t(81) = 5.98$, $p < .001$

The biggest improvement was in active participation ($d = 0.76$), followed by willingness to speak ($d = 0.71$) and speaking confidence ($d = 0.66$). According to Cohen (1988), these are moderate to large effects, showing that the ESL-oriented teaching had a positive impact on students' communication.

The transition involved both challenges (affective barriers, uneven participation) and opportunities (increased engagement and improved communicative behavior over time). Taken together, evidence from the present study suggests that although the transition created considerable challenges, appropriate pedagogical support enabled measurable improvements in classroom engagement and willingness to communicate.

4.5. Overall Summary of Findings

The results show that ESL-oriented teaching was perceived positively by students but initially constrained by affective factors such as anxiety and low confidence. Teacher adaptation, particularly through scaffolding and task-based redesign, played a central role in facilitating classroom participation. Although challenges persisted, quantitative and qualitative evidence both indicate a gradual improvement in engagement and communicative interaction.

5. Discussion

5.1. Transition as a Gradual and Non-Linear Process

The findings show that the shift from EFL to ESL-oriented teaching happens slowly, not right away. At the start, many students were not very willing to join communicative tasks because they were used to teacher-centered and grammar-focused learning. This suggests that changing activities alone is not enough to change how students behave in class. As Richards (2006) notes, communicative teaching requires students to take a more active role in using English for real communication. Burns and Richards (2021) also point out that how CLT is applied depends a lot on classroom context, not just teaching methods. Therefore, students' initial hesitation should be viewed as a natural stage of adaptation rather than a sign of unsuccessful implementation. This interpretation is consistent with previous studies showing that communicative reforms require sustained pedagogical and learner adjustment rather than immediate behavioral change (Lam et al., 2021). However, unlike earlier research, which has mainly examined reform at the policy or institutional level, the present study provides classroom-level evidence of how teacher adaptation and learner participation evolved during a 12-week implementation.

From the perspective of the conceptual framework, this gradual transition primarily reflects micro-level adaptation, where learners progressively adjusted to communicative classroom practices rather than responding immediately to pedagogical change. At the same time, the findings suggest that these learner responses were shaped by meso-level teacher mediation through continuous instructional adjustment, illustrating the dynamic relationship proposed in Figure 1.

5.2. Affective Barriers and the Legacy of EFL Instruction

Affective factors, especially anxiety and fear of making mistakes, were the main barriers to student participation. They affected how willing students were to speak in different classroom tasks. This shows that communicative ability is not only about language skills but also about feelings and confidence. In learning environments that focus strongly on correctness, students often see speaking English as risky rather than helpful. Previous studies also report speaking anxiety as a common problem in communicative classrooms (Woodrow, 2006; Vu & Nguyen, 2021). The present study confirms these findings but further demonstrates that such affective barriers gradually diminished when communicative tasks were supported by scaffolding and a low-anxiety classroom environment. This highlights the importance of considering affective support as an integral component of ESL-oriented pedagogy rather than a supplementary classroom practice.

These findings further reinforce the micro-level dimension of the conceptual framework by demonstrating that learners' communicative participation is influenced not only by linguistic competence but also by affective conditions created through classroom interaction.

5.3. Learner Dependency and Challenges to Autonomy

Another issue from the findings is that students still depended a lot on teacher guidance. Even during task-based activities, many students expected clear instructions, sample answers, and quick correction from the teacher. This matches Willis (1996), who notes that students new to TBLT often find it hard when they have less teacher control and more responsibility for learning. The results also show that students in this study had not yet fully developed the autonomy needed for ESL-oriented learning. Similar findings are reported in Vietnamese higher education, where students still rely heavily on teachers even in communicative classes (Ngan et al., 2025). Unlike previous studies that mainly describe learner dependency as a contextual challenge, this study

illustrates how structured scaffolding can gradually encourage greater learner autonomy during classroom interaction.

Within the conceptual framework, learner dependency represents a micro-level challenge that requires sustained meso-level pedagogical support. Teacher scaffolding functioned as the mediating mechanism through which greater learner autonomy gradually emerged.

5.4. Contextual Constraints: Large Classes and Interactional Inequality

The study also underscores the impact of contextual constraints, particularly large class size and mixed proficiency levels. Uneven participation, with more proficient students dominating discussions, was a recurring issue. This finding is consistent with Ellis (2003), who acknowledges that managing interaction in large classes poses significant challenges for TBLT implementation. Similarly, Nunan (2004) notes that class size can limit opportunities for meaningful interaction and individualized feedback. In Vietnam, Nguyen et al. (2023) also identifies large-class teaching as a major barrier to implementing student-centered approaches. The present study adds nuance to this perspective by showing that, while large classes constrain interaction, they do not necessarily prevent the development of communicative competence if appropriate strategies are employed.

These contextual constraints illustrate how macro-level educational conditions, such as institutional realities associated with the implementation of national language policy, continue to shape classroom practice. However, consistent with the proposed framework, their influence was mediated through teachers' instructional decisions rather than determining learning outcomes directly.

5.5. Teacher Agency and the Role of Reflective Practice

A key contribution of this study is the role of teacher agency in the transition process. Through ongoing reflection and adjustment, the teacher could respond to classroom challenges and change teaching strategies when needed. This supports the idea of reflective teaching, where teachers are seen as active decision-makers, not just people who follow policy. As Nunan (2004) notes, teaching innovation depends on how teachers adapt theory to fit their own classrooms. This idea is also supported by Tao and Gao (2021) and Ngo (2024), who argue that reform depends on teachers' professional judgment in practice. Unlike earlier studies that focus mainly on theory, this study provides classroom evidence showing how reflection, scaffolding, and small teaching adjustments helped support the shift toward ESL-oriented teaching.

Among the three dimensions of the conceptual framework, the findings provide the strongest support for the central mediating role of meso-level teacher agency. Rather than functioning as passive recipients of policy, teachers actively interpreted reform goals, adapted instructional practices, and responded to emerging classroom needs. This mediating role explains how macro-level policy aspirations were translated into observable micro-level learner engagement.

5.6. The Effectiveness of Scaffolding and Real-World Tasks

Despite initial challenges, observed classroom practices reveal that scaffolding, structured interaction, and authentic communicative tasks were effective in promoting student engagement and willingness to communicate. This supports Willis's (1996) task-based framework, which highlights the role of pre-task support in facilitating successful task performance, and is consistent

with Ellis (2003) and Nunan (2004), who emphasize the value of authentic language use. Similarly, Vu and Nguyen (2021) found that Vietnamese learners were more motivated when classroom activities reflected real-life communication. The present study extends these findings by providing both qualitative evidence and significant paired-samples t-test results showing that these pedagogical strategies contributed to measurable improvements in students' classroom participation and speaking confidence over time.

Viewed through the conceptual framework, scaffolding represents the instructional mechanism through which teacher agency connects policy intentions with learner participation, thereby linking the meso and micro levels of implementation.

5.7. Implications for ESL-Oriented Teaching in Vietnam

The findings have implications across all three levels of the conceptual framework. At the macro level, national ESL policy should be accompanied by curriculum alignment, assessment reform, and sustained institutional support to facilitate meaningful classroom implementation. At the meso level, teacher professional development should strengthen teachers' capacity to exercise agency through reflective practice, scaffolding, and adaptive pedagogical decision-making. At the micro level, classroom instruction should prioritize learner engagement, affective support, and authentic communicative opportunities to promote students' willingness to communicate and communicative competence. Taken together, these findings support the conceptual framework by demonstrating that successful ESL-oriented teaching depends on the dynamic interaction among policy intentions, teacher agency, and learner participation rather than on any single dimension in isolation.

6. Conclusion

6.1. Summary of Key Findings

This study investigated the transition from EFL-oriented to ESL-oriented teaching in a Vietnamese university context using a mixed-methods case study design. The findings reveal that this transition is complex, gradual, and strongly shaped by both learner-related affective factors and contextual constraints.

At the student level (RQ1), many learners were not confident at first. They were afraid of making mistakes and not very willing to speak in communicative tasks. However, questionnaire results still showed that students had fairly positive views of ESL-oriented teaching, especially its usefulness.

At the teacher level (RQ2), change mainly came through scaffolding and redesigning tasks to be more communicative. These adjustments helped connect traditional teaching with ESL-oriented practices.

At the implementation level (RQ3), the study found both difficulties and benefits. Problems included anxiety, dependence on the teacher, and unequal participation in large classes. At the same time, both quantitative and qualitative data showed that students gradually became more engaged and more confident in speaking over the 12-week period.

6.2. Theoretical Contributions

This study contributes to ESL-oriented teaching research in three ways. First, it extends TBLT and CLT theories (Ellis, 2003; Nunan, 2004; Willis, 1996) by showing that tasks and interaction alone are not enough. Students still need clear scaffolding that matches their level and makes tasks easier to follow. Second, it shows that student participation depends not only on language ability but also on feelings like anxiety and confidence. This means affective factors should be included in models of communicative teaching. Third, it highlights teacher agency in real practice. Teachers do not just follow policy, but adjust and adapt it to fit their classroom context in Vietnamese universities.

6.3. Pedagogical and Policy Implications

Several implications can be drawn from the findings. First, the move to ESL-oriented teaching should be seen as a slow process. It needs time and support for both teachers and students. Quick changes are unlikely to work well if students' habits and classroom culture do not change at the same time. Second, affective factors like anxiety and fear of making mistakes need to be addressed directly. A safe and supportive classroom environment is important to help students feel more willing to speak. Third, scaffolding and clear task design are very important, especially in large classes where students may find it hard to work independently. Finally, teacher reflection and agency are key in making this change work. Teachers need space to adjust and adapt teaching in real classroom conditions. From a policy view, ESL reform should go beyond changing the curriculum. It should also include ongoing teacher training, practical classroom support, and assessment that values communication. Institutional support for reflective teaching is also necessary to help teachers apply reforms effectively in different contexts.

6.4. Limitations of the Study

Despite its contributions, this study has several limitations. First, it was conducted with a relatively small sample of students from a single institution, which may limit the generalizability of the findings. Second, the study relied partly on self-reported data, which may be subject to bias. Third, the duration of the implementation was relatively short, and therefore the long-term impact of ESL-oriented teaching practices was not fully explored.

6.5. Recommendations for Future Research

Future research could expand this study by looking at ESL-oriented teaching in different universities and teaching contexts. Long-term studies are also needed to see how students' speaking skills and learning behaviors change over time. In addition, future work could explore how digital tools and AI can support ESL-oriented teaching, especially in large classes.

6.6. Final Remarks

In conclusion, this study shows that the shift from EFL to ESL-oriented teaching is both difficult and changeful. At first, students face problems such as anxiety, low confidence, and dependence on the teacher. However, these issues can improve over time with scaffolding, task-based activities, and reflective teaching.

The findings suggest that successful change does not depend only on new teaching methods, but also on how teachers act, how students adapt, and the classroom context. ESL-oriented teaching should therefore be seen not as a final goal, but as an ongoing process of change in classroom practice.

#115 CONCEPTUALIZATION OF TEACHERS' RESEARCH MINDSET AS A COMPLEX DYNAMIC SYSTEM IN THE ENGLISH LANGUAGE TEACHING CONTEXT

Hạnh Nguyễn Thị Minh[1], Xuan Mai Le[2], Trang Le Diem Bui[3]

Abstract

Research plays a crucial role in shaping the English Language Teaching (ELT) context, especially as demands for teacher professional development increase. This leads to a growing trend towards pursuing postgraduate programs that place greater demands on research competence. While studies on research are prevalent, a research gap remains regarding how ELT teachers – especially those who are graduates – conceptualize their research mindset. This study aims to fill that gap. This is Phase 1 of a larger study, utilizing a qualitative case study design incorporating a narrative frame (N=30) and in-depth interviews (N=4), which were conducted sequentially. Through the lens of Complex Dynamic Systems Theory (CDST), the results show that teachers' research mindset is not a static entity but a non-linear transition, from viewing research as a mandatory task to voluntary professional engagement. The study also highlights the paradoxes between practical perception, the self-efficacy gap, and diplomatic capability in the research process. The findings initially imply that integrating research into practice in the training program is necessary, as well as building scaffolding pathways to strengthen self-reliance and foster communities of practice to cultivate a sustainable research mindset among teachers.

***Keywords*:** research mindset, Complex Dynamic System Theory, ELT context, teacher professional development

1. Introduction

In the modern era of education, the role of English as a Language Teacher (ELT) is not simply that of a language transmitter; it has expanded to include that of a reflective practitioner and researcher within the classroom (Kamali et al., 2024). The teacher-researcher relationship has become one of the key elements for sustainable professional development. In line with this, a new relationship between teaching and research was proposed, and early studies (Brew, 2001; Hattie & Marsh, 1996) demonstrated the unity of research and teaching, grounded in the common pursuit of knowledge by teachers and students, with an increasing role. Hattie and Marsh's framework (1996) provided positive and negative relationships between teaching and research. This historical perspective supports the argument for a "teacher-researcher nexus," where roles are mutually reinforcing. Then, Brew (2001) posits that teachers are active decision-makers whose beliefs are deeply rooted in their own apprenticeship of observation as learners. This illustrates the early

[3] *Doctor, Faculty of Foreign Languages at An Giang University, Vietnam National University, Ho Chi Minh City, Viet Nam*

acknowledgement of the teacher-research nexus, which lasts until current research concerns (Dao et al., 2022; Heng et al., 2022; Henry et al., 2020; Nguyen et al., 2016; Nguyen et al., 2022)

However, for a teacher to transition from a mere instructor to a researcher requires not only professional skills but also a certain orientation and intrinsic belief (Nguyen et al., 2022). While research in higher education is extremely important, many graduate students and faculty members still face significant psychological and institutional barriers. Although the concept of "mindset" as famously developed by Dweck (2006) also provides insight into why some people persevere in tackling difficult scientific problems while others give up, the specific concept of mindset about research in the ELT context is still scant. This study examines the role of developing a "research mindset" in graduate students using Complex Dynamic Systems Theory (CDST) to bridge the knowledge gap regarding intrinsic psychological components within the educational context of Vietnam.

2. Literature Review

2.1. Teacher research in English Language Teaching

Borg (2010) defines teacher research as a systematic, public inquiry aimed at the improvement of practice, drawing a clear boundary between engagement in research (production) and engagement with research (consumption). Research engagement is widely conceptualized as encompassing two interrelated but distinct forms: engagement with research (e.g., reading, consuming, and critically evaluating research) and engagement in research (e.g., designing studies, collecting and analyzing data, and disseminating findings) (Borg, 2010; Dao et al., 2022). Johnson và Hepworth (2022) also defined research in teaching as:

…research generated by practitioners working to understand their own practices and their own lives… begins with a puzzle or an issue related to practice that requires development and improvement (Johnson & Hepworth, 2022, p.31).

From the book of Banegas et al. (2022), the core characteristics of teacher research are performative and agentic. This positions teachers in an inquiry practice with an aim to bridge the gap between educational research and practice. Teachers are encouraged to utilize their knowledge and specific school surroundings to intervene in their teaching contexts (Banegas et al., 2022)

In this case, teacher research is viewed as a form of professional practice, not merely an academic product. In ELT, an inquiry-oriented mindset helps teachers view classroom problems as researchable issues, thereby fostering systematic reflection and evidence-based decision-making (Nguyen et al, 2022). Despite its value for professional development, direct research practice remains a minority activity due to institutional barriers and a technocratic orientation that views research as separate from teaching (Borg, 2010). The transition from consuming research to producing research is a developmental process, not an automatic one, and requires structured support such as mentoring and dialogue guidance (Dao et al., 2022; Nguyen et al., 2022).

2.2. A brief history of teachers' research mindset in English Language Learning

Mindset, mentioned as a target of concern to unpack individual differences, including capacity, cognition, and ethics (Dweck, 2006). In practice, individuals are capable of the capacity for lifelong learning and development through both nature (e.g., heredity or talent) and purposeful engagement (e.g., experience, training, individual effort, and environmental impact). From

Dweck's perspective, natural abilities serve as a starting point, and "purposeful engagement" facilitates the remainder of the process (Sternberg, 1985). Accordingly, learning and cognition occur interdependently. Elliot and Dweck (1988) developed "Achievement Goal Theory" to construct differences in response by distinguishing between performance goals and learning goals. Individuals seeking to validate their competence are considered to have performance-related goals; in contrast, those with learning goals maintain a perception of developing their current competence. To further understand the origins of these goals, the concept of mindset and theories of intelligence have been studied. Throughout extensive research on this issue, Dweck (2006) indicated that the perspective individuals apply to themselves profoundly affects their way of life, achievements, and goals. This opened a new research direction regarding the interdependence of beliefs, qualities, competence, and psychology, as well as their formation and whether they are fixed or malleable. From this, Dweck (2006) introduced the concept of mindset with two perspectives: fixed mindset and growth mindset. Specifically, those with a fixed mindset apply the concept of stasis to intelligence, while those with a growth mindset believe that intelligence is merely a starting point and is capable of changing over time.

Dweck (2008) identified two implicit theories of intelligence: "Incremental" and "Entity." First, aligned with the fixed mindset, entity theory posits that intelligence is a fixed and stable trait that humans possess from birth (Dweck et al, 1995). Individuals with this mindset tend to blame their own intelligence and ability when facing failure, which leads to the risk of poor performance. Conversely, those following the incremental theory possess a growth mindset, believing their intelligence can be molded, changed, and nurtured through effort and persistence; they are also ready to face novelty and challenges, desiring to develop competence and utilize their knowledge effectively (Dweck, 2000). In line with Achievement Goal Theory (Elliot & Dweck, 1988), mentioned above, growth-mindset individuals tend to set learning goals, whereas fixed-mindset individuals choose performance goals. When facing challenges, entity theory views them as threats, whereas incremental theory views them as information, including mistakes or failures (Dweck, 2008).

The analysis above demonstrates the connection between theories related to intelligence factors and learner achievement. It also shows the foundational nature of these theories for the terminology and classification of fixed and growth mindsets. Consequently, the term "mindset" is often cited as a foundational concept in theories of intelligence (Dweck & Molden, 2007). Overall, mindset is considered and researched as part of a belief system and self-regulation mechanism, providing a more comprehensive view of how mindset affects human motivation and behavior (Ryan & Mercer, 2012).

Mindset plays a crucial role in the learning process and learning outcomes. This is because learners' beliefs about their own abilities and intelligence significantly mediate how they approach learning and develop knowledge (Dweck, 2006). In other words, mindset can lead to differences in learning outcomes. Factors such as learners' beliefs, behaviors, needs, and skills are all related to their thinking systems (Dweck, 2006). Mindset in education is divided into two main types: fixed mindset and growth mindset. These two types of mindsets reflect an individual's belief that learning ability is fixed or can be developed through effort (Ryan & Mercer, 2012; Dweck, 2006). A fixed mindset causes learners to prioritize the validation of competence over its cultivation. Individuals with this mindset often avoid challenges, fear making mistakes, and are susceptible to disengagement when faced with difficulties (Dweck, 2008). A growth mindset encourages learners

to believe that abilities can be developed through effort and learning. This perspective is linked to incremental theory and learning goals, rather than focusing solely on results (Dweck, 2000; Elliot & Dweck, 1988). Thus, learners with a growth mindset are more likely to progress and develop academically than learners with a fixed mindset. This is because a growth mindset fosters motivation, perseverance, and a positive attitude towards mistakes. Learners view mistakes and feedback as opportunities to improve their learning (Dweck & Molden, 2007).

2.3. Teacher's research mindset as a continuous, dynamic, and integrated system under the complex dynamic perspectives

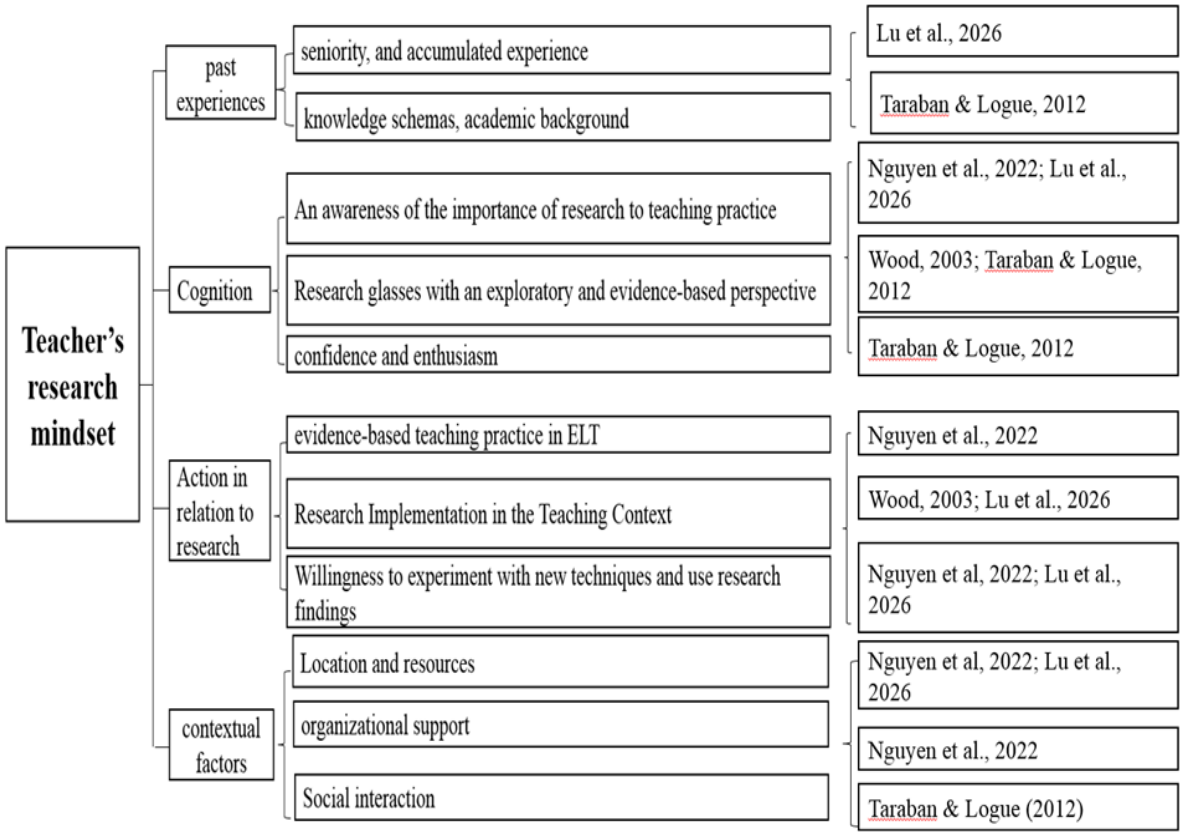
The construct of mindset has undergone a profound theoretical evolution over the last two decades. The analysis identifies Dweck (2006) as the predecessor of the field, establishing the influential dichotomy of fixed versus growth mindsets. This binary framework – categorizing individuals as possessing either fixed or growth mindsets – was instrumental in explaining motivational patterns, wherein individuals are categorized based on their belief in the malleability of human competence. However, a dominant theme emerging from recent scholarship is the problematization of this static framework.

The introduction of Complex Dynamic Systems Theory (CDST) as an explanatory mechanism is crucial here. The review highlights Larsen-Freeman (1997) as the initiator of this paradigm shift in language development, challenging linear models of mastery in favor of a process of becoming. Since language development is often dynamic and context-dependent, accompanying psychological mechanisms like mindset should also be viewed with corresponding flexibility and non-linearity. Therefore, current studies reframe mindset not as a static internal attribute, but as a dynamic psychological orientation that is emergent and context-dependent. From this point, mindsets are not merely possessed but are enacted through continuous interaction with social, institutional, and cultural environments. This change reflects a new trend in educational psychology, which focuses on the developmental process through experience and community collaboration, rather than viewing the research mindset as a fixed characteristic.

A research mindset can be examined as a dynamic and socially situated system of cognition and action toward research. Based on the conceptual framework with Complex Dynamic System Theory (CDST), the research mindset emerges not as a stable individual disposition but as a multilevel construct. Under the lens of CDST, this encompasses initial research experiences, cognitive mediation, behavioral enactment, and situational affordances.

2.4. Working definition of teachers' research mindset

The research mindset is not a static state or a rigid definition, but a developing concept with fluidity and high adaptability. Originating in science education (Wood, 2003) and adapted by Nguyen et al. (2022) for language teachers, this concept has continuously evolved through various stages (Lu et al, 2026). From focusing solely on the primary element of individual perception within the university environment (Wood, 2003), the concept has expanded to the field of language teaching to describe enduring individual dispositions (Taraban & Logue, 2012) closely linked to scientific understanding and readiness for action (Nguyen et al., 2022; Lu et al., 2026).



Because of its non-fixed nature, the research mindset continually opens new spaces for redefinition and enrichment across diverse professional contexts and empirical data. By placing the cognition and action elements of previous studies into the specific context of language teaching

education, Lu et al. (2026) emphasized the importance of recognizing the teacher's dual roles as both practitioners and researchers. This aims to strengthen the link between research and practice. This perspective aligns with the current needs for teacher development in language teacher education (LTE) "for teachers to engage not only with research to inform their teaching …but also to carry out research in their classrooms" (Lu et al., 2026). Based on this, the present study applies the perspective of language teachers as both practitioners and researchers to explore the characteristics of their thinking and research practices when assuming this dual role, and how they develop and strengthen the relationship between research and practice.

Based on the development process of the research mindset concepts mentioned above, in this study, teachers' research mindset in ELT is operationalized as a persistent yet adaptive disposition toward evidence-based problem-solving, encompassing their perceptions and actions related to research in ELT. It functions as a dynamic system wherein teachers' cognition (an awareness of the importance of research to teaching practice, research glasses with an exploratory and evidence-based perspective, confidence, and enthusiasm) and actions (evidence-based teaching practice in ELT, research implementation in the teaching context, willingness to experiment with new techniques and use research findings) related to research in ELT are mutually constitutive and continuously mediated by past experiences (knowledge schemas, seniority, accumulated experience, and academic background) and situated professional context (location and resources, organizational support, social interaction).

Figure 1

Components of the teacher's research mindset

2.5. Current studies on the teacher research and teachers' research mindset

Although the relationship between research and teaching is widely acknowledged, much of previous research has focused on the influence of external factors on research productivity or the role of research in professional development (Hattie & Marsh, 1996). In recent years, a significant shift has been observed as research has pivoted toward internal factors and the process of fostering a research mindset (Smith & Rust, 2011; Wilson et al., 2017; Dao et al., 2022; Nguyen et al., 2022; Truong et al., 2025).

These studies have shown that pedagogical interventions at the micro level can promote research thinking, particularly through research-based learning, fostering critical thinking, academic engagement, and a learning community among students and faculty (Smith & Rust, 2011). First, research programs for students, such as the Summer Undergraduate Research Fellowship, demonstrate that direct participation in research can enhance problem-solving skills, academic understanding, and learning motivation (Wilson et al., 2017). Additionally, teacher-learner engagement in research requires structured pedagogical support, such as the Research Engagement Process (REP) model, which utilizes scaffolding and expert guidance to help learners transition from reading research to conducting research (Dao et al., 2022). Practical research experiences and community practice also play a crucial role in developing inquiry-oriented thinking and research identity through academic collaboration and shared problem-solving (Nguyen et al., 2022; Truong et al., 2025).

However, other studies have also shown that the development of a research mindset at the individual level does not necessarily translate into research productivity at the organizational level, as it is influenced by structural constraints within the higher education system (Harman & Ngoc, 2010; Fatseas, 2010; Heng et al., 2022; Nguyen et al., 2016). More specifically, institutional factors and working conditions such as academic qualifications, income, and teaching workload significantly influence faculty research productivity (Henry et al., 2025). In the Vietnamese context, although the government has promoted higher education reform and strengthened research capacity, universities still face many limitations, such as a lack of resources, research infrastructure, and research culture (Harman & Ngoc, 2010; Fatseas, 2010). High teaching workloads and financial pressures lead many faculty members to prioritize teaching over research, resulting in low scientific publication rates at regional universities (Nguyen et al., 2016). Similar challenges are also observed in the Southeast Asian context, where a gap exists between policy discourse and academic practice, even though research and teaching are often seen as complementary (Heng et al., 2022).

2.5. Problem statement

Overall, evidence suggests that the development of research-oriented thinking is a result of the interaction between micro-interventions and macro-structural conditions, highlighting the need to consider both levels simultaneously when studying research engagement in higher education. This reveals research gaps in focusing solely on surface productivity, the dissonance within the research-teaching nexus, and the need for a deeper understanding of how the research mindset of teachers has been defined, and how this understanding should be changed or maintained within the education system and postgraduate training environment.

2.6. Research aim and research question

Acknowledging the gap mentioned above, the researcher conducted an exploratory sequential longitudinal study, which aims to not only explore teachers' conceptualization of their research mindset but also examine whether their research mindset changes after completing an official post- graduate program, their Master program. This study consists of two stages with four different phases, conducted sequentially.

In this paper, we present the first phase of Stage 1 of this study, which aims to explore the conceptualization of teachers' research mindset with the specific question:

How do teachers, as graduates, conceptualize their research mindset during their Master's program?

3. Methodology

3.1. The design

In this current study, we employed a qualitative case study design, as the first phase in stage 1 of another exploratory sequential longitudinal mixed-methods study.

The narrative frame was used in this to serve a large cohort, allowing broad access to participants' reflections while maintaining a structured format. Then, in-depth interviews were conducted to gather insights about how they conceptualize their research mindset in the ELT context.

Narrative frames are recognized as a legitimate and increasingly established method in narrative inquiry within EFL and teacher education research (Wicking, 2021). This was first developed by Barkhuizen and Wette (2008) and is defined as a written story template consisting of a series of incomplete sentences and blank spaces of varying lengths (Barkhuizen, 2011). The collection of rich qualitative data from a large number of participants without the constraints of time, geographical distance, or scheduling that typically limit face-to-face data collection (Barkhuizen, 2014). Methodologically, the structured nature of narrative frames helps participants organize their reflections logically and coherently, which is especially valuable when working with respondents with varying levels of academic writing proficiency (Wicking, 2021). Moreover, completing the frames independently, without direct researcher presence, may reduce social desirability bias and encourage more candid responses. Nevertheless, narrative frames also present certain limitations. Participants may perceive the structured format as restrictive or frustrating, and the absence of direct interaction prevents researchers from clarification or elaboration by asking any follow-up questions (Wicking, 2021). Narrative frames were not used as the sole data source (Barkhuizen, 2014) but were complemented by in-depth interviews. In this study, narrative frames therefore functioned both as an initial exploratory tool and as a foundation for the subsequent in-depth interviews (Creswell & Guetterman, 2024). Thus, this is considered appropriate in the study to strengthen the protocols for the following in-depth interview and to overcome the limitations of a small participant sample.

As mentioned in the section on the working definition of teachers' research mindset in ELT, some empirical studies contributed to the development of teachers' research mindset (Woods, 2003; Taraban & Logue, 2012; Nguyen et al., 2022; Lu et al., 2026). Narrative frames and in-depth interview protocols were designed based on findings of these empirical studies on

teachers' research mindset with four main clusters. The four clusters consist of teachers' previous experiences, their cognition, their action in relation to research, and the contextual factors (See Figure 2.1).

3.2. The context and participants

3.1.1. The context and participants

Participants are teachers in English Language Teaching and are studying in a Master's program at a university in the Mekong Delta. They were recruited for many reasons. Firstly, due to the need for teacher professional development up to 2030 (MOET, 2021), an increasing number of teachers, especially core teachers at schools, institutions, or universities, are participating in Master's programs. Given their current teaching and research roles, as well as their role as future human resources, their research mindset at this stage is extremely important. Secondly, in terms of the context, choosing a Master's program at a university in the Mekong Delta is for the following reasons. This is not just about enhancing knowledge, but the most crucial transition period for a teacher to become a researcher. Furthermore, this is one of the region's prestigious and important institutions for training postgraduate human resources. Finally, in the Vietnamese context, the diversity of input (those who have previously completed a graduate thesis and those taking a substitute course) creates a significant gap in readiness. This research is crucial because it helps determine how this difference in background affects the ability to absorb the research mindset during the two years of training.

3.1.2. Sampling

More than 30 participants were recruited by using convenience sampling. They were invited to complete a narrative frame in person. This sampling takes advantage of the availability and willingness of Master's students who are studying in the same university.

The participants have finished the three courses in relation to educational research, including courses for research methodology, data collection and analysis, and writing for publication. At the end of these courses, each of them had a proposal and some preliminary data as course outcomes and preparation for their graduation thesis. All of the invited participants passed these courses with an acceptable quality of outcomes.

Based on the results of the narrative frame, which showed their in-depth response and willingness to participate in the next phases, four of the 30 participants (detailed information is presented in Table 1 below) were selected to individually join an online in-depth interview, using purposive sampling. We also tried to ensure that the four participants who were invited also had diverse academic and teaching backgrounds, from a novice freelance tutor to a senior teacher in a public high school.

Table 1

Participant description

No.	Coded Name	Description
P1	Hoa	She is an English teacher at an English language center.

		Previously, she mainly learned about research through documents, books, and articles. She had never participated in any research.
P2	Huy	He is a senior English teacher at a High school. He has never conducted research, only knowing about it through two courses in his Bachelor's program.
P3	Nam	He is a teacher at an English tutoring center. He habitually reads short articles about research in various fields from sources such as National Geographic. In addition, he has participated as a participant in research. From this, he has an understanding of research but has never conducted any research.
P4	Tâm	He is currently not officially employed by any organization. He is pursuing a Master's program immediately after graduating with a Bachelor's degree. Previously, he had experience approaching research from courses at the Bachelor's level and tried applying it to research during his Master's program.

3.2. Data collection and analysis procedure

Data collection

After being designed, the template of narrative frames was piloted with at least two students (different from the participants of this stage) to test its effectiveness and receive constructive feedback. The results were collected and compared with the study objectives, and the researcher and supervisor carefully considered constructive feedback to rewrite and simplify some sections before sending them to participants. After completing narrative frames, 4 participants were selected and invited to an in-depth interview. Each interview was conducted individually in approximately 90 minutes.

Data analysis

Thematic analysis is a method developed by Braun and Clarke (2006), primarily suitable for qualitative data in psychology, social science, or education. This method can not only organize and describe the data set in detail but also interpret various aspects of the research topic (Braun & Clarke, 2006). Thematic analysis (Braun & Clarke, 2006) fits this design because of its flexibility to identify broad patterns in how participants conceptualized teachers' research mindset during the program.

The analysis process of the data includes six steps. After gathering narrative frames from target participants, I familiarized myself with the data by lining up and rearranging. Then, I generated initial codes after grouping, reading, and analyzing raw data. The third step helped search for themes, and then reviewed them again and again in the next step. Themes, latter, were refined and named. Finally, the report was produced with generated themes and sufficient excerpts. Noticeably, I also asked for my lecturers' and supervisor's checks for both the generated codes and themes. These themes played a crucial role in the revision of the in-depth interview protocol, in-depth interview participant recruitment (mentioned in the Sampling section), and data triangulation. Then, after gathering in-depth interview data, this six-step process was conducted again, also under the supervision of the lecturers and supervisors, to analyze the in-depth interview data. The two sources of data were then triangulated to find out the final themes.

4. Results

The research results show that, although all four participants were enrolled in the same Master's degree program, differences in background, research experience, and current work environment led to differences in how they conceptualized their research mindset. This demonstrates that a research mindset is not a fixed concept but a dynamic system that is constantly changing and influenced by both experience and the current environment.

Theme 1: The research mindset is about continuous improvement to solve real-world problems

Hoa conceptualized her research mindset as being closely linked to innovation and improving the quality of teaching through reflection, inquiry, and independent research. She did not view research as a "distant theoretical field" but rather as a continuous mindset process aimed at finding solutions to problems, especially those in her own classroom. Hoa said:

"I think a research mindset is about continuous improvement and finding new results…it's a system in which I constantly review my teaching process…to solve problems and improve quality."

Regarding her perspective on research and teaching, Hoa previously felt that research did "not support teaching much because it was time-consuming". However, she realized there is a "strong connection when research results can support practical work," and conversely, a "separation" if it is "merely paper theory." Although Hoa currently identifies herself primarily as someone who "uses research for her graduate studies", she believes in her ability to develop her research competence in the future and affirms that research is necessary.

Linking with Hoa's teaching context and previous experiences, reported in Table 1, and her narrative frame, her research mindset is conceptualized as a tool for classroom improvement, which needs to be practical. This stemmed directly from her purely theoretical experiences from books, which caused the initial confidence gap in her research mindset. Her teaching context at a language center, which is mostly product-driven and demands tangible results, also affected her research mindset and characterized it with innovation and improvement in her teaching quality, with direct and practical effects in her classrooms.

Sharing the same conceptualization approach, Huy has taken the research mindset beyond the realm of knowledge or skills, instead focusing on attitude and emotion. He conceptualized the research mindset as a continuous process of learning and self-evaluation. He said:

"A research mindset includes learning, reflection, application, and self-evaluation."

But he added the element of "curiosity and dedication to discovering knowledge." He believes that a teacher needs "an open-minded, inquisitive, and inquisitive mindset." Like Hoa, for Huy, research must have "practical value and help teachers develop their problem-solving thinking." However, he faces "time pressure," especially when balancing teaching and participating in a Master program, which sometimes weakens his thinking. Nevertheless, Huy remains "determined to continue" his research in the future to bring "value to learners and the community."

Mentioning curiosity and dedication as characteristics of Huy's research mindset reflected the interaction between his seniority and environmental pressure. As a high school teacher, he also

lacked practical research experience like Hoa and experienced the workload at the public school, which limited his research engagement. This acts as a strong external constraint and leaves his research mindset heavily influenced by his own determination, reflected in his internal goal to bring value to his community.

Theme 2: Research Mindset is the ability to think systematically and logically, inspired by practical values

Nam believed that a research mindset is a process of logical thinking, where teachers "do not perceive, evaluate, and solve problems emotionally or formally." He emphasized structure and observation skills to adjust teaching methods. He defined it as:

"A research mindset is the ability to think systematically, logically, and flexibly in problem-solving… helping me approach research problems systematically and avoid formalistic research."

However, he often encountered a conflict when conducting research "does not fit within his time constraints and heavy teaching workload at school." He felt "lacking confidence in his ability to conduct systematic research" and "does not believe" he "can further develop this ability" due to "lack of opportunities for training." Because he prioritized teaching, Nam plans "not to continue doing research in the future."

Nam's research mindset showed a focus on a logical and systematic approach, shaped by his habit of reading multidisciplinary scientific papers and his experience as a research participant. This experience helped him develop a knowledge schema. Even though he did not directly conduct his own study, as a consumer and participant of educational research, he exposed and understood the nature of research. However, his current teaching context with teaching intensity and a lack of training opportunities, as he mentioned above, hindered his faith in his potential to conduct research independently.

Tam also shared this view, but took a more practical approach. He conceptualized that "a research mindset must be based on proven evidence and is part of professional development." He stated:

"A mindset is something sustainable over time… based on existing research, because it has been validated. A teacher with a research mindset is someone who can utilize existing research as well as obtain data themselves within the current teaching context."

Tam used to think "research is unnecessary for teachers," but now he believes it is part of "being a professional teacher." He particularly saw a "strong connection" in the action research model. He also emphasized the "support of modern tools like AI in developing research capabilities". Regarding research engagement, he "affirms the possibility" of participating in research in the future. However, he was "not entirely sure" about whether to "conduct the research [himself] or simply use" existing research. He also stated that he "would not commit to a long-term engagement unless it was absolutely necessary for his studies or work."

Tam demonstrated a pragmatic and professional research mindset, reinforced by his current academic context as a full-time Master students. Despite following the same Master program as the three former participants, he showed his background acted as an ideal catalyst with no workload pressure. Lacking current teaching experience, his research mindset was stuck with an academic

foundation in his Bachelor program and his self-study using AI and other supporting tools. However, due to his limited teaching practice, he cannot make sense of the role between teaching and research, and showed his uncertainty with his future commitment to do research.

5. Discussion

5.1. Unpacking their conceptualization of research mindset with Complex Dynamic System Theory

Under the lens of Complex Dynamic System Theory (CDST) (Larsen-Freeman, 1997; Larsen-Freeman & Hiver, 2025), a research mindset is viewed not as a static trait, but as an emergent, non-linear, and socially situated system. Using the above-identified themes, this study can briefly unpack this system through its interacting components, constraints, and attractors. Furthermore, based on the themes above, a person with an evolving research mindset in an ELT context can be described in the following paragraph.

Environmental factors act as "attractions/constraints" shaping systemic behavior. The large workload and time scarcity are strong constraints limiting research participation. Research is difficult to become a regular activity because the time and effort costs (thinking, completing research) are too high. The difficulties of workload, time scarcity, and the lack of connection between research and classroom reality shared by students have been confirmed in recent studies by Henry et al. (2020) and Heng et al. (2022). CDST views these as strong constraints hindering the development of mindset systems. The study by Lu et al. (2026) adds that teaching location (urban and rural) also creates significant differences in cognition and action due to disparities in resources and cultural support for research. This means that the research mindset may develop gradually with effort and time, but competence needs time and conditions. Therefore, without environmental intervention, such as support from the school or training program, persistently low research engagement or experiences can lead to a decline in research mindset over time, as mentioned in the study by Taraban and Logue (2012).

Then, non-linearity and transformation in the training process also occur. According to CDST, the system changes when there is a catalyst. Master's programs act as a catalyst, helping learners shift from being consumers of research to having a more multi-dimensional understanding of research (Dao et al, 2022). Further, a study by Lu et al. (2026) points to a paradox that novice teachers often have a very high cognitive mindset but a lower action-oriented mindset compared to experienced teachers. This reflects the non-linear shift observed in current findings when learners begin to move from viewing research as a mandatory task to a voluntary professional commitment when they realize the practical value in solving classroom problems. This shift demonstrates the emergent nature of the teacher-researcher identity thanks to the training process. Therefore, situational factors are both hindrances (teaching pressure, fixed curriculum) and motivators (passion for discovery, Master's program).

In terms of attractor state and professional identity, the majority of participants position themselves as users or consumers of research rather than researchers. The main reason is a lack of confidence in their research abilities (e.g., confident in reading literature but lacking the ability to identify a topic or conduct methodological research) (Nguyen et al., 2022). This causes the thinking system to be "stuck" in the consumer state. Behavior and feedback loops are considered within the system. When faced with difficulties, learners seek social support (colleagues, experts).

They receive feedback – reflect – adjust their goals and methods, demonstrating self-regulation and adaptability. The prominent professional identity is that teachers are always thinking, curious, and seeking new solutions to improve teaching (Wood, 2003). This is driven by critical thinking and long-term goals aimed at providing value to learners.

The cognitive component of the research mindset is also presented. Participants see themselves as teachers with critical thinking skills, but still primarily as consumers of research. They value the practicality of research, viewing it as a tool for solving classroom problems. A lack of confidence in their abilities prevents them from taking on the role of a researcher. Then, about the behavioral component, believing that research skills can be developed through learning and practice. Demonstrating perseverance, seeking literature and support from professional networks to improve their abilities.

In conclusion, the research mindset of teachers participating in this study is pragmatic, highly dependent on social context, and currently in a state of academic transition. This state is facilitated with a growth orientation, when the perception of research shifts from a forced requirement to a necessary professional investment with personal traits like curiosity and passion.

5.2. Research-teaching paradox and transition emerging from teachers' research mindset

The above results show similarities with Borg's (2010) study, where viewing oneself as merely a consumer of research products was mentioned as one of the two main types of teacher engagement with scientific research in the field of education. Furthermore, Nguyen et al.'s (2022) study found that while teachers had graduated with the necessary knowledge and understanding for research, they lacked confidence in their ability to conduct research and had not had much practical experience. The study of Priyadarsini and Kumar (2024) emphasizes that practical research experiences (UREs) and effective mentoring are key catalysts for improving self-efficacy and fostering a research mindset. This explains why Hoa and Huy lack confidence in their own research capabilities, regardless of their trained research skills. On the contrary, Clark and Johnstone's (2018) study of undergraduate students also indicates that overconfidence sometimes masks actual shortcomings in scientific research and citation skills. This seems different when considering teachers as graduates, as they tend to underestimate their scientific research and citation skills and overestimate the difficulty of the research procedure.

The lack of a tendency to participate in research due to a preference for teaching demonstrates a negative correlation, as seen in Hattie & Marsh's study (1996). Simultaneously, the difficulties they shared regarding workload, research not being closely aligned with reality (Ding et al., 2025), or lack of time have also been confirmed in recent studies (Henry et al., 2020; Heng et al., 2022). The current research emphasizes the deep link between research and problem-solving ability, a perspective also found in high school students in the study by Ding et al. (2025), where research is understood as a continuous process of curiosity, progression, and in-depth exploration. For teachers like Nam, who prioritize teaching over research is not only a personal choice but also a consequence of institutional factors such as assessment standards focused on course overall scores rather than research outcomes. Their denial of either the research or teaching role, despite recognizing the relationship between the two, shows the variability of the research mindset when environmental factors become unfavorable. These factors can include institutional and working conditions such as educational qualifications, income, and teaching workload (Henry

et al., 2020), or a lack of resources, research infrastructure, and research culture (Harman & Ngoc, 2010; Fatseas, 2010).

Additionally, the belief that one cannot develop research capabilities or that one's mindset is always fixed also reflects a fixed mindset (Dweck, 2006). In this case, all past and present difficulties and failures become barriers to future research participation. To overcome the problem of a fixed mindset, the role of Communities of Practice is essential (Dao et al., 2022). Walker et al. (2020) pointed out that collaboration among colleagues not only creates a safe space for experimentation but also helps teachers overcome feelings of isolation and build researcher identity. Conversely, there is still a belief that one's own ability can be developed, which reflects a growth mindset (Dweck, 2006). In the case of Hoa and Huy, their belief in the potential for future research capacity development is an expression of a growth mindset according to Dweck (2006), which helps them view current challenges as opportunities and affirm their intention to continue participating in research in the future. The fact that students in this study proactively sought support from the professional network when facing difficulties is a positive feedback loop, helping the mindset system to self-adjust and develop sustainably (Wilson et al, 2017; Nguyen et al., 2022). The overview of teachers' research mindset emphasizes the connection between research ability and inquiry, a factor nurtured through training as participants gradually apply their studies to teaching. They see a deep link between research and their problem-solving abilities, as demonstrated in previous studies (Wilson et al., 2017) and with teaching (Nguyen et al., 2022; Truong et al., 2025).

6. Conclusion

This study has provided a comprehensive picture of the research mindset of graduate students majoring in English Language Teaching (ELT), affirming that it is not a static psychological trait but a dynamic, non-linear system that emerges from the complex interaction between the individual and the environment. The research results point to three key points in the formation of this mindset.

The results indicate a clear shift in teacher motivation and identity while revealing the persistent paradoxes between perception and actual competence. The former shift is characterized by a transition from viewing research as a mandatory academic obligation at the undergraduate level to a voluntary professional commitment at the graduate level. The Master's program acts as a crucial catalyst, helping students move from the position of passive knowledge consumers to multi-dimensional research users, beginning to form the identity of a teacher-researcher. In contrast, the latter paradox persists between perception and intrinsic ability. There exists a gap between appreciating the practical value of research and believing in one's own research capabilities. Although students possess a positive research mindset and a desire to improve teaching, they remain stuck in the attractor state of a consumer due to a lack of confidence in methodology and pressure from external barriers such as limited time and heavy workload. This leads to the third point – adaptability and nurturing a research mindset. Under the lens of CDST, teachers' research mindsets are driven by flexibility through social adjustment strategies (like seeking support from colleagues and the use of digital tools). Their perseverance and emotional resilience in the face of difficulties show a growth mindset, suggesting potential for ongoing system evolution.

These findings showed some implications. From the perspective of CDST, the research mindset of teachers is constantly evolving and influenced by their surrounding context. Therefore, after training and acquiring theoretical knowledge of research, they showed a shift. Cognitively, they viewed research as an ongoing process of professional engagement rather than an imposition. In terms of action, it transitions individuals from inactive engagement to autonomous inquiry. This shows that, due to its non-linear nature, the research mindset can be influenced by its surroundings, specifically the training environment. Furthermore, teachers only shift from passive to active engagement and take practical action when they perceive a connection between research and teaching. Therefore, to sustain this non-linear development, designing a training program aligning with individual research topics and teaching practices is crucial. When teachers actively engage in research, their cognition and actions interact, helping them deepen their theoretical understanding and improve their practical skills. In this case, the bidirectional interaction between cognition and action will be directly enacted.

Furthermore, although they all undergo the same training program, not all teachers believe they will be teacher-researchers in the future. This highlighted the importance of external factors, including scaffolding methods, supervisors, and mentoring. A lack of self-confidence, even after completing part of the training process, can underscore an insufficiency of isolated structural training. Because the research mindset is a continuous and dynamic process, it demands more than a formation stage, but a systematic ecological nurturing through robust communities.

In short, the research mindset of ELT teachers as graduates is currently situated in an academic transition. To foster the sustainable development of their research mindset, training programs need to focus more on bridging the gap between theory and practice, while establishing a supportive institutional context to help teachers overcome self-reliance barriers, thereby nurturing and maintaining their research mindset for further potential of research engagement within their professional context.

However, there is a limitation on participants who can only represent the current Master training program at a university, while a research mindset appears in many other contexts with different subjects, like novice-teachers, university students, etc. Therefore, further studies can widen the scope or look at different subjects. Additionally, the current results can only present the first phase of a longitudinal study, so they can merely capture teachers' research mindset after their in-class courses with limited real research experiences. This leaves room for further studies to clarify whether their research mindset changes after they finish their graduation thesis and return to the teaching context.

Bionote

Thi Minh Hanh Nguyen, Can Tho University

Nguyen Thi Minh Hanh is a PhD student in Principles and Methods in English Language Education at Can Tho University, Vietnam, where she was honored to be admitted directly to the doctoral program without completing a Master's degree. In recognition of her early research contributions, her previous work has focused primarily on understanding group work dynamics in language education. Building upon these experiences, Hanh's current doctoral research explores teachers' research mindsets in English language teaching practices, with the hope of contributing to professional development practices in Vietnamese higher education.

Mai X. Le, Can Tho University

Dr. Le Xuan Mai, Head of the Department of General English and English for Specific Purposes, School of Foreign Languages, Can Tho University, Vietnam, obtained her doctorate degree in Education in Australia. Her research interests include English language teaching (ELT), ICT in ELT, teacher education, and teacher professional development.

Trang Le Diem Bui, An Giang University, Vietnam National University Ho Chi Minh City

Dr. Bui Le Diem Trang is a senior lecturer in the Faculty of Foreign Languages at An Giang University, Vietnam National University, Ho Chi Minh City. She has a master's degree in Applied Linguistics from the University of Queensland, Australia, and a PhD in Applied Linguistics from Victoria University of Wellington, New Zealand. She has over 15 years of teaching experience, specializing in training pre-service and in-service EFL teachers. Her professional interests include English teacher education, task-based language teaching (TBLT), and technology in language education.

#116 THE EFFICACY AND STUDENT PERCEPTIONS OF AI-GENERATED VERSUS TEACHER FEEDBACK ON UNIVERSITY STUDENTS' L2 WRITING DEVELOPMENT: A MIXED-METHODS STUDY

Anh Tran Duc[1]

Abstract

The arrival of GenAI tools in language education has necessitated an understanding of their efficacy, particularly in propelling learners to greater writing proficiency. This study seeks to explore the extent to which Automated Writing Feedback (AWF) generated by ChatGPT can assist learners in writing, together with their perceptions of its effectiveness, compared to the traditional teacher-led method. This 10-week, mixed-methods research investigated two groups of 54 students who either received feedback from the educator or from AI during completion of 8 paragraph writing tasks. Findings retrieved from quantitative data (pre-test/post-test scores) indicate improvements in writing scores of both groups, while qualitative data (survey results and interview responses) suggest that teacher feedback played a meaningful role in fostering students' affective aspects. We conclude that AI holds the potential to assist the marking process by handling micro-level errors, supplying timely feedback, allowing educators to prioritize macro-level errors, and providing a more thorough feedback experience. Thus, this paper proposes that a blended feedback approach is adopted to maximize the students' learning outcomes.

***Keywords*:** Automated Writing Feedback, teacher feedback, writing performance, blended feedback approach

1. Introduction

Among major linguistic skills, writing is particularly challenging for learners to achieve mastery, often due to the lack of both practice opportunities and personalized feedback from educators (Hyland, 2007; Storch & Wigglesworth, 2010). During the writing process, formative feedback and opportunities for revision play a pivotal role in assisting learners in acquiring competence (Bardwell, 1981), not only by pinpointing errors but also serving as a powerful pedagogical tool for guidance (Perdana et al., 2025). Timely and thorough feedback provision, however, is particularly testing due to external factors including a high student-teacher ratio (Chen, 2025) and a heterogeneous distribution of proficiency levels within the same class (Alnemrat et al., 2025), together with the tutor's emotional fatigue due to overwhelming workload (Ballet & Kelchtermans, 2009). Consequently, this causes delays in feedback delivery and risks weakening instructional efficacy (Makwana, 2025).

Recent advances in technology, particularly in the field of automated writing evaluation (AWE), eg, ChatGPT, have offered promising solutions for the aforementioned issues. By providing real-time computerized feedback, ChatGPT addresses learners' concerns about various

aspects of their own writing in a timely manner, which in turn reduces the workload of teachers (Alnemrat et al., 2025). Multiple past studies have advocated a blended approach, in which the immediacy of automated feedback is strategically combined with nuanced and contextualized human feedback to achieve optimal correction efficacy (Makwana, 2025; Marzuki et al., 2023; Wu, 2024). To achieve this, it is crucial to understand the extent to which each feedback modality has a positive impact on learners' writing competence and their own perceptions of these feedback sources. Previous studies have often examined AI feedback from a general viewpoint, such as speaking, reading, accomplishment, or motivation (Mohammed & Khalid, 2025) in non-Vietnamese settings. Meanwhile, very few studies focus on the context of Vietnamese university settings, with Vietnamese students' beliefs and self-evaluation of the use of AI in writing correction remaining a fairly closed book. Furthermore, more research is also needed to explain what remains unknown about feedback quality, feedback uptake, and learner trust in AI-supported writing revision. To fill this gap, the purpose of this study is to examine how the two feedback modalities affect Vietnamese English-major freshmen's writing development as well as their affective responses. By shedding light on these important aspects, this study aims to contribute to the general understanding of the huge impact of AI on revolutionizing the current educational setting. Proposed below are the research questions:

1. To what extent do AI-generated feedback and teacher-provided feedback improve students' writing performance?

2. What are students' perceptions regarding the usefulness of each feedback modality?

3. What is the student's perceived motivational value of AI feedback, in contrast to teacher feedback?

2. Literature Review

2.1. Why does feedback matter?

The essential role of corrective feedback was based on theoretical frameworks of constructivist learning theory and sociocultural theory, which posit that feedback assists students in their process of comprehending and internalizing language, especially writing conventions (Hyland, 2007; Vygotsky, 1978).

Corrective feedback is a cornerstone in improving learners' writing performance, contributing to the promotion of long-term writing development towards greater proficiency (Makwana, 2025). Well-informed and formative feedback promotes learners' writing performance, provided it is delivered promptly, with a strong focus on meaning (Peltzer et al., 2024). First, through corrective feedback, learners can identify their own strengths and weaknesses to make informed revisions to their writing. In the realm of ESL writing, feedback clarifies erroneous aspects of the learner's written work, ranging from problematic linguistic forms (vocabulary, grammar, and mechanics) to rhetorical dimensions (organization, coherence, and argumentation) (Bitchener & Ferris, 2012). Secondly, feedback promotes learners' self-regulation and boosts their motivation. In the traditional classroom setting, teacher-provided feedback is particularly beneficial because students trust their teachers, who rely on their contextual knowledge to offer nuanced scaffolding in line with classroom dynamics (Alnemrat et al., 2025).

2.2. Traditional teacher-led instruction

Conventional correction practice, particularly teacher-led feedback, is central to ESL education. The multiple strengths of teacher-led feedback are evident in past studies. For instance, with their expertise, teachers can tailor their remarks to specific writing tasks to provide personalized and contextualized feedback that can account for the specific needs of learners. (Han & Li, 2024). Far from merely providing direct revision guidance, teachers provide metalinguistic instructions to foster students' critical thinking abilities by encouraging them to address higher-order writing concerns, such as structure and content development (Chen & Cheng, 2008). Despite its effectiveness, extensive teacher-led feedback falls short in providing immediate, extensive feedback, especially to teachers with limited time and resources (Makwana, 2025; Zhang & Hyland, 2018).

Written corrective feedback (WCF) refers to written information or codes given by teachers to address errors in learners' writing with the goal of leveraging their writing performance and facilitating second language acquisition. At its core, two levels of feedback include lower-order skills, which include sentence-level skills, such as spelling, punctuation, grammar, or capitalization; or higher-order skills that deal with idea elaboration, self-reflection, or writing organization (Wilson & Czik, 2016).

2.3. Computer-mediated feedback in writing

Investigation into automated written feedback has yielded heterogeneous outcomes (Baz & Aksoy, 2025; Goldstein, 2004; Makwana, 2025; Yu & Xie, 2025). When guided by rigorously designed prompts, AWF has the potential to bring positive impacts on enhancing students' writing performance. Through feedback, students achieve gains in multiple aspects of language learning, including speaking, learning accomplishment, self-regulation, and enjoyment of reading. Additionally, computer-based feedback is capable of improving the feedback quality while lessening the teacher's workload (Makwana, 2025; Yu & Xie, 2025) by generating immediate, specifically-tailored, and individualized feedback on the content and the language of students' writing (Lin & Crosthwaite, 2024), so that teachers can allocate more time to addressing higher-order concerns.

However, it should be noted that the effects of computerized feedback are not always positive. Past findings have indicated that this type of feedback tends to emphasize surface-level errors while overlooking meaning-level issues. Consequently, this does not contribute to broadening EFL learners' understanding of complex linguistic forms. Due to the nature of relying on algorithms to provide pre-defined errors and functions, these automated writing evaluation systems are unable to provide feedback that considers nuanced differences between learners. What is more, computer feedback is occasionally vague, lengthy, formulaic, or even misleading. Unfocused comprehensive feedback overloads the students' attentional capacity, which impedes the quality of writing and the overall writing progress.

2.4. ChatGPT as the source of feedback

Unlike past AWF platforms, ChatGPT, a product of GenAI, is capable of formulating human-like conversations through prompt construction (Han & Li, 2024). By definition, a prompt is a natural language text provided by the user to insert related information to inform the model to perform specific tasks, which allows the model to create output not originally part of its training

data (Si et al., 2022). Depending on the clarity and rigor of prompt formulation, ChatGPT offers various responses. Inheriting features from its predecessors, ChatGPT is also capable of giving instant formative feedback on different concerns of writing by clarifying major points (Makwana, 2025; Yu & Xie, 2025).

In summary, AI is capable of providing timely and repeated feedback, while teachers are able to provide contextual, motivational, and pedagogically sensitive feedback. By incorporating the strengths of these two feedback modalities, teachers can offer a more thorough feedback experience to their students, which advocates for a blended use of both feedback sources.

3. Methodology

3.1. Research participants and settings

Research participants include 54 Vietnamese English-major first-year students (21 males, 33 females, aged from 18 to 21). To minimize external variables, they were all taught by the same teacher (with a master's degree in Applied Linguistics and at least 10 years of experience in teaching writing for intermediate-level students) with the same writing lesson content. Based on the entrance exam result, their level was A2/B1 of the CEFR at the time the research was conducted. Most of them had prior experience in using AI-supported writing platforms such as ChatGPT and used these regularly on their personal digital devices, like smartphones or laptops. On the orientation day, after being clarified about the purpose of the research, these students were divided into two groups: 33 students received feedback from the teacher, and 21 students received it from ChatGPT. They were assigned based on their preferences and experience with using AI. Students could choose which group would best suit them, which led to unequal participant numbers. Therefore, this is a quasi-experimental comparative design rather than a randomized experiment. Therefore, to counteract the likelihood of variations in competencies between the two groups, an independent samples T-test was employed.

3.2. Research design and instruments

As quantitative writing scores and qualitative perception data were collected during the same intervention and interpreted together, the study adopted an embedded mixed-methods design. This research design was selected to provide a holistic view of not only what changes (writing scores), but also why and how they did so. In addition, numerical results on writing score gains alone will not suffice to state which feedback modality is more effective, as they do not provide insights into the cognitive and affective processes students undergo during interactions with feedback. Combining two sets of data is, therefore, crucial for a deeper understanding of the impact these two types of feedback have on students' writing performance.

Different research instruments were used to collect both quantitative and qualitative data. These include 8 paragraph writing topics taken directly from the textbook. The students are familiar with the major themes in the textbook (including daily activities, travel experiences, or an effective advertisement), and the topics are arranged to be progressively more challenging. The study employs a 5-point analytic rubric description table for assessment of 4 surface-level aspects (Grammar, Vocabulary, Mechanics, Sentence Structure) and 3 meaning-level aspects (Content and Idea development, Coherence and Organization, Writing style) (see Appendix B); a 5-point Likert-scale survey (Appendix C); and a set of questions for semi-structured interviews (Appendix D). This analytic rubric was adopted from various past studies (Alnemrat et al., 2025; Ferretti &

Graham, 2019; Qin & Karabacak, 2010), which helps analyze specific dimensions, rather than only giving a holistic impression of the student's writing ability. To ensure practicality, the rubric received reviews from the raters about whether the dimensions are suitable for paragraph writing evaluation. Based on the raters' expertise, the researchers made modifications to the rubric that best suited the purpose of the study. On the orientation day, 10 students were selected to write a paragraph as part of the pilot test. The raters marked these paragraphs, using the piloted rubric, to confirm its usability before officially being put into use for the remaining topics.

The content validity of the marking rubric, survey questions, and interview questions is supported. To begin, the marking rubric covers the seven key criteria of writing evaluation, divided into two main categories of micro issues (Grammar, Vocabulary, and Mechanics) and macro issues (Content and idea, Coherence and organization, and Writing style). Each criterion is classified into 5 levels, from poor performance (1) to excellent performance (5), to minimize the raters' bias and illustrate the aspects AI or teacher feedback benefits students most and least. Secondly, the survey confirms the construct validity by raising questions to explore the perception of students, including satisfaction, clarity, trust, and motivation. Additionally, the survey is divided into two versions, which compare two groups of students on the same dimension. The combination of quantitative data (Likert scale from questions 1-7) and qualitative data (question 9) allows for students' further explanation of their own choices, enriching data collection. Lastly, the interview questions dive deeper into affective factors of learners by mentioning important aspects such as "non-judgemental tool" and "anxiety". Also, questions regarding students' own critical thinking and learner agency (question 5) shed light on the learning process of students. Moreover, by asking students to compare the pros and cons of using AI in question 6, the interview encouraged them to reflect on their own learning process with AI, thus giving both the researcher and them a better understanding of the proper use of AI in improving their own writing quality.

3.3. Data collection

Data collection took place over 10 weeks, as described in the timeline below. During the orientation day (Week 1), after being informed of the purpose of the research, students provided their consent to participate. Topic 1 was also assigned, and students had one week to hand in their first version. Students in the AI group also received the assigned prompts for feedback from ChatGPT (see Appendix A). Well-crafted prompts minimize external variables due to inadequate prompt engineering and ensure that the AI responses are consistent among all students, which is essential in resulting in representative outcomes (Kung et al., 2023). To this end, the designed prompt only required AI to provide explicit suggestions for corrections, rather than correcting the whole paragraph itself. Students were advised to engage in continued dialogues with AI for deeper engagement with the feedback to fulfill the writing task.

After all students from both groups have submitted Draft 1, they revise it and submit the refined versions, called Draft 2. During the scoring, two raters, with years of experience in teaching writing, were trained on how to use the analytic rubric; any disputes over scoring were settled by their discussion for the final result. To further ensure objectivity, fairness, and consistency in writing evaluation, the Intraclass Correlation Coefficient (ICC) has been employed, with the results of 0.84 and 0.89 for pre-test and post-test, respectively.

Table 1

Intraclass Correlation Coefficient

Tests	Number of raters	ICC value	*p-value*	Reliability
Pretest	2	0.84	< .001	Good
Posttest	2	0.89	< .001	Good

In Week 10, all students took part in the survey with both closed and open-ended questions regarding their experiences and preferences for both types of feedback. 10 random students (5 from each group) were selected for an interview to gain deeper insights into their perspectives for a more comprehensive understanding of the efficacy of feedback.

Table 2

Description of the procedure

Timeline	Session description	Assignment of a new topic	1st version submission	2nd version submission
Week 1	Orientation + Instruction for Topic 1 (Pre-test)	Topic 1		
Week 2	Instruction for Topic 2	Topic 2	Topic 1	
Week 3	Instruction for Topic 3	Topic 3	Topic 2	Topic 1
Week 4	Instruction for Topic 4	Topic 4	Topic 3	Topic 2
Week 5	Instruction for Topic 5	Topic 5	Topic 4	Topic 3
Week 6	Instruction for Topic 6	Topic 6	Topic 5	Topic 4
Week 7	Instruction for Topic 7	Topic 7	Topic 6	Topic 5
Week 8	Instruction for Topic 8 (Post-test)	Topic 8	Topic 7	Topic 6
Week 9			Topic 8	Topic 7
Week 10				Topic 8

4. Results

To ensure baseline equivalence for the initial writing ability of the control group (teacher-led) and experimental group (AI-provided), the Shapiro-Wilk test was employed. This test was deliberately chosen to deal with samples with sizes less than 50 (Razali & Wah, 2011).

Table 3

Normality distribution of two groups

Test	Sample (N)	Shapiro-Wilk Statistic (W)	*p*-value	Normality Assumption

Teacher	33	0.963	**0.306**	Normal
AI	21	0.942	**0.237**	Normal

As the numbers between the two groups were unequal (33 and 21), the researcher also employed Levene's test to assess the equality of variances and confirmed that the *p*-value was greater than .05.

Table 4

Normality distribution of two groups

Variances	F-value	*p*-value	Equality of variances
Gain score	0.681	.412	Equal
Post-test Total	0.134	.715	Equal

Levene's test indicates that equality of variances was not violated (F = 0.681, *p* = .412). A paired samples t-test was run to evaluate the efficacy of feedback in writing improvement. Both groups achieved statistically significant improvement.

Table 5

Paired Samples T-test

Groups	**Test**	**Mean**	**SD**	***t***	***df***	***p (2-tailed)***	***Cohen's d***
Teacher (n=33)	Pre-test	19.82	4.31	-16.85	32	**< .001**	**2.93**
	Post-test	26.79	4.41				
AI (n=21)	Pre-test	19.14	3.52	-14.65	20	**< .001**	**3.20**
	Post-test	26.33	4.02				

The score gain of the AI group was slightly higher than that of the teacher group. The effect size was also calculated by using Cohen's d. At $d = 0.09$ (< 0.2), this shows that the difference in effectiveness between the teacher feedback and AI feedback is negligible, indicating that both groups improved during the intervention under different feedback conditions.

Table 6

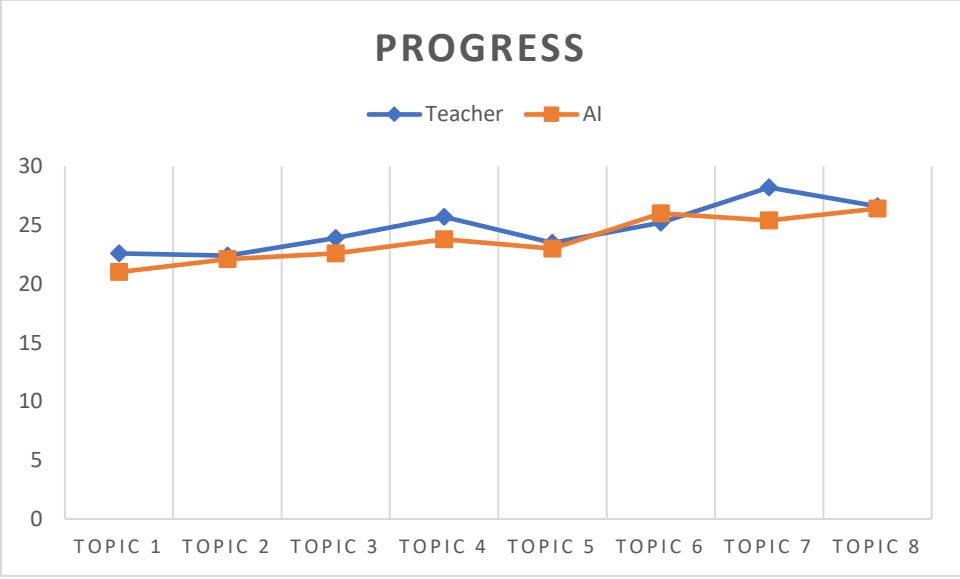
Gain scores

Variance	***Group***	***Mean Gain***	***SD***	***t***	***df***	***p (2-tailed)***	***Cohen's d***
Gain scores	*Teacher*	*6.97*	*2.38*	*-0.325*	*52*	***.746***	*0.09 (< 0.2)*
	AI	*7.19*	*2.25*				

Criteria	***Gain score (Teacher)***	***Gain score (AI)***	***p-value***	***Result***

Grammar	*1.36*	*1.16*	*0.452*	*Similar*
Vocabulary	*0.88*	*0.72*	*0.485*	*Similar*
Mechanics	*0.88*	*1.13*	*0.354*	*Similar*
Sentence Structure	*1.06*	*0.88*	*0.428*	*Similar*
Content & Idea	*0.94*	*1.03*	*0.697*	*Similar*
Coherence & Organization	*0.97*	*1.00*	*0.895*	*Similar*
Writing Style	*0.88*	*0.94*	*0.812*	*Similar*

Table 7



Mean scores across topics of both groups

Group	***Topic 1***	***Topic 2***	***Topic 3***	***Topic 4***	***Topic 5***	***Topic 6***	***Topic 7***	***Topic 8***
Teacher	22.6	22.4	23.9	25.7	23.5	25.2	28.2	26.6
AI	21.0	22.1	22.6	23.8	23.0	26.0	25.4	26.4

The mean scores of the rewritten versions for the eight topics were recorded. These versions were the refined products of the students after receiving either of the two feedback types.

Figure 1

Progress in scores of two groups for 8 weeks

For the first four weeks, both groups enjoyed fairly gradual improvement in their writing performance, with the figures climbing from 22.6 to 25.7 for the teacher group, and 21 to 23.8 for the AI group. During this period, the teacher group slightly outperformed the AI group. In week

5, the scores of both groups fell, which was possibly due to the difficulty level of this week's topic. With both groups falling in performance, this signifies that the difficulty level was consistent for both. During the remaining period, it is notable that even though the teacher group retained its constant growth, the AI group improved significantly and outperformed its counterpart for the first time in week 7 (28.2 compared to 25.4), before reaching the same score level in week 8 at just over 26.0. This implies that the AI group might require more time to become acquainted with the novel feedback method.

Survey responses

The reliability of two questionnaires (for the teacher group and the AI group) was confirmed with Cronbach's alpha. The figures for both were higher than 0.8, indicating high reliability. All items had a total correlation of at least 0.30; thus, none were removed from the questionnaire. To sum up, all items were relevant and valid to collect insights from participants regarding multiple aspects of their writing experience, including satisfaction levels, trust in feedback accuracy, perceived usefulness to both surface- and meaning-level issues, perceived motivation, and overall writing performance improvement.

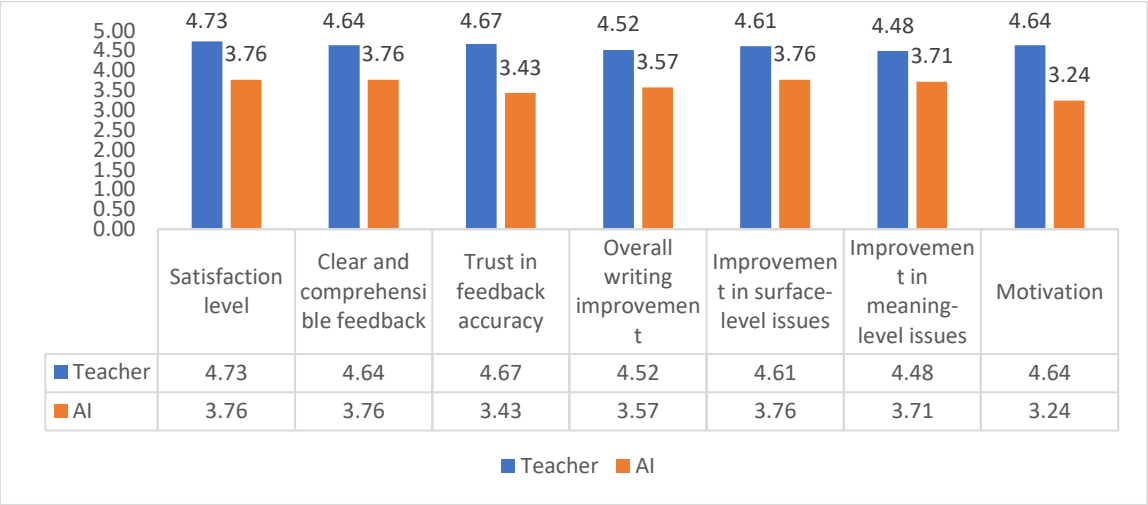


Table 8

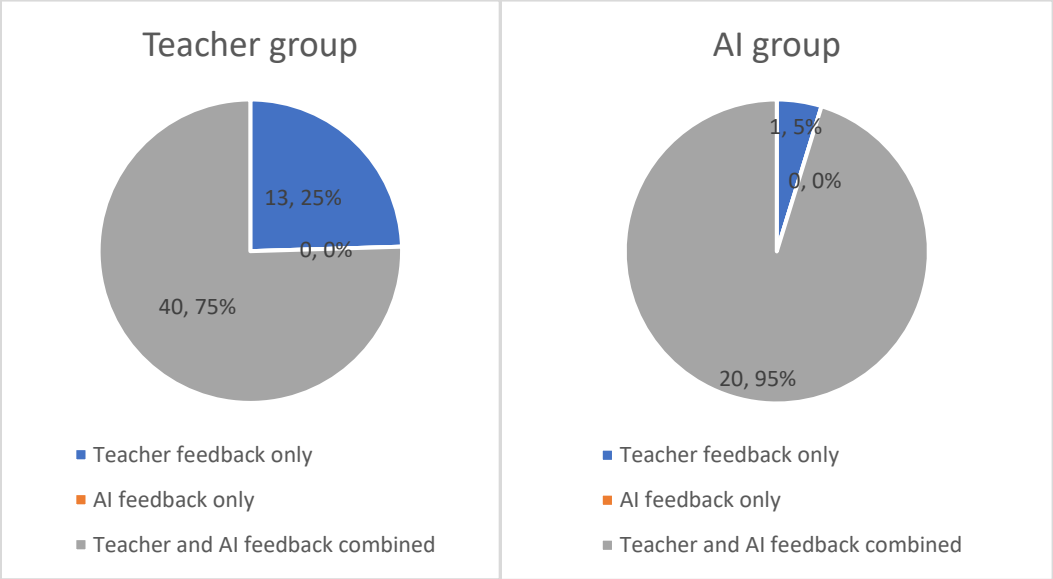
Reliability of the questionnaire

Surveyed groups	Sample (N)	Number of items	Cronbach's Alpha	Evaluation of reliability
Teacher	33	7	**0.932**	**Reliable**
AI	21	7	**0.871**	**Reliable**

Figure 2

Survey responses of Teacher group and AI group



Overall, compared to AI-generated feedback, teacher-provided feedback was better received in all categories. The aspects that students appreciated most were their satisfaction level with the teacher-provided feedback (4.73) and their trust in their instructor's ability to deliver accurate corrections (4.67). Meanwhile, the aspects that students found most content with using AI were the general satisfaction level, clarity and comprehensibility of the feedback, and

improvement in surface-level issues, at 3.76 each. Similar gain scores in this sample suggested that the aspect in which AI was perceived to be nearly as useful as a human teacher was meaning-level issues (content development and organization), with a difference of just 0.77. By contrast, the widest gap was seen in the motivation aspect, with a difference of 1.4, indicating that AI was less effective in motivating students to revise their own writing and improve their later writing assignments.

Figure 3

Preferences for feedback sources

Responses from the survey highlight a common pattern in students' perceptions of feedback sources: a strong preference for a blended approach of both feedback modalities, and an absence of fondness for AI feedback alone. Within the teacher feedback group, a quarter of students expressed a liking for teacher feedback solely, while this figure was three times larger (75%) in those who opted for a combination of both feedback types. Similarly, a vast majority of students from the AI-feedback group (95%) preferred this dual feedback, with only one student who favored the traditional feedback type. No student from either group placed their full trust in AI alone.

To dive even deeper into the learners' perspectives on the feedback sources, 5 students from each group were invited to join the interview (with a total of 10 students). With their consent, the whole interview was recorded for later transcription and analysis. A thematic approach was employed to classify the interview responses into 12 major themes, which helped shed light on the pros and cons of each feedback type. Irrelevant or vague responses, such as "OK", were left out. The 12 major themes were collected from responses to interview questions, then generated by the following procedure. First, the interview recordings were transcribed into text. The researcher read these scripts multiple times to understand the context and significance and identify key features. Second, these features are grouped into categories with similar features. For instance, codes such as "quick correction" and "didn't have to wait" were grouped into "AI provides quick responses".

Thirdly, the list of themes is narrowed down, with only themes that are mentioned repeatedly selected. Illustrated below are the 12 major themes (6 for each group) and the quotes from the interviewees. The number of students who mentioned these themes was also included.

Table 9

Students' personal perspective on Teacher feedback

Major themes	**Quotes**	**Number of students who mentioned this**
1. Teacher provides detailed corrections	"…teacher's correction is detailed, helping me understand better and improve my skills"	3/5
2. Teacher provides comprehensible feedback	"…teacher's correction is very easy to understand"	3/5
3. Teacher's professionalism allows highly accurate and trustworthy feedback	"…teacher understands my writing problems and corrects my writing in line with the writing task"	4/5
4. The teacher understands the students' context, thus providing feedback that aligns with the writing goal	"…teacher gave me highly professional comments that suit the requirements of the lesson"	3/5
5. Teachers help develop meaning-level aspects (idea development)	"…teacher provides feedback to help me extend the ideas for my writing"	3/5
6. Teacher's "human touch" boosts the student's writing motivation and helps them feel at ease	"…sometimes my teacher adds jokes and interactions, which makes me feel interested when receiving feedback"	5/5

Table 10

Students' personal perspective on AI feedback

Major themes	**Quotes**	**Number of students who mentioned this**
7. AI provides quick responses	"…feedback is provided constantly as I ask questions or make requests, so I didn't have to wait"	5/5
8. AI feedback is vague and mechanical, lacking depth	"…sometimes AI feedback is unclear to me, and it lacks depth"	3/5
9. AI feedback is convenient, allowing students to engage in prolonged conversations for clarifications	"AI can support me anytime, so I can study whenever I need to"	5/5
10. AI excels at spotting and correcting surface-level errors	"AI might do better in correcting minor errors that teachers might overlook"	2/5
11. AI still occasionally makes mistakes	"AI can point out the mistakes with grammar and vocabulary, but not entirely correct all the time"	2/5

12. AI's lack of human emotions might not motivate students to revise their writing	"(AI's) disadvantage: lack of emotions, not as motivating as teachers"	3/5

5. Discussion

1. To what extent do AI-generated feedback and teacher-provided feedback improve students' writing performance?

As indicated by the results, both feedback types had a positive impact on students' writing performance, with the teacher group's score rising from 19.82 to 26.79 and the AI group from 19.14 to 26.33. In terms of the difference in effectiveness between each feedback type, the tests suggested that both teachers and AI were helpful in leveraging students' writing ability. A detailed look into the progress reveals that in the first half of the period (week 1 – 4), the teacher group slightly outperformed the AI group. Presumably, this could have been the degree of familiarity of students with the feedback modality. While the teacher group was familiar with the conventional feedback strategy and applied it more effectively (their score increasing from 22.6 to 25.7), it took longer for the AI group to become accustomed to using AI for writing revision (with their score increasing from 21.0 to 23.8). After this threshold, however, the AI could keep up with the teacher group in the following weeks, even surpassing them in week 6 (26.0 compared to 25.2). In the final week, both groups reached the same score at approximately 26.

Regarding feedback levels, past studies argued that while AI excelled at addressing local concerns, such as syntax, lexical resource, or spelling, teachers are superior in global concerns, including ideation or organization. In line with this, findings of this study also found that students in the AI group achieved higher scores for mechanics (including errors with spelling, punctuation, and capitalization), with 1.13 compared to 0.88. This is evident as AI's algorithmic nature allows it to compile information from multiple sources and formulate common rules. However, the same did not apply to grammar, as the grammar score of the teacher group was slightly higher than that of the AI group, with 1.36 compared to 1.16. It could be suggested that when teachers do attend to providing detailed corrections to surface-level errors, including grammar, they can also provide accurate feedback that allows students to clearly understand grammar rules.

With respect to meaning-level aspects, including idea development and organization, it is notable that within this specific sample, task type, prompt design, and short intervention period, AI feedback was just as effective as teacher feedback (1.03 and 1.00 compared to 0.94 and 0.97, respectively). This contradicts past studies, which claimed that the realm of higher-order thinking skills was the strength of human teachers. This could be due partly to recent advancements in AI technology, whose database has been constantly growing. Arguably, careful prompt engineering might also have a role to play, as the prompt requires AI to also develop students' logical thinking, which helps produce not only accurate but also convincing pieces of writing.

2. What are students' perceptions regarding the usefulness of each feedback modality?

Students in the sample value teacher feedback in all seven aspects, namely overall satisfaction, clear and comprehensible feedback, trust in feedback accuracy, overall writing improvement, improvement in surface-level issues, improvement in meaning-level issues, and

motivation. Interestingly, this reveals that although the students benefit from AI feedback and enjoyed score gains, they still gravitate towards teacher feedback. One reason for this could be that students are still not totally familiar with interactions with AI and thus might develop less trust for this new feedback modality, compared to teacher feedback. A further explanation for this strong preference could lie in the last aspect of the survey: motivation. This is the aspect with the greatest deviation in both groups. While the score for motivation of the teacher group was 4.64, that of the AI group was far lower, at 3.24. This recurring theme was reiterated in the survey's last question. With his understanding of the students' context, including their language proficiency, the teacher was able to provide feedback that not only matches the students' level but also aligns with the writing goals. The result of this was focused, tailored, comprehensible feedback that students could instantly understand and apply accordingly. Students' comfort and great trust in the expertise of their teacher were other reasons why they were more motivated to improve their writing in the following topics, compared to mechanical and vague feedback from ChatGPT, which was reported to be inaccurate at times, causing a sense of distrust. Participants in the interview complained that:

"AI didn't give me detailed corrections, nor feedback; it just generally states something like 'you made quite a few mistakes.'"

Despite this, students do appreciate the immediacy of AI, stating that the feedback was delivered in a timely manner upon request. This was helpful as the process of correction could start right after the students finish their writing, which avoids delays that might hinder learning. One student said:

"If the feedback arrives late, I might forget the ideas I put in my writing."

A further upside of AI is its availability, which allows users to ask questions anytime they are pleased, and the conversation can also be extended until the users are satisfied with the responses and their final writing product. Immediacy and availability have long been seen as shortcomings of teacher feedback, as teachers are usually overwhelmed with workload, resulting in delayed feedback, which might fail to provide students with the necessary information to refine their writing in time.

Responses from the interview highlight that students of both groups are in favor of a combined approach of both feedback sources. Those from the teacher-feedback group said that:

"I think we can use both and learn the good things from each of them."

"We can use AI, but we shouldn't completely depend on it, because good writing must contain human emotions."

3. What is the student's perceived motivational value of AI feedback, in contrast to teacher feedback?

Qualitative data collected from the class survey and the interview assist in measuring the students' motivation. Through semi-structured interviews, students express their thoughts on how the feedback modalities encourage them to put in the extra effort in revising their own writing. From the findings of this paper, students receiving teacher feedback confirmed a higher level of motivation compared to those receiving AI feedback (themes 6 and 12). This was in line with previous studies, which also claimed that the human factor was of greater value in boosting the learners' learning motivation (Alnemrat et al., 2025; Mohammed & Khalid, 2025). That said, the

effects of teacher feedback and AI feedback on learners' motivation in writing revision remain a multifaceted issue. On the one hand, students highly value the instant and easily accessible feedback AI generates, as this eliminates the long delays of feedback often associated with conventional teacher feedback. Without fear of forgetting what they have written, students can immediately ask AI to provide feedback and refine their writing, which gives them the motivation boost to complete their writing tasks quickly.

On the other hand, the human characteristics of teacher AI were a major contributor to students' motivation. Firstly, students' trust in the teacher's ability to provide accurate and well-suited feedback motivates them to improve their writing skills during revision. Compared to AI's generative responses, teacher feedback was more focused and tailored to students' comprehension. Previous studies have strongly supported this, as it avoids overwhelming students with redundant corrections on all aspects of their writing. Additionally, teacher feedback included words of encouragement and even small jokes, which significantly put students at ease and inspired them to write better. Interestingly, some students claim that when receiving the handwritten feedback of their teacher, they feel appreciative of their teacher's dedication to helping students and determined to correct their writing accordingly.

"I feel more motivated to think that my effort is recognized by my teacher, which encourages me to perform better as a way to repay my teacher's dedication."

Furthermore, it is worth considering the novelty effects and familiarity when discussing the impact on the motivational value of teacher feedback and AI feedback. Regarding the novelty effects, students tend to feel a great sense of enthusiasm during the first stage of the learning process as they experience a novel learning method. Despite short-term improvement in motivation, students may "blindly" accept AI quick corrections instead of truly learning, which may lead to loss of learner agency or over-reliance on AI tools, as warned by previous researchers (Shi et al., 2026). Familiarity may also come into play in affecting the learning outcomes. Students who have been too accustomed to the longstanding habits of receiving feedback from the educators might suffer from temporary anxiety and discomfort due to a change in unfamiliar learning methods (Bakla, 2020). Thus, the successful integration of modern learning tools heavily depends on whether the students are willing to abandon old learning habits. This will prove challenging for students who tend to trust their teachers' expertise and authority more than technological tools (Chen, 2025). The lack of contact with AI may reduce trust in this tool, as students may argue that AI lacks the authority to evaluate their writing (Yu & Xie, 2025). To sum up, by understanding the novelty effects of using AI, thus maintaining stable engagement with the technology and developing familiarity with the novel learning experience over the traditional method, students can gain a better understanding of the proper use of AWE and truly take advantage of this innovative learning approach.

6. Conclusion

Findings from the 10-week research have offered deeper insights into the current knowledge of the use of AI in providing feedback to improve students' writing skills. All students enrolled in the same course, used the same textbook, and received instructions from the same teacher, with the only difference being their feedback source. Relevant tests were applied to inform the researcher of the extent to which each feedback source benefited the students, and survey

responses were collected to add deeper meaning to the data by elaborating score gains and explaining students' perceptions.

In terms of the effectiveness of each feedback modality on students' writing improvement, it might be proposed that in this specific sample, task type, and short intervention period, AI feedback was nearly as effective as teacher feedback, provided that the prompt is carefully engineered and students took an active role in interacting with AI for deeper engagement with the feedback. Apart from the overall positive effect on writing gains, AI was also remarkably helpful in addressing various aspects of students' writing, including both surface-level errors and even meaning-level errors. Results of the findings stand to argue that with a well-tailored prompt and active engagement from students, AI is fully capable of providing in-depth suggestions on higher-order concerns of writing and propelling students into more proficient writers. However, it should be noted that AI does not always outperform teachers regarding surface-level issues such as grammar or spelling. This means that the argument relating to AI's better ability to correct surface-level issues might actually stem from the lack of teachers' time to extensively provide corrections for this type of issue. The implication of this is that the current AI technology is capable of assisting teachers in feedback provision, in the face of heavy workload and time constraints to mark large numbers of assignments. However, students are still in great need of their teacher's guidance on designing prompts that align with the course's objectives and providing them with professional and personalized comments that tie both feedback types together. Only at this stage will students reap the full benefits of corrective written feedback and make steady progress to become more proficient writers.

With respect to motivation, there will still be a long way to go for AI to provide the inspiring feedback that fully captures the students' interest and attention. This might stem from the students' attitude towards the role of AI in their own learning. Students tend to regard AI as a technological tool that offers instant and widely available suggestions, and although they value its quickness and vast knowledge, they do not fully trust it to provide accurate information, which might lessen the credibility of its feedback. By contrast, students have much greater confidence in their tutor, believing that the teacher's expertise will safeguard the accuracy of the feedback. This great degree of trust is the primary reason why students seem to take teacher feedback more seriously and are more likely to associate their improvement with their teacher's hard work and dedication.

Some students expressed concerns about information overload from AI feedback. To tackle this, it is advised that students be trained not only in how to devise proper prompts but also in how to select only relevant and useful computerized suggestions that benefit their own writing, instead of trusting all feedback generated by AI. This process will further sharpen their critical thinking skills.

This study acknowledges the following limitations. The first shortcoming is the small sample size (54) and differences in the number of students in the two groups (33 and 21). Despite relevant tests to ensure reliability, this might still impact the generalizability of the sample due to self-selection bias; thus, the findings should be seen as exploratory. Secondly, 10 weeks was a satisfactory period for investigation into the effectiveness of two types of feedback, but this cannot confirm whether the effect is long-lasting after the intervention came to an end. During this period, there was limited control over students' actual engagement with AI feedback outside class, so

external variables have not been fully regulated. Thirdly, the student's English proficiency level is intermediate, and their main task was to write in one paragraph, so there is a need for further research into other proficiency levels and with other types of writing tasks, such as creative writing. Lastly, even though past studies stated that teachers were less effective than AI in providing surface-level corrections, it is unclear whether teachers' willingness to provide detailed feedback was at play, together with some other variables, such as novelty effects and familiarity.

To address these shortcomings, the researcher therefore proposes that future studies can be carried out on larger sample sizes, with a wider variety of language proficiency, for more generalizability. Furthermore, a blended approach could be adopted to gauge the effectiveness of both feedback types. This means instead of receiving feedback from AI alone, the experimental group could receive feedback from both AI and the teacher to test if there would be a cumulative effect that far surpasses a single type of feedback. Future researchers could also examine feedback uptake directly by analyzing the process by which students revise from Draft 1 to Draft 2. This would provide stronger evidence of how teacher and AI feedback actually affect revision behavior, rather than relying solely on score gains and perceptions.

To conclude, this research attempts to contribute to answering the rising question, "Can AI replace teachers?". It can be argued that AI's positive effect in EFL education should not be underestimated, but students will still need guidance from human tutors to utilize this tool efficiently and responsibly. What is more, the affective factors, such as trust and motivation, shall continue to secure the teacher's role in the current climate of education in the information era. However, in order to truly leverage their pedagogical capabilities and better adapt to the ever-changing waves of technology, teachers are advised to take full advantage of AI's power to provide their learners with a novel learning experience that not only enhances their linguistic skills but also facilitates their lifelong learning.

Bionote

The author is currently working in tertiary education at the English Faculty. He has been teaching English for different purposes (communication, test preparation) for over 10 years. During his career, he has developed a fascination with the dynamics and rapport between teachers and learners. With a growing curiosity about how this interpersonal relationship facilitates the learning process and outcome, he has sought to pinpoint aspects that will render human educators irreplaceable, especially in light of the prevalence of AI technology.

Appendices

Appendix A

Prompt: *You are my writing mentor. I will paste my paragraph draft below, based on the paragraph structure (topic sentence – supporting sentences – concluding sentence). Please give me feedback without rewriting the paragraph.*

Follow these steps:

A. Start with strengths: Tell me what I did well in my paragraph.

B. Then, give me at least one suggestion for improvement for each aspect below:

1. Grammar (word form, article, tense)

2. Vocabulary / Word Choice (is the choice appropriate and natural?)

3. Mechanics (spelling, punctuation, capitalization)

4. Sentence Structure (variety and complexity)

5. Content and Idea Development (is the idea well-developed, with main points and supporting ideas?)

6. Coherence and Organization (are the ideas well-connected, with good use of linking words?)

7. Writing Style (is the style appropriate and natural?)

C. Give an overall comment: Summarize the main things I should focus on when revising.

D. Remember: Do not rewrite my paragraph — just guide me with feedback.

Appendix B

SURVEY

Part 1 - Participants' details:

1. Full name: _____
2. Gender: ☐ Male ☐ Female
3. ID (written by the researcher): _____

Part 2 – Survey questions:

Construct	***AI-feedback group***	***Teacher-feedback group***
Satisfaction level	1. I am **satisfied** with the feedback I received from AI throughout the 10-week writing course.	1. I am **satisfied** with the feedback I received from the teacher throughout the 10-week writing course.
Clarity and comprehensibility	2. AI feedback is **very clear and easy to understand**, helping me know exactly what I need to do to improve my writing.	2. The teacher's feedback is **very clear and easy to understand**, helping me know exactly what I need to do to improve my writing.
Trust in feedback accuracy	3. I **trust** the **accuracy** of AI's revision suggestions.	3. I **trust** the **accuracy** of the teacher's revision suggestions.
Overall writing improvement	4. AI feedback has helped me effectively improve my **overall writing skills**.	4. The teacher's feedback has helped me effectively improve my **overall writing skills**.
Improvement in surface-level issues	5. AI feedback helps me improve **grammar, vocabulary, punctuation, capitalization, and spelling** (surface-level errors).	5. The teacher's feedback helps me improve **grammar, vocabulary, punctuation, capitalization, and spelling** (surface-level errors).
Improvement in meaning-level issues	6. AI feedback helps me improve **writing organization, idea development and argumentation, and the logical sequencing of ideas within sentences** (meaning-level errors).	The teacher's feedback helps me improve **writing organization, idea development and argumentation, and the logical sequencing of ideas within sentences** (meaning-level errors).
Perceived motivation	7. AI feedback gives me **motivation** to **take the initiative to revise and write better** in subsequent assignments.	The teacher's feedback gives me **motivation** to **take the initiative to revise and write better** in subsequent assignments.
Preferences for a blended approach	8. If given the choice, would you prefer to receive feedback from the teacher, from AI, or a combination of both?	

Personal insights	9. Please explain your choice above in detail and describe the greatest advantage and disadvantage of the type of feedback you received (teacher or AI).

Notes:

- From questions 1-7, participants choose 1-5 points on the Likert scale, of which:

1: Totally disagree

2: Disagree

3: Neutral

4. Agree

5. Totally agree

- In question 8, participants choose between three options:

☐ Teacher feedback only ☐ AI feedback only ☐ Teacher and AI feedback combined

- Question 9 is an open-ended question to explore aspects that may not have been covered in the previous questions.

Appendix D

INTERVIEW QUESTIONS (AI-FEEDBACK GROUP)

1. How would you evaluate the level of detail in the AI's feedback compared with what you would expect from a teacher? Do you think the AI was more effective at helping you improve surface-level errors (e.g., grammar and spelling) or meaning-level issues (e.g., organization and idea development)?

2. What benefits did receiving almost immediate feedback from the AI bring to your learning process? Did you find the AI's feedback to be consistent across different writing submissions?

3. How did receiving feedback from a non-judgmental tool like AI affect your writing? Did it make you feel more confident or less anxious when submitting your work?

4. Did you encounter any difficulties when reading and applying the AI's feedback? For example, did the AI ever use vocabulary or expressions that you had to look up? If so, did this make it harder for you to understand and apply the feedback?

5. Did you ever feel that the AI's feedback was repetitive or suggested changes that you thought were unnecessary? Did you feel the need to question or respond to the AI's feedback before accepting its suggestions?

6. Compared with the traditional feedback you have previously received from teachers, in what ways do you think AI feedback is superior (e.g., speed, specificity, comprehensiveness)? Conversely, what strengths does teacher feedback have that AI cannot replace?

7. Would you recommend that other students use AI-generated feedback as a self-learning tool? In your opinion, at which stage of the writing process should AI be used most effectively (e.g., brainstorming ideas, producing a first draft, or making final revisions)?

#118 STUDENT PERCEPTIONS OF CHATGPT-GENERATED FEEDBACK IN IELTS SPEAKING PART 3 PRACTICE: A QUALITATIVE STUDY

Diem Bich Huyen Bui[1], Vo Man Nghi Nguyen [2]

Abstract

The integration of Artificial Intelligence (AI) tools in language learning has sparked interest in their potential use in supporting the improvement of speaking skills, especially in high-stakes tests such as IELTS. However, research about how learners perceive the usefulness of AI-generated feedback in IELTS Speaking Part 3 practice remains limited. Therefore, this study employed a qualitative approach to explore students' perceptions of using ChatGPT for IELTS Speaking Part 3 practice. Semi-structured interviews were conducted with eight English-major undergraduates with IELTS band scores ranging from 5.5 to 6.5 who had experience using ChatGPT to practice IELTS speaking part 3 and receive feedback. Both positive and negative perceptions were revealed using qualitative data analysis. On the one hand, ChatGPT was perceived as useful in providing a secure environment to practice speaking, giving immediate feedback, expanding lexical and grammatical resources, and developing ideas, coherence and cohesion of the speech. On the other hand, participants reported drawbacks in speech recognition and prompt quality. Such limitations were found to influence learners' trust in the system and shape their overall perception of its usefulness. The findings indicate potential applications of ChatGPT in facilitating IELTS Speaking Part 3 practice and, at the same time, highlight the need to provide training or guidance on creating efficient prompts and follow-ups, as well as to raise learners' awareness of critical evaluation of AI-generated responses.

***Keywords*:** AI-generated feedback, ChatGPT, IELTS Speaking Part 3, qualitative study

1. Introduction

In the era of globalization, excellent English skills are widely seen as a crucial measure of competitiveness (Wu et al., 2020). Tertiary educational institutions worldwide have placed emphasis on students' mastery of English as one of the requirements for academic pursuits (Muluk et al., 2022). As a result, demand for international English proficiency certificates has been on the rise, with the International English Language Testing System (IELTS) being among the most common tests nowadays. IELTS is one of the leading assessments in Vietnam as it is considered a primary criterion in many university admissions, graduate prerequisites, scholarship hunts for studying abroad, and career development (H. N. Nguyen & D. K. Nguyen, 2022). Therefore, achieving a high IELTS score can help individuals thrive in today's competitive educational context.

Vietnamese IELTS test-takers are often reported to perform better at receptive skills and struggle with productive skills. In the 2023-2024 period, the average band scores for Vietnamese

[1]*Corresponding author, PhD Candidate, School of Languages, International University – Vietnam National University Ho Chi Minh City, Ho Chi Minh City, Vietnam; Email: bdbhuyen@hcmiu.edu.vn*
[2] *BA, Department, School of Languages, International University – Vietnam National University Ho Chi Minh City, Ho Chi Minh City, Vietnam*

IELTS candidates were 6.3 in Listening, 6.4 in Reading, 6.0 in Writing, and 5.7 in Speaking (Nga, 2024). Speaking was particularly lower than the global mean and has been considered the most difficult skill for many EFL learners in Vietnam (Le, 2017).

Le (2017) also argued that, since the speaking test requires face-to-face interaction and spontaneous, direct answers to questions, candidates' anxiety and underperformance during this productive skill test are serious concerns. Vietnamese test-takers often struggle to develop ideas, maintain coherence and fluency, and produce immediate, relevant answers under pressure (Le, 2017). Traditional face-to-face methods often fail to address these issues for several reasons. First, traditional classes often focus on language aspects rather than skills development. Second, influenced by culture, many students have a habit of memorizing examples by heart rather than brainstorming ideas or generating their own responses (Duong & Nguyen, 2006). Finally, students lack exposure to authentic practice and immediate feedback due to large class sizes or a tight syllabus (Copland et al., 2014). As a result, many test-takers are still unable to achieve their target band scores despite intensive preparation.

The IELTS speaking test comprises three parts. While Part 1 asks questions about personal and familiar topics, Part 2 requires a structured 2-minute monologue, and Part 3 involves a two-way discussion on abstract issues (British Council et al., n.d.). This final section is widely considered the most challenging part of the test. Test-takers are expected to expand their ideas logically, provide relevant justifications and speculations, and use a range of topic-specific vocabulary and complex grammar structures within a time limit (Le, 2017).

With the development of technology in recent decades, AI, particularly ChatGPT, can offer a promising solution to these challenges by providing simulated conversations, immediate and personalized feedback on fluency, vocabulary, grammar, pronunciation, and idea expansion, and can create a low-pressure practice environment that can reduce general speaking anxiety (Alsalem, 2024; Grab, 2025; Hitokdana, 2025). However, it remains unclear whether this technology can address the cognitive and psychological barriers that Vietnamese learners encounter in dealing with the demanding, highly abstract nature of IELTS Speaking Part 3.

Both existing global and domestic studies have explained ChatGPT's application in IELTS Writing tasks and general speaking practice (Hoang, 2025; Le & Nguyen, 2026; Saricaoglu & Bilki, 2025; Song & Song, 2023; Widyawati, 2026). However, previous studies rarely explore the viewpoints of English-major undergraduates, who are usually trained to analyze linguistic matters critically. Furthermore, no research in Vietnam has been conducted on students' perceptions of AI feedback for high-stakes tests, especially IELTS Speaking Part 3. Therefore, this study aims to bridge the gap by investigating such students' perceptions of ChatGPT-generated feedback for this specific testing context. Understanding learners' experiences, perceived usefulness, limitations, and trust in AI feedback is important for the meaningful integration of such tools into teaching methods. In addition, uncovering these deep personal insights is also likely to help design targeted experimental studies or develop accurate questionnaire items for larger quantitative surveys in the future.

The present qualitative study aims to close this gap by answering the following question:

How do students perceive the value of ChatGPT-generated feedback in supporting different aspects of IELTS Speaking Part 3?

This study is limited to three dimensions. First, it investigates qualitative perceptions, not quantitative score changes. Second, the participants are eight English-major undergraduates from a University in Ho Chi Minh City, who have achieved IELTS band scores of 5.5-6.5. Finally, the study focuses on ChatGPT as the AI tool, excluding others because ChatGPT is highly capable of holding open-ended dialogue and giving contextualized feedback, which are important for simulating an IELTS Speaking Part 3 examiner.

2. Literature Review

2.1. Speaking and its grading criteria

Speaking is defined in different ways. For example, Bygate (1987) describes it as making sounds to interact and get responses from others. Nunan (2003) defines it simply as using spoken words to share meaning. In this study, speaking is understood as a process of making meaning, which involves thinking about ideas and physically expressing them to communicate effectively in a specific situation (Burns & Joyce, 1997).

Speaking is complex and interactive because it involves both linguistic and cognitive factors. Thornbury (2005) states that good speaking requires accuracy in grammar, vocabulary, and pronunciation, fluency, and the use of complex language. Similarly, Common European Framework of Reference for Languages (CEFR) lists vocabulary range, accuracy, fluency, interaction, and coherence as its main parts (Council of Europe, 2020). These criteria align with how the IELTS Speaking test is graded, which focuses on four specific areas, namely Fluency and Coherence, Lexical Resource, Grammatical Range and Accuracy, and Pronunciation (British Council, n.d.). Therefore, the current study will use these four grading criteria as a guide to explore how learners perceive the AI tool in different aspects of speaking.

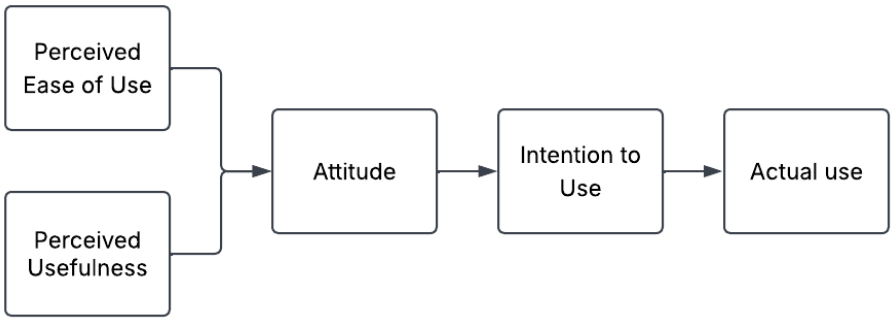
2.2. Speaking IELTS part 3

IELTS Speaking Part 3 is a two-way discussion between the examiner and candidate on abstract topics related to Part 2 cue cards. Unlike Part 1 (personal questions on familiar topics) or Part 2 (a 2-minute monologue), Part 3 requires the candidate to think with a higher order, such as idea expansion, argument justification, speculation, comparison, and evaluation (British Council et al., n.d.). The band descriptors clearly favor lexical resource, grammatical range and accuracy, fluency and coherence, and pronunciation (British Council, n.d.).

Vietnamese test-takers often report Part 3 as the most challenging section. They have difficulty in expanding ideas logically, using a wide range of academic vocabulary for unfamiliar and abstract topics, and responding spontaneously without rehearsal (Le, 2017). Rote memorization of model answers, often employed in traditional classrooms, is highly unlikely to facilitate spontaneous, complex discourse, leaving many candidates stuck at band 5.0-6.0 despite strong receptive skills (Vietnamnet, 2024).

2.3. Perception

In language learning, perception is defined as learners' beliefs, attitudes, and evaluations of tools, methods, or learning experiences (Ellis, 2008). According to Dörnyei (2009), learners' perceptions are crucial because they affect participation, persistence, and learning outcomes. In the study by Darma et al. (2023), EFL students' perceptions of technology were explored across three areas: their understanding of the tool, perceived advantages, and perceived disadvantages of



ChatGPT. Therefore, in this study, perception refers to how learners view and evaluate their experiences with ChatGPT-generated feedback for IELTS Speaking Part 3 practice. It includes both the benefits and challenges they perceive while using the tool.

2.4. Technology Acceptance Model (TAM)

This study uses the Technology Acceptance Model (TAM), originally developed by Davis (1989), as the theoretical framework (See in figure 1). The original TAM is made up of five constructs, which are Perceived Ease of Use (PEOU), Perceived Usefulness (PU), Attitude Towards using (AT), Behavioral Intention to use (BI), and Actual Use (AU). Davis (1989) explained that how easy and useful a tool seems (PEOU and PU) shapes a person's attitude toward it (AT). This attitude then influences their intention to use the tool (BI), which ultimately leads them to actually use it (AU).

Figure 1.

TAM from Davis (1989)

While TAM is comprehensive for evaluating technological adoption, this study intentionally narrows down to two main constructs, which are Perceived Usefulness (PU) and Perceived Ease of Use (PEOU). This adaptation is widely accepted by other research in the field. According to Granić and Marangunić (2019), who reviewed TAM in education, researchers often choose PU and PEOU because they are primary independent variables that affect learners' acceptance of a new tool. Similarly, Alsaedi (2025) highlighted that PU is the strongest predictor of the use of AI in learning languages. Due to the time constraints of the current investigation, focusing on PU enables a deeper understanding of ChatGPT's benefits and drawbacks.

This study uses this adapted model for qualitative research. The focus is on PU because it gives insight into how students subjectively weigh its strengths in helping them organize thoughts, develop ideas and vocabulary, fix grammar, and rehearse without pressure during IELTS Speaking Part 3 practice. Using the PU in TAM model allows the evaluation towards the adoption of AI in IELTS practice to be more structured and align with the IELTS four speaking criteria.

2.5. Previous studies

ChatGPT has become more popular in English language learning since its arrival in late 2022. Numerous studies report that ChatGPT is perceived as a useful, accessible, and non-judgemental tool for EFL learners to complete their language tasks. Students appreciate that it can give instant explanations, provide vocabulary, support grammar, and customize exercises (Alghasab, 2025; Alsalem, 2024; Teng, 2024). Many learners also value the less stressful

environment it creates, which encourages them to take risks and develop self-learning (Xiao & Zhi, 2023). However, it raises concerns over abuse, potential inaccuracies, cultural misinterpretation, and academic integrity (Baek et al., 2024; Warschauer et al., 2023). Consequently, to help learners manage these issues while studying independently, Van Horn (2024) and Li et al. (2024) find it important to provide proper training in prompt design and critically evaluate AI responses to maximize benefits while minimizing drawbacks.

Research on ChatGPT for practicing speaking is recent but promising. Studies by Alsalem (2024) and Hitokdana (2025) find that ChatGPT is considered effective in reducing speaking anxiety, increasing motivation, and providing flexibility in practice. The main reason is that AI creates an easy and comfortable environment where learners can practice repeatedly to improve their fluency without worrying about being judged by others. Furthermore, Nguyen and Nguyen (2025) found that using ChatGPT to prepare for IELTS Speaking helped Vietnamese EFL learners develop ideas, expand their vocabulary, and practice independently. As a result, participants reported greater confidence and improved speaking performance.

As for learner engagement, postgraduates using ChatGPT to practice IELTS Speaking increased practice frequency, chose better grammar, and were more engaged, despite having a lack of fully authentic human-like interaction (Zhang et al., 2025). Other studies highlight ChatGPT's ability to provide feedback that is instant and aligns with given criteria, such as fluency, coherence, and vocabulary (Meng, 2025; Sok & Shin, 2025). Limitations often include imperfect speech recognition, generic responses, and reduced trust when feedback feels inauthentic or inaccurate (Alghasab, 2025; Hitokdana, 2025; Jeon et al., 2024).

Previous research shows that ChatGPT helps with general speaking and IELTS writing practice. However, little is known about its use for IELTS Speaking Part 3, especially among Vietnamese English majors. Unlike regular learners, these students are trained to analyze language deeply and discuss complex topics, which makes their views on AI feedback uniquely valuable. To address this gap, this qualitative study explores how they perceive ChatGPT's feedback in this challenging test.

3. Methodology

3.1. Design of the study

To better understand learners' experiences and perceptions, this study adopted a qualitative research design (Creswell & Poth, 2018). According to DeJonckheere and Vaughn (2019), qualitative research is suitable for exploring participants' beliefs, attitudes, and understanding of contexts, including the use of AI tools in language learning. Since the study focused on students' previous experiences, a retrospective qualitative design was used, which allows participants to reflect on their use of ChatGPT.

3.2. Research Context

This study was conducted at an English-Medium Instruction (EMI) university located in Ho Chi Minh City, Vietnam. At this university, students are required to achieve at least an IELTS band score of 5.5 before registering for their major courses. This setting was considered relevant because the participants were already familiar with the IELTS examination and were motivated to improve their speaking ability for academic purposes.

3.3. Participants

Participants were chosen purposely, and they participated voluntarily. The study involved eight English-major undergraduates, including two males and six females, who had IELTS overall band scores ranging from 5.5 to 6.5. Participants needed to have previous experience using ChatGPT to practice IELTS Speaking Part 3 and receive feedback before the research began. After reading the information sheet and providing informed consent, all participants agreed to join voluntarily. Their ages ranged from 21 to 22 years. Creswell and Poth (2018) noted that this type of sample size is suitable because qualitative research focuses on a deep understanding rather than broad results.

3.4. Data Collection Instrument

The study used individual semi-structured interviews to collect data. This interview format is considered flexible because it allows researchers to ask follow-up questions and delve deeper into participants' responses, enriching the data compared with structured interviews (Kallio et al., 2016; Ruslin et al., 2022).

The interview guide mainly focused on the perceived usefulness of the TAM model, examining the benefits and limitations, based on the four IELTS Speaking Part 3 assessment criteria. Since the questions focused on prior experiences, the researchers asked participants to recall their independent practice sessions, describe the prompts they used, provide examples of ChatGPT's feedback, and explain how AI affected their speaking performance and mental readiness.

Individual interviews were used instead of focus groups to allow participants to freely discuss sensitive topics (Gray et al., 2020). All interviews were done through Zoom. This is because it was convenient to schedule and record interviews with participants with their consent while reducing geographical barriers (Gray et al., 2020; Oliffe et al., 2021). Vietnamese was used throughout the interviews, as it was the participants' first language. This helped them express themselves more naturally and reduced misunderstandings that might occur when speaking in a second language (Rolland et al., 2023). Each interview lasted around 30 to 40 minutes.

3.5. Data Analysis

All interviews were audio-recorded with participants' permission and transcribed. The Vietnamese transcripts were first translated into English using ChatGPT. Afterwards, two researchers reviewed and edited the translations independently to check their accuracy and make sure the wording sounded natural.

This study combined Thematic Analysis (Braun & Clarke, 2006) and qualitative Content Analysis (Hsieh & Shannon, 2005). Thematic Analysis was the main method used to identify and organize patterns in the data. The initial codes were deductively created based on two main sources. First, the coding was based on the four IELTS Speaking band descriptors, namely fluency and coherence, lexical resource, grammatical range and accuracy, and pronunciation. Second, the codes were derived from themes found in previous studies on language learning supported by AI. As for perceived advantages, codes such as immediate feedback and lexical support were adapted from studies of Meng (2025) and Sok and Shin (2025). The code for grammatical range and accuracy was drawn from existing studies about AI's ability to correct mistakes and give complex

structures at the same time (Kohnke et al., 2023; Su et al., 2023). In a similar vein, idea development and coherence were adapted from studies of Barrot (2023) and Yan (2023), who noted that AI can help generate ideas and expand arguments. The code for a secure practice environment was collected from the studies of Grab (2025) and Hitokdana (2025). In this study, a secure practice environment means having the convenience to practice repeatedly to become fluent. Regarding limitations, the code for speech recognition issues and overreliance on AI were derived from studies of Baek et al. (2024) and Jeon et al. (2024).

However, the analysis was not limited to these codes. New emerging themes were also identified from participants' responses. For example, themes such as prompt quality and learners' critical judgment toward AI feedback appeared during the coding process. Qualitative content analysis was also applied to categorize the findings and count how often they appeared. The mixed coding approach helps the study look at data from both existing frameworks and participants' real experiences (Braun & Clarke, 2006).

3.6. Trustworthiness

The interview questions were reviewed by two experts in TESOL and qualitative research to check whether they were clear and relevant to the study. The researchers also shared summarized findings with two participants so they could confirm that the interpretations reflected their actual experiences.

Interview transcripts, translation notes, and records were maintained throughout the study. In addition, two researchers coded the data independently and discussed any differences until they reached agreement. In addition, detailed information about the research setting, participants, and research procedures was included to help readers consider their application in further research.

4. Results

From the analysis of the semi-structured interviews, two main themes emerged. Those are related to students' perceptions of ChatGPT-generated feedback for IELTS Speaking Part 3. The themes were Advantages Enhancing Perceived Usefulness, Limitations Affecting Perceived Usefulness.

4.1. Advantages Enhancing Perceived Usefulness

Participants strongly emphasized several advantages when discussing how ChatGPT enhances the perceived usefulness of the IELTS speaking part 3. One key finding was the idea of a secure environment to practice. In this study, the majority of participants were satisfied with how accessible ChatGPT was for them to practice more often. P1 explained, "*Since classroom time is limited and valuable, I preferred testing my ideas and answers with AI first*." Similarly, P2 mentioned the good side of repeated practice by saying, *"There are questions I answered 4–5 times and still wasn't satisfied; a real teacher can't wait forever. But with AI, I just practice until I am fluent."* They appreciated being able to practice difficult questions repeatedly at any time without worrying about time limits or judgment from others. P8 shared similar ideas, "*Because nobody laughs and nobody remembers, it helps me dare to try more complex sentence structures that I normally wouldn't dare to use*." This means learners felt more comfortable taking risks when using ChatGPT as they did not worry about being judged. P5 and P7 added similar ideas that unlike human teachers, ChatGPT did not get tired of repeated practice. This means that learners could

practice the same answer many times until they felt more confident and fluent. This also made students become less concerned about wasting class time.

Almost all participants valued the immediate feedback provided by ChatGPT. They felt that receiving feedback right after speaking helped them notice mistakes while their ideas were still fresh in their minds. Some examples include *"because the feedback comes right away, I can still remember what I was trying to say and correct my mistakes more easily"* (P1), *"compared to waiting for teacher feedback, ChatGPT responds much faster, so I can practice more questions in a shorter amount of time."* (P2), and "*what I like most is that ChatGPT gives feedback at once, so I don't have to wait until the next class to know what I did wrong to adjust*" (P5). However, a participant expressed a concern about being too reliant on AI-generated answers, saying, "*I felt like it made me become lazy in coming up with my own ideas."*

For lexical resources, many participants agreed that ChatGPT was useful for supporting paraphrasing. This is because the AI suggested a wide range of alternative vocabulary and collocations for each specific case or for each personalized need (P2, P5, P6). To be more specific, P1 mentioned that he can learn topic-specific vocabulary from ChatGPT, especially in subjects such as technology, education, and the environment, without spending much time searching for this vocabulary online. In addition, P7 and P8 showed a positive attitude related to the fact that ChatGPT helped them overcome the habit of using repeated words by suggesting a variety of words or phrases that can be used in a similar context, with specific examples or even providing more controlled practice in case they felt that they still felt confused about using the words. For example, the participants (P6, P7, and P8) listed out some useful phrases given by ChatGPT to introduce opinions (in my opinion, from my perspective), give reasons (this is mainly because, one reason for this is that), provide examples (for example, for instance), and show contrast (however, on the one side, on the flip side). At the same time, they received sample sentences on how to use these phrases from ChatGPT. Benefits related to collocations were also stated by P1 and P4. They reported that before using ChatGPT, their knowledge of collocations was limited because materials on collocations were scarce.

ChatGPT was also reported to support participants with complex sentence structures. P1, P2, and P4, respectively, said that "*ChatGPT tends to replace my simple sentences with complex sentences*", "*it often gives me structures like although, while it is true that*", and "*conditional sentences are one of the most common structures I get from ChatGPT*". While P5 liked the idea that ChatGPT could help suggest varied structures in speaking Part 3, especially for opinion questions, P6 emphasized the awareness that ChatGPT raised for the practitioner when giving feedback to the grammatical resources and the suggested versions, which include different grammatical structures. P7 also noted that ChatGPT could help buy time before answering challenging prompts by using "*That's an interesting question*".

In terms of idea development and coherence, most participants appreciated ChatGPT for helping them develop ideas logically and connect their ideas cohesively. P3 said that "*the AI helps me develop the supporting details for my arguments by suggesting ideas related to explanations, causes or effects, which directs me to expand relevant ideas faster*". P4 reported that "*ChatGPT helps me think about the good and bad sides of things with specific explanation or examples or further consequences*", while P6 noted "*ChatGPT opens my mind since it considers new viewpoints which often followed by explanation*". P7 liked the way ChatGPT suggested to arrange

the two main ideas of each response in Speaking Part 3 from less important to more important or from less serious to more serious, which gradually shaped the logic of her speech. In addition, to ensure cohesion, the AI often provided linking words and discourse markers. P1 and P2 shared similar experiences, saying that "*I often receive words like however, for example, on the other hand, and on top of that, etc. to add to my answers*". In most of ChatGPT's feedback, cohesive devices were mentioned explicitly, reminding the speaker to be aware of linking ideas effectively. For example, P3 shared that to strengthen the ideas or organize the ideas in the response more logically, phrases such as one of the reasons is that, another reason is that, one possible solution can be, government should, etc. were often suggested.

4.2. Limitations Affecting Perceived Usefulness

Participants faced limitations that affected ChatGPT's usefulness, especially with prompt quality and speech recognition. P2, P6, and P7 reported that the quality of feedback depended a lot on how the prompts were written. P3 estimated that prompt quality could account for from 80 to 90% of the feedback's usefulness, noting, "*The prompt is basically what you give ChatGPT so it knows what you want it to do*." P8 also emphasized that "*a good prompt is what differentiates me from others using the same AI.*" When prompts were too broad or unclear, the feedback often felt general and not specific enough to be helpful. Because of this, participants gradually created their own ways of using the tool more effectively. For example, P2 learned to ask ChatGPT to evaluate responses based on IELTS band descriptors, while P6 spent time trying different prompt styles to see which ones produced better feedback.

Participants also shared different experiences with speech recognition. P3, P6, and P8 did not report any serious problems. Meanwhile, P1 and P2 were frustrated with occasional technical lag and speech misrecognition. This is because they interrupted their speaking flow and made it harder to maintain their ideas. However, instead of stopping, P5 viewed it as a "*challenge to adjust and pronounce more clearly and accurately*" Interestingly, P4 preferred typing instead of using the voice feature to avoid these problems completely.

In addition, participants realized that using ChatGPT could be a double-edged sword. While it provided feedback instantly, they recognized that they might become too dependent on it. P1 said, "*if I rely too much on ChatGPT, my brain just stops working*" when she found herself waiting for ChatGPT's answers instead of her own ideas first. P2 and P4 also shared similar ideas, such as "*I might lose my ability to think without the help of ChatGPT*" and "*I sometimes feel really lost when not using AI*". Because of this overreliance, learners tend to lack independent thinking. Consequently, they might blindly adopt all AI's suggestions, even when those cues are not accurate. Therefore, participants knew they needed to think critically about ChatGPT's feedback. Many did not fully trust the AI because they had received wrong or unreliable information. For instance, P3 and P6 reported encountering situations in which ChatGPT provided incorrect information or unverifiable links. P6 clearly said "*I've seen ChatGPT create fake links and wrong information."* Similarly, P8 mentioned that the AI sometimes suggested collocations that sounded outdated or changed the original meaning when correcting grammar.

As a result, participants had a tendency to double-check the feedback instead of accepting it immediately. P2 relied on reliable dictionaries such as Cambridge and Oxford, while P5, P6, and P7 checked AI-generated information against research articles and other online sources. These experiences suggest that participants generally saw ChatGPT as a tool to support learning rather

than something that could fully replace human teachers. P6 mentioned, " *My trust in ChatGPT is never 100%; I always need to check again."*

5. Discussion

5.1. Advantages Enhancing Perceived Usefulness

In line with the Perceived Usefulness construct of the TAM model, the qualitative data showed that ChatGPT helps reduce the cognitive and psychological load of IELTS Speaking Part 3. The majority of the participants (5 out of 8) found ChatGPT useful, especially because it created a secure environment for practice and provided immediate feedback. When using this tool, they are not afraid of being judged by a real person, which prevents them from losing face or feeling hurt. Instead, they can overcome anxiety when speaking and produce more coherent ideas or more fluent speech, thanks to the convenience of repeating answers. This preference is largely attributed to the demanding, spontaneous nature of Part 3, which often causes speaking anxiety. Similar findings were reported by Grab (2025) and Hitokdana (2025), who confirmed that removing human judgment can eliminate the fear of making mistakes and encourage students to keep practicing. In addition, participants particularly liked the fact that ChatGPT is tireless. For the same number of students, this flexibility was important since classroom practice is often limited by time and class size. This comfort can motivate them to practice frequently, reconsider their responses, recognize their problems, and adjust and revise them. They could also attempt more complex sentence structures until they felt more confident and fluent, or until they reached the day's practice time limit. Therefore, when using ChatGPT, learners can actually improve their speaking performance and confidence. This finding is consistent with Zhang et al. (2025), who reported that learners using ChatGPT practiced more frequently and became more engaged in IELTS preparation.

The findings also showed that most of the participants (6 out of 8) found ChatGPT helpful in suggesting a wider vocabulary range and in paraphrasing to avoid repetition when responding to the Speaking Part 3 question. In addition, collocations were a plus point reported by those users, helping them achieve a higher band score. This effectiveness may stem from ChatGPT's design as a generative AI model. Unlike traditional language-learning apps that offer only pre-programmed phrases, ChatGPT can analyze learners' natural, spontaneous speech and immediately suggest suitable alternatives based on the provided prompts, with detailed descriptions of the criteria and examples (Kohnke et al., 2023). Receiving these corrections while their original thoughts remain active in memory eases the process of internalizing advanced academic words or paraphrasing to avoid repetitive language use. As a result, the revision process was faster. Furthermore, ChatGPT also benefited participants by offering useful phrases to introduce opinions, give reasons and examples, show contrast, etc. (3 out of 8). Since AI also provided sample sentences and controlled practice, learners were able to use new expressions effectively (2 out of 8). These findings align with the results from Meng's (2025) and Sok and Shin's (2025) studies, which found that ChatGPT was useful for expanding topic-specific vocabulary and collocations, as well as helping learners avoid repeating words. This real-time, personalized language support helps students articulate abstract ideas in Part 3 with more confidence.

Furthermore, the interview findings highlighted the roles of ChatGPT in assessing and expanding learners' grammatical range. In the beginning, it raised participants' awareness of grammatical variety by evaluating their spoken responses against the IELTS criteria. For example,

P6 reported that this detailed feedback helped them realize their structural limitations. Three participants (P1, P2, P4) valued the AI's ability to diversify their sentence structures by replacing their simple sentences with more complex, content-specific alternatives such as conditional tenses or concession clauses. As highlighted by Teng (2024), this AI feature works well in this regard because it personalizes support to fit the context. Moreover, studies by Kohnke et al. (2023) and Su et al. (2023) found that AI helps correct mistakes and develop structures simultaneously based on the learner's original ideas. Although these studies focused on writing, the positive findings regarding correcting and expanding grammatical structures are similar. As the diversity of grammatical resources is one of the criteria for improving IELTS speaking band scores, this benefit is worth considering.

Finally, the findings showed that 6 out of 8 participants found that ChatGPT was effective at providing comments on content development. They also reported that ChatGPT helped them a lot improve the overall structure and the logical connections in their spoken responses. While Meng (2025) and Sok and Shin (2025) noted that ChatGPT provides helpful feedback on coherence, this study builds on this by showing how the AI does so in IELTS Speaking Part 3 practice. Specifically, to build this structural coherence, ChatGPT encouraged participants to develop their answers by explaining causes and effects, looking at advantages and disadvantages, and considering various viewpoints when answering Part 3 questions. This finding also supports Barrot (2023), who argued that ChatGPT helps EFL learners generate and expand their ideas. Even though this study focuses on the evaluation stage rather than the pre-stage, ChatGPT also plays a role in suggesting additional ideas to help learners think critically and select the most suitable one. Similarly, Yan's (2023) findings confirmed that ChatGPT assists learners in broadening their arguments, explaining them in greater detail, and exploring multiple perspectives. Although Barrot (2023) and Yan (2023) focused on second-language writing, this study shows that their findings also apply to IELTS Speaking Part 3 practice, where the learner's competence is expressed by the ability to provide strong arguments with relevant supporting details to convince the examiner. Although AI cannot replace human teachers, it can be a useful tool for IELTS Speaking Part 3 practice.

5.2. Limitations affecting Perceived Usefulness

Despite these benefits, the study shows that ChatGPT's usefulness was affected by technical limits and prompt design, reflecting the Perceived Ease of Use in the TAM framework. Most participants (5 out of 8) identified a primary limitation, which was prompt dependency. The gap in feedback quality stems from the fact that AI does not naturally know how to teach. If students do not give specific instructions, such as asking the AI to use IELTS band descriptors and to provide specific examples for well-qualified responses, along with guidance on how to comment on the response, ChatGPT simply gives vague, generic feedback, as noted by those five participants. The tool becomes less user-friendly when students must put a lot of mental effort into figuring out the perfect prompts. As Van Horn (2024) and Li et al. (2024) argued, students need training in prompt design to achieve the best possible results, as vague feedback often erodes learners' trust and interest. Therefore, to learn independently with ChatGPT, students must understand how to communicate effectively with AI by equipping themselves with AI principles and effective prompts.

Another problem was speech misrecognition, reflecting the technical barriers mentioned by Jeon et al. (2024). Half of the participants in this study felt frustrated when the app lagged or misheard their accents, mainly because this interrupted their train of thought. However, instead of giving up, learners actively adapted to these technical flaws. One student (P4) skipped the voice feature and switched to typing to receive more accurate feedback on the quality of their responses, excluding pronunciation, voicing techniques, and fluency, while the other (P5) treated the flaws as a chance to practice speaking more clearly. This shows that motivated learners will find ways to make the tool work for them despite speech misrecognition. From these efforts, they could improve their speech performance, especially by adjusting their pronunciation and voice clarity.

Besides that, several students (P1,P2,P4) were worried about becoming too dependent on ChatGPT because it sometimes provided incorrect information or unnatural phrases. Because ChatGPT sometimes makes up information or uses words out of context, it raises concerns about accuracy and academic integrity, as pointed out by Baek et al. (2024). Consequently, if students accept these responses without thinking critically, they might risk losing their critical thinking skills in the long run (Warschauer et al., 2023). To avoid this, nearly all students (6 out of 8) in this study adopted a strategy of always double-checking the AI's comments using their knowledge of grading criteria, reflective and critical thinking skills, and the foundations of language components or discourses. For comments that seemed confusing, P5, P6, and P7 shared that they would use AI to suggest reliable, relevant sources to read about the issue they are facing, so that they can judge if AI provides accurate comments. This supports Van Horn (2024) and Li et al. (2024), who argued that critically evaluating AI responses is absolutely necessary, emphasizing that learners need to actively judge and use their reflective skills to filter, verify, and choose the most accurate AI’s responses. Although checking facts takes time, it actually helps students become more independent, noted by Xiao and Zhi (2023).

Furthermore, this situation redefines the teacher's role. As Teng (2024) described, ChatGPT is a "companion, not enemies." Since AI can handle repetitive practice and basic vocabulary, human teachers are free to focus on higher-level thinking. Human instructors cannot be replaced because AI cannot replicate real human conversation or understand context perfectly. Teachers are essential not only for verifying AI feedback, but also for providing the real conversational pressure and emotional support needed for IELTS Speaking Part 3. Ultimately, ChatGPT is a powerful support tool, but it works best when combined with a human teacher's expertise.

6. Conclusion

This study explores undergraduates’ perceptions towards the use of ChatGPT’s feedback for IELTS Speaking Part 3 practice. Overall, the participants found ChatGPT to be highly convenient and useful for test practice. Without being rushed or judged, they appreciated ChatGPT for creating a secure environment where they could practice frequently and repeatedly until they felt truly fluent. The tool also helped them improve their speaking by giving instant feedback and suggesting advanced vocabulary.

However, students also found some difficulties when using the tool. Many struggled to write quality prompts, which often led to unhelpful feedback from the AI. Speech recognition errors were also quite common, which disrupted their speaking flow and caused frustration. In addition, students had difficulty in applying the advanced vocabulary suggested by ChatGPT naturally into

their speech. This is usually because the AI could not explain the specific context of the words like a real human instructor would.

These findings offer practical suggestions for both teaching and learning. Using ChatGPT for practicing fluency with lots of repetition and vocabulary building can be very effective. However, it needs to be combined with human guidance. Teachers should train students on how to write specific prompts and how to critically evaluate the AI's feedback, so they do not simply accept incorrect information. Because ChatGPT cannot act exactly like a real person in a conversation, human teachers are still essential. They are needed to verify the AI's information and guide students to improve their reflexes needed in the real IELTS Speaking test.

This study, however, remains limited. This is because the research only involved a small group of students from one university. Consequently, the results might not represent all EFL learners. Moreover, the study only focused on students' opinions and feelings, not their actual test scores. For future research, it would be helpful to study whether using ChatGPT actually improves students' IELTS Speaking scores over a longer period. It will also be valuable to train students to write better prompts because these can affect their learning outcomes.

Acknowledgements

We would like to express our sincere gratitude to all the students who participated in this study. Your honest responses and valuable time greatly contributed to the success of this research. Without your cooperation and generosity, this research would not have been possible. I would also like to thank the conference chairs and reviewers for their helpful comments on earlier drafts of the article.

#120 DIGITAL TRANSFORMATION IN FORMATIVE ASSESSMENT: THE DESIGN, IMPLEMENTATION, AND EVALUATION OF TESTMOZ FOR ENGLISH GENERAL COURSES AT VIETNAM AVIATION ACADEMY

Trinh Phan Tu[1]

Abstract

The ongoing digital transformation in higher education has exposed limitations in traditional self-study practices at Vietnam Aviation Academy (VAA), particularly as self-directed learning accounts for up to 30% of course assessment. In General English courses, paper-based homework frequently results in delayed feedback, increased administrative workload for instructors, and low levels of student engagement. Despite national efforts to promote Industry 4.0 integration in Vietnamese higher education, homework and self-study activities at many universities in general and VAA in particular remain largely manual and insufficiently aligned with digital learning environments.

To address challenges, the author needs streamlined digital tools that support rather than complicate the learning process. This study investigates the integration of Testmoz as a solution to modernize formative assessment. Specifically, it examines students' perceptions of Testmoz's contribution to feedback quality, learning motivation, homework completion, learner engagement, and autonomous learning. A mixed-methods design following the ADDIE model was employed. Data were collected from 182 undergraduate students who had used Testmoz for formative homework activities over one academic semester through a questionnaire comprising Likert-scale items and open-ended questions. Quantitative data were analyzed descriptively, while qualitative responses provided additional insights into students' learning experiences.

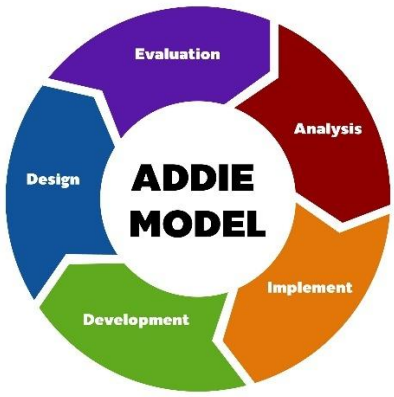
Moreover, the research aim is to clarify if digitizing these practices from designing Testmoz assignment can be able to not only provide students with more timely feedback but also reduce the daily workload for instructors. By implementing and evaluating Testmoz at the Vietnam Aviation Academy (VAA), the research also hopes to provide a practical roadmap for using digital tools to improve student outcomes in the Vietnamese higher education context.

***Keywords*:** digital transformation, Testmoz, assessment, feedback, student perceptions

1. Introduction

In the age of Industry 4.0 development, the digital transformation of many society fields including education has become a national priority in Vietnam. However, a profound gap remains

[1] *Foreign Language Faculty, Vietnam Aviation Academy, Ho Chi Minh City, Vietnam; Email: trinhpt@vaa.edu.vn*



between traditional assignment and classroom reality. At the Vietnam Aviation Academy (VAA) in addition, self-directed learning contributes 30% of the total course assessment, yet this significant component is still largely managed through traditional, paper-based methods. In General English courses, these manual processes often result in "feedback delays," where the gap between a student's effort and a teacher's response is too wide to be effective. This not only increases the administrative burden on instructors but also distracts student motivation.

According to the previous research on digital assessment of management systems (LMSs), It has primarily focused on comprehensive , online learning environments, or large-scale digital assessment platforms (Priyeti et al., 2025). While these studies demonstrate the potential of technology to support teaching and learning, less attention has been paid to lightweight, low-cost assessment tools that can be easily implemented in resource-constrained educational contexts. In particular, few studies have documented how such tools can be systematically designed, implemented, and evaluated using an instructional design framework within General English courses (Pariska & Rayusda, 2026).

To bridge this gap, an urgent need for streamlined digital tools is necessary that they can enhance, rather than complicate, the formative assessment process. This study has concentrated on investigating the integration of Testmoz, a digital platform which is lightweight and versatile, as a strategic solution with the combination of the ADDIE model from Culatta (2018) includings Analysis, Design, Development, Implementation, and Evaluation, the research documents the transition from paper-based homework to a digitized workflow.

Figure 1

ADDIE model

By digitizing homework and self-study activities, the research explores whether Testmoz can facilitate immediate feedback, alleviate the heavy workload of manual grading, and better align the curriculum with digital learning environments. Through the design, implementation, and evaluation of Testmoz at VAA, this study aims to provide a practical roadmap for educators seeking to modernize assessment practices and improve student outcomes by utilizing the digital transformation. From the certain purposes that are to measure the technical success and the "speed" of the new system, to identify the "human" benefit for teachers and to understand the psychological and professional impact on the learners themselves, the paper focuses on addressing 2 research questions.

Research Questions

1. How can Testmoz be designed to align with the General English syllabus at VAA, and to what extent does this implementation improve the timeliness of feedback and student completion rates?

2. How do students perceive the transition from manual to digital assessment, particularly regarding their motivation and control over their own learning?

2. Literature Review

This literature review has researched on digital transformation and formative assessment in higher education, with emphasis on feedback, instructional efficiency, and learner self-study. It also discusses digital assessment tools and instructional design frameworks, identifying a research gap in the ADDIE-based implementation of friendly platforms such as Testmoz in Vietnamese General English courses.

2.1 Digital Transformation in Higher Education

Digital transformation has been widely being recognized as a critical method of innovation and quality improvement in higher education systems worldwide. According to Selwyn (2016), digital transformation in education is not merely about adopting technology but about reshaping pedagogical practices, assessment models, and institutional cultures. In the current era of Industry 4.0, universities are increasingly required to integrate digital tools to enhance flexibility, student autonomy, and efficiency (Dang et al., 2024).

In Vietnam, the Ministry of Education and Training (MOET) has prioritized digital transformation as a strategic impression, particularly after the COVID-19 pandemic which is accelerated the adoption of online and blended learning models (Nhung et al., 2025). However, several researches show that while digital platforms are often used for content delivery, assessment practices, especially formative assessment, remain predominantly traditional and paper-based (Phuong et al., 2024). This mismatch reduces the overall effectiveness of digital learning environments limits students' access to timely feedback and opportunities for self-regulated studying.

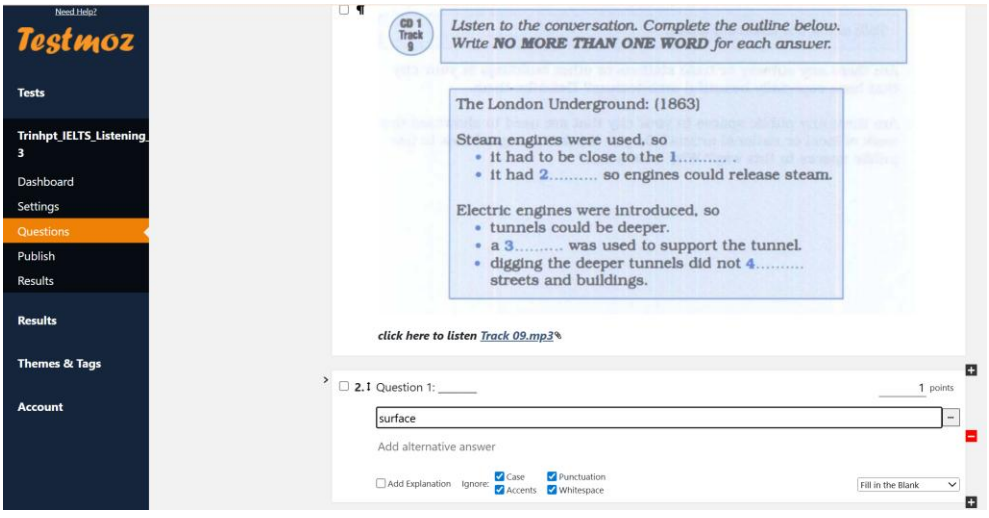
2.2 Formative Assessment and the Role of Feedback

The formative assessment plays extremely significantly in supporting learning by giving feedback provision that helps learners identify gaps between current and desired performance (Black & Wiliam, 1998). The quick and effective formative feedback is featured by timeliness, clarity, and actionability (Hattie & Timperley, 2007). When delaying in feedback, as is common in paper-based homework systems, its pedagogical value is crucialy diminished.

Digital formative assessment tools have been clarified to address this issue by permitting immediate or rapid feedback, thereby enhancing student engagement and learning outcomes (Nicol & Macfarlane-Dick, 2006). In language learning contexts, online quizzes and automated

assessment systems are particularly effective in reinforcing grammar, vocabulary, and reading comprehension skills (Chapelle & Douglas, 2006).

2.3 Digital Assessment Tools and Instructor Workload



The increasing administrative workload associated with assessment and grading is one of the major challenges that instructors in higher education face nowadays. The study of "Changing assessment towards a new assessment paradigm using ICT" indicates that automated and semi-automated digital assessment tools can significantly reduce grading time, minimize repetitive tasks, and allow instructors to focus more on pedagogical decision-making (Redecker & Johannessen, 2013).

Platforms such as Moodle quizzes, Google Forms, Kahoot, and Testmoz have been widely adopted due to their ease of use and automatic scoring features (Bennett, Dawson, Bearman, Molloy, & Boud, 2017). Lightweight tools like Testmoz are particularly suitable for educators with the limitation of the technical infrastructure, as they do not require complex learning management systems while still supporting large-scale formative assessment.

For specialized assessments such as rearrangement or sentence transformation within the "Fill in the Blank" format, Testmoz offers rigorous evaluation settings. To ensure exact grading and linguistic accuracy, teachers can set four distinct validation modes: 1. Case Sensitivity: Distinguish between upper and lowercase characters; 2. Accents: Validate the correct use of diacritics; 3. Punctuation: Require exact matches for all grammatical symbols; 4. Whitespace: Monitor the specific spacing between words or characters. It has been used in diverse educational settings due to its ease of use and versatility.

Figure 2

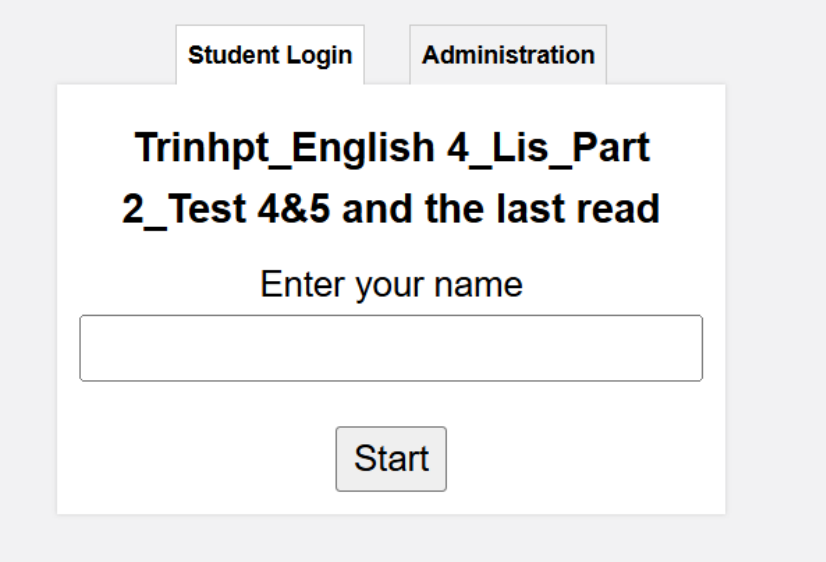
Testmoz interface displaying the four validation settings

Unlike some other quiz platforms, Testmoz does not require students to create accounts just click on the link type their name and can easily get access to do the homework, which reduces barriers to participation and is very friendly to use. Having used Testmoz for over 5 years since

the epidemic, the author has found that Testmoz supports continuous assessment and improves homework submission rates. Moreover, its ability to monitor student responses and generate performance reports helps educators to identify areas where learners may need some more additional support.

Figure 3

Student login interface on Testmoz highlighting account-free access via direct link and name entry



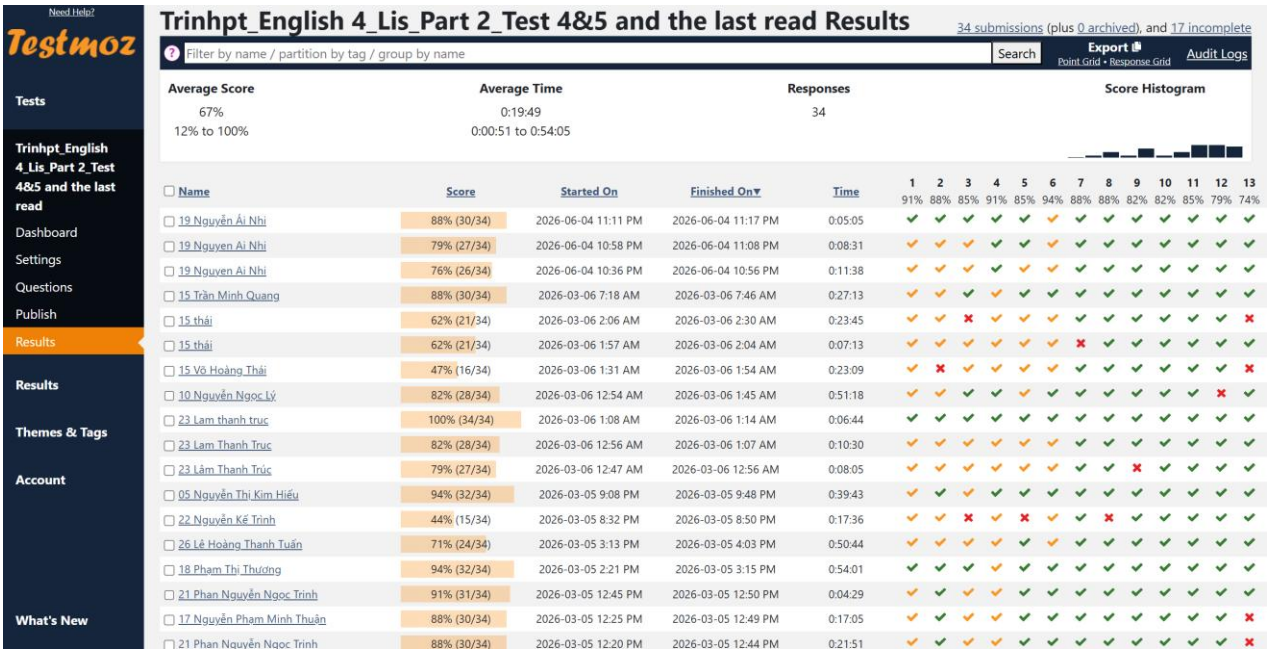


Figure 4

Testmoz administrative dashboard displaying aggregated scores, completion times, and individual item responses for educator analysis

2.4 Student Motivation, Autonomy, and Perceptions of Digital Assessment

Learner perception is a key factor which influences the success of digital assessment implementation. Studies grounded in Self-Determination Theory suggest that digital tools are able to enhance motivation by supporting autonomy, competence, and control over learning pace (Deci & Ryan, 2000). Having immediate feedback and being able to monitor the assignment progress, students can be more likely to take responsibility and interest for their learning (Zimmerman, 2002).

In the Vietnamese EFL context, Nguyen and Dang (2022) have found that students respond positively to online quizzes and digital homework, citing increased convenience, reduced anxiety, and greater transparency in assessment. However, successful adoption depends on clear alignment with course objectives and adequate guidance from instructors.

2.5 Research Gap

While existing literature highlights the benefits of digital formative assessment, there is limited empirical research focusing on lightweight digital tools such as Testmoz in Vietnamese higher education, particularly in General English courses where self-study accounts for a substantial proportion of course assessment. Moreover, few studies adopt a systematic instructional design framework such as the ADDIE model to document the design, implementation, and evaluation of such tools. This study seeks to address this gap by examining

both technical efficiency and human-centered impacts on instructors and students at Vietnam Aviation Academy.

3. Methodology

3.1 Research Design

The study combined the ADDIE instructional design model with a convergent mixed-methods approach, in which quantitative and qualitative data were collected at the end of the implementation and interpreted together to evaluate students' perceptions of Testmoz. The project followed the ADDIE model:

- Analysis
- Design
- Development
- Implementation
- Evaluation

The study involved 182 undergraduate students enrolled in General English courses at Vietnam Aviation Academy. Participants represented multiple English classes and completed the survey voluntarily after using Testmoz for formative homework activities over one academic semester. Ramdomly, the proportion of female students and male students accounted for 50% with 91 students for each gender. Smartphones emerged as the most frequently used device for accessing Testmoz with the percentage of 53%, followed by laptops with 45%, indicating the mobile-friendly nature of the platform.

The questionnaire consisted of Likert-scale items measuring ease of use, engagement, motivation, feedback effectiveness, homework consistency, and continuance intention. Open-ended questions explored learner experiences and suggestions. Internal consistency reliability could be assessed using Cronbach's Alpha to ensure acceptable reliability of the survey instrument.

3.2 Context and Participants

Participants include 182 undergraduate students enrolled in General English courses at VAA. These students, taking English 3 or 4, are familiar with Testmoz and have used it for at least one semester on laptops, smartphones, or tablets to complete quizzes as homework with not only reading and listening but also writing and speaking assignment.

3.3 AI-Supported Assessment Model

Digital quizzes were developed on Testmoz. Features included:

- Automated scoring
- Immediate feedback display
- Randomized question order
- Time limits
- Exportable performance reports

While not generative AI, the system automated assessment processes traditionally performed manually. AI writing tools were discussed in class within ethical guidelines, emphasizing transparency and proper use.

3.4 Ethical Considerations

Participation was voluntary. No personally identifiable information was published. Data were anonymized. Students were informed about data usage and consented prior to survey participation.

4. Findings

4.1 Student Perceptions of Testmoz

Based on the survey results, the data was exported to Excel and categorized into three groups: scores of 1 and 2 were classified as 'Disagree', 3 as 'Neutral', and 4 and 5 as 'Agree'. This grouped data was then analyzed to produce the results shown in Table 1 below:

Table 1

Student Perceptions of Testmoz (N = 182)

Dimension	Disagree (%)	Neutral (%)	Agree (%)	Interpretation
Ease of Use	4.5	8.4	87.1	The vast majority of students found Testmoz easy to use, with only a small proportion reporting difficulties. This indicates that the platform was highly accessible and user-friendly for most learners.
Engagement	5.6	9.6	84.8	A large majority of students reported that Testmoz made homework more engaging than traditional paper-based assignments. The high level of agreement suggests that the platform increased students' interest and participation in learning activities.
Digital Preference	5.5	8.9	85.6	Most students preferred digital assignments over traditional paper-based homework. The high level of agreement indicates strong acceptance of digital formative assessment and suggests that students valued the flexibility and convenience offered by Testmoz.
Motivation	4.9	12.0	83.1	Most students agreed that Testmoz increased their motivation to complete assignments. The high level of agreement suggests that features such as convenience, accessibility, and immediate feedback encouraged greater participation in learning activities.
Feedback Helpfulness	5.6	8.9	85.5	Most students perceived the feedback provided by Testmoz as helpful for identifying mistakes and improving their learning. The high level of agreement highlights the value of immediate feedback in supporting self-monitoring and learning improvement.
Completion Consistency	4.4	8.8	86.7	A large majority of students reported completing assignments more consistently when using Testmoz. The high level of agreement suggests that the platform encouraged regular participation and supported students in maintaining their study routines.

Dimension	Disagree (%)	Neutral (%)	Agree (%)	Interpretation
Continuance Intention	3.8	7.7	88.5	The overwhelming majority of students expressed a desire to continue using Testmoz in future English courses. This strong level of support suggests high overall satisfaction with the platform and its perceived value for learning.

In addition, the mean scores from the five-point Likert scale further supported these positive perceptions. Continuance Intention received the highest mean score (M = 4.47), followed by Ease of Use (M = 4.43), Completion Consistency (M = 4.38), Feedback helpfulness (M = 4.30), and Motivation (M = 4.28). Across all surveyed items, over 83% of respondents selected either "Agree" or "Strongly Agree." Specifically, 70% of the total respondents opted for "Strongly Agree," while 30% selected "Agree." These high percentages reflect strong consensus and internal consistency across the dataset.

Moreover, these findings indicate that students adapted favorably to the transition from paper-based assignments to digital formative assessment. While ease of use scored the highest quantitatively, the qualitative responses suggest that the helpfulness of immediate feedback was a primary driver of student satisfaction, encouraging continued participation due to rapid access to results. However, a minor yet important trend emerged regarding a small group of students who reported lower satisfaction levels. This minority likely represents learners facing technological barriers or lower digital literacy. Although they constituted a small percentage of the sample, their feedback highlights the necessity of providing targeted support to ensure equitable participation in digital learning environments.

And some qualitative evidence open-ended responses consistently emphasized the speed and convenience of the platform: “I like Testmoz the most because it gives quick feedback on scores.”; “Online tasks can be done anywhere and quickly.”; “Reviewing the results and mistakes helps me identify my weaknesses and learn from them.” → These comments demonstrate that Testmoz improved administrative efficiency while simultaneously promoting learner autonomy by enabling students to independently monitor and evaluate their own progress.

4.2 Challenges and Areas for Improvement

Although student perceptions were generally positive, several challenges emerged from the open-ended responses.

Table 2

Main Challenges Reported by Students

Theme	Representative Comments	Educational Implication
Internet Connectivity	“The internet connection can affect the test.”	Reliable infrastructure remains essential.
Connectivity Anxiety	“I’m worried about losing the connection during the test.”	Digital assessment may introduce new forms of stress.
Limited Explanatory Feedback	“I want the app to point out mistakes more clearly.”	Automated scoring should be supplemented with pedagogical feedback.

Theme	Representative Comments	Educational Implication
Need for More Practice Activities	"I would like more practice exercises."	Students value opportunities for additional learning and revision.

The most frequently reported challenge concerned Internet stability. Students recognized the convenience of online assessment but also expressed concern about technical interruptions during quizzes. This finding suggests that successful digital transformation depends not only on software adoption but also on reliable technological infrastructure.

Another recurring theme was the demand for explanatory feedback. While students appreciated automatic scoring, several respondents expressed a desire for more detailed explanations of incorrect answers. This indicates that digital tools can improve efficiency but cannot fully replace the instructional role of teachers.

5. Discussion

The purpose of this study was to investigate the implementation of Testmoz in General English courses at Vietnam Aviation Academy (VAA) and to examine students' perceptions of the transition from paper-based to digital formative assessment. The discussion is organized around the two research questions.

5.1 Discussion of RQ1: Designing and Implementing Testmoz for Formative Assessment

The first research question explored how Testmoz could be aligned with the General English syllabus at VAA and whether its implementation improved formative assessment practices.

The findings suggest that Testmoz successfully supported the transition from traditional paper-based homework to a digital assessment environment. The platform enabled instructors to create not only quizzes that corresponded directly to vocabulary, grammar, reading, and listening objectives but also short answers for writing and collecting assignement of essay and speaking within the General English curriculum. More importantly, the automated scoring system provided immediate feedback, a feature that students consistently identified as the most valuable aspect of the platform.

Table 3

Summary of Student Perceptions

Variable	Mean Score
Ease of Use	4.43
Feedback Helpfulness	4.30
Motivation	4.28
Homework Completion	4.38
Continuance Intention	4.47

The high ratings for feedback helpfulness (M = 4.4) and continuance intention (M = 4.4) indicate that students valued the speed and convenience of digital assessment.

The ranging from 4.28 to 4.47 on a five-point Likert scale indicates extremely positive student perceptions across all measured dimensions. Continuance intention received the highest rating (M = 4.47), suggesting that students were strongly willing to accept and continue using Testmoz in future English courses. Ease of use (M = 4.43) and homework completion (M = 4.38) also received particularly favorable evaluations, showing that students found the platform accessible and believed it helped them complete assignments more conveniently.

In addition, these findings support the argument of Hattie and Timperley (2007) that timely feedback plays a critical role in improving learning outcomes. Similarly, Nicol and Macfarlane-Dick (2006) emphasized that rapid formative feedback promotes self-regulated learning by helping learners identify weaknesses and adjust their study strategies.

5.2 Discussion of RQ2: Student Perceptions, Motivation, and Learner Autonomy

The second research question mainly focused on how students perceived the transition from manual to digital assessment, particularly regarding motivation and control over their own learning because of the marks self-directed learning that accounts for up to 30% of course assessment.

Overall, student perceptions were strongly positive. Most respondents described Testmoz as easy to use, convenient, and accessible. Open-ended responses frequently referred to “quick feedback,” “easy use,” and “learning anywhere,” demonstrating that digital assessment was viewed as more flexible than traditional homework.

The findings further suggest that Testmoz enhanced learner autonomy. Students reported that immediate access to results helped them identify mistakes independently and monitor their own progress. This supports the view that formative assessment is most effective when learners actively engage with feedback rather than passively receive grades. The ability to complete quizzes outside class and instantly review performance encouraged greater ownership of learning.

Another noteworthy finding concerns mobile learning. A substantial proportion of students accessed Testmoz through smartphones, indicating that the platform functioned effectively within a Mobile-Assisted Language Learning (MALL) environment. This finding aligns with previous research suggesting that mobile accessibility increases learning flexibility and encourages continuous engagement beyond classroom boundaries. In the context of VAA, smartphone compatibility appears particularly valuable because it allows students to complete self-study activities at convenient times and locations.

Despite these positive perceptions, several challenges emerged. The most common concern involved unstable Internet connections. Students expressed anxiety about potential disconnections during quizzes, suggesting that digital assessment introduces new forms of technological stress that are absent in paper-based environments. Additionally, some students indicated that numerical scores alone were insufficient and requested clearer explanations of errors. These findings demonstrate that successful digital transformation requires attention not only to technological functionality but also to learner support and confidence.

5.3 The E-SAFE Framework for Responsible Digital Assessment

Based on the findings, this study proposes the E-SAFE framework as a practical model for implementing digital formative assessment in higher education.

Table 4

The E-SAFE Framework

Component	Description	Evidence from This Study
E – Ethical Governance	Transparency, informed consent, responsible use of learner data	Low student awareness of data privacy issues
S – Sustainable Infrastructure	Reliable and scalable digital systems	Concerns regarding unstable Internet connections
A – Academic Integrity Protection	Assessment design that discourages misconduct	Time limits and randomized questions reduced opportunities for cheating
F – Feedback Transparency	Clear and meaningful explanations of performance	Students requested more detailed explanations of mistakes
E – Equity	Inclusive access regardless of device or location	Successful use through both smartphones and laptops

The framework extends beyond technological adoption by emphasizing the human and ethical dimensions of digital assessment. In particular, the student comments concerning Internet reliability directly support the need for Sustainable Infrastructure and Equity. Institutions should therefore consider flexible assessment settings, backup submission procedures, and mobile-friendly design to reduce technology-related barriers.

Similarly, the demand for explanations rather than simple scores highlights the importance of Feedback Transparency. Automated grading should be supplemented by teacher interpretation and discussion so that students understand not only what is wrong but also why it is wrong.

The findings also raise broader ethical concerns. Although students demonstrated strong acceptance of digital assessment, only a minority reported understanding how educational platforms store and manage personal data. This suggests that digital literacy training should accompany technological implementation. Universities must ensure that students understand both the benefits and responsibilities associated with digital learning environments.

Finally, while AI-supported assessment tools create opportunities for efficiency, they should not replace professional judgment. Human oversight remains essential for interpreting learner needs, addressing misconceptions, and maintaining academic integrity. The most effective approach appears to be a balanced model in which automated systems handle routine assessment tasks while instructors focus on pedagogical guidance and learner development.

6. Conclusion

6.1 General view

This study investigated the design, implementation, and evaluation of Testmoz as a digital formative assessment tool in General English courses at Vietnam Aviation Academy (VAA). The findings provide evidence that Testmoz is a lightweight and low-cost digital assessment platform and can support the ongoing digital transformation of higher education while remaining practical for institutions with limited technological resources.

Regarding the first research question, the study strongly indicated that Testmoz could be effectively matched the General English syllabus through the development of curriculum-based quizzes targeting not only vocabulary, grammar, reading, and self-study activities but also writing and speaking. The implementation improved the speed of formative feedback and reduced instructor workload through automated grading and reporting functions. Digital transformation helps teachers spend less time on routine administrative tasks and more time on instructional support and curriculum refinement.

Regarding the second research question, students generally perceived the transition from paper-based homework to digital assessment positively. High ratings for ease of use, feedback helpfulness, homework completion, and continuance intention indicate strong acceptance of the platform. Qualitative responses further revealed that immediate feedback, convenience, and accessibility were the most valued features. Many students reported that Testmoz helped them identify mistakes, monitor learning progress, and take greater responsibility for their own learning, suggesting enhanced learner autonomy and self-regulation.

Beyond the local context, the study proposes the E-SAFE framework (Ethical Governance, Sustainable Infrastructure, Academic Integrity Protection, Feedback Transparency, and Equity) as a practical model for guiding responsible digital assessment implementation. The framework emphasizes that successful digital transformation requires not only technological adoption but also attention to ethical governance, equitable access, meaningful feedback, and sustainable infrastructure.

Overall, the study argues that digital formative assessment should be viewed not merely as a technological innovation but as a pedagogical strategy that enhances learning efficiency, supports learner autonomy, and improves instructional effectiveness. For emerging universities seeking sustainable pathways toward digital transformation, Testmoz provides an accessible example of how assessment practices can be modernized without requiring expensive or complex technological solutions.

6.2 Limitations

Here are some of the limitations that can be recognized. First, the study relied primarily on self-reported student perceptions rather than longitudinal measures of academic achievement. Second, the research was conducted at a single institution and within General English courses only. As a result, the findings may not be fully generalizable to other educational contexts, disciplines, or student populations. Third, the study focused on the implementation of one digital assessment platform and did not compare Testmoz with alternative systems. Therefore, it is not possible to determine whether the reported benefits are unique to Testmoz or representative of digital formative assessment tools more broadly. Finally, although issues related to academic integrity, digital literacy, and data privacy were discussed, these dimensions were explored through student perceptions rather than objective behavioral measures.

6.3 Contributions and Future Directions

This study contributes to the growing body of research on digital formative assessment by presenting a sustainable, low-cost, and scalable model for emerging universities. The findings demonstrate that Testmoz can enhance feedback efficiency, support learner autonomy, reduce instructor workload, and function effectively within mobile learning environments. The proposed

E-SAFE framework also provides a practical and conceptual guide for responsible digital transformation in higher education.

Building on these contributions, future research should examine the long-term impact of digital formative assessment on language learning outcomes, compare different assessment platforms, and explore integration with AI-enhanced learning systems, learning analytics, and Mobile-Assisted Language Learning (MALL). Further investigation into ethical issues, academic integrity, and self-regulated learning will help ensure that digital assessment practices remain effective, equitable, and sustainable in evolving educational contexts.

Survey Title: Student Perceptions of Using Testmoz for General English Homework

Participants: 182 students

Type: Mixed-format (Likert scale + open-ended)

Section 1: Background Information

1. Gender: ☐ Male ☐ Female ☐ Other
2. Device used to access Testmoz: ☐ Smartphone ☐ Laptop ☐ Tablet ☐ Other

---

Section 2: Student Experience with Testmoz

No.	Statement	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
1	I found Testmoz easy to use.	☐	☐	☐	☐	☐
2	Testmoz made English homework more engaging.	☐	☐	☐	☐	☐
3	I prefer doing homework on Testmoz over paper-based assignments.	☐	☐	☐	☐	☐
4	I completed my homework more regularly when using Testmoz.	☐	☐	☐	☐	☐
5	Receiving instant feedback helped me learn better.	☐	☐	☐	☐	☐
6	I feel more motivated to complete assignments on Testmoz.	☐	☐	☐	☐	☐
7	Testmoz helped me understand my mistakes.	☐	☐	☐	☐	☐
8	I would like to continue using Testmoz in future English classes.	☐	☐	☐	☐	☐

Section 3: Open-Ended Questions

1. What did you like most about using Testmoz for English 3 homework?
2. What difficulties did you face (if any) while using Testmoz?
3. In what ways do you think Testmoz helped improve your English learning?
4. Do you have any suggestions for improving digital homework tools like Testmoz?

122 ENGLISH TEACHER IDENTITY AND AGENCY IN A VIETNAMESE EDUCATIONAL CONTEXT: RESPONDING TO ESL-ORIENTED EXPECTATIONS

Thanh Hai Ha[1], Thi Thu Hien Nguyen [2]

Abstract

This study investigates how upper secondary English teachers in Vietnam respond to emerging ESL-oriented expectations within the country's evolving English language education context. Although recent educational directions increasingly emphasize communicative and use-oriented English teaching, limited research has explored how teachers interpret such expectations before they become fully institutionalized. The study examines how teachers perceive ESL-oriented expectations and how these perceptions shape their professional identity and agency. A qualitative research design was employed, using semi-structured interviews with eight female secondary English teachers working in urban public schools in Vietnam. The data were analyzed using reflexive thematic analysis. The findings indicate that teachers associate ESL-oriented expectations primarily with communicative teaching and authentic language use, while simultaneously experiencing uncertainty due to limited implementation guidance. Participants anticipated shifting from knowledge transmitters to facilitators of communication and learning, yet also foresaw tensions related to exam-oriented systems, large class sizes, and uneven student proficiency. Although teachers anticipated adapting professionally, their agency appeared strongly mediated by institutional and contextual constraints. The study contributes to research on teacher identity and agency by showing how professional meaning-making emerges not only through emerging ESL-oriented educational change, but also through teachers' interpretations of anticipated policy expectations. Given the context-specific nature of the study, the findings should be understood as reflecting the experiences of female English teachers working in urban public secondary schools rather than Vietnamese teachers more broadly.

***Keywords*:** teacher identity, professional agency, ESL-oriented expectations, educational change, Vietnam

1. Introduction

English language education has undergone significant transformation in many contexts, particularly through increasing emphasis on communicative and use-oriented approaches to English learning. In Vietnam, this shift is reflected in ongoing efforts to move beyond an exam-oriented EFL model toward approaches that emphasize real-life language use and communication. However, such changes are often articulated as broad orientations rather than fully specified and systematically implemented policies, leaving teachers to interpret and respond to evolving expectations in their own ways.

In this study, the term ESL-oriented does not suggest that Vietnam is becoming a traditional ESL society in which English functions as a dominant societal language. Rather, it refers to

[1] *Corresponding author, Doctor, Department of Foreign Languages, Quy Nhon University, Gia Lai, Vietnam; hathanhhai@qnu.edu.vn*
[2] *Assoc. Prof. Dr, Department of Foreign Languages, Quy Nhon University, Gia Lai, Vietnam.*

emerging expectations for English to serve increasingly as a medium for communication, participation, and learning within educational contexts. The term therefore captures a pedagogical and functional orientation toward English use rather than a complete sociolinguistic transition.

Within this context, research on language teacher identity provides a useful lens for understanding how teachers engage with change. Teacher identity has been widely conceptualized as dynamic, socially constructed, and context-dependent (Beijaard et al., 2004; Varghese et al., 2005). Rather than being fixed, identity is continuously negotiated through teachers' interactions with institutional discourses, professional experiences, and sociocultural expectations. From this perspective, changes in educational orientations - such as a shift toward communicative or ESL-oriented approaches - are likely to reshape how teachers understand their roles and responsibilities.

While teacher identity helps explain how teachers understand their professional roles, the concept of teacher agency provides insight into how they respond to educational change in practice. From an ecological perspective, agency is not an inherent capacity but an achievement emerging from the interaction between individuals and their contexts (Priestley et al., 2015; Biesta & Tedder, 2007). Teachers are therefore not passive implementers of policy, but active agents who interpret, adapt, and negotiate pedagogical expectations within the constraints and affordances of their working environments. Understanding teachers' anticipatory responses to educational reform is important because teachers' interpretations often shape how policy directions are eventually enacted in practice. Examining teachers' perceptions at this emerging stage therefore provides insight not only into possible implementation challenges, but also into how educational change is interpreted and imagined before formal institutionalization occurs.

At the same time, a substantial body of research has documented tensions between policy expectations and classroom realities. Teachers' beliefs, prior experiences, and contextual conditions often shape how educational reforms are interpreted and enacted, leading to discrepancies between intended policy goals and actual classroom practices (Borg, 2006). From a policy enactment perspective, educational change is not implemented uniformly but interpreted and negotiated differently across local contexts (Ball et al., 2012). Such tensions become particularly visible in contexts where teachers are expected to adopt new professional roles without sufficient structural support, institutional alignment, or clear implementation guidance.

In Vietnam, recent studies have highlighted similar challenges, including large class sizes, exam-oriented assessment systems, and uneven student proficiency levels, all of which complicate the implementation of communicative approaches (Do, 2022; Vu & Burns, 2014). While these studies provide valuable insights into the difficulties of reform implementation, they have largely focused on enacted practices rather than on how teachers perceive and respond to emerging expectations before such expectations become clearly institutionalized.

This points to an important gap in the literature. While teacher identity and agency have been extensively studied, less attention has been paid to how these constructs are shaped in contexts where policy directions remain evolving and not yet fully institutionalized. In such contexts, teachers are not responding to clearly defined requirements, but to anticipated and interpreted expectations, which may influence how they understand their roles and prepare for change.

Addressing this gap, the present study examines how English teachers in a Vietnamese educational context perceive, interpret, and respond to emerging ESL-oriented expectations. By focusing on teachers' perceptions, anticipated challenges, and projected responses, the study seeks to contribute to a more nuanced understanding of educational change as a process shaped not only through implementation, but also through interpretation and anticipation.

To address these issues, the study investigates how English teachers perceive and respond to emerging ESL-oriented expectations, with particular attention to professional identity, anticipated challenges, and professional agency. With this aim, the study addresses the following research questions

RQ1. How do English teachers in Vietnam perceive their changing roles in response to emerging ESL-oriented expectations?

RQ2. What tensions and challenges do they anticipate in responding to ESL-oriented expectations?

RQ3. How do they anticipate exercising professional agency in negotiating policy expectations and classroom realities?

While previous studies have primarily examined teachers' experiences after communicative reforms have been implemented, considerably less attention has been paid to how teachers interpret and make professional meaning from anticipated ESL-oriented expectations before such reforms become fully institutionalized. This study addresses this earlier stage of educational change.

2. Literature Review

2.1. Vietnam's shift toward an ESL-oriented educational context

English language education in Vietnam has undergone substantial transformation in recent years as the government increasingly positions English as a strategic resource for international integration, economic development, and educational modernization. This shift is reflected in recent policy documents such as Kết luận số 91-KL/TW (Bộ Chính trị, 2024) and Quyết định số 2371/QĐ-TTg (Thủ tướng Chính phủ, 2025), which articulate the national vision of gradually bringing English into schools as a second language. These policy directions indicate a movement away from a traditional exam-oriented EFL model toward a more communicative and use-oriented approach to English education.

Within a conventional EFL framework, English is generally treated as a discrete academic subject emphasizing grammar, vocabulary, and examination performance. By contrast, an ESL-oriented perspective tends to position English more functionally, emphasizing communication, participation, and practical language use within educational and social contexts. However, Vietnam cannot yet be considered a fully developed ESL society in the traditional sense. Rather, the country appears to be moving toward an ESL-oriented educational context, where English is increasingly expected to function as a communicative and educational resource within schooling.

Recent scholarships suggest that this transition involves more than curriculum reform alone. Ngo (2023), for example, argues that English in Vietnam is increasingly associated with employability, mobility, and globalization, yet the implementation of communicative teaching remains uneven across educational contexts. This indicates that policy aspirations alone are

insufficient to transform classroom practice unless accompanied by pedagogical, institutional, and professional change.

Educational reform does not occur uniformly across contexts. Policy enactment perspectives emphasize that schools and teachers actively interpret and negotiate policy within local institutional realities rather than mechanically implementing official directives (Ball et al., 2012; Braun et al., 2011). This is particularly relevant in Vietnam, where differences in resources, assessment systems, and institutional conditions may shape how ESL-oriented expectations are understood and enacted.

Such changes inevitably place English teachers at the center of educational transition. As English becomes increasingly positioned as a resource for communication and participation rather than solely as an object of study, teachers may be expected to assume new pedagogical and professional roles. Understanding how teachers perceive and respond to these emerging expectations therefore becomes an important area of inquiry.

2.2. Teacher identity and the redefinition of professional roles

The concept of teacher identity has become increasingly important in research on educational reform because it helps explain how teachers understand themselves and their professional roles within changing institutional contexts. Beauchamp and Thomas (2009) conceptualize teacher identity as a dynamic and complex construct shaped by personal experience, professional interpretation, and contextual influences rather than fixed individual characteristics. From this perspective, educational change often requires teachers not only to adopt new practices but also to renegotiate their professional sense of self.

Research in language teacher identity has similarly emphasized the socially situated and continuously evolving nature of identity construction. Barkhuizen (2016, 2017) argues that language teacher identity is constructed and reconstructed through interaction with institutional discourses, policy expectations, classroom experiences, and sociocultural contexts. Language teachers are therefore not passive recipients of reform; rather, they actively interpret and negotiate what it means to teach language within specific educational environments.

In contexts of educational transition, identity is often future-oriented. Ruohotie-Lyhty (2018) suggests that teachers construct imagined professional selves in response to anticipated expectations and projected professional demands, while Zembylas (2003) highlights the emotional dimensions accompanying identity reconstruction during periods of change. These perspectives are particularly relevant in Vietnam's emerging ESL-oriented context, where teachers may increasingly be expected to move beyond traditional knowledge-transmission roles and adopt more communicative and facilitative professional identities.

In the present study, teacher identity serves as a lens for examining how teachers perceive and reconstruct who they are becoming in response to emerging ESL-oriented expectations.

2.3. Professional agency and educational change

Professional agency provides insight into how teachers respond to educational change within the opportunities and constraints of their professional contexts. Priestley, Biesta, and

Robinson (2015) conceptualize teacher agency from an ecological perspective, arguing that agency is not an inherent individual trait but an achievement emerging from the interaction between teachers' prior experiences, present working conditions, and future aspirations.

From this perspective, teachers' responses to reform are shaped not only by their motivation or beliefs, but also by contextual conditions such as curriculum demands, institutional culture, assessment systems, professional support, and available resources. Agency is therefore relational and contextually mediated rather than purely individual.

Existing studies in Vietnam have also documented tensions associated with English-related educational reforms, including language proficiency concerns, pedagogical pressures, unequal learning conditions, and contextual constraints (Do, 2022; Vu & Burns, 2014; Vo et al., 2022). These studies suggest that teachers' responses to communicative and English-related expectations are strongly shaped by institutional realities and local teaching conditions. More recently, Dang (2024) highlights the role of transformative agency among Vietnamese teachers, showing that teachers actively reinterpret and negotiate reform expectations within sociocultural and institutional constraints.

Taken together, these studies suggest that teachers' responses to ESL-oriented expectations are likely to involve ongoing negotiation between emerging professional demands and existing structural realities. However, limited research has explored how teachers imagine responding to such expectations before they become fully institutionalized. In the present study, professional agency provides a lens for examining teachers' projected actions, adaptation strategies, and responses to anticipated educational change.

2.4. Theoretical framework

The literature reviewed above highlights three complementary perspectives relevant to understanding teachers' responses to emerging ESL-oriented expectations. Teacher identity explains how teachers perceive and reconstruct their professional roles. Professional agency explains how teachers imagine responding to educational change within contextual opportunities and constraints. Policy enactment contributes a broader perspective by explaining how reform expectations are interpreted, negotiated, and translated differently across local educational contexts.

This study is grounded in a socio-constructivist perspective of teacher identity, an ecological perspective of professional agency (Priestley et al., 2015), and the concept of policy enactment (Ball et al., 2012; Braun et al., 2011). Together, these perspectives conceptualize teachers' responses to ESL-oriented expectations as a dynamic interaction among evolving professional identity, contextually mediated professional agency, and institutional conditions shaping educational change.

This integrated framework provides the conceptual basis for examining how teachers make sense of emerging ESL-oriented expectations and project their professional responses in contexts where reform directions remain evolving and not yet fully institutionalized.

The framework also informed the design of the interview protocol and the analytical process. Teacher identity guided questions related to perceived role changes, professional responsibilities, and imagined future selves. Professional agency informed questions concerning projected actions, adaptation strategies, and the negotiation of contextual constraints. Policy

enactment informed questions exploring how teachers interpreted emerging and sometimes unclear reform expectations. During analysis, these concepts served as sensitizing lenses for coding and theme development, while still allowing new themes to emerge inductively from the data.

3. Methodology

3.1. Research design

This study adopts a qualitative research design to explore how upper secondary English teachers in Vietnam perceive and respond to emerging ESL-oriented expectations. A qualitative approach was considered appropriate because the study focuses on teachers' interpretations, perceptions, and projected responses to educational change within their specific professional contexts.

The study is informed by a socio-constructivist perspective, which views teacher identity and agency as socially constructed and context-dependent. Since ESL-oriented expectations in Vietnam have not yet been fully institutionalized, the study focuses on how teachers interpret and anticipate these emerging expectations rather than on actual policy implementation.

More specifically, the study may be characterized as an interpretive qualitative interview study informed by teacher identity research, ecological perspectives on professional agency, and policy enactment theory.

3.2. Research participants and participant coding

The participants included eight female English teachers working in urban public upper secondary schools. Participants ranged in age from 27 to 49 years old and had between 6 and 25 years of teaching experience. All participants held bachelor's degrees in English Language Teacher Education, and five had completed master's degrees in TESOL. Purposive sampling was employed to recruit information-rich participants who were likely to provide meaningful insights into emerging ESL-oriented expectations. Participants were selected because they were experienced English teachers working in public upper secondary schools where communicative teaching reforms and English language policy developments were increasingly relevant. Variation in age, teaching experience, and academic qualifications was also considered during recruitment to capture a range of professional perspectives.

The participants worked within the context of Vietnam's 2018 General Education English Curriculum, which officially emphasizes communicative competence and the integrated development of four language skills. However, English teaching and learning at the secondary level remain strongly influenced by examination-oriented assessment systems. Although current textbooks include communicative and four-skill activities, classroom instruction often focuses on language knowledge and test-oriented content related to school examinations, high school graduation examinations, and university entrance assessments. Major examinations continue to rely heavily on multiple-choice formats, while listening, speaking, and extended writing are rarely formally assessed. At the upper secondary level, English is generally taught approximately three periods per week under the national curriculum. As a result, participants worked within educational contexts characterized by tensions between communicative curriculum goals and exam-oriented classroom realities.

To ensure confidentiality, pseudonymized participant codes were used throughout transcription, coding, and reporting. Each participant was assigned a numerical code (e.g., T1, T2, T3), in which T refers to Teacher.

Although the sample provided rich professional perspectives, it represents a relatively specific group of participants. All teachers were female and worked in urban public upper secondary schools. Consequently, the findings should be interpreted within this particular educational context and may not fully reflect the experiences of male teachers, teachers working in rural or disadvantaged areas, private-school teachers, or teachers operating under different institutional conditions. The purpose of the study, however, was not statistical generalization but in-depth exploration of teachers' professional meaning-making in a specific educational setting.

3.3. Data collection

Data were collected through semi-structured individual interviews conducted over approximately three weeks in March 2026. Each interview lasted between 40 and 60 minutes and was conducted primarily in Vietnamese to allow participants to express their ideas comfortably and in depth.

The interview questions were developed based on the study's research questions and theoretical framework, particularly the concepts of teacher identity, professional agency, and policy enactment. Because ESL-oriented expectations remain emerging rather than fully implemented, many questions were framed using future-oriented language to explore teachers' anticipations, imagined roles, and projected responses.

The interview protocol focused on three main areas aligned with the research questions: (1) teachers' perceptions of changing professional roles under emerging ESL-oriented expectations; (2) anticipated tensions and challenges related to classroom realities and institutional conditions; and (3) teachers' projected professional agency in responding to evolving educational expectations. Prior to data collection, the interview protocol was reviewed by two colleagues with expertise in English language education and qualitative research. Minor revisions were made to improve question clarity, sequencing, and alignment with the research questions and theoretical framework. Sample interview questions are provided in Appendix A.

Although the interview questions were organized around these broad areas, participants were also encouraged to elaborate on related experiences, emotions, concerns, and professional expectations that emerged during the interviews. All interviews were audio-recorded with participants' consent and later transcribed for analysis.

3.4. Data analysis

The data were analyzed using reflexive thematic analysis following Braun and Clarke (2006, 2021). Interview transcripts were read multiple times to achieve familiarity with the data before initial codes were generated.

The coding process combined deductive and inductive approaches. Initial coding categories were informed by the study's research questions and theoretical framework, particularly the concepts of teacher identity, professional agency, and policy enactment. At the same time, additional patterns related to uncertainty, ambiguity, emotional pressure, and imagined professional roles emerged inductively during the analysis.

Related codes were subsequently grouped into broader themes representing shared patterns across participants' responses. The final themes focused on teachers' perceived role changes under emerging ESL-oriented expectations; anticipated tensions between educational expectations and contextual realities; and projected professional agency in responding to emerging educational change.

The analysis adopted an interpretive rather than purely descriptive orientation, focusing not only on what teachers said but also on how they constructed meaning around anticipated educational change, uncertainty, and professional transformation.

To enhance the trustworthiness of the analysis, the researchers engaged in repeated transcript reading, iterative coding, and ongoing analytical discussions throughout the study. Reflexive notes were maintained to document emerging interpretations, coding decisions, and potential researcher assumptions. Themes were reviewed repeatedly against the complete dataset to ensure coherence, consistency, and adequate representation of participants' perspectives. Consistent with reflexive thematic analysis, the emphasis was placed on analytic transparency and reflexivity rather than inter-rater reliability (Braun & Clarke, 2021).

3.5. Ethical considerations

All participants were informed about the purpose of the study before the interviews were conducted. Participation was voluntary, and participants had the right to withdraw from the study at any time. To protect confidentiality, all names and identifying information were anonymized during transcription and reporting.

4. Results

4.1. Perceived role changes under emerging ESL-oriented expectations

Six of the eight participants associated emerging ESL-oriented expectations with a stronger emphasis on communicative competence and authentic language use within educational settings. Teachers perceived that future expectations would extend beyond traditional exam-oriented instruction, requiring them to support students' ability to communicate effectively both inside and outside the classroom. As one participant explained:

"Chắc chắn sẽ dạy cho sinh viên giao tiếp nhiều hơn… làm sao cho học sinh, sinh viên có thể giao tiếp được trong phạm vi nhà trường…" (T3)

Three participants (T5, T7, T8) also anticipated broader professional responsibilities extending beyond language teaching itself. They described English teachers as potentially becoming a central force in supporting communication across the school environment, including assisting colleagues from other subject areas in using English more confidently.

These perceptions suggest that teachers anticipated ESL-oriented expectations as requiring a shift from knowledge transmission toward more facilitative, communicative, and supportive professional roles. Participants envisioned themselves not only as instructors, but also as facilitators, encouragers, consultants, and creators of English-speaking environments:

"Có lẽ không chỉ là một người giảng bài, mà có thể đóng nhiều vai facilitator, encourager, cooperator…" (T1)

"Tôi nghĩ mình sẽ là một cooperator cùng tham gia các hoạt động ngôn ngữ với các em" (T2)

In addition, teachers associated these changing roles with increased interpersonal, emotional, and professional demands. Participants like T1, T4, T6, and T7 described the future English teacher as needing to become more flexible, communicative, active, and professionally responsible. Such responses indicate an emerging reconstruction of teacher identity shaped by anticipated expectations regarding communication-oriented teaching and authentic language use.

However, despite this general understanding, three participants (T4, T7, and T8) consistently expressed uncertainty regarding how such expectations would eventually be implemented in practice. T4, for example, described current directions as "mơ hồ" (unclear) and difficult to predict:

"Tôi thấy khá mơ hồ… nhưng chắc sẽ khó khăn." (T4)

This perceived ambiguity appeared to shape how teachers imagined their future professional roles. While most participants viewed communicative expectations positively, a few teachers (T1, T3 and T4) also expressed skepticism regarding the feasibility of such expectations within Vietnam's highly exam-oriented educational system. In addition, some participants expressed anxiety about whether they would be capable of fulfilling these expanding professional responsibilities:

"Nhiều responsibilities hơn nên lo lắng không biết có làm tròn không." (T2)

These findings suggest that teachers are actively constructing future-oriented professional identities based not on clearly institutionalized policy requirements, but on their interpretations of evolving and anticipated educational expectations.

4.2. Anticipated tensions between ESL-oriented expectations and contextual realities

Nearly all participants (seven of the eight teachers) anticipated significant challenges in aligning ESL-oriented expectations with existing classroom and institutional conditions. A key concern was the mismatch between communicative teaching approaches and structural constraints such as large class sizes, exam-oriented systems, and uneven student proficiency levels:

"*Lớp hiện tại rất đông không phù hợp để dạy giao tiếp… thi cử còn nặng nề… đặc biệt ở các lớp cuối cấp." (T5)*

Teachers also pointed to broader systemic issues, including disparities across regions and limitations in teachers' own language proficiency:

"*Một số giáo viên chưa đạt chuẩn để giao tiếp bằng tiếng Anh lưu loát… trình độ học sinh cũng còn thấp và chênh lệch giữa các vùng miền." (T7)*

These anticipated tensions reflect a perceived gap between policy aspirations and classroom realities. Teachers expressed concern that without structural changes, the expected shift toward ESL-oriented teaching may be difficult to achieve:

"*Không có môi trường giao tiếp bên ngoài lớp học… thi cử chưa thay đổi thì chưa đạt kỳ vọng được." (T8)*

In addition, economic and institutional factors were also identified as potential barriers:

"Lương giáo viên quá thấp nữa." (T2)

Such responses indicate that teachers are not only aware of pedagogical challenges but also critically evaluating the feasibility of reform within existing systemic conditions.

Moreover, several participants (T2, T5, T7, and T8) anticipated significant pressure associated with these changes:

"*Chắc chắn là áp lực rồi… không chỉ về cách dạy mà còn nâng cao khả năng tiếng Anh nữa." (T8)*

This highlights that the anticipated transition involves not only instructional adjustments but also substantial demands for professional development, often without clear support structures.

4.3. Professional agency under emerging expectations

Participants projected a forward-looking sense of professional agency, expressing intentions to adapt their teaching practices in response to anticipated ESL-oriented expectations. A key strategy identified was self-directed professional development, particularly in improving their own English proficiency:

"Tôi nghĩ đầu tiên mình phải tự nâng cao năng lực tiếng Anh của mình…" (T1)

In addition, some other teachers envisioned creating more opportunities for authentic language use within school settings, such as increasing communicative activities and fostering English-speaking environments:

"*Có thể tạo sân chơi cho các em nhiều hơn… nếu sân trường là một môi trường bắt buộc giao tiếp bằng tiếng Anh… thì sẽ từ từ improve mọi thứ." (T3)*

These responses suggest that teachers anticipated taking proactive steps to align their practices with anticipated expectations, particularly in terms of pedagogy and learning environment.

However, this sense of agency was not entirely autonomous. Most participants (six of the eight teachers) emphasized the need for formal training and theoretical grounding, particularly in areas such as second language acquisition:

"*Chúng tôi cần được đào tạo về second language acquisition… đầu tiên cần thay đổi trọng tâm bài học sang hướng giao tiếp." (T6)*

This suggests that while teachers anticipated being open to change, their capacity to act is closely tied to access to professional development and institutional support.

Moreover, teachers' projected agency appeared to be significantly constrained by systemic factors, particularly the persistence of exam-oriented assessment systems. One participant highlighted a reluctance to implement changes without clear alignment at the policy level:

"*Tôi sẽ chờ hướng dẫn cụ thể… nếu tôi thay đổi cách dạy, sợ rằng khi thi cử các em không đạt yêu cầu…" (T5)*

This reflects a form of projected and conditional agency, in which teachers' willingness to innovate is mediated by external structures such as curriculum and assessment. Rather than

anticipating independent pedagogical change, participants projected themselves as responding to top-down guidance and system-wide reform initiatives.

5. Discussion

This study set out to examine how English teachers in a Vietnamese educational context perceive and respond to emerging ESL-oriented expectations, with a particular focus on teacher identity and professional agency. The findings reveal a complex and dynamic process in which teachers actively interpret, anticipate, and negotiate their roles under conditions where expectations remain evolving rather than fully defined.

5.1. Teacher identity as anticipatory and negotiated

The findings suggest that teachers' professional identities are dynamic, future-oriented, and continuously negotiated in response to emerging ESL-oriented expectations. Consistent with Beauchamp and Thomas's (2009) view of teacher identity as socially constructed and evolving, participants in this study did not describe their roles as fixed or stable. Instead, they imagined themselves adopting more facilitative, communicative, and relational roles within increasingly communication-oriented educational environments.

These findings also support Barkhuizen's (2017) argument that language teacher identity is shaped through interaction with institutional and sociocultural discourses. However, unlike many previous studies focusing on enacted reform, the present study demonstrates that identity reconstruction may begin even before educational expectations become fully institutionalized. Teachers were not responding to clearly operationalized policy requirements, but rather to evolving and interpreted expectations regarding future educational change.

In line with Ruohotie-Lyhty's (2018) notion of imagined professional selves, teachers projected themselves into future-oriented identities associated with communication, flexibility, emotional engagement, and expanded professional responsibility. Their responses suggest that teacher identity is shaped not only by present classroom realities but also by teachers' interpretations of anticipated professional demands.

At the same time, this process of identity negotiation was accompanied by considerable uncertainty and emotional tension. Participants consistently described ESL-oriented expectations as unclear and difficult to predict, yet they still attempted to construct meaningful understandings of their future roles. Consistent with Zembylas (2003), concerns about competence, preparedness, and expanding responsibilities highlight the emotional dimensions of professional identity during periods of educational change.

Taken together, these findings suggest that professional identity reconstruction may begin before reform implementation occurs, as teachers actively construct meanings around anticipated rather than enacted educational expectations.

5.2. Anticipated tensions and policy ambiguity

The findings indicate that teachers anticipate significant tensions between emerging ESL-oriented expectations and existing classroom realities. Consistent with previous research on policy- practice gaps (Borg, 2006), participants identified multiple structural constraints that may hinder the realization of communicative and use-oriented teaching approaches, including large class sizes, exam-oriented assessment systems, uneven student proficiency, limited English-

speaking environments, and regional disparities. These findings also align with previous studies highlighting contextual barriers affecting English language education reform in Vietnam (Do, 2022; Vu & Burns, 2014; Vo et al., 2022).

Importantly, these tensions were largely anticipatory rather than based on direct implementation experience. Nevertheless, they already shaped how teachers interpreted emerging expectations and imagined their future practices. This suggests that the effects of educational reform may emerge not only through implementation, but also through anticipation and interpretation.

The findings also support Ball et al.'s (2012) policy enactment perspective, which argues that educational reform is interpreted and negotiated differently across local contexts rather than mechanically implemented. Even in the absence of clearly operationalized policy directives, teachers in this study were already constructing localized meanings around ESL-oriented expectations based on their professional experiences and contextual realities.

It is important to note, however, that these interpretations emerged from experienced teachers working in urban public secondary schools. Therefore, the findings should be interpreted within this particular context, as teachers in other educational settings may experience ESL-oriented expectations differently.

Overall, the findings suggest that anticipated reform may generate forms of uncertainty and tension long before institutional implementation occurs, highlighting the importance of examining educational change as an interpretive and anticipatory process rather than solely an implementation-driven phenomenon.

5.3. Professional agency under emerging reform expectations

The findings further suggest that teachers projected a forward-looking and contextually mediated form of professional agency in responding to emerging ESL-oriented expectations. Participants anticipated improving their English proficiency, incorporating more communicative activities, and creating environments that encourage authentic language use within schools. These responses indicate that teachers were actively imagining and preparing for possible future professional demands rather than passively awaiting policy implementation.

Such findings resonate with the ecological perspective on teacher agency proposed by Priestley et al. (2015), which conceptualizes agency as emerging from the interaction between individual capacities and contextual conditions. Participants' projected responses were shaped not only by motivation and professional commitment, but also by institutional structures, assessment systems, workload, and access to professional support.

At the same time, participants' projected agency appeared conditional rather than fully autonomous. Teachers consistently emphasized the need for clearer policy guidance, professional development opportunities, and systemic alignment before implementing substantial pedagogical change. Several participants expressed hesitation about independently adopting communicative approaches if assessment systems remained exam-oriented. This reflects a form of constrained agency in which teachers' willingness to innovate is mediated by broader structural realities.

The findings also align with Dang's (2024) discussion of transformative agency in Vietnam, which highlights teachers' active attempts to reinterpret and negotiate educational

expectations within sociocultural and institutional constraints. However, unlike teachers responding to enacted reforms, participants in the present study were responding primarily to anticipated and evolving expectations. This suggests that professional agency may begin to emerge before educational reforms become fully institutionalized.

Together, these findings suggest that teachers' projected responses to ESL-oriented expectations involve both identity reconstruction and contextually mediated forms of professional agency, highlighting the importance of examining educational change before formal implementation occurs.

6. Conclusion

This study examined how English teachers in a Vietnamese educational context perceive and respond to emerging ESL-oriented expectations, with particular attention to teacher identity, anticipated tensions, and professional agency. The findings revealed that teachers generally associated ESL-oriented expectations with communicative language use, authentic interaction, and expanded professional responsibilities beyond traditional exam-oriented teaching. In response to these anticipated expectations, participants projected more facilitative, relational, and communication-oriented professional identities, suggesting that teacher identity reconstruction may begin even before reforms become fully institutionalized.

At the same time, the study found that teachers anticipated significant tensions between emerging expectations and existing educational realities, including exam-oriented assessment systems, large class sizes, uneven student proficiency, and limited institutional support. Despite these challenges, participants expressed a forward-looking sense of professional agency through their willingness to improve their own professional competence and adapt their teaching practices. However, such agency appeared strongly mediated by structural and contextual conditions, particularly policy coherence and systemic alignment.

Overall, the study suggests that educational change should be understood not only as a process of policy implementation, but also as a process of interpretation, anticipation, and professional meaning-making. The findings also imply that supporting teachers in emerging reform contexts may require not only individual professional development, but also clearer policy guidance, greater alignment between assessment systems and communicative teaching goals, and stronger institutional support for teachers navigating educational change.

Dr. Ha Thanh Hai has been an English lecturer at Quy Nhon University for more than 33 years. He earned his Master's degree in Educational Studies from The University of Adelaide and a PhD in Contrastive Linguistics. Throughout his academic career, he has published extensively in national and international scholarly journals. His research interests include academic writing, cognitive linguistics, second language acquisition, discourse analysis, and English language education. Email: hathanhhai@qnu.edu.vn.

Assoc. Prof. Dr. Nguyen Thi Thu Hien has been teaching English at Quy Nhon University for over 34 years. She holds a Master's degree in Applied Linguistics and a PhD in Contrastive Linguistics. She has authored numerous publications in professional and peer-reviewed academic journals. Her research interests include English language teaching methodology, academic writing, academic presentation, ESP, multimodality, and discourse analysis. Email: nguyenthithuhien@qnu.edu.vn.

Appendix A. Sample Interview Questions

1. How do you understand the emerging shift toward a more ESL-oriented approach to English education in Vietnam?

2. How do you think your role as an English teacher may change under these emerging expectations?

3. What challenges or tensions do you anticipate when responding to such expectations?

4. What actions might you take to adapt to these changes?

5. What forms of support would help you respond effectively to emerging ESL-oriented expectations?

#123 THE PERCEIVED USE OF METACOGNITIVE ONLINE READING STRATEGIES AMONG STUDENTS AT AN EMI UNIVERSITY IN VIETNAM

Thinh Tien Vu[1], Thi Thuy Dung Dang[2]

Abstract

In the age of technology, reading online materials has become a fundamental skill for acquiring, storing, and retrieving information, particularly as higher education institutions increasingly rely on digital resources. Despite the growing popularity of online reading, the perception of Metacognitive Online Reading Strategies (MORS) among students, especially in English-medium instruction (EMI) settings in Vietnam, remains insufficiently examined. This quantitative study addressed this gap by investigating how students at an EMI university in Vietnam perceived the use of MORS. Participants were 124 students, evenly divided between English and non-English majors. Data were collected via a survey, focusing on three sub-categories of MORS: global, problem-solving, and support strategies. Descriptive analyses indicated that problem-solving strategies were most frequently employed, followed by global and support strategies. These findings contribute to a foundation for further investigation into the application of MORS in digitally mediated EMI higher education in Vietnam.

***Keywords*:** EMI, digital reading, metacognitive online reading strategies, MORS

1. Introduction

Among the four skills in learning English, reading is considered the most important because it involves acquiring, storing, and retrieving information from texts (Amer et al., 2010; Pardede, 2022). Pardede (2022) stated three positive consequences of reading: increased input from daily interactions, enhanced learners' competence in other language-related skills, and students' personal development. Given the importance of reading skills, effectively applying reading strategies is vital for enhancing reading comprehension (Huang et al.,2009). Much research indicates that successful readers use a wider range of reading strategies more frequently than less successful readers do. (Carrell et al., 1989; Wang, 2016; Kung, 2019; Aydinbek, 2021).

Since the COVID-19 outbreak in 2020, advances in information and communication technology have made the internet a significant factor in many aspects of education, particularly in foreign language learning (Pardede, 2022; Putera & Anggrainy, 2024). In terms of technology use in the educational environment, its integration has led students to become more interactive and active rather than passive and reactive (Raja & Nagasubramani, 2018). The benefits of emerging technologies for education include enhanced teaching and learning, globalisation, removal of geographical limitations, scalability, easy-to-update learning materials, access to materials, self-

[1] *Corresponding author, PhD candidate, School of Languages, International University - VNU HCM, HCMC, Vietnam; vtthinh@hcmiu.edu.vn*
[2] *BA, School of Languages, International University - VNU HCM, HCMC, Vietnam*

management of learning location, and various designs and delivery methods for mobile technology (Ally, 2013; Raja & Nagasubramani, 2018). Thus, the use of electronic learning materials has become the norm in many countries (Parker & Lenhart, 2011). Parker and Lenhart (2011) stated that most textbooks may shift from offline materials to online materials within 10 years, so students need to apply online reading skills to obtain information from online resources. However, the transfer of reading skills from offline to online texts may be similar, but they differ significantly in purpose.

In the context of EMI universities, reading academic texts is an important skill with university students. In particular, students are often required to read textbooks and learning materials which are not available in their mother tongue (Phuong & Nguyen, 2019). These materials are usually available online rather than offline. Furthermore, EMI university students find it significantly challenging to comprehend English texts due to limited vocabulary and academic knowledge (Phuong & Nguyen, 2019). Therefore, applying online reading strategies is remarkably essential in the EMI context.

While much research focuses on metacognitive offline reading strategies, metacognitive online reading strategies (MORS) have received limited attention. Additionally, existing literature has paid little attention to the use of online reading strategies in the English-as-a-Medium-of-Instruction (EMI) context. Given the above-mentioned problem, this study aims to explore students' online reading strategies at an EMI university in Vietnam through their perceptions. To achieve the research objective, this study focuses on the following question: How do students at an EMI university use metacognitive online reading strategies?

2. Literature Review

2.1 Reading strategies

As Par (2020) stated, reading strategies are deliberate plans that readers use flexibly and adaptively to reconstruct texts. These plans involve conscious techniques aimed at improving reading comprehension on reading tasks (Kulsum et al., 2023). Reading strategies are considered important factors in comprehending text. Students can monitor their own reading and make it more efficient, and teach those strategies to others (Afflerbach et al., 2008). Moreover, readers who apply reading strategies achieve higher scores on reading comprehension tests than those who do not (Karbalaee Kamran, 2013). To summarise, learners' use of the reading strategy can predict their reading proficiency, academic achievement, and learning success (Par, 2020).

2.2 Offline reading strategies

Offline reading strategies are divided into two sub-categories: cognitive strategies and metacognitive strategies (Sheorey & Mokhtari, 2001)

2.2.1. Cognitive reading strategies

According to Sheorey and Mokhtari (2001), cognitive strategy refers to the actions or procedures used in the direct processing of text. For instance, guessing words and re-reading to better understand are two cognitive strategies. Gagne and Briggs (1979) supported this view, describing cognitive strategies as internal skills that influence the learner's intellectual processes. These processes include understanding problems, learning, remembering, and thinking.

2.2.2. Metacognitive reading strategies

Metacognitive strategies can be understood as higher-order executive skills that utilise learners' knowledge of cognitive processes. These processes help learners control their learning through activities such as planning, monitoring, and evaluating, which involve both declarative and procedural knowledge. In the same vein, Sheorey and Mokhtari (2001) argued that metacognitive strategies are intentional, carefully planned techniques that involve monitoring and management. Generally, metacognitive strategies involve two elements: the conscious awareness of strategic reading processes and the actual application of reading strategies. These strategies may distinguish successful readers from less successful readers (Sheorey & Mokhtari, 2001). In terms of categorising metacognitive reading strategies, Amer et al. (2010) classify them into three subcategories: global strategies, problem-solving strategies, and support categories. Global strategies are carefully planned to monitor students' independent reading. Problem-solving strategies are the actions or procedures readers employ when reading the text directly. Support strategies are the actions employed to aid comprehension.

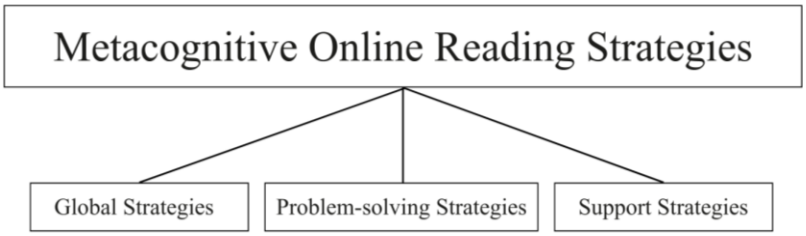
2.3 Online reading strategies

Offline and online reading strategies differ due to the richness and depth of online texts (Preece, 1993). Coiro (2003) claimed that printed text is structured by the author and that readers need to follow the author's intended plot or expository structure. On the contrary, digital texts are multimodal, integrating text, static images, animations, embedded videos, and sound, and possess hyperlinks. This creates non-sequential page structures in digital texts, allowing readers to approach the content independently.

Due to the complexity of electronic texts, readers need metacognitive online reading strategies (MORS) to enhance reading comprehension. Behalova (2010) notes that online reading strategies are regarded as both learners' conscious, intentional actions and behaviours when working with electronic texts. More specifically, electronic texts are those that appear on social media platforms, in newspapers, in articles, and so on (Pookcharoen, 2009). In this study, electronic texts for learning purposes may include e-books, online articles, journals, and related materials. Generally, I suggest that MORS are intentional, carefully planned techniques used for online learning texts, including monitoring or managing the online reading process.

2.4 Perception

Perception is the process by which we absorb sensory information from our environment and use it to engage with the environment (Adiwinata, 2017). Specifically, the American Psychological Association states that perception is the process or result of becoming aware through the senses, including tasks such as recognising, observing, and discriminating. In the context of foreign language learning, learner perception refers to how students interpret themselves. In this paper, perception is defined as the process or results of IU students' self-awareness regarding the use of MORS.



2.5 The framework

Figure 2.1 presents the framework used in this study to examine the perception of MORS. The framework is grounded in Sheorey & Mokhtari (2001) and later adapted by Amer et al. (2010). In this framework, metacognitive online reading strategies are classified into three subcategories: global, problem-solving, and support strategies.

Global strategies refer to approaches to reading texts, aiming to plan, monitor, and evaluate comprehension (Sheorey & Mokhtari, 2001). In detail, readers may apply these strategies to judge the content of the reading, attend to text features, and predict the reading topic (Anderson, 2003). Using global strategies targets readers' ability to analyse the text globally, as these strategies are significant predictors of reading performance (Rastegar et al., 2017; Yang & Sim, 2017). Problem-solving strategies are defined as strategies learners use to directly cope with challenges (Huang, 2013). As the name suggests, these strategies may provide readers with a specific plan to solve problems they may encounter while reading (Amer et al., 2010). Support strategies involve localised techniques to aid reading comprehension (Huang, 2013). In other words, these strategies involve using external resources and materials, as well as specific, useful tips (Aman & Lemu, 2023).

Figure 2.1

The framework of the study

2.5 Previous studies

Many previous studies have focused on the students' use of metacognitive online reading strategies. A mixed-methods study by Pookcharoen (2009) identified differences in MORS use between proficient and less proficient readers. In a study of Thai EFL students, the researcher found that proficient readers most frequently use problem-solving strategies. This finding aligns with Anderson's (2003), Omar's (2014), and Rianto's (2022) studies, which reported that problem-solving strategies were the most commonly used across the three subcategories, though the populations in those studies do not share similar characteristics. As they concluded, the frequent use of problem-solving strategies is shared among proficient readers and less proficient readers, ESL and EFL readers, and male and female readers. In contrast, Amer et al. (2010) investigated the use of online reading strategies among EFL students; the results revealed that global were most frequently used. Similarly, Harputra et al. (2023) found that global strategies were the most frequently used among EFL students. However, most studies similarly reported that support strategies are less frequently used than other strategies.

In addition, some studies have investigated the relation between the students' use of MORS and other aspects. Firstly, both Poole (2005) and Amer et al. (2010) examined differences in gender use of MORS. The results indicated no statistically significant difference between males and females when applying MORS. Secondly, some papers have examined the relationship between MORS use and students' reading comprehension. Most studies found a significant positive relationship between MORS use and reading comprehension (Aman & Lemu, 2023; Rastegar et al., 2017; Rianto, 2022; Zare-ee, 2007). Evidently, using MORS is necessary for students to

enhance reading comprehension when dealing with academic online texts. Thirdly, global strategies are considered powerful predictors for better comprehension (Huang et al., 2009; Yang & Sim, 2017). In particular, global strategies are identified as a significant predictor of reading performance, and excellent reading performance may imply a high level of metacognitive awareness of their use (Yang & Sim, 2017).

In Vietnam, Do and Phan (2021) conducted a study to explore the frequency with which Vietnamese undergraduates use reading strategies in academic texts. Researchers found that problem-solving strategies are most frequently used, followed by support and global strategies. As they noted, the frequency of problem-solving strategies does not differ across contexts such as Vietnam, Indonesia, and Turkey. Another finding that aligns with previous studies is the relationship between the use of global strategies and reading performance. However, no research has yet explored the students' perceived use of metacognitive online reading strategies in an EMI context. As EMI students who spend much time processing L2 texts through online materials, identifying students' perceptions may be significantly beneficial to them. Thus, this research aims to provide insights for future learners and educators to develop a comprehensive understanding of students' perceived use of metacognitive online reading strategies.

3. Methodology

3.1 Study design

The study employed a quantitative research design because it generates reliable, factual outcome data (Casebeer & Verhoef, 1997). This design helps researchers identify patterns and trends in the use of metacognitive online reading strategies (MORS) among students in an English-medium of Instruction (EMI) setting.

3.2 Participants

The study population consists of students at an English-medium instruction (EMI) university, the International University - VNU HCMC. The study sample consisted of 124 students, evenly divided between English and non-English majors. The convenience sampling method is used in this paper because it is easy to obtain as many students as possible (Triola, 2010). All participants have sufficient experience with online materials at the EMI university, which was considered appropriate for the study. To confirm voluntary participation, participants were provided with informed consent that outlined the study purpose and procedures. Demographic information for all participants is presented in Table 3.1.

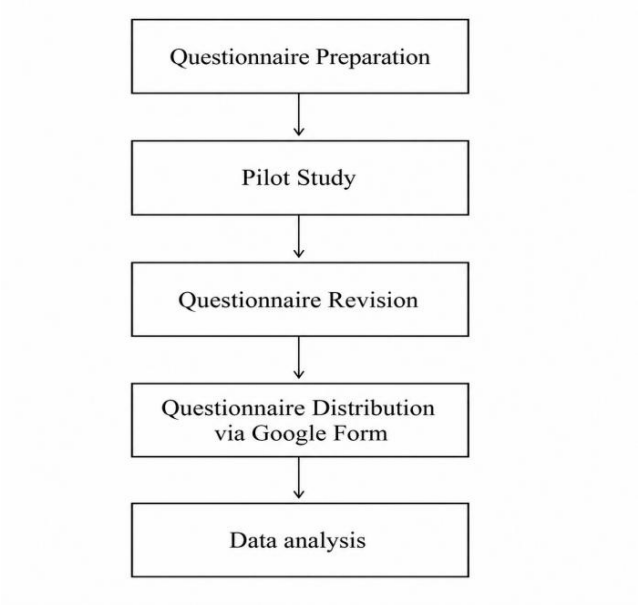
Table 3.1

Demographic information of participants

Major	**Number of participants**
English majors	62
Non-English majors	62
Total	**124**

3.3 Data collection instrument

The survey was used to collect data on students' perceived use of MORS. The Online Survey of Reading Strategies (OSORS) by Amer (2010) was employed in the present study. As Amer et al. (2010) noted, this tool was adapted from the Survey of Reading Strategies (SORS) (Sheorey & Mokhtari, 2001). This adaptation was intended to differentiate offline from online reading strategies (Amer, 2010). This adaptation has made this tool appropriate for this study, which examines online rather than offline reading strategies.



In this paper, the researcher used a Five-point Likert Scale via Google Form. Google Forms was chosen because it helped target a wide range of participants at low cost, ensured anonymity, and facilitated automatic sorting and export to SPSS at subsequent stages (Bhalerao, 2015). The survey consisted of two parts: (A) demographic information and (B) the perceived use of MORS among EMI students. The first section included four questions about confirming enrollment at EMI University, using online materials for learning, major, and gender, while the second section asked participants to rate their frequency of MORS use based on their perceptions. In the second section, there are 34 questions that indicate 34 MORS strategies, categorised into three subcategories. Items B1 - B17 surveyed students' perception of the use of global strategies, while items B18 - B25 recorded their use of problem-solving strategies, and items B26 - B34 examined their perceptions toward using support strategies. This structured distribution enabled targeted statistical analysis of each subcategory independently.

3.4 Procedure of the study

Figure 3.1 illustrates the data collection and analysis procedure. After adopting the framework and data collection instrument, the researcher conducted a pilot test to assess the clarity, validity and reliability of the instrument (Creswell & Creswell, 2018). The questionnaire was distributed to 20 volunteer participants, who had characteristics similar to those of the study sample. After the pilot test, Cronbach's alpha was calculated at .80, confirming the instrument's reliability (Taber, 2017). Additionally, two items in the global strategies have been revised based on participants' feedback to improve clarity and avoid ambiguity. In the official data collection, participants were provided with informed consent at the beginning of the survey, which outlined the nature of the study and their voluntary participation. After collecting data, Cronbach's alpha was recalculated to reconfirm reliability before data analysis. The result revealed acceptable internal consistency for the overall scale ($\alpha = .89$), confirming the survey's reliability (Taber, 2018).

Figure 3.1

Data collection and analysis procedure

3.5 Data analysis

As the study design is quantitative, this paper used the Statistical Package for the Social Sciences (SPSS) version 27 to analyse data from OSORS responses. The researcher aimed to describe the data numerically, using means (M) and standard deviations (SD) to identify trends in students' perceived use of MORS (Okamoto & Oanh, 2026). In terms of the mean, determining the central value generalises the sample mean to the population mean (Triola, 2010). By measuring the variation of values about the mean, the standard deviation indicates how much variation there is. Using these values may offer the researcher an overall view of MORS use, including the most and least frequently used strategies across the 34 OSORS items and within each sub-category. This procedure may answer the question of how students perceive their use of MORS.

To interpret the frequency of students' responses in the survey, this research uses the mean interpretation, as in Table 3.2, guided by Pimentel (2010). Regarding the interpretation of the standard deviation, Creswell's (2014) scale is used to assess variation in students' frequency of use around the mean, as shown in Table 3.3.

Table 3.2

Interpretation of the Mean Values

Means interval	Interpretation
1 - 1.50	Never
1.51 - 2.50	Rarely
2.51 - 3.50	Sometimes

3.51 - 4.50	Often
4.51 - 5	Always

Table 3.3

Interpretation of the Standard Deviation Values

Standard deviations interval	Interpretation
0.00 - 0.49	Very Low Variation (High Agreement)
0.50 – 0.99	Low to Moderate Variation
1.00 – 1.49	Moderate to High Variation
1.50 – 2.00	High Variation (Diverse Opinion)

4. Results

4.1 The perceived use of metacognitive online reading strategies

An overview of the data characteristics is presented using mean scores and SDs. Each sub-category of the metacognitive online reading strategies (MORS) is demonstrated in Table 4.1 below. As shown in the table, the problem-solving strategies have the highest mean score of 3.83, indicating that this group is the most frequently used among the 3 groups. All 3 subcategories (global, problem-solving, and support strategies) are often used by students when reading online learning materials. In other words, there is little difference in students' use of MORS at IU. Furthermore, students share a moderate perception of their use of global strategies (SD = 0.96) and problem-solving strategies (SD = 0.98). However, the SD value of 1.17 for support strategies indicates that the perceived use of support strategies falls within a different range than that of the other support strategies among IU students.

Table 4.1

Metacognitive Online Reading Strategies Means and Standard Deviations

Sub-category	Mean	SD
Problem-solving strategies	3.83	0.99
Global strategies	3.78	0.97
Support strategies	3.51	1.17

Total	**3.71**	**1.04**

4.2 The perceived use of global strategies

Regarding the students' perceived use of global strategies (B1 - B17), the overall mean is 3.78, and the SD is 0.97, indicating moderate variation in the number of students who often apply global strategies in online reading. For global strategies, item B7 has the highest mean of 3.95, indicating that students often adjust their attention to better understand online readings when encountering difficult texts. In contrast, item B3 has the lowest mean value at 3.50. Evidently, students sometimes apply the strategy of previewing online texts before reading.

Table 4.2

Students' perceived use of global strategies

Item	Statement	Mean	SD
B7	When online text becomes difficult, I pay closer attention to what I am reading.	3.95	0.94
B2	I think about what I have known to help me understand what I read online.	3.94	0.80
B9	I use context clues to help me better understand what I am reading online.	3.94	0.80
B1	I have a purpose in mind when I read online.	3.92	0.83
B12	When reading online, I check my understanding when I come across new information.	3.87	0.96
B6	When reading online, I decide what to read thoroughly and what to ignore.	3.82	0.98
B8	I use tables, figures, and pictures in the online text to increase my understanding.	3.82	1.11
B4	I think about whether the content of the online text fits my reading purpose.	3.81	0.95

B17	When reading online, I look for sites that cover both sides of an issue.	3.81	0.94
B16	I critically evaluate the online text before choosing to use its information.	3.79	0.96
B10	I use typographical features like boldface and italics to identify key information.	3.76	1.07
B13	I try to guess what the content of the online text is about when I read.	3.75	1.01
B14	I check to see if my guesses about the online text are right or wrong.	3.70	0.96
B15	I scan the online text to get a basic idea of whether it will serve my purposes before deciding to read it.	3.70	1.06
B11	I critically analyse and evaluate the information presented in the online text.	3.61	0.84
B5	I review the online text first by noting its characteristics like length and organisation.	3.60	1.04
B3	I take an overall view of the online text to see what it is about before reading it.	3.50	1.14
Total		**3.78**	**0.97**

4.3 The perceived use of problem-solving strategies

Concerning the students' perceived use of problem-solving strategies (B18-B25), the overall mean is 3.83, and the SD is 0.99, indicating a moderate gap in their perceptions of how often they use these strategies. Item B23 has the highest mean value of 4.02, indicating that students frequently use these strategies when reading online. Notably, this strategy also reaches the highest mean value among all MORS. In contrast, item B25 has the lowest mean value at 3.54. Evidently, students sometimes distinguish between facts and opinions when acquiring online texts.

Table 4.3

Students' perceived use of problem-solving strategies

Item	Statement	Mean	SD

B23	When online text becomes difficult, I re-read it to increase my understanding.	4.02	1.01
B19	I try to get back on track when I lose concentration.	3.91	0.91
B18	I read slowly and carefully to make sure I understand what I am reading online.	3.90	0.94
B22	I try to picture or visualise information to help remember what I read online.	3.90	0.92
B20	I adjust my reading speed according to what I am reading online.	3.89	0.87
B24	When I read online, I guess the meaning of unknown words or phrases.	3.83	1.06
B21	I stop from time to time and think about what I am reading online.	3.63	1.08
B25	I can distinguish between fact and opinion in online texts.	3.54	1.01
Total		**3.83**	**0.99**

4.4 The perceived use of support strategies

Regarding students' perceptions of applying support strategies (B26 - B34) for online reading, the overall mean is 3.51, and the SD is 1.17, indicating that students often use these strategies, though their opinions of their use may differ moderately. In particular, item B29 has the highest mean value at 3.93, indicating that students often use reference materials to support their online reading comprehension. In contrast, item B26 has the lowest mean at 3.05, revealing that some students may use note-taking to support their online reading comprehension. Coincidentally, this strategy is the least frequently used among all MORS by students at the EMI setting.

Table 4.4

Students' perceived use of support strategies

Item	Statement	Mean	SD
B29	I use reference materials (e.g., an online dictionary) to help me understand what I read online.	3.93	1.06
B34	When reading online, I think about information in both English and my mother tongue.	3.83	1.12

B33	When reading online, I translate from English into my native language.	3.76	1.14
B32	I ask myself questions I want to have the answers in the online text.	3.56	1.12
B31	I go back and forth in the online text to find relationships among ideas in it.	3.52	1.01
B30	I paraphrase (restate ideas in my own words) to better understand what I read online.	3.44	1.14
B27	When online text becomes difficult, I read aloud to help me understand what I read.	3.32	1.26
B28	I print out a hard copy of the online text, then underline or circle information to help me remember it.	3.17	1.40
B26	I take notes while reading online to help me understand what I read.	3.05	1.31
Total		**3.51**	**1.17**

5. Discussion

Based on the collected data, problem-solving strategies are the most frequently used among the 3 MORS sub-categories (M = 3.83). This finding aligns with Do and Phan's (2021) study of EFL students' use of metacognitive online reading strategies in a Vietnamese university context. According to them, most participants tend to use problem-solving strategies rather than other MORS sub-categories. The frequent use of these strategies may be explained by the linguistic challenges students face when acquiring academic online texts (Meniado, 2016).

Regarding the use of global strategies, this study found that item B7 had the highest mean score of 3.95. Attention adjustment during online text acquisition significantly affects the reading process, particularly reading comprehension (Yildiz & Çetinkaya, 2017). According to the automatization theory (LaBerge & Samuels, 1974), attention is an important factor for reading comprehension. Thus, students tend to use this strategy to enhance their reading comprehension. In comparison, item B3 has the lowest mean score (M = 3.50), indicating that students sometimes preview online texts before reading. As this strategy requires readers to determine the text's purpose before reading the whole text, students may comprehend it more successfully (Rukmini et al., 2014). However, if students encounter unfamiliar academic vocabulary for the first time when applying this strategy, they may find it difficult to use it, leading to discouragement and fear of its frequent use (Rukmini et al., 2014).

Regarding the use of problem-solving strategies, item B23 has the highest mean in this subcategory (M = 4.02), indicating frequent rereading to better comprehension. As Laverspool (2008) noted, rereading is recognised as one of the oldest and principal means for readers to evaluate and regulate their reading process. At various instructional levels, rereading remains one of the primary reading strategies taught to students (Laverpool, 2008). Thus, it is understandable that this strategy is most frequently used among students. In contrast, item B25 reaches the lowest mean (M = 3.54) in this group. As Graney (1990) presented, determination between opinions and facts is a critical reading problem in text evaluation. By attempting to evaluate the text, readers may recognise both explicit and implicit information (Brown & Yule, 1983). However, given the richer, more complex components of online texts, readers may find it more difficult to distinguish

between opinions and facts (Pardede, 2022). This challenge may lead to reduced confidence in applying this strategy, which explains its least frequent use among problem-solving strategies.

In terms of the use of support strategies, item B29 has the highest mean (M = 3.93), indicating frequent use of reference materials to aid reading comprehension. This result supports Hamdi (2015), who found that electronic dictionaries, a type of reference material, would be effective and motivating aids for successfully acquiring texts. Pookcharoen (2009) stated that using reference materials is one of the most frequently used strategies to address unfamiliar vocabulary or concepts. This strategy may be applied by both proficient and non-proficient readers. While non-proficient readers perceive these learning aids as the simplest way to understand the meanings of words or concepts, proficient readers use them to check meanings after using context clues and guessing. In comparison, item B26 regarding the use of notetaking to support comprehension has the lowest mean among 34 strategies (M = 3.05), which is consistent with Anderson (2003). By investigating the use of MORS among both ESL and EFL students, his study revealed that this strategy is among the least-used strategies. Judging from the EMI context of this study, students must simultaneously understand disciplinary concepts and process unfamiliar academic vocabulary to comprehend the material. Taking notes may add another layer to the complexity, in which students must identify important information, reformulate it, organise it, and write it down. This possible cause resonates with Salame et al. (2024)'s study, claiming that effective note-taking itself requires active selection and reformulation rather than simple copying. This process turned out to be more demanding for students, especially those at the beginning of their undergraduate studies. Therefore, this may explain why item B26 is the least-used strategy.

6. Conclusion

The study indicates how students at an English-medium instruction (EMI) university perceive the use of metacognitive online reading strategies (MORS), particularly the frequent use of all three sub-categories: global, problem-solving, and support strategies. Students most frequently use problem-solving strategies, aligning with other previous studies. Students frequently pay attention to the text, reread, and use reference materials to support successful reading, while applying previewing, note-taking, and determining between opinions and facts less frequently than other strategies. These findings support previous studies on students' use of metacognitive online reading strategies.

Besides, this research has some limitations. A sample size of 124 participants from an EMI university may affect the generalizability of the results. In addition, the Online Survey of Reading Strategies (OSORS) is a self-report instrument that asks participants to complete the survey based on their perceptions; the results may be subjective (Jusoh & Abdullah, 2015)

These implications suggest that lecturers, educators, and researchers may consider them for future work. Particularly, as a self-report questionnaire, OSORS cannot capture students' actual use of MORS; therefore, future research in this field should employ longitudinal designs or experimental methods to measure it more precisely. Furthermore, expanding the sample size to enhance the generalizability of the results is recommended for future studies.

Acknowledgments

First and foremost, we would like to express our sincere gratitude to International University, Vietnam National University Ho Chi Minh City, and the School of Languages for

providing the necessary support and conditions for the completion of this study. We are also deeply thankful to the students who generously participated in the research. Their honest responses and valuable time made an important contribution to the success of this study. Our appreciation is further extended to the teachers who kindly allowed us to collect data in their classrooms. Finally, we would like to thank the conference chairs and reviewers for their insightful and constructive comments on earlier versions of this article.

Her academic interests include English online learning, technology-enhanced language learning (TELL), and teaching reading.

#126 LEARNERS' PERCEPTIONS OF TEACHER ORAL FEEDBACK IN VSTEP SPEAKING PREPARATION: IMPLICATIONS FOR ESL-ORIENTED INSTRUCTION IN VIETNAM

Doan Ngoc Sang[1], Pham Huu Duc [2]

Abstract

Teacher oral feedback plays a crucial role in supporting learners' speaking preparation, particularly in high-stakes test contexts. This study investigates learners' perceptions of teacher oral feedback in VSTEP speaking preparation classes at Lac Hong University, Vietnam. Data were collected from 64 students through a structured questionnaire measuring four dimensions of feedback: clarity, timing, focus, and affective tone. The findings indicate that learners generally hold positive perceptions of teacher oral feedback (Mean = 3.90). Among the dimensions, feedback clarity and focus were rated highest, suggesting that learners value explicit and task-related guidance. In contrast, affective tone received lower ratings, with evaluative feedback negatively associated with learners' reported confidence. Correlation analysis further revealed that feedback clarity was positively associated with perceived speaking development, whereas supportive feedback was positively associated with learners' perceived confidence and willingness to communicate. These findings highlight the importance of balancing instructional clarity and emotional support in speaking feedback practices. Importantly, the observed relationships are correlational and should not be interpreted as evidence of causal effects. The study suggests that effective oral feedback in VSTEP speaking classrooms may support learners' perceived speaking development and communicative confidence, providing pedagogical insights for the transition toward ESL-oriented instruction in Vietnam. The study contributes to ongoing discussions on language teaching in Vietnam, where English is increasingly positioned as a second language.

***Keywords*:** vstep; oral feedback; learner perceptions; speaking skills; esl-oriented instruction

1. Introduction

The increasing institutionalization of English proficiency requirements in higher education has positioned standardized assessments as central drivers of language teaching and learning practices, as widely noted in research on assessment driven education systems (Fulcher, 2024). In Vietnam, the Vietnamese Standardized Test of English Proficiency (VSTEP), aligned with the CEFR, has not only functioned as a graduation benchmark but has also reshaped instructional priorities, particularly by intensifying the focus on test oriented speaking preparation, a trend commonly observed in high-stakes testing contexts where assessment exerts strong washback effects on teaching and learning. Within such high-stakes contexts, speaking performance is often

[1] *Corresponding author, Lecturer, Lac Hong Foreign Languages and Informatics Center, Lac Hong University, Dong Nai, Vietnam; Email: sangdn@lhu.edu.vn*
[2] *Associate Professor, International University, Vietnam National University–Ho Chi Minh City, Vietnam*

constrained by real-time processing demands while simultaneously being influenced by affective variables such as anxiety and fear of negative evaluation, which have been shown to significantly mediate learners' oral production MacIntyre and Gardner (1989); Dewaele & Li (2020).

Within this pedagogical landscape, teacher oral feedback remains a critical instructional mechanism, yet its effectiveness is increasingly understood as contingent upon learner interpretation rather than mere teacher provision. While earlier models conceptualized feedback as a unidirectional transmission of corrective information, more recent perspectives emphasize that learners actively construct meaning from feedback through cognitive and affective engagement, thereby determining its ultimate impact on learning outcomes (Winstone & Carless, 2021; Tai et al., 2018). This shift toward a learner-centered understanding of feedback aligns with findings that feedback clarity, relevance, and timing function as key determinants of perceived usefulness, whereas affective tone can either facilitate or hinder learner uptake depending on how feedback is emotionally received (Mäkipää, 2024; Han & Hyland, 2015).

In speaking instruction, the role of oral feedback becomes even more complex due to its immediate and interactional nature, which requires teachers to balance corrective intent with communicative flow. Empirical evidence suggests that feedback delivered during or after speaking tasks can influence learners' confidence and willingness to communicate, with supportive feedback promoting engagement while overly evaluative feedback may increase anxiety and reduce participation (Sato & Loewen, 2019; Zhang, 2018). At the same time, learners' prior experiences, beliefs, and contextual expectations shape how feedback is interpreted, reinforcing the argument that "what learners make of feedback" is as important as "what teachers provide" (Carless & Boud, 2021).

Parallel to these developments, the integration of digital technologies and artificial intelligence into language education has introduced new forms of feedback that are increasingly immediate, individualized, and data driven. Such technological affordances, while expanding opportunities for speaking practice and feedback, also raise important pedagogical questions regarding the alignment between automated feedback and human-mediated feedback processes, particularly in contexts where communicative competence remains the primary instructional goal (Godwin-Jones, 2022; Stickler & Hampel, 2022).

Despite the expanding body of research on feedback and learner engagement, previous studies have largely examined feedback in general second and foreign language learning contexts. Comparatively little attention has been paid to how learners interpret teacher oral feedback in high-stakes VSTEP speaking preparation in Vietnam, where feedback serves not only as instructional guidance but also as an indicator of test readiness. This context is particularly important because learners' interpretations of feedback may shape both their cognitive engagement and emotional responses during speaking preparation. Moreover, limited research has explored how learners' perceptions of different feedback dimensions relate to their perceived speaking development and communicative confidence in VSTEP classrooms. Addressing this gap is important because English is increasingly conceptualized not merely as a foreign language but as a second language within Vietnamese educational discourse. Consequently, there is a growing need to understand how feedback practices in test preparation can also support broader communicative learning goals aligned with ESL-oriented instruction, in which language use extends beyond examination performance to authentic communication Doan et al. (2018).

Against this backdrop, the present study investigates learners' perceptions of teacher oral feedback in VSTEP speaking preparation classes at Lac Hong University. Specifically, it examines how learners perceive four key feedback dimensions, namely clarity, timing, focus, and affective tone, and explores how these perceptions are associated with learners' perceived speaking development and communicative confidence. By focusing on learners' interpretations of teacher oral feedback in a high-stakes VSTEP context, the study extends previous feedback research beyond general language learning settings. Furthermore, it contributes to the growing discussion on how feedback practices in test-oriented classrooms may provide pedagogical support for the broader transition toward ESL-oriented communicative instruction in Vietnam.

Therefore, this study focuses on investigating learners' perceptions of teacher oral feedback in VSTEP speaking preparation classes, with particular attention to key feedback dimensions, including clarity, timing, focus, and affective tone. Given the limited empirical evidence in high-stakes test preparation contexts in Vietnam, examining how learners interpret and respond to oral feedback is essential for understanding its pedagogical effectiveness. To bridge these gaps, this study attempts to answer the following research questions:

RQ1: What are learners' perceptions of teacher oral feedback in VSTEP speaking preparation classes in terms of clarity, timing, focus, and affective tone?

RQ2: How do these perceptions influence learners' speaking development and communicative confidence in a high-stakes test preparation context?

2. Literature Review

2.1. Feedback Theory

Feedback has been widely acknowledged as a central mechanism in second language learning, functioning not only as a tool for correcting linguistic errors but also as a means of guiding learners' cognitive and metacognitive development (Hattie & Timperley, 2007; Ellis, 2020). While earlier perspectives emphasized feedback as information transmission, more recent frameworks conceptualize feedback as an interactive and learner-mediated process in which meaning is actively constructed rather than passively received (Carless & Boud, 2018; Winstone & Carless, 2019). Within this reconceptualization, feedback effectiveness depends on how learners interpret and utilize the information, as feedback only becomes meaningful when it is actively taken up and applied in subsequent learning processes (Tai et al., 2018; Zhang & Hyland, 2018).

Extending this view, Tai et al. (2018) highlight that feedback operates across multiple levels, including task, process, and self-regulation, each contributing differently to learning outcomes depending on how learners engage with them. This multidimensional nature of feedback is further supported by empirical evidence showing that clarity and alignment with learning goals significantly influence learners' ability to use feedback productively, while unclear or unfocused feedback often leads to disengagement. In this regard, Mäkipää (2024) demonstrates that learners who perceive feedback as clear and actionable are more likely to maintain engagement and regulate their learning effectively.

At the same time, recent studies increasingly emphasize the affective dimension of feedback, suggesting that emotional responses play a crucial role in shaping learners' engagement. While feedback has traditionally been associated with cognitive gains, it is now recognized that factors such as confidence, anxiety, and motivation mediate whether feedback leads to

improvement. For instance, Zhang (2018) shows that feedback delivered within a supportive pedagogical environment enhances learner engagement, whereas overly evaluative feedback may undermine motivation and reduce participation. Similarly, Han and Hyland (2015) argue that the emotional tone of feedback significantly influences how learners process and respond to corrective input.

Taken together, these theoretical perspectives provide the foundation for the four feedback dimensions examined in the present study. Specifically, feedback clarity refers to the extent to which learners perceive feedback as understandable and actionable (Hattie & Timperley, 2007; Mäkipää, 2024). Feedback timing concerns when feedback is delivered in relation to speaking tasks and how its immediacy influences learner engagement (Sato & Loewen, 2019). Feedback focus reflects the extent to which feedback targets specific aspects of task performance and learning goals (Tai et al., 2022). Finally, affective tone captures the emotional quality of teacher feedback and its potential role in shaping learners' confidence and willingness to engage in speaking activities (Han & Hyland, 2015; Zhang, 2018). These four dimensions therefore represent complementary cognitive and affective aspects of teacher oral feedback that are particularly relevant to speaking instruction.

2.2. Learner Perception of Feedback

A growing body of research has shifted the focus of feedback studies toward learners' perceptions, recognizing that feedback does not inherently lead to learning unless it is meaningfully interpreted by learners. This learner centered perspective posits that feedback effectiveness is mediated by learners' beliefs, prior experiences, and contextual expectations, rather than being determined solely by teacher practices. As Carless and Boud (2021) emphasize, feedback should be understood as a process of sense-making in which learners actively engage with information to regulate their learning.

Recent empirical studies further demonstrate that learners' perceptions are shaped by both cognitive and affective factors. For example, Zhang and Hyland (2018) found that learners are more likely to engage with feedback when it is perceived as relevant, specific, and actionable, whereas vague or overly critical feedback can hinder engagement. Complementing this view, research on feedback literacy suggests that learners need specific competencies to interpret and use feedback effectively, including the ability to manage emotional responses and translate feedback into action (Tai et al., 2018).

Moreover, emerging studies highlight the importance of affective responses in shaping feedback perception. Learners who perceive feedback as supportive tend to demonstrate greater willingness to communicate and participate in learning activities, while negative perceptions may lead to increased anxiety and avoidance behaviors. For instance, recent findings indicate that emotional engagement plays a decisive role in determining whether learners act upon feedback, reinforcing the idea that feedback effectiveness is inseparable from learners' affective experiences. Accordingly, the present study adopts these four dimensions as the conceptual basis of the questionnaire because they represent key characteristics through which learners interpret teacher oral feedback. Examining learners' perceptions across these dimensions provides a learner-centered perspective on feedback effectiveness, complementing previous studies that have primarily focused on teachers' feedback practices.

2.3. Oral Feedback in Speaking and VSTEP Contexts

Oral feedback occupies a distinctive position in speaking instruction due to its immediacy and interactional nature, requiring learners to process feedback while simultaneously engaging in communication. Unlike written feedback, which allows for delayed reflection, oral feedback is embedded within real-time interaction, making it both a powerful and potentially disruptive instructional tool. Research indicates that different forms of oral feedback, including explicit correction and recasts, play varying roles in supporting language development, with explicit feedback often facilitating greater noticing of linguistic forms.

The effectiveness of oral feedback in speaking contexts depends on how teachers balance corrective intent with communicative flow. While feedback delivered during interaction can promote immediate awareness, it may also interrupt fluency if not managed carefully. Conversely, delayed feedback may support reflection but reduce immediacy of learning. Sato and Loewen (2019) argue that optimal feedback practices require a dynamic balance between these competing demands, highlighting the importance of contextual sensitivity in feedback delivery.

In high-stakes test preparation contexts such as VSTEP, oral feedback assumes an additional evaluative dimension, as it is often interpreted by learners as an indicator of test readiness. This dual role both instructional and evaluative can shape learners' perceptions in complex ways, influencing not only their cognitive engagement but also their emotional responses. Despite the widespread implementation of VSTEP in Vietnamese higher education, research examining learners' perceptions of oral feedback in this context remains limited, indicating a clear gap in the literature.

Recent developments in educational technology have introduced AI-mediated feedback as an additional source of speaking support. Although previous studies suggest that AI can provide immediate and individualized feedback (Xu et al., 2024), the present study focuses specifically on teacher oral feedback, given its interactive, contextual, and relational nature in VSTEP speaking classrooms. Therefore, AI-mediated feedback is acknowledged as a complementary development rather than the primary focus of this research.

Based on the literature reviewed above, the present study operationalizes teacher oral feedback through four dimensions: clarity, timing, focus, and affective tone. These dimensions were selected because they consistently emerge in contemporary feedback research as key factors influencing how learners interpret, engage with, and respond to teacher feedback in speaking classrooms. They also provide the conceptual framework for the questionnaire used to investigate learners' perceptions in the present study.

3. Methodology

3.1. Research Design

This study employed a quantitative survey design to investigate learners' perceptions of teacher oral feedback in VSTEP speaking preparation classes. A quantitative approach was considered appropriate because the primary objectives were to describe learners' perceptions across four predefined feedback dimensions and to examine the statistical relationships between these dimensions and learners' perceived speaking development and perceived confidence. Since the study focused on identifying general patterns of learners' responses rather than exploring

individual experiences in depth, a structured questionnaire was considered the most suitable instrument.

Although a mixed-methods design incorporating interviews might provide richer insights into how learners interpret teacher feedback, the present study adopted a quantitative approach to establish an initial empirical understanding of learners' perceptions within a high-stakes VSTEP context. Future studies may complement these findings through qualitative or mixed-methods research to provide a deeper explanation of learners' feedback experiences.

3.2. Participants

This study was conducted at the Lac Hong Foreign Languages and Informatics Center, Lac Hong University, Dong Nai Province, Vietnam. The participants were 64 undergraduate students enrolled in VSTEP B1-B2 speaking preparation courses. Participants were recruited from two intact VSTEP speaking preparation classes (K33 and K34) using convenience sampling. Participation was voluntary, and all respondents completed the questionnaire anonymously.

Table 1

Summarizes the demographic characteristics of the participants.

Characteristic	**Category**	**n**	**%**
Gender	Male	32	50.0
	Female	32	50.0
VSTEP Preparation Course	K33	29	45.3
	K34	35	54.7

Basic demographic information, including gender and course enrollment, was collected to describe the sample. Additional background variables, such as academic year, previous VSTEP experience, and preparation duration, were not collected and are therefore acknowledged as limitations of the study. As the sample was drawn from a single language center within one university, the findings should be interpreted with caution and cannot be generalized to all VSTEP learners in Vietnam.

3.3. Instrument

Data were collected using a structured questionnaire specifically designed to measure learners' perceptions of teacher oral feedback in VSTEP speaking preparation classes. The questionnaire consisted of 20 Likert-scale items (five items for each feedback dimension) measured on a five-point scale ranging from 1 (Strongly Disagree) to 5 (Strongly Agree).

The four dimensions were developed based on established feedback literature.

- Feedback clarity focused on the extent to which feedback was understandable, specific, and actionable, drawing on feedback usability (Hattie & Timperley, 2007; Mäkipää, 2024).

- Feedback timing examined learners' perceptions of when feedback was provided during or after speaking activities, based on interactional feedback research (Sato & Loewen, 2019).

- Feedback focus measured whether teacher feedback addressed specific aspects of speaking performance and learning goals, reflecting task alignment (Tai et al., 2018).

- Affective tone investigated learners' perceptions of teachers' emotional support, encouragement, and sensitivity when providing feedback, drawing upon research on learner engagement and feedback emotion (Han & Hyland, 2015; Zhang, 2018).

Sample questionnaire items included:

- "My teacher's feedback is easy to understand."
- "Feedback is provided at an appropriate time."
- "Teacher feedback focuses on important speaking problems."
- "My teacher gives feedback in an encouraging manner."

The questionnaire was adapted from contemporary feedback perception literature and further contextualized for VSTEP speaking preparation through a review of relevant theoretical frameworks and recent empirical studies.

3.4. Instrument Reliability and Validity

Prior to the main survey, the questionnaire was reviewed by experienced VSTEP instructors and researchers in language education to ensure content validity and contextual appropriateness. Minor revisions were made to improve wording clarity and item specificity. Internal consistency was evaluated using Cronbach's alpha. All four constructs exceeded the commonly accepted threshold of .70, indicating satisfactory reliability.

Table 2

Participant Characteristics (N = 64)

Construct	**Cronbach's α**
Clarity	.88
Timing	.82
Focus	.86
Affective Tone	.84

Overall questionnaire α = .90. These results indicate satisfactory internal consistency for all constructs included in the questionnaire.

3.5. Data Analysis

The collected data were analyzed using SPSS. Descriptive statistics (minimum, maximum, mean, and standard deviation) were calculated to summarize learners' perceptions across the four feedback dimensions. Pearson correlation analysis was then conducted to examine the relationships between these feedback dimensions and learners' perceived speaking development as well as perceived confidence. Because both outcome variables were measured through self-report questionnaire items, the findings indicate statistical associations rather than causal relationships.

This study was conducted at Lac Hong University (LHU) in Dong Nai Province, Vietnam. It focuses on learners' perceptions of teacher oral feedback in VSTEP speaking preparation classes, particularly in relation to key feedback dimensions, including clarity, timing, focus, and

affective tone. The study investigated a group of 64 undergraduate students who were preparing for the VSTEP B1-B2 speaking test at the Lac Hong Foreign Languages and Informatics Center.

A quantitative research approach was employed to collect and analyze data from the participants. Specifically, a structured questionnaire was used as the primary research instrument, as it is widely recognized as an effective tool for gathering large-scale perception data and examining patterns of learner responses in educational contexts (Winstone & Carless, 2019). The design of the questionnaire was informed by established feedback frameworks, particularly those emphasizing the role of feedback clarity, timing, and learner engagement in shaping learning outcomes (Tai et al., 2018). In addition, the inclusion of affective dimensions in the instrument reflects recent findings that emotional responses to feedback significantly influence learners' willingness to engage with speaking tasks (Han & Hyland, 2015).

Participants were asked to evaluate their perceptions of teacher oral feedback in speaking classes using a Likert-scale questionnaire. The instrument consisted of multiple items measuring different aspects of feedback, allowing for a comprehensive understanding of how learners experience and interpret feedback in a high-stakes test preparation context. This approach aligns with previous research suggesting that learners' perceptions play a mediating role in determining the effectiveness of feedback practices (Carless & Boud, 2021). The questionnaire was administered to all 64 participants, and all responses were collected for analysis.

To ensure the reliability of the instrument, internal consistency was examined using Cronbach's alpha, with all constructs meeting acceptable reliability thresholds. The collected data were then analyzed using the Statistical Package for the Social Sciences (SPSS). Descriptive statistics, including minimum, maximum, mean, and standard deviation, were calculated to identify general trends in learners' perceptions. In addition, correlation analysis was conducted to examine the relationships between different feedback dimensions and learners' perceived speaking development and confidence.

The findings derived from the quantitative data provide insights into how learners perceive teacher oral feedback and how these perceptions may influence their engagement and performance in VSTEP speaking preparation.

4. Results

4.1. Descriptive Statistics of Learners' Perceptions

To address the first research question, descriptive statistics were computed based on students' responses to the questionnaire, focusing on four key dimensions of teacher oral feedback: clarity, timing, focus, and affective tone. Overall, the findings suggest that learners tend to hold positive perceptions of teacher feedback in VSTEP speaking classes, with an average mean score of 3.90.

Table 3

Descriptive Statistics of Feedback Dimensions

Dimension	N	Min	Max	Mean	Std. Deviation
Clarity	64	2.80	5.00	4.12	0.56
Focus	64	2.75	5.00	4.05	0.60
Timing	64	2.50	5.00	3.85	0.64
Affective Tone	64	2.30	5.00	3.60	0.72
Overall	64	2.70	5.00	3.90	0.58

Note. N = 64; values are based on a 5-point Likert scale.

As shown in Table 3, feedback clarity and feedback focus received the highest mean scores, indicating that learners particularly valued oral feedback that was clear, explicit, task-related, and easy to apply in subsequent speaking activities. By contrast, affective tone received the lowest mean score, suggesting greater variation in how learners perceived the emotional quality of teacher feedback. Overall, these findings indicate that learners generally held positive perceptions of teacher oral feedback, especially when feedback was understandable and directly related to speaking tasks.

By contrast, feedback timing was rated at a moderate level (Mean = 3.85), reflecting some differences in learners' preferences regarding when feedback should be provided during or after speaking tasks. The lowest mean score was observed for affective tone (Mean = 3.60), which may indicate that students have more varied experiences in terms of how feedback is delivered emotionally. This is further reflected in the relatively higher standard deviation (SD = 0.72), suggesting greater variability in learners' responses to the emotional dimension of feedback.

4.2. Correlation Analysis

To address the second research question, Pearson correlation analysis was conducted to examine the relationships between different dimensions of teacher oral feedback and learners' perceived speaking development as well as their perceived confidence. The results reveal several statistically significant associations among the variables.

Table 4

Correlation between Feedback Dimensions and Learning Outcomes

Variables	Perceived Speaking Development	Perceived Confidence
Clarity	.62**	.58**
Focus	.59**	.55**
Timing	.41*	.38*
Affective Tone	.35*	.52**

Note. The values of p indicate the level of statistical significance of the correlations. A result is considered statistically significant at p < .05, meaning there is less than a 5% probability that the relationship occurred by

*chance. A stronger level of significance is indicated by p < .01 (marked by **), suggesting a higher level of confidence in the reliability of the results.*

As shown in Table 4, feedback clarity demonstrated a strong positive correlation with learners' perceived speaking development ($r = .62$, $p < .01$) and perceived confidence ($r = .58$, $p < .01$). Similarly, feedback focus was positively correlated with both perceived speaking development ($r = .59$, $p < .01$) and perceived confidence ($r = .55$, $p < .01$). These findings indicate that learners who perceived teacher feedback as clearer and more task-focused also tended to report higher levels of perceived speaking development and confidence.

By comparison, feedback timing showed a moderate positive correlation with perceived speaking development ($r = .41$, $p < .05$), whereas affective tone demonstrated a stronger correlation with perceived confidence ($r = .52$, $p < .01$) than with perceived speaking development ($r = .35$, $p < .05$). These associations suggest that different dimensions of teacher oral feedback may relate to different aspects of learners' perceptions. However, because the study employed a correlational design based on self-reported questionnaire data, these relationships should not be interpreted as evidence of causal effects.

5. Discussion

The findings of this study provide a more nuanced understanding of learners' perceptions of teacher oral feedback in VSTEP speaking preparation, directly addressing the two research questions.

With regard to the first research question, the results indicate that learners generally hold positive perceptions of teacher oral feedback, particularly in terms of clarity and focus. These dimensions were not only rated highest but also consistently associated with learners' sense of usefulness and relevance. This suggests that learners value feedback that is explicit, structured, and closely aligned with task requirements, as it enables them to better understand performance expectations and identify areas for improvement. This finding supports Winstone and Carless (2019), who emphasize that feedback only becomes effective when learners can meaningfully interpret and act upon it. Similarly, Tai et al. (2018) highlight the importance of feedback that enhances learners' evaluative judgment and task understanding. This pattern may be partly explained by the nature of VSTEP as a high-stakes speaking examination. Because learners are preparing for an assessment in which speaking performance is evaluated against clearly defined criteria, they are likely to place greater value on feedback that is explicit, task-focused, and immediately applicable. Clear guidance may help learners better understand performance expectations, identify specific weaknesses, and prioritize areas for improvement during test preparation. In this context, clarity and focus appear to be particularly meaningful because they reduce uncertainty and provide learners with practical directions for subsequent speaking practice.

However, learners' perceptions were less consistent with regard to timing and affective tone, indicating that feedback is experienced not only as a cognitive resource but also as a socially and emotionally mediated process. In particular, the relatively lower rating of affective tone suggests that learners may be sensitive to how feedback is delivered, especially in high-pressure speaking contexts. This aligns with Han and Hyland (2015), who argue that feedback is inherently relational, and that its effectiveness depends on how it is emotionally received by learners.

In relation to the second research question, the findings reveal that different feedback dimensions play distinct roles in shaping learners' perceived speaking development and communicative confidence. Specifically, clarity and focus demonstrate strong relationships with speaking development, suggesting that cognitively oriented feedback is more influential in helping learners improve their performance. By contrast, affective tone shows a stronger association with confidence, highlighting the role of emotional support in fostering learners' willingness to communicate. This indicates that while cognitive clarity facilitates learning, emotional factors are equally important in sustaining engagement, particularly in speaking activities that require real-time performance.

The role of timing appears to be more moderate, suggesting that although it contributes to learning, it is less decisive compared to clarity and focus. This finding reflects the dynamic nature of oral interaction, where feedback must be carefully integrated into communicative flow. As Sato and Loewen (2019) suggest, the effectiveness of feedback depends not only on its content but also on its delivery within interactional contexts.

Taken together, these findings highlight the dual nature of feedback as both a cognitive and affective process, particularly in high-stakes test preparation environments. In such contexts, feedback often serves both instructional and evaluative functions, which may influence how learners interpret and respond to it. As Carless and Boud (2021) argue, feedback effectiveness ultimately depends on learners' sense-making processes rather than the feedback itself.

Importantly, these findings also have broader implications for the ongoing shift toward ESL-oriented instruction in Vietnam. Rather than suggesting that oral feedback in VSTEP preparation directly develops ESL-oriented communicative competence, the present findings indicate that balanced teacher oral feedback may support learners' perceived speaking development and confidence, both of which are valuable foundations for communication beyond examination settings. In this sense, effective feedback can be viewed as a pedagogical bridge between test preparation and broader communicative learning goals rather than as a direct cause of ESL-oriented competence. This includes promoting interaction, learner autonomy, and meaningful language use, as suggested by Ellis (2020) and Li (2010). Furthermore, the integration of AI-mediated feedback may complement teacher feedback by providing immediate and individualized input, although its effectiveness remains dependent on learners' engagement with such tools (Shi & Aryadoust, 2024; Godwin-Jones, 2022).

The findings suggest that effective oral feedback in VSTEP speaking classrooms requires a balanced combination of clarity, focus, appropriate timing, and emotional support. These dimensions were statistically associated with learners' perceptions of speaking development and confidence; however, the present study did not measure actual speaking performance or classroom behavior. Consequently, the pedagogical implications discussed here should be interpreted as being based on learners' reported perceptions rather than direct evidence of learning outcomes.

The findings suggest several practical implications for teachers working in VSTEP speaking preparation classes. First, oral feedback should be clear, concise, and directly linked to the VSTEP speaking assessment criteria so that learners understand exactly which aspects of their performance require improvement. Second, brief post-task feedback may be more effective than frequent interruptions during fluency-oriented speaking activities, thereby maintaining communicative flow while still providing opportunities for reflection. Third, teachers should

balance comments on learners' strengths with constructive suggestions for improvement in order to sustain motivation. Finally, repeated speaking errors should be addressed using supportive and encouraging language, as emotionally positive feedback may help maintain learners' confidence and willingness to communicate despite the pressures associated with high-stakes speaking assessments.

6. Conclusion

This study investigated learners' perceptions of teacher oral feedback in VSTEP speaking preparation classes at Lac Hong University, with particular attention to four key feedback dimensions: clarity, timing, focus, and affective tone. By examining how learners perceived these dimensions and their relationships with perceived speaking development and perceived confidence, the study sought to contribute to a better understanding of teacher oral feedback within a high-stakes speaking preparation context in Vietnam.

From an academic perspective, the study extends previous feedback research by focusing on learners' interpretations of teacher oral feedback rather than teachers' feedback practices alone. The findings suggest that the cognitive dimensions of feedback, particularly clarity and focus, were more strongly associated with learners' perceived speaking development, whereas affective tone was more closely associated with perceived confidence. These findings contribute to the growing body of research emphasizing the learner-centered nature of feedback and highlight the importance of considering both cognitive and affective dimensions when examining oral feedback in high-stakes speaking contexts.

From a pedagogical perspective, the findings suggest that teachers should provide oral feedback that is clear, focused, timely, and emotionally supportive. In VSTEP speaking preparation classes, brief post-task feedback, explicit links to VSTEP speaking assessment criteria, balanced comments on learners' strengths and weaknesses, delayed correction during fluency-focused activities, and supportive language when addressing repeated errors may help learners better understand speaking expectations while maintaining their confidence and willingness to communicate. Rather than suggesting that teacher oral feedback directly develops ESL-oriented communicative competence, the findings indicate that balanced oral feedback may support learners' perceived speaking development and confidence, both of which are valuable foundations for communication beyond examination settings.

Several limitations should be acknowledged. First, the study relied on a single self-report questionnaire administered to a relatively small sample of learners from one language center at one university, limiting the generalizability of the findings. Second, because the study collected only learners' self-reported perceptions, responses may have been influenced by self-report bias. Third, no qualitative data, classroom observations, teacher perspectives, or recordings of teacher oral feedback were collected to triangulate learners' responses. Finally, the study did not include objective measures of speaking performance; therefore, the reported relationships should be interpreted as associations between learners' perceptions rather than evidence of causal effects or actual improvements in speaking ability. Future studies could adopt mixed-methods designs combining questionnaires with classroom observations, semi-structured interviews, teacher feedback recordings, and analyses of learner uptake. Including objective measures such as pre- and post-speaking test scores would provide stronger evidence regarding the relationship between teacher oral feedback and speaking performance. Such approaches would also help explain why

learners perceive particular feedback dimensions as more useful or emotionally supportive within high-stakes speaking preparation contexts.

Overall, the present study contributes to the growing literature on teacher oral feedback by providing learner-centered evidence from a Vietnamese high-stakes VSTEP context, offering practical implications for improving speaking instruction while supporting broader communicative learning goals.

Acknowledgments

The author would like to thank Lac Hong University and all participating students for their valuable contributions to this research.

#127 SHORT-FORM VIDEO PLATFORMS AS DIGITAL TOOLS FOR ESL VOCABULARY DEVELOPMENT: EVIDENCE FROM VIETNAMESE UNIVERSITY STUDENTS

Nguyen Thi Nuong[1], Phan Thi Thanh Tam[2], Nguyen Thanh Dung[3], Duong Thi Thu Uyen[4]

Abstract

This study investigates the role of short-form video platforms, particularly TikTok and Instagram Reels, in supporting English vocabulary learning among Vietnamese EFL university students. Based on Cognitive Theory of Multimedia Learning and micro-learning principles, the study examines the effects of engagement, repetition, multimedia elements, and distraction on vocabulary acquisition. A quantitative research design was employed, and data were collected from 220 university students through an online questionnaire. The data were analyzed using reliability analysis, Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA), and Structural Equation Modeling (SEM). The findings indicate that repetition was the only statistically significant predictor of vocabulary acquisition ($\beta = .549$, $p = .012$), whereas engagement, multimedia elements, and distraction did not demonstrate statistically significant effects. The results suggest that repeated encounters with vocabulary items play a more important role in vocabulary learning than entertainment-oriented features or passive multimedia exposure. The study contributes to the growing literature on digital language learning and provides pedagogical implications for integrating short-form video platforms into technology-enhanced vocabulary instruction.

***Keywords*:** short-form video platforms, vocabulary acquisition, repetition, micro-learning, ESL, Vietnam, TikTok, Instagram Reels.

1. Introduction

English has become the dominant global lingua franca in education, business, science,

English has become the dominant global lingua franca in education, business, science, and international communication. In the Vietnamese context, English is generally regarded as a foreign language (EFL), although recent educational reforms have increasingly emphasized communicative competence and international integration. The growing importance of English proficiency has been institutionalized through national educational policies that promote English as a compulsory subject from primary school onward. Consequently, improving English language competence, particularly vocabulary knowledge, has become a major educational priority.

Vocabulary plays a fundamental role in second language acquisition because it forms the basis for listening, speaking, reading, and writing skills. Without sufficient vocabulary knowledge,

[1]*Nguyen Thi Nuong, Faculty of Foundation Studies and Foreign Languages, Academy of Policy and Development, Hanoi City, Viet Nam, Email: nuongnguyen@apd.edu.vn*
[2] *Faculty of Foreign Languages, University of Labour and Social Affairs, Hanoi city, Viet Nam.*
[3] *Department of General Education, National University of Arts Education*
[4] *Faculty of Foundation Studies and Foreign Languages, Academy of Policy and Development*

learners struggle to communicate effectively regardless of their grammatical competence. Despite its importance, vocabulary acquisition remains challenging for many English as a Foreign Language (EFL) learners due to traditional teaching approaches that rely heavily on memorization and decontextualized exercises. In recent years, digital technologies and social media platforms have transformed language learning environments. Among these technologies, short-form video platforms such as TikTok and Instagram Reels have become increasingly popular among university students. These platforms provide highly visual, interactive, and concise content that aligns with contemporary learners' media consumption habits. The growing popularity of short-form video content is particularly significant in Southeast Asia. According to Digital 2025 reports, Vietnamese users spend several hours each week consuming short-form videos on social media platforms. Beyond entertainment purposes, these platforms are increasingly used for informal learning activities, including English vocabulary development. The pedagogical potential of short-form videos can be explained through several theoretical perspectives. Mayer's Cognitive Theory of Multimedia Learning suggests that learners process information more effectively when verbal and visual information are presented simultaneously. Similarly, micro-learning theory emphasizes the effectiveness of short, focused learning units that reduce cognitive overload and increase learner engagement. Short-form videos integrate audio, subtitles, visual illustrations, and contextualized language use, thereby potentially supporting vocabulary acquisition in meaningful and memorable ways. Previous studies have shown that social media-based learning can enhance learner motivation, engagement, and vocabulary retention. However, existing research presents several limitations. First, many studies focus on a single platform rather than comparing multiple short-form video environments. Second, empirical research examining the direct relationship between specific video characteristics and vocabulary acquisition remains limited. Third, little research has investigated these relationships within the Vietnamese higher education context.

Although previous studies have highlighted the educational potential of social media platforms, most research has focused on learners' motivation, engagement, attitudes, or general platform use. Relatively little attention has been paid to identifying which specific characteristics of short-form video platforms are associated with vocabulary learning outcomes. In particular, the respective roles of engagement, repetition, multimedia elements, and distraction remain insufficiently understood. By examining these factors simultaneously within a single structural model, the present study contributes to a more nuanced understanding of how short-form video platforms may support English vocabulary learning among Vietnamese EFL university students.

To address these gaps, the present study investigates the impact of engagement, repetition, multimedia elements, and distraction on English vocabulary acquisition through TikTok and Instagram Reels among Vietnamese university students.

The study aims to answer the following research questions:

RQ1. *Which factors influence vocabulary acquisition through short-form video platforms?*

RQ2. *To what extent do these factors affect English vocabulary acquisition?*

RQ3. *Which factor exerts the strongest influence on vocabulary learning outcomes?*

The findings are expected to contribute both theoretically and practically to the field of digital language learning and technology-enhanced vocabulary instruction.

2. Literature Review

2.1. Social media and language learning

The rapid expansion of digital technologies has transformed how people communicate, interact, and access knowledge. Among these developments, social media platforms have become influential environments for information sharing, collaboration, and learning. Kaplan and Haenlein (2010) define social media as Internet-based applications built on Web 2.0 that enable the creation and exchange of user-generated content, while Boyd and Ellison (2007) describe social networking sites as web-based services that allow users to create profiles, establish connections, and interact within online communities. Their increasing accessibility has significantly influenced educational practices, particularly language learning.

Recent research has highlighted the pedagogical value of social media in second and foreign language education. These platforms promote communication, collaboration, learner autonomy, and authentic language exposure, supporting interactive and learner-centered learning (Manca & Ranieri, 2016). Kabilan et al. (2010) found that social networking environments enhance vocabulary development, writing fluency, and communicative competence through authentic interaction. From a sociocultural perspective, Vygotsky (1978) argues that social interaction is fundamental to cognitive development, and online communities provide opportunities for learners to negotiate meaning and co-construct knowledge (Reinhardt, 2019). These environments may also reduce language anxiety and encourage communication (Lee, 2014).

Social media has also been associated with greater learner motivation and engagement. Junco et al. (2011), for example, reported positive effects on student engagement and academic performance. Video-based content is particularly valuable because audiovisual input facilitates learning through multiple sensory channels (Mayer, 2009), improving listening comprehension, vocabulary acquisition, and pronunciation in authentic contexts (Vanderplank, 2016). Despite these benefits, social media may also create learning challenges. Excessive use can negatively affect academic performance and time management (Kirschner & Karpinski, 2010), while frequent digital multitasking may reduce sustained attention and cognitive performance (Rosen et al., 2013). These contrasting findings suggest that the relationship between social media use and language learning remains complex and context-dependent.

Consequently, greater attention should be given to examining how specific forms of social media content influence language learning. Among current digital trends, short-form video platforms such as TikTok and Instagram Reels have attracted increasing scholarly interest because of their rapid global growth and widespread popularity among younger learners.

2.2 Short-form videos and micro-learning

Short-form videos are concise audiovisual content, typically lasting from a few seconds to several minutes, and have gained widespread popularity through platforms such as TikTok, Instagram Reels, and YouTube Shorts. The educational potential of short-form videos can be attributed partly to their concise format and engaging audiovisual features. Research suggests that concise and visually engaging instructional videos can enhance learner attention and engagement. Guo et al. (2014) found that shorter videos achieved higher completion rates and sustained learner attention, whereas Bétrancourt & Benetos (2018) emphasized that the effectiveness of instructional videos depends on how video content and design interact with learners' cognitive and perceptual

processes. The effectiveness of short-form videos is also supported by Mayer's (2009) Cognitive Theory of Multimedia Learning, which suggests that learners process verbal and visual information through dual channels. Accordingly, multimedia elements such as narration, subtitles, visuals, and contextual demonstrations can enhance comprehension and memory retention. Likewise, Cognitive Load Theory (Sweller, 1988) proposes that presenting information in manageable segments reduces cognitive overload, although excessive pacing or visual complexity may hinder learning (Paas & Sweller, 2014).

The growing popularity of TikTok and Instagram Reels has encouraged research on their educational applications. Escamilla-Fajardo et al. (2021) suggest that TikTok promotes active and collaborative learning through its interactive features. Similarly, Dizon (2021) found that learners held favorable perceptions of video streaming for informal foreign language learning, highlighting its potential to support out-of-class language learning. In addition, captioned audiovisual input can support learners' comprehension and language development (Vanderplank, 2016).

2.3. Vocabulary acquisition in digital environments

Vocabulary knowledge is a fundamental component of language proficiency because it underpins learners' ability to comprehend and produce language across listening, speaking, reading, and writing (Nation, 2001; Schmitt, 2010). Contemporary research suggests that vocabulary learning is a gradual process influenced by repeated exposure, meaningful input, cognitive engagement, and opportunities for retrieval and use (Webb & Nation, 2017). Based on previous research, the present study examines four factors influencing vocabulary learning through short-form video platforms: repetition, multimedia elements, engagement, and distraction.

First, repetition is widely recognized as a key mechanism for vocabulary acquisition. Nation (2001) argues that repeated encounters strengthen form meaning connections, while Webb (2007) suggests that multiple exposures improve learners' ability to recognize, recall, and use vocabulary. Similar findings have been reported by Pellicer-Sánchez & Schmitt (2010), Waring and Takaki (2003), and Horst et al. (1998). However, most previous studies were conducted in reading-based or classroom settings, leaving the effectiveness of algorithm-driven repeated exposure on short-form video platforms insufficiently explored.

Second, multimedia elements play an important role in digital vocabulary learning. According to the Cognitive Theory of Multimedia Learning (Mayer, 2009) and Dual Coding Theory (Paivio, 1991), combining verbal and visual information enhances learning. In language education, subtitles, images, narration, and contextual demonstrations support vocabulary recognition and comprehension (Vanderplank, 2016). Previous studies have reported positive effects of audiovisual input and captioned videos on incidental vocabulary learning (Montero Perez et al., 2014; Peters & Webb, 2018). Nevertheless, it remains unclear whether multimedia directly improves vocabulary acquisition or mainly increases learners' attention and interest.

Third, engagement reflects learners' behavioral, emotional, and cognitive involvement in learning (Fredricks et al., 2004). Greater engagement is generally associated with higher attention, persistence, and learning effectiveness (Skinner & Pitzer, 2012). However, prolonged engagement does not necessarily result in meaningful vocabulary processing, making its contribution to vocabulary learning uncertain.

Finally, despite their educational benefits, short-form video platforms may also create distractions that interfere with learning. Cognitive Load Theory suggests that excessive stimulation can overload working memory and reduce learning efficiency (Sweller et al., 2011). Rapid transitions, background music, algorithmic recommendations, and entertainment-oriented content may divert learners' attention, while digital multitasking has been shown to impair concentration and academic performance (Ophir et al., 2009; Rosen et al., 2013). At the same time, some evidence suggests that learners can adapt to highly stimulating digital environments, leaving the relationship between distraction and vocabulary learning inconclusive.

Overall, the literature indicates that repetition, multimedia elements, engagement, and distraction influence vocabulary learning through different cognitive and behavioral mechanisms. However, evidence regarding their relative contributions in short-form video environments remains limited and inconsistent, highlighting the need for further investigation into how these factors shape vocabulary learning on platforms such as TikTok and Instagram Reels.

2.4. Research model and hypotheses

Drawing upon the theoretical foundations discussed in the preceding literature review, this study proposes a conceptual research model to examine the factors influencing English vocabulary acquisition through short-form video platforms, particularly TikTok and Instagram Reels. The model is grounded primarily in Mayer's (2009) Cognitive Theory of Multimedia Learning, Sweller's (1988) Cognitive Load Theory, and vocabulary acquisition research emphasizing repetition, multimodal input, and learner engagement (Nation, 2001; Webb & Nation, 2017).

The proposed framework conceptualizes vocabulary acquisition as the dependent construct influenced by four independent variables: engagement (ENG), repetition (REP), multimedia elements (MUL), and distraction (DIS). These constructs were selected because they have been consistently identified in previous research on digital learning environments, multimedia-assisted language learning, and social media-based learning. Although engagement, repetition, and multimedia elements may co-occur in authentic short-form video environments, they represent conceptually distinct dimensions of the learning experience. For example, videos containing rich multimedia features may attract greater learner engagement and encourage repeated viewing. Nevertheless, engagement refers to learners' behavioral, emotional, and cognitive involvement while interacting with content (Fredricks et al., 2004), repetition concerns the frequency with which learners encounter and revisit vocabulary items, and multimedia elements refer to the visual, auditory, and textual features that support meaning construction. Although these constructs may be related in practice, they were operationalized as theoretically distinct dimensions and measured using separate questionnaire items derived from their respective conceptual definitions.

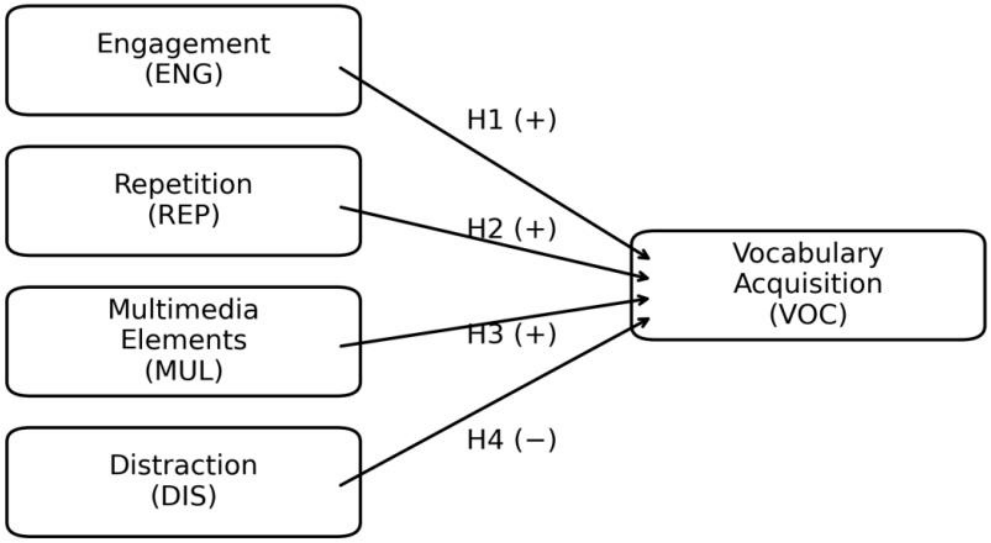
Engagement refers to the degree of learners' behavioral, emotional, and cognitive involvement while interacting with short-form video content (Fredricks et al., 2004). Previous studies suggest that engaged learners are more likely to sustain attention, invest effort, and participate actively in learning activities, which may contribute to more effective vocabulary acquisition (Junco et al., 2011; Dörnyei & Ushioda, 2011). In the context of TikTok and Instagram Reels, highly interactive and visually appealing videos may encourage learners to spend more time engaging with English vocabulary content. Therefore, engagement is expected to positively influence vocabulary acquisition.

Repetition represents the frequency with which learners encounter and review lexical items through repeated exposure to short-form videos. Vocabulary acquisition research consistently identifies repetition as a critical factor supporting long-term memory retention and lexical consolidation (Nation, 2001; Webb, 2007). Repeated encounters with vocabulary items strengthen form meaning connections and facilitate retrieval from long-term memory (Pellicer-Sánchez & Schmitt, 2010). Given that algorithm-driven social media platforms frequently recommend similar content, learners may repeatedly encounter target vocabulary across different contexts, thereby reinforcing vocabulary learning. Consequently, repetition is hypothesized to positively influence vocabulary acquisition.

Multimedia elements refer to the integration of visual illustrations, audio narration, subtitles, animations, and contextual demonstrations within short-form videos. According to Cognitive Theory of Multimedia Learning (Mayer, 2009) and Dual Coding Theory (Paivio, 1991), combining verbal and visual input enhances cognitive processing and information retention. Previous studies have shown that subtitles and audiovisual input can facilitate incidental vocabulary acquisition and listening comprehension (Montero Perez et al., 2014; Peters & Webb, 2018). Therefore, multimedia elements are expected to facilitate vocabulary acquisition by supporting comprehension and retention through multiple channels of information processing.

In the present study, distraction refers to learners' perceived experience of cognitive interference while using short-form video platforms. It does not measure actual attentional loss or objectively observed multitasking behavior. Cognitive Load Theory suggests that excessive information-processing demands may overload working memory and negatively affect learning effectiveness (Sweller, 1988). Similarly, studies on digital multitasking indicate that frequent distractions may reduce concentration and impair academic performance (Ophir et al., 2009; Rosen et al., 2013). Accordingly, perceived distraction is hypothesized to negatively influence vocabulary acquisition. Based on the theoretical and empirical foundations discussed above, the study proposes the following hypotheses:

H1: Engagement (ENG) positively affects vocabulary acquisition (VOC).



H2: Repetition (REP) positively affects vocabulary acquisition (VOC).

H3: Multimedia elements (MUL) positively affect vocabulary acquisition (VOC).

H4: Distraction (DIS) negatively affects vocabulary acquisition (VOC).

Figure 1

Research model and hypotheses

3. Methodology

3.1. Research design

This study employed a quantitative research design to investigate the relationships between short-form video characteristics and English vocabulary acquisition among Vietnamese university students. A quantitative approach was considered appropriate because the study aimed to examine the magnitude and direction of relationships among multiple variables and to statistically test the proposed research hypotheses. The research framework was developed based on theories of multimedia learning, cognitive load, and vocabulary acquisition in digital learning environments. Specifically, the study examined the effects of four independent variables engagement (ENG), repetition (REP), multimedia elements (MUL), and distraction (DIS) on the dependent variable, vocabulary acquisition (VOC). A cross-sectional survey design was adopted to collect empirical data from participants at a single point in time. This approach enabled the researchers to efficiently gather data regarding learners' experiences and perceptions of using TikTok and Instagram Reels for English vocabulary learning. The study further used Structural Equation Modeling (SEM) as the primary analytical technique to evaluate the relationships among the constructs and validate the proposed conceptual framework.

3.2. Participants

The participants in this study consisted of 220 Vietnamese university students who regularly used short-form video platforms, particularly TikTok and Instagram Reels, for English learning purposes. The sample size of 220 participants was considered adequate for Structural Equation Modeling (SEM). According to Hair et al. (2010), a sample size exceeding 200 observations is generally acceptable for covariance-based SEM models with moderate complexity. In addition, the sample satisfied the commonly recommended ratio of at least 10 respondents per estimated parameter, thereby providing sufficient statistical power for the analyses conducted in this study. The participants were recruited using convenience sampling through online learning communities and university-related social media groups.

The sample primarily represented university-aged learners who actively engaged in self-directed English learning through digital platforms. Most participants reported intermediate levels of English proficiency, indicating that they possessed sufficient linguistic competence to evaluate the effectiveness of short-form video content for vocabulary acquisition. In terms of gender distribution, female students constituted the majority of the sample. The selection of university students as the target population was considered appropriate because young adult learners are among the most active users of social media platforms and frequently engage with short-form video content in both educational and entertainment contexts. Furthermore, university students are generally familiar with mobile-assisted language learning practices, making them suitable participants for investigating digital vocabulary learning behaviors.

Prior to data collection, participants were informed about the purpose of the study and assured that their responses would remain anonymous and confidential. Participation in the survey was entirely voluntary.

3.3. Research instrument

Data were collected through an online questionnaire administered via Google Forms. The questionnaire was designed based on established measurement scales from previous studies on digital learning, multimedia learning, learner engagement, and vocabulary acquisition. To ensure contextual appropriateness, several items were adapted and modified to align with the Vietnamese higher education context and the specific characteristics of short-form video platforms.

The questionnaire consisted of two main sections. The first section collected demographic information, including gender, age, English proficiency level, learning experience, and the frequency of using TikTok and Instagram Reels for English learning purposes. The second section measured the research constructs, namely engagement (ENG), repetition (REP), multimedia elements (MUL), distraction (DIS), and vocabulary acquisition (VOC). Each construct was operationalized through multiple observed variables adapted from prior literature. All questionnaire items were measured using a five-point Likert scale ranging from 1 (“strongly disagree”) to 5 (“strongly agree”). The Likert-scale format was selected because it allows respondents to express varying degrees of agreement and is widely used in educational and behavioral research. The engagement construct assessed learners’ levels of attention, interest, and interaction while using short-form videos. The repetition construct measured the extent to which learners repeatedly encountered vocabulary items across videos. Multimedia elements examined learners’ perceptions of subtitles, visuals, audio, and contextual illustrations in facilitating vocabulary learning. Distraction assessed the extent to which rapid pacing, entertainment-oriented content, and excessive stimulation interfered with learning processes. Finally, vocabulary acquisition evaluated learners’ perceived improvement in vocabulary retention, understanding, and usage.

To ensure content validity, the questionnaire items were reviewed and refined based on relevant theoretical frameworks and empirical studies in second language acquisition and digital learning research.

3.4. Data analysis

The collected data were analyzed using IBM SPSS Statistics 26 and IBM SPSS AMOS 26. Prior to analysis, the dataset was screened for completeness and consistency. Descriptive statistics were used to summarize participants' demographic characteristics. Cronbach's Alpha was employed to assess the internal consistency of the measurement scales, while Exploratory Factor Analysis (EFA) was conducted to examine the underlying factor structure and construct validity. The suitability of the data for factor analysis was evaluated using the Kaiser-Meyer-Olkin (KMO) measure and Bartlett's Test of Sphericity.

Multiple regression analysis was initially performed to examine the predictive relationships between the independent variables and vocabulary acquisition. Subsequently, Confirmatory Factor Analysis (CFA) and Structural Equation Modeling (SEM) were conducted using AMOS 26. CFA was used to assess the reliability and validity of the measurement model, whereas SEM was employed to test the hypothesized relationships among the latent constructs. SEM was selected because the study involved latent variables measured by multiple observed indicators and allowed the simultaneous assessment of both measurement and structural models while accounting for measurement error. Model fit was evaluated using χ^2/df, CFI, TLI, and RMSEA.

4. Results and discussion

4.1. Descriptive statistics

Table 1

Frequency distribution of the research sample (N=220)

Variable	Category	Frequency (N)	%	Valid %	Cumulative %
Gender	Male	49	22.3	22.3	22.3
	Female	171	77.7	77.7	100.0
Age	Group 1	6	2.7	2.7	2.7
	Group 2	206	93.6	93.6	96.4
	Group 3	8	3.6	3.6	100.0
English proficiency	Level 1	55	25.0	25.0	25.0
	Level 2	150	68.2	68.2	93.2
	Level 3	15	6.8	6.8	100.0
English learning experience	Level 1	17	7.7	7.7	7.7
	Level 2	28	12.7	12.7	20.5
	Level 3	33	15.0	15.0	35.5
	Level 4	142	64.5	64.5	100.0

	Level 2	26	11.8	11.8	17.7

Level 3	136	61.8	61.8	79.5
Level 4	38	17.3	17.3	96.8
Level 5	7	3.2	3.2	100.0

Source: Analysis results obtained from SPSS 26

After collecting data through the online survey, the research team obtained a total of 220 valid responses, which were included in the analysis. The research sample is described based on several fundamental demographic characteristics, including gender, age, English proficiency, English learning experience, and the participants' level of self-study.

4.2. Reliability analysis

Prior to hypothesis testing, the internal consistency and reliability of the measurement scales were evaluated using Cronbach's Alpha coefficients. According to Nunnally and Bernstein (1994), a Cronbach's Alpha value above .70 indicates acceptable reliability for social science research. The results demonstrated that all constructs achieved satisfactory reliability levels, confirming the consistency of the measurement items used in this study.

Specifically, the engagement construct (ENG) obtained a Cronbach's Alpha coefficient of .819, indicating good internal consistency among the observed variables measuring learners' interaction and motivation when using short-form videos. The repetition construct (REP) achieved an Alpha coefficient of .815, suggesting that the items consistently reflected repeated lexical exposure within short-form video environments. The multimedia elements construct (MUL) showed a relatively high reliability level with a Cronbach's Alpha value of .865, indicating strong consistency among items related to subtitles, visuals, audio, and contextual illustrations. Similarly, distraction (DIS) demonstrated the highest reliability among the independent variables with an Alpha coefficient of .878, reflecting strong coherence among the items measuring cognitive interference and overstimulation. The dependent variable, vocabulary acquisition (VOC), achieved a Cronbach's Alpha value of .830, indicating satisfactory reliability in measuring learners' perceived vocabulary development.

Overall, all scales exceeded the recommended reliability threshold, and no observed variables were removed from the analysis. These findings confirm that the measurement model possesses adequate internal consistency and is suitable for subsequent factor analysis and hypothesis testing.

Table 2.

Reliability analysis of measurement scales

Construct	**Number of items**	**Cronbach's Alpha**	**Reliability level**
Engagement (ENG)	2	.819	Good
Repetition (REP)	2	.815	Good
Multimedia Elements (MUL)	3	.865	Very Good
Distraction (DIS)	2	.878	Excellent
Vocabulary Acquisition (VOC)	3	.830	Good

Source: Authors' calculation based on SPSS output.

4.3. Exploratory factor analysis

To examine the construct validity and underlying factor structure of the measurement model, Exploratory Factor Analysis (EFA) was conducted using Principal Component Analysis with Varimax rotation. The Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy yielded a value of .928, substantially exceeding the recommended threshold of .50 (Hair et al., 2010). This result indicates that the dataset was highly appropriate for factor analysis. Furthermore, Bartlett's Test of Sphericity was statistically significant ($p < .001$), confirming that the observed variables were sufficiently correlated to justify factor extraction.

The EFA results indicated that the extracted factors explained 66.451% of the total variance, demonstrating acceptable construct validity for the proposed measurement model. In social science research, a total variance explained value above 50% is generally considered acceptable, indicating that the factor structure adequately represents the observed data. The extracted factor structure generally aligned with the proposed theoretical framework. The independent variables including engagement, repetition, multimedia elements, and distraction loaded strongly onto the primary latent dimension, while vocabulary acquisition emerged as a separate dependent construct. The factor loadings exceeded the acceptable threshold, supporting the convergent validity of the measurement scales.

Overall, the EFA results confirm that the observed variables appropriately represent the underlying theoretical constructs and provide empirical support for the proposed research model.

Table 3

KMO and Bartlett's Test

Measure	Value
Kaiser–Meyer–Olkin (KMO)	.928
Bartlett's Test of Sphericity	Significant
Sig.	< .001

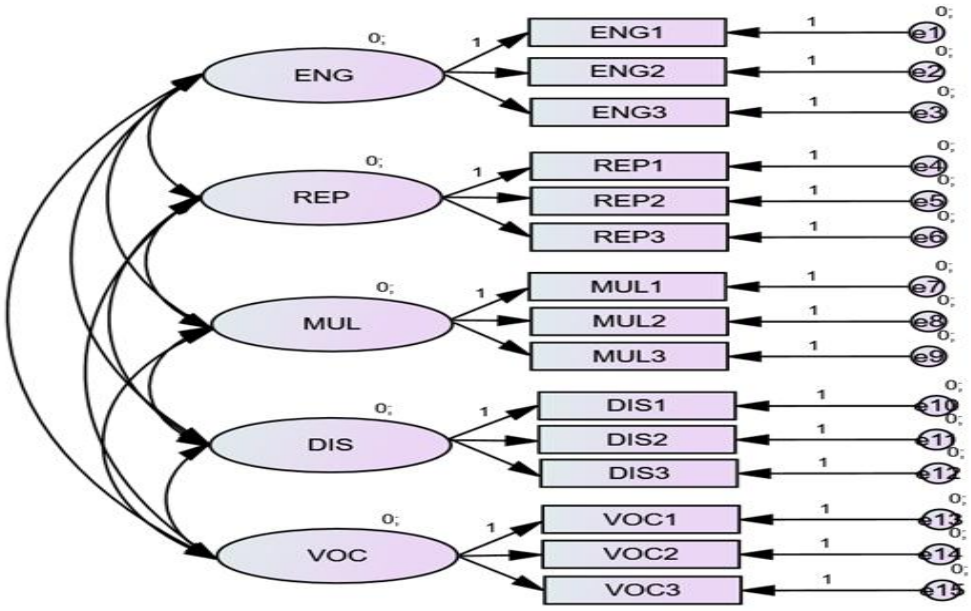
Total variance explained

Factor	Eigenvalue	% of Variance	Cumulative %
Factor 1	7.214	48.093	48.093
Factor 2	2.754	18.358	66.451

Source: Authors' calculation based on SPSS output.

4.4. Confirmatory factor analysis



4.4.1. Objective

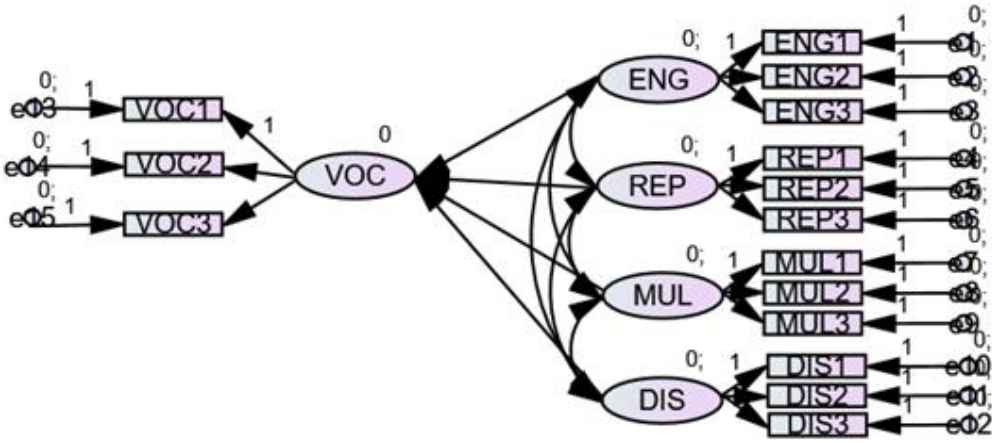
Confirmatory factor analysis (CFA) was conducted to validate the measurement model, examine the goodness-of-fit between the proposed model and the empirical data, and assess the convergent and discriminant validity of the constructs. Following the reliability analysis and Exploratory Factor Analysis (EFA), the CFA included five latent constructs: Engagement (ENG), Repetition (REP), Multimedia Elements (MUL), Distraction (DIS), and Vocabulary Acquisition (VOC), represented by 15 observed variables.

4.4.2. Measurement model

Figure 2

Confirmatory factor analysis (CFA) measurement model

The measurement model demonstrated acceptable fit indices ($\chi^2/df = 2.11$, CFI = .931, TLI = .918, RMSEA = .061), indicating a satisfactory fit between the proposed model and the observed data (Hair et al., 2010). The CFA results showed that all standardized factor loadings were statistically significant ($p < .001$) and exceeded the recommended threshold of 0.50, ranging from 0.718 to 0.884 (Hair et al., 2010). These findings indicate that all observed variables adequately represented their corresponding latent constructs and provide evidence of satisfactory convergent validity. Furthermore, the reliability analysis reported in the previous section showed that all constructs achieved Cronbach's Alpha values above the recommended threshold of .70, indicating acceptable internal consistency (Nunnally & Bernstein, 1994). Taken together, the CFA results, reliability analysis, and acceptable model fit indices support the adequacy of the proposed measurement model for subsequent structural analysis.



The mean values of the observed variables ranged from 3.436 to 3.986, reflecting a moderately high level of agreement among respondents. The Multimedia Elements (MUL) construct obtained the highest mean scores, suggesting that learners highly appreciated the role of

multimedia features in supporting vocabulary learning. By contrast, the Distraction (DIS) construct recorded comparatively lower mean scores, indicating that distraction was generally perceived at a moderate level.

4.5. Structural equation modeling (SEM) results

Figure 3

Structural equation model with standardized estimates

The Structural Equation Modeling (SEM) analysis was conducted to examine the effects of Engagement (ENG), Repetition (REP), Multimedia Elements (MUL), and Distraction (DIS) on Vocabulary Acquisition (VOC). The results indicate that engagement (ENG) did not significantly affect vocabulary acquisition (β = .118, p = .231). This finding suggests that learners' interaction and engagement with short-form video content alone may not necessarily lead to improved vocabulary acquisition. In contrast, repetition (REP) demonstrated a positive and statistically significant effect on vocabulary acquisition (β = .549, p = .012). This result highlights the critical role of repeated lexical exposure in reinforcing vocabulary retention and enhancing learning effectiveness. Similarly, multimedia elements (MUL) did not significantly influence vocabulary acquisition (β = .093, p = .187). Although multimedia features may increase learner attention and engagement, they may not independently produce substantial vocabulary gains without repeated exposure and meaningful processing. Finally, distraction (DIS) did not demonstrate a statistically

significant effect on vocabulary acquisition (β = –.074, p = .294). This finding may indicate that learners are capable of adapting to high-stimulation digital environments and selectively focusing on relevant linguistic information during learning activities.

Overall, among the four proposed predictors, repetition emerged as the only statistically significant factor influencing vocabulary acquisition in short-form video learning environments.

4.6. Regression and structural equation modeling (SEM) results

To examine the relationships between repetition, multimedia elements, engagement, distraction, and learners' perceived vocabulary acquisition, multiple regression analysis was initially conducted, followed by Structural Equation Modeling (SEM) to validate the findings while accounting for measurement error and simultaneously evaluating both the measurement and structural models. The regression results indicated that the proposed model demonstrated good explanatory power, accounting for 64.9% of the variance in learners' perceived vocabulary acquisition (Adjusted R^2 = .649). This finding suggests that the four predictor variables collectively provide a substantial explanation of vocabulary learning within short-form video environments.

Among the independent variables, repetition (REP) emerged as the strongest and only statistically significant predictor of perceived vocabulary acquisition. The regression coefficient was positive and significant (β = .372, p < .001), indicating that repeated exposure to vocabulary through short-form videos substantially enhanced learners' vocabulary acquisition. This result was further supported by the SEM analysis, in which the path from repetition to vocabulary acquisition remained statistically significant (β = .549, p = .012), confirming repetition as the most influential factor in the proposed structural model. By contrast, engagement (ENG), multimedia elements (MUL), and distraction (DIS) did not demonstrate statistically significant effects on perceived vocabulary acquisition. Although these constructs showed directional relationships with the dependent variable, their path coefficients did not reach statistical significance in the final structural model.

These findings suggest that repeated encounters with vocabulary items play a more decisive role in vocabulary learning than entertainment-oriented features, visual attractiveness, or passive interaction with short-form video content.

Table 5

Multiple regression results

Predictor	Standardized Beta (β)	t-value	Sig.
Engagement (ENG)	.104	1.421	.157
Repetition (REP)	.372	5.884	< .001
Multimedia Elements (MUL)	.087	1.238	.217
Distraction (DIS)	-.061	-0.942	.347

Table 6

Structural Equation Modeling (SEM) Results

Structural path	Estimate	p-value	Result
ENG → VOC	.118	.231	Not Supported
REP → VOC	.549	.012	Supported
MUL → VOC	.093	.187	Not Supported
DIS → VOC	-.074	.294	Not Supported

5. Discussion

5.1 Interpretation of findings

The findings of this study provide important insights into learners' perceived vocabulary acquisition through short-form video platforms such as TikTok and Instagram Reels. Among the four examined predictors, repetition emerged as the only statistically significant factor influencing vocabulary acquisition, highlighting the central role of repeated lexical exposure in digital language learning environments.

The significant influence of repetition is consistent with previous research in second language acquisition emphasizing the importance of repeated encounters with vocabulary items for long-term retention and lexical consolidation (Nation, 2001; Webb, 2007; Webb & Nation, 2017). From a cognitive perspective, repeated exposure strengthens form-meaning connections and facilitates the transfer of lexical information from working memory into long-term memory storage. Within short-form video environments, algorithm-driven recommendation systems may unintentionally support this process by repeatedly exposing learners to similar lexical items, expressions, and thematic content across multiple videos. The findings further suggest that repetition may play a more decisive role in vocabulary learning than entertainment-oriented or visually attractive characteristics of short-form videos. Although social media platforms are commonly associated with highly stimulating multimedia features, the present study demonstrates that repeated lexical exposure, rather than content richness alone, functions as the primary mechanism supporting vocabulary acquisition. This result reinforces the argument that frequency of exposure remains a fundamental determinant of vocabulary development regardless of technological learning environments. Contrary to the proposed hypotheses, engagement and multimedia elements did not significantly predict vocabulary acquisition. One possible explanation is that visually attractive content and interactive features may increase learners' attention and enjoyment without necessarily promoting deeper cognitive processing or durable vocabulary retention. Learners may passively consume entertaining content without systematically focusing on lexical learning. Consequently, while multimedia features may facilitate short-term engagement, they may not independently produce measurable vocabulary gains unless accompanied by repeated and meaningful exposure. Similarly, the non-significant effect of engagement indicates that increased interaction or enjoyment does not automatically translate into improved vocabulary acquisition. Although previous studies have linked learner engagement to stronger academic performance and motivation (Fredricks et al., 2004; Junco et al., 2011), the present findings suggest that engagement alone may be insufficient to generate substantial vocabulary learning outcomes in informal digital learning contexts. Interestingly, distraction did

not exert a statistically significant negative effect on vocabulary acquisition. This finding may indicate that contemporary learners have become increasingly accustomed to high-stimulation digital environments and may possess the ability to selectively process relevant linguistic information despite rapid pacing, background music, and entertainment-oriented content. In other words, learners may develop adaptive cognitive strategies that enable them to extract useful vocabulary input even within highly dynamic social media environments. Nevertheless, the absence of statistical significance should not be interpreted as evidence that distraction has no effect on learning. Rather, it suggests that within the present sample and research context, distraction did not substantially hinder vocabulary acquisition outcomes.

Overall, the findings indicate that effective vocabulary learning through short-form video platforms depends less on entertainment value or multimedia complexity and more on structured repetition and repeated lexical exposure. The study therefore highlights the pedagogical importance of repetition as a cognitive reinforcement mechanism in digital vocabulary learning environments and suggests that short-form videos can support vocabulary acquisition when designed to facilitate repeated encounters with target lexical items.

5.2. Theoretical and practical contributions

This study makes several important contributions to the existing literature on digital language learning, vocabulary acquisition, and social media-assisted education. First, the study extends current research on short-form video platforms by examining the pedagogical mechanisms underlying vocabulary acquisition within algorithm-driven social media environments such as TikTok and Instagram Reels. While previous studies have frequently emphasized learner motivation, engagement, and entertainment value in social media learning, the present study demonstrates that repeated lexical exposure functions as the primary mechanism supporting vocabulary development in short-form video contexts. In doing so, the study shifts scholarly attention from surface-level engagement toward deeper cognitive processes associated with vocabulary retention and lexical consolidation.

Second, the study contributes to vocabulary acquisition theory by reaffirming the central role of repetition in informal digital learning environments. Although multimedia learning research often highlights the benefits of audiovisual input and interactive media, the findings suggest that multimedia richness alone may not be sufficient to produce substantial vocabulary gains without continuous lexical recycling and repeated encounters with target vocabulary items. The study therefore provides a more nuanced understanding of how learners process language input in highly stimulating digital environments and highlights repetition as a fundamental pedagogical principle that remains effective even within contemporary social media ecosystems.

Third, the study contributes contextual evidence from the Vietnamese higher education context, which remains relatively underrepresented in current research on short-form video-assisted language learning. By focusing specifically on Vietnamese university students, the study broadens the geographical and educational scope of research on social media-based vocabulary

acquisition and provides empirical insights into how learners in emerging digital learning environments interact with short-form educational content.

From a practical perspective, the findings offer meaningful implications for educators, instructional designers, and digital content creators. The study suggests that vocabulary-oriented short-form videos should prioritize repeated exposure to target lexical items through subtitles, thematic recycling, contextual repetition, and spaced reinforcement strategies rather than relying primarily on entertainment-oriented features or excessive multimedia stimulation. Furthermore, teachers may integrate short-form video platforms into supplementary vocabulary instruction to extend learners' exposure to authentic English input beyond formal classroom settings and promote continuous vocabulary reinforcement through mobile-assisted learning practices.

6. Conclusion

This study investigated the effectiveness of short-form video platforms, particularly TikTok and Instagram Reels, in supporting English vocabulary acquisition among Vietnamese university students. Drawing upon the Cognitive Theory of Multimedia Learning, Cognitive Load Theory, and micro-learning principles, the study examined the effects of engagement, repetition, multimedia elements, and distraction on vocabulary acquisition through a quantitative research design employing Structural Equation Modeling (SEM). The findings revealed that repetition was the only statistically significant predictor of vocabulary acquisition, whereas engagement, multimedia elements, and distraction did not demonstrate significant effects.

The findings suggest that effective vocabulary learning in short-form video environments depends less on entertainment-oriented interaction or multimedia complexity and more on repeated lexical exposure and continuous vocabulary reinforcement. The study therefore highlights the pedagogical importance of repetition as a key mechanism supporting vocabulary retention in contemporary digital learning environments. From a practical perspective, educators and digital content creators should prioritize subtitles, contextual recycling, thematic consistency, and repeated encounters with target vocabulary items when designing vocabulary-oriented short-form video content. Despite its contributions, the study has several limitations. First, the research relied on self-reported questionnaire data collected from a relatively limited sample of Vietnamese university students, which may restrict the generalizability of the findings to other educational and cultural contexts. Second, the cross-sectional research design did not permit the examination of long-term vocabulary retention or causal relationships over time. Third, the study focused primarily on learners' perceptions rather than objective measures of vocabulary performance. In addition, the use of convenience sampling through online learning communities may have introduced self-selection bias, as students with greater interest in English learning or short-form video platforms were more likely to participate. The sample was also predominantly female, which may limit the representativeness of the findings across the broader university student population. Furthermore, several constructs, including engagement, repetition, and distraction, were measured using only two observed indicators. Although the reliability coefficients were acceptable, these measures may not fully capture the complexity of the underlying constructs. Finally, engagement, repetition, and multimedia elements may partially overlap in authentic short-form video learning environments, despite being operationalized as

theoretically distinct constructs in this study. Future studies may therefore employ longitudinal or experimental approaches, incorporate vocabulary testing instruments, and compare multiple social media platforms across diverse learner populations.

Overall, the study demonstrates that short-form video platforms possess considerable potential for supporting vocabulary acquisition when they facilitate repeated and meaningful exposure to target lexical items. As social media increasingly becomes integrated into language learning practices, understanding the cognitive and pedagogical mechanisms underlying digital vocabulary learning will remain an important area for future research.

Nguyen Thi Nuong holds a PhD in Linguistics and is currently a lecturer at the Academy of Policy and Development, Viet Nam. She has over 18 years of experience in teaching, academic management, and professional development training for primary school teachers. Her teaching areas include General English, ESP, Business English, translation, communicative skills, linguistics, and intercultural communication. Her researches focus on applied linguistics, technology-enhanced language learning, digital transformation in higher education, foreign language teaching methodology, translation studies, and learner autonomy development.

Phan Thi Thanh Tam holds a Master's degree and is currently a lecturer at the University of Labour and Social Affairs, Viet Nam. She has over 25 years of experience in teaching and academic work. Throughout her career, she has been actively involved in teaching English language courses and developing innovative teaching methodologies. She has also contributed to academic research with several scientific publications in reputable national journals. Her research interests mainly focus on English language studies, language teaching methodologies, and innovations in foreign language education.

Dung Thanh Nguyen is a teacher of English and dean of General Education Department at National University of Arts Education in Vietnam. She obtained a bachelor degree in TESOL at Vietnam National University (VNU) in 2001, a master degree in TESOL at VNU in 2009, and a doctor degree in linguistics at Vietnam Academy of Social Sciences in 2017. She has published articles about English teaching issues such as implementing new methods in classrooms and ways of motivating EFL students. She is interested in English teaching methodology, motivation, learning styles and materials and curriculum development.

Uyen Thu Thi Duong is currently a second-year student majoring in English language, specializing in Economics and Business. She has actively participated in academic and extracurricular activities, including scientific research projects and writing reports for scientific conferences. She also has experience in public speaking and event hosting through volunteer and educational programs. Her academic interests mainly focus on English language studies, communication, economics, and business.

Appendices

Appendix A

Measurement items

Construct	Code	Measurement items
Engagement (ENG)	ENG1	I actively engage with English vocabulary content on TikTok and Instagram Reels.
	ENG2	Short-form video platforms increase my motivation to learn English vocabulary.
Repetition (REP)	REP1	I frequently encounter repeated English vocabulary in short-form videos.
	REP2	Repeated exposure helps me remember English vocabulary more effectively.
Multimedia Elements (MUL)	MUL1	Visual and audio elements help me understand vocabulary more easily.
	MUL2	Subtitles and illustrations support my vocabulary learning process.
	MUL3	Multimedia features enhance my ability to memorize new vocabulary.
Distraction (DIS)	DIS1	Entertainment-oriented content distracts me from vocabulary learning.
	DIS2	Rapid video transitions reduce my concentration while learning vocabulary.
Vocabulary Acquisition (VOC)	VOC1	Short-form videos help me expand my English vocabulary.
	VOC2	I can remember vocabulary more effectively through short-form videos.
	VOC3	My vocabulary usage has improved after using TikTok and Instagram Reels.

Scale:
1 = Strongly disagree
2 = Disagree
3 = Neutral
4 = Agree
5 = Strongly agree

Appendix B

Demographic questionnaire

1. Gender

□ Male
□ Female

2. Age

□ Under 18
□ 18–22
□ Above 22

3. English proficiency level

□ Beginner
□ Intermediate
□ Advanced

4. English learning experience

□ Less than 1 year
□ 1–3 years
□ 4–6 years
□ More than 6 years

5. Frequency of self-learning English through short-form video platforms

□ Rarely
□ Sometimes
□ Often
□ Very often
□ Always

6. Which short-form video platform do you use most frequently for English learning?

□ TikTok
□ Instagram Reels
□ YouTube Shorts
□ Facebook Reels
□ Others: _____

7. Average daily time spent watching English-learning short-form videos

□ Less than 15 minutes
□ 15–30 minutes

□ 30–60 minutes
□ More than 60 minutes

#128 USABILITY TESTING OF WEB-BASED DICTATION TOOLS FOR ESL LISTENING COMPREHENSION

Thao Nguyen Thi Da[1], Ngoc Phung Tuan[2]

Abstract

Dictation has long been recognized as an effective method for improving ESL learners' listening comprehension. With the rise of web-based applications, learning English has become more accessible and engaging. However, the abundance of dictation websites can pose challenges for both teachers and students in selecting suitable platforms. This qualitative usability case study examines the affordances of three popular web-based applications – DailyDictation, English Club, and Parroto – through usability testing focused on site design and user experience. Ten non-English-major university students with mixed levels used the three websites over one week to complete usability testing tasks. Data was collected from users' journals, and visual analysis.

The study demonstrates that clear information and effective interaction design foster self-directed listening practice, enhanced by personalized suggestions, engaging activities, timely feedback, and error correction. These findings highlight the pedagogical importance of usability, urging educators and developers to prioritize adaptable, well-designed platforms that sustain long-term language learning outcomes.

***Keywords*:** dictation, web-based learning, listening, usability testing

1. Introduction

Listening is one of the fundamental skills besides speaking, reading, and writing. However, it is often overlooked as the ability to write and speak is predominantly viewed as the standard for language competency. In other words, listening is more like a minor skill which is a means to achieve speaking proficiency (Nunan, 2002). The perspective in which listening is static and passive has influenced the way this skill is taught. Ji (2015) reflected the traditional approach of listening teaching in many schools with a rigid procedure including the introduction of complex lexicon and background knowledge, followed by multiple listening exercises. As a result, students play a more submissive role in learning since what they do is to patiently listen and respond to the oral stimulus from the tape recorder (Movva et al., 2022). Meanwhile, Nunan (1998) opposed the idea of "listeners as tape recorders" and suggested that they could construct and interpret audio input by utilizing their schematic knowledge. Listening thus requires more efforts from the learners' part and has received much attention since the theory of comprehensible input gained its dominance (Nunan, 2002).

Although listening emerged as crucial in language classrooms, acting as an input provider for students, promoting the language skill among non-majors in universities and colleges is not a

[1] *Master, English Division, Faculty of Fundamental Sciences, Sai Gon Technology University, Ho Chi Minh City, VietNam; Email: thao.nguyenthida@stu.edu.vn*

straightforward task (Hong et al., 2024). Students are most often hindered in listening comprehension due to a dearth of lexical, grammatical, and schematic resources. The voices and accents of speakers also remarkably contribute to the grasp of the discussed notions if they present a wide array of phonological features. Other affecting factors to be considered include anxiety, non-verbal clues, and listening contexts (Ji, 2015; Movva et al., 2022).

To address these challenges, the present study revisits dictation – a conventional listening practice – through its integration with three web-based applications: DailyDictation, English Club, and Parroto. Unlike prior research that has primarily examined the effectiveness of digital tools in improving listening comprehension, this study advances the discussion by focusing on usability. Specifically, it investigates how accessibility, presentation, task diversity, and individual differences shape learners' willingness to engage with dictation websites. In doing so, the study evaluates the usability and suitability of these platforms for non-English-major students, aligning its scope with the following research questions:

1. What features of web-based applications do non-English-major students prefer regarding dictation activities?

2. Which of the three web-based applications – DailyDictation, English Club, and Parroto – is the most suitable for non-English-major students?

2. Literature review

2.1 The current trend in teaching Listening

Students in many language classrooms are of diverse abilities and levels, and while there is no one-size-fit-all way to deliver listening lessons (Gower et al., 2005), it is vital to tackle such differences with the most current teaching methods. A well-known approach is Activity-based language teaching, which comprises pre-listening, while-listening, and post-listening activities (Movva et al., 2022). This three-stage format is inherently based on the traditional model characterized in mainstream language teaching manuals such as Richards & Renandya (2002), Field (2009), or Parrish (2019). Although the stages persist throughout the development of language teaching, it is the core activities that have evolved, from the fundamental steps recognized by Mary Underwood (including the activation of learners' vocabulary and background knowledge, the development of information retrieval, and the consolidation of comprehension) to the adoption of task-based listening activities that emphasized the information transformation in real-world communication (Cook, 2013). For instance, Parrish (2019) suggested using a discussion or questionnaire to generate learners' schemata in addition to pre-teaching new words. However, not all researchers are in favor of the conventional activities with pre-set questions. Ji (2015) argued that this approach significantly hinders listening improvement and learners' motivation as it emphasizes the outcomes instead of the process. This author adopted strategies from the realm of discourse analysis to solve learners' difficulties in the listening process, such as anxiety, speech presentation, or message gaps. In the same vein, He (2016) modified Underwood's model using the "lexical chunks schema-oriented listening teaching method" to enhance short-term memory and bridge learners' background knowledge with the listening materials.

While scholars hold different perspectives in terms of techniques in teaching listening, they seem to agree on the use of authentic materials (Mendelsohn, 1998; Richards & Renandya, 2002; Field, 2009). According to Ur (2024), the ultimate goal of teaching listening is to prepare students

for real-life situations where speech is generated spontaneously, featuring background noises, multiple accents, and redundancy, rather than formal pre-scripted discourse followed by a series of comprehension tasks. To make listening lessons more authentic, the author suggests two approaches. One involves utilizing the teacher's talk as a valuable source of language input that can scaffold learners to accomplish language tasks or offer opportunities for language acquisition (Moser et al., 2011; Jin & Webb, 2020). The other necessitates the proper choice of teaching materials, whether they are recordings from official coursebooks or online video tapes. Depending on the purposes, teachers can choose to make the listening texts or tasks authentic. Nunan (2015) believed modifying the task is even more crucial than editing the listening text, and thus, there is room for either authentic or non-authentic materials. Evidently, Chang et al. (2018) showed students' listening improvement using audio files from graded readers in combination with extensive listening and reading-while-listening techniques. The difficulty degrees of listening activities were also recognized in Hong et al. (2024) to cater to obstacles that learners often encounter, including a limited lexical resource, poor sound recognition and distinction, lack of listening strategies, and low concentration.

2.2 Dictation and online listening practice

In addition to the prevalent three-stage approach to listening teaching, dictation has emerged as a promising technique to enhance this language skill. The origin of dictation can date back to the Middle Ages when it was strictly associated with the grammar translation method in foreign language teaching. The technique underwent ups and downs over the nineteenth century. As the natural method became fashionable, it promoted more imitation in speaking and listening and, thus, dictation was rejected. However, it regained its high status with the introduction of the direct method which featured phonetic dictation exercises, before being overshadowed by the remarkable success of the audio-lingual method later (Stansfield, 1985). Nation & Newton (2009) argued that despite its peaks and troughs, dictation can make tremendous contribution to the language proficiency, particularly in vocabulary learning. Dictation urges learners to focus more on forms and structures at the clause and phrase levels by allowing them to be aware of their errors through checking the dictation on their own, in pairs or groups. When choosing dictation materials, it is important for teachers to take accent variety into account. This is because English has been widely used by native speakers of other languages, making it a lingua franca with various norms that are different from the standardized rules (Kecskes, 2019). Nowadays, deploying listening resources from English native speakers is not so difficult due to the omnipresence of multimedia instructional applications. Najjar (1996) depicted multimedia is the utilization of "text, graphics, animation, pictures, video and sound to present information". Therefore, these means can be easily accessed through a computer or other portable devices such as smartphones or laptops. Media-rich classrooms may facilitate a more engaging and motivating learning experiences as media-language learning tools are able to bring the real-life world into the conventional classroom, complementing it with interactive interface accompanied by sound, animation and other visual and aural effects (Mukhtarkhanova et al., 2023). Such multimedia, additionally, can be modified to match leaners' needs and preferences (R. Liu, 2023). For instance, visual learners may benefit most from watching videos or graphs, while auditory learners can make use of podcasts.

Online learning is one of the ways to access these multimedia tools, offering more exposure to effective L2 listening. First of all, students are able to work in their own space by controlling the listening speed, repeating the audio, or reading the caption (Robin, 2007). They can also access

an inexhaustible collection of listening activities, topics and accents (Kamalitdinovna, 2021). Therefore, the impact of online listening is significant in terms of learning strategies and incidental vocabulary acquisition, respectively (Smidt & Hegelheimer, 2004), concurs with Rahmat (2018) who discovered that complementing multimedia learning with dictation can boost students listening comprehension. However, the author warned that students in the experimental group encountered difficulty at the beginning of the treatment, saying that they cannot comprehend the recorded native voice of speakers. This somehow reflects the findings in Kazazoğlu (2013), which indicated a more excessive number of word errors from tape-recorded dictation compared to teacher-led one. Furthermore, if metacognitive instructions are integrated in the online listening tasks, the L2 listening comprehension ability can be improved as learners are encouraged to use strategies such as evaluation which can be achieved through dictation (Pei et al., 2023).

2.3 Framework for assessing a web-based application

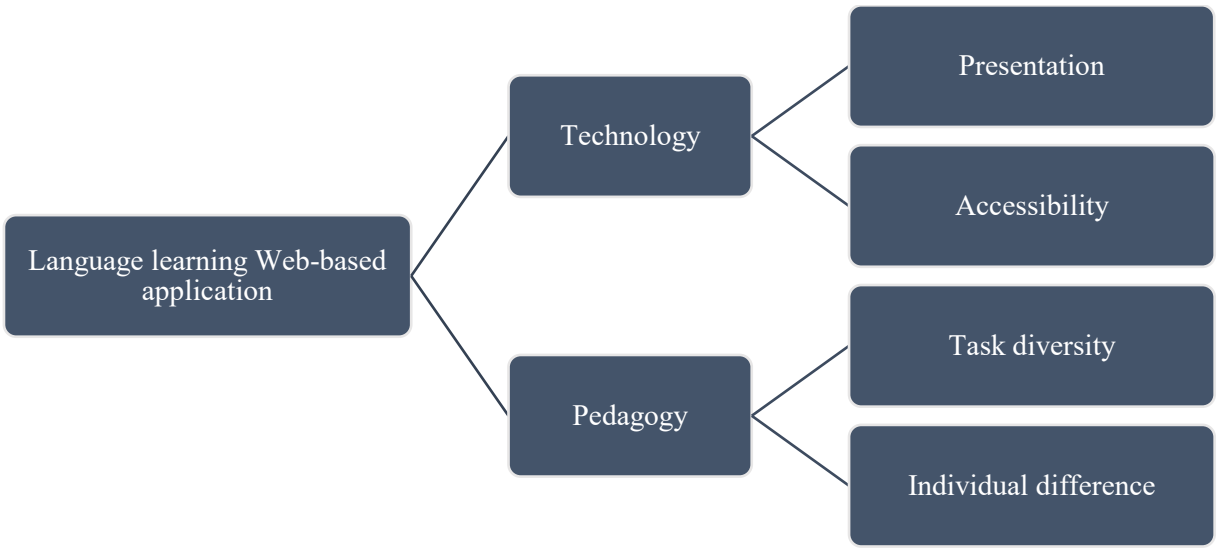
When it comes to using web-based applications to assist language learning, there are a variety of choices online. Some have been proven to effectively improve learners' language skills, such as Wordwall, Memrise for boosting vocabulary acquisition (Esmaeili & Shahrokhi, 2020; Hasram et al., 2021; A. T. Nguyen et al., 2023), LyricsTraining for listening enhancement (Borromeo García, 2015; T. G. M. Nguyen, 2023), ELSA for communication practice (Dhivya et al., 2023), or Duolingo for reading and listening proficiency (Jiang et al., 2024). Such an abundance of digital resources, while adding diversity and interest to language lessons, can cause decision fatigue and potentially put considerable pressure on teachers. Web-based tools, in a strict view, can be considered teaching materials, and the decision on the choice of which to use is completely subjective, and the procedure for evaluating an adequate material requires an exhaustive list featuring principles from theories of language teaching and learning, and language acquisition (Tomlinson, 2023). However, learners' experience with digital materials is rather different from the traditional ones, demanding another perspective for evaluation.

Erdogan & Uzun (2010), while claiming there is an obvious neglect of pedagogical and methodological approaches, developed a checklist for an adequate language learning website. The evaluation checklist features general information about the website, user interfaces, contextual aids, and educational purposes. Meanwhile, M. Liu et al. (2015) proposed usability testing as the framework for assessing a website's design, which utilizes a series of interaction tasks for users to explore the website, experience a specific feature, and navigate through different sections. Moreno Fuentes & Risueño Martínez (2018) suggested using a checklist from the perspective of ergonomics, linguistics, and pedagogy. The checklist includes nine areas: general site information, language skills and components, educational material, multimedia use, interactivity, communication, aid tools and linguistic resources. In the same vein, Alhabdan (2021) took the viewpoint of students and developed a checklist questionnaire with two categories: functionality and usability. The former refers to the ease of access and navigation, while the latter involves the design, content, and instructions offered by the website.

Overall, to evaluate a language learning website, previous research often targets the user interface and the quality of online materials. Hadjerrouit (2010) suggested that any web-based learning resource should include four important features:

1. It is hosted online through websites

2. Its content serves specific learning outcomes
3. Its design involves theories from the learning and teaching fields
4. It is reusable for various contexts.



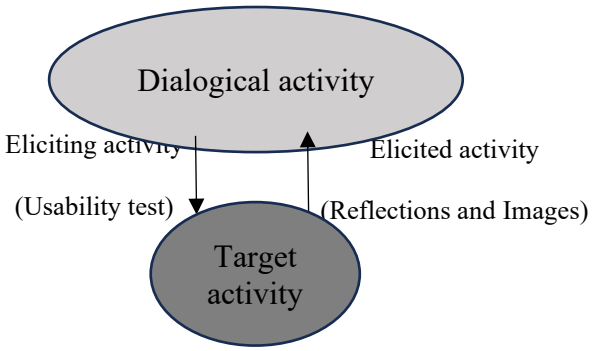
The author stressed that online learning tools were still in the ground of software programmers instead of teachers or educators, and therefore, their "technical usability" seems more dominant and influential than "pedagogical usability".

Although there are concerns about linguistic and pedagogical values, the link of those elements to learning and teaching theory seems to be overlooked. For example, the characteristic of helping learners to conduct language tasks step by step and facilitating interaction with other people is well aligned with Vygotsky's theory of mediation and zone of proximal development (Hadjerrouit, 2010; G.-Z. Liu et al., 2011; Huong & Bui, 2024). Moreover, in order to help learners to be more independent and self-regulated beyond the classroom, they should fully know their strengths, weaknesses, preferences, and styles to make informed learning decisions (Hadjerrouit, 2010; Brown & Lee, 2015; Allison et al., 2019). These individual differences are believed to be closely connected to the domain of second language acquisition. Apart from these concerns, some other aspects need attention as well. Web users nowadays can access online platforms through various devices such as smartphones, tablets, or laptops with different screen sizes, demanding the ability to optimize the interface for effective interaction. Furthermore, with the advent of AI technology, the integration of AI models into existing learning platforms should also be taken into account as it offers personalized learning experiences, allowing specific individual needs to be fulfilled through automatic assessment, real-time feedback, and educational recommendations (Shafiee Rad, 2025).

Based on the previous literature, a language learning web-based application should essentially balance technology and pedagogy (Figure 1).

Figure 1

The framework for language learning web-based applications



3. Methodology

This study adopted a small-scale qualitative usability case study to explore learners' experiences with three web-based dictation tools. Ten freshmen from Sai Gon University of Technology participated, all non-English-major students with mixed proficiency levels. They were selected through convenience sampling, as they were readily accessible to the researcher. The sample pool was limited to ten as the scope of this study is restricted to a case study and phenomenology (Creswell & Creswell, 2018). The students were asked to experience three popular web-based applications: DailyDictation, English Club, and Parroto. Meanwhile, they had to complete usability testing tasks and keep a journal which delineates their views and reflections on the applications. First, the authors met ten students in person, using a designed journal (Appendix) to instruct students how to reflect and take screenshots while experiencing the three websites. Then, a Zalo group was created for further communication between authors and participants. After receiving participants' journals via Zalo group, researchers would examine thoroughly and ask for clarification or changes if needed.

The data was collected mainly from participants' journals and photo-observation. In order to ensure students' reports adhere to the purposes and scopes of this study, a usability test was used to elicit their reflections for each application. The test was adapted from M. Liu et al. (2015), and it includes three categories: exploratory, specific, and open-ended tasks. The first type is for the participants to familiarize themselves with the applications, the second type requires them to conduct an assignment using some features of the applications, and the last one only asks them to perform a task without instructions. The use of the usability test to capture students' reflections was based on the eliciting model by Van Belleghem (2016) (Figure 2). The eliciting activity was the test, while the elicited activity was the constructed data – reflections written and photos captured in journals. The target activity was what the researchers expected the students to do in this study: recording their interactions with the applications, and the dialogical activity involves the member checking process where the researchers gave the participants the final report to determine whether they feel it was accurate (Creswell & Creswell, 2018).

Figure 2

Belleghem's model for reflection elicitation.

The data was analyzed using directed content analysis which can be applied to various writing materials. Texts are then summarized through the use of pre-determined categories, and thus, the theme structure usually emerges from the theories in the literature (Cohen et al., 2018). As mentioned in the previous section, there seems to be few coding schemes targeting learning and teaching fields, so this study filled the gap by synthesizing schemes (Table 1) from three sources in the literature (Hadjerrouit, 2010; Allison et al., 2019; Huong & Bui, 2024). While ten journal entries were read several times and coded in accordance with the pre-existing themes and subthemes related to the features of technology and pedagogy, the screenshot images were viewed as instances associated with the given themes.

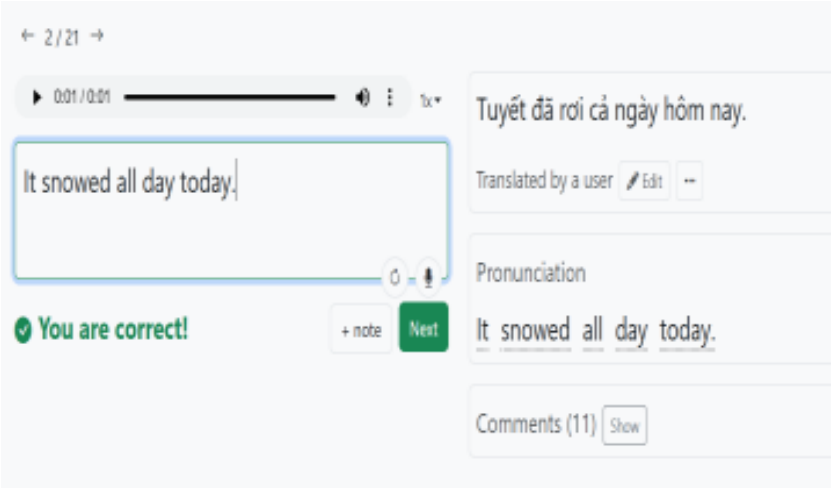
Table 1.

Coding Scheme for the Usability Task

Coding Theme	**Explanation**	**Examples from Usability testing tasks**	**Examples from the current study's journal data**
Accessibility	The language learning tool is user-friendly and compatible with different devices; and the homepage indication, and navigation are supportive.	*Please take 5 minutes to explore the sites freely. If you need to register to explore, please do so.*	*The site runs smoothly without errors, the homepage is easy to view and use.*
Presentation	The content such as corlors, fonts, styles, media or graphics is easy to read and impressive.	*Pay attention to the interface design (labels, colours, and banners), ease of navigation, and the types of listening materials available.*	*Animated interface, cartoon videos appeal to GenZ, allowing users to learn while being entertained.*
Task diversity	The activities provided by the online application are varied including games, quizzes, riddles, pedagogical or real-life tasks.	*Use the site to find a dictation that matches your current English level.* *After completing it, explore the related 'Dictation Tips' or 'Grammar' links.* *Decide if these additional resources help you understand why you made certain mistakes.*	*Listening exercises, quizzes and games in each section*
Individual Difference	Learners' needs, characteristics and learning styles are taken into account to optimize learning experiences. AI technology is integrated to support learners' autonomy by providing timely and specific feedback for their actions.	*Pick a short video clip of your interest.* *Use the 'repeat' or 'slow down' features to transcribe the dialogue.* *Verify your accuracy using the built-in feedback system.* *Report if the interactive features made the difficult parts easier to understand.*	*Easy to transcribe and replay multiple times. Accuracy check is quick and helps beginners improve their listening faster.*

To guarantee reliability, the usability test was piloted with a subset of four students of the same population. It is noted that these respondents did not participate in the main study. Based on the feedback of the students in the pilot study, the usability test and the instructions for journals were refined to suit the purpose of the current research. Moreover, the researchers also conducted content analysis on the pilot data and cross-checked with each other to reach the intercoder agreement. Specifically, each researcher coded the texts using the predetermined themes in Table 1 independently. After that, the results were compared and discussed to find the common grounds between the coders until the consensus of the coding reached at least 80% of the time (Creswell & Creswell, 2018).

4. Results



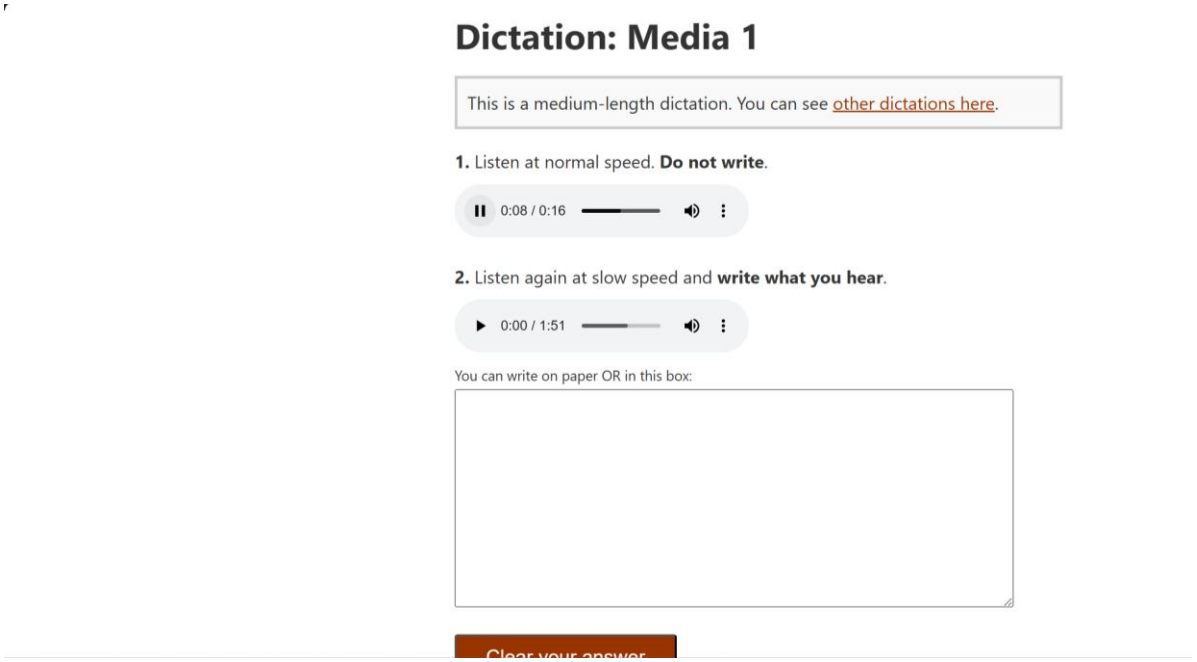
4.1 The Accessibility of the Online Listening Web-based Applications

The respondents in the current study have consistent perspectives toward the accessibility of the three platforms – DailyDictation, English Club, and Parotto. While the first and the last ones received positive feedback from the students, English Club did not seem to be user-friendly. Evidently, S1, S6, and S10 agreed that DailyDictation was "easy to use; accessible for newcomers." S3 and S8 shared a similar view about the "simple design" of this platform that makes it "easy to view and operate". This is also the first impression of S6 about it, she wrote, "First impression is simplicity, no flashy images, clear and easy to use. Feels serious for learning, not distracting." However, S1 reported that "the loading speed is slow and laggy; loading errors occasionally", which contradicts the experience of S2, S3, S7, S9 and S10 who observed "fast access speed", "smooth interaction", "normal speed without lag" and "quick loading time".

In the same vein, Parotto offered great usability as in the words of S2, "it is easy to view and search, with an online community chat bar for help if needed." S7 even stressed that this platform is "stable, easy to use, suitable for Gen Z and Alpha". Not all students have such positive experiences with this platform, S1 commented "There are serious errors. I cannot interact with the homepage to do exercises and cannot click on short clips to use". The loading speed was also a concern among the students. While only S5 wrote "the system runs stably. I'd give 9/10 for smoothness", the others, such as S3, S6, S7, and S9, described "the speed is a bit slow" or "the platform is sometimes laggy due to heavy traffic".

Figure 3

DailyDictation's feature of dictation activity



The participants appeared to be disappointed with the interaction with English Club when most of them reported undesirable experiences with the loading speed, search engine, and device compatibility. S2 wrote in her journal, "Although divided into clear sections but lacks illustrative images for beginners, the site speed is slow, and the entertainment value is low. It needs a cleaner interface for easier navigation. I do not want to return because it is hard to find the desired sections." S7 and S9 underwent opposite observations related to the compatibility elements. Whereas S7 noted, "the user interface fits phones only, and it is uncomfortable on desktops. It is hard to locate exercises, and the audio is unclear for full sentences", S9 wrote, "the application is not optimized for mobile. The experience is not smooth. It needs improvement." In the worst-case scenario, S1 reported "the anti-bot mechanism makes it difficult or impossible for users to access."

4.2 The Presentation of the Online Listening Web-based Applications

As for the presentation theme, DailyDictation and Parotto continued to be preferable. The former was viewed as an "interesting site" (S1) with "pleasant graphics, high entertainment value" (S2), "clear interface" (S3), "exercise organized by topics, clear readings" (S4). S7 and S10 acknowledged the presentation modes of the application; for example, S7 thought "the app has a harmonious, minimalist interface, and supports both light and dark modes". He also pointed out that "the 'Available exercises' section looks glaring with green font." Some other students valued the quality of audio and visual features, such as S5 and S9. S5 wrote "the site offers clear loud voices. No distortion, smooth use without lag, even with simultaneous traffic," and S9 mentioned "short listening clips prevent boredom". Furthermore, the display of scores and results was considered "easy to view" by S3 and "clear, with both Vietnamese and English for better understanding" by S5.

Figure 4

Englishclub's feature of dictation activity

Parotto significantly impressed the participants with its design as in the words of S5, "Tech-style design makes it engaging for users." S2, S6, and S8 also mentioned the "attractive interface", "clearly different, modern design", and "dynamic design" in their journals. Specifically, S2 stressed the entertainment value when she wrote "animated interface, cartoon videos appeal to Gen Z, allowing users to learn while being entertained". S6 and S8 emphasized the "cute, eye-catching design, and rich materials, stimulating interest". Similarly, S5 detailed the strengths of Parotto thoroughly, "the layout is nicely connected with green-black tech style colors, engaging for learners. The display of visuals and audio is vivid and lively; words and quizzes are fairly easy. Fast-moving words are arranged to look modern and engaging."

When it comes to English Club, the respondents had mixed opinions about this platform, but the overall view is negative. S9 and S10 recognized "the content is divided clearly, from reading to writing, speaking, grammar, vocabulary". In the same vein, S6 and S8 also appreciated the rich content, but they pointed out that this was also a drawback. S6 complained that "it requires time to explore. Presentation is not very attractive, but it is still a great app for practice. There is lots of content, but the cluttered presentation makes it easy to lose focus". The complaints about the presentation of English Club were also present in the other students' journals. For instance, S3 commented that "the layout is cluttered with too much text, and the content is scattered and cluttered. It is hard to find listening exercises. The interface is hard to use, and the pronunciation is difficult to hear. The layout is too messy. I cannot find where to type text. It is very hard to use, so I cannot find the needed content". S7 remarked that the web design made him "feel academically rigid in a negative way".

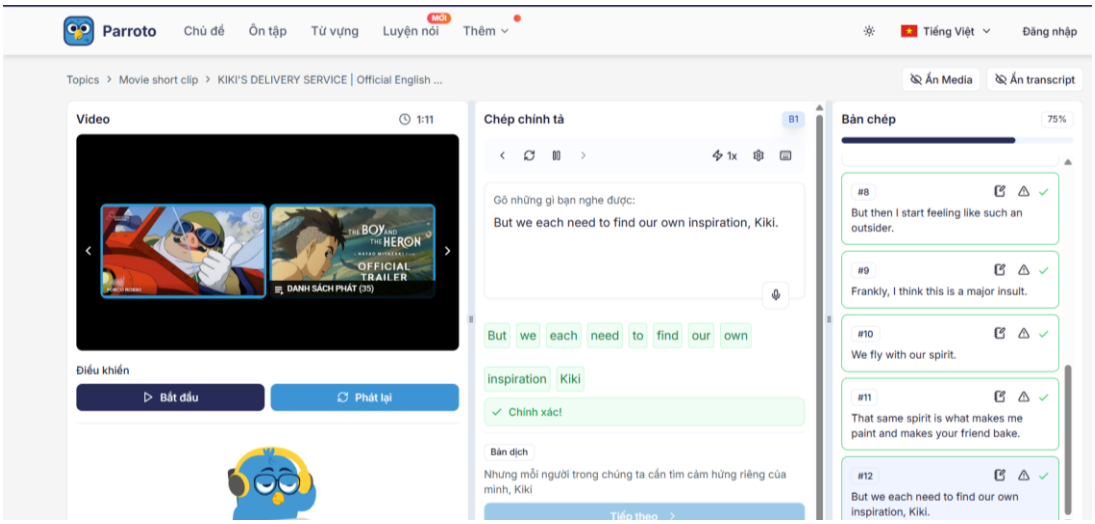
4.3 The Task Diversity of the Online Listening Web-based Applications

An upside of DailyDictation is its wide range of topics. For instance, S7 wrote, "The app has many topics for different levels," and S8 and S9 shared this opinion, further stating, "it is worth using daily to improve writing and listening skills". Furthermore, speaking skills could be enhanced when students are asked to pronounce parts of the recording. While S1 claimed "it is easy to shadow", S2 "dislikes the pronunciation task". The app is especially suitable for low-level learners as S4 suggested that he could "improve English skills through everyday stories that are easy to understand". The length of the recording was what S6 considered useful

as she wrote, "short listening audio (1–2s) keep it engaging". Despite the topic diversity, the tasks offered by the application seem to be uniform. S2 and S5 commented on this shortcoming:

"The content is easy to listen to and understand, but exercises are somewhat repetitive". (S2)

"The site does well in basic areas, needs more new exercise types" (S5)



S8 suggested the application "should add features like short video transcripts".

The next issue with DailyDictation was the pronunciation task. Explaining why S2 found this section unfavourable, S3 wrote, "the pronunciation is good but quite fast, which may be difficult for weak English learners".

There was general agreement among the participants that Parotto is interesting due to its appealing tasks and exercises. As expressed by S8, "The website is convenient for dictation practice. It is more interesting than traditional dictation'". S3 also praised the website for being a game changer in dictation, "It is easy to find lots of interesting content, combining audios with videos/images makes dictation more engaging". S2, S4, and S7 shared similar opinions; for example, S4 reported his experiences with various task formats, "The site offers many interesting learning types such as short clips, music, games, and exam practice". The combination between entertainment and learning was another good aspect of Parroto. According to S6, she stated "Learning is fun through videos, practicing listening, dictation, and speaking. It includes pronunciation practice with native speakers. It makes dictation practice fun by combining audio, video, and images". S9, on the other hand, associated the application to "a mini social network, with vocabulary, speaking, dictation videos, grammar, mini games".

Figure 5

Parroto's feature of dictation activity

Task diversity is also a recurring theme in the students' journals for English Club. Most respondents indicated that the website offered quizzes, games, and videos to make learning less boring. One student (S9) explained that "There are mini games, pronunciation videos, and supports for TOEIC test preparation. It explains new words, and includes interactive exercises, and diverse resources". Another (S4) noted the effectiveness of the application for English skills improvement, "It helps users improve many English skills such as listening, speaking, reading, and writing. It offers many short exercises that help users practice daily without

boredom". In contrast, though S7 agreed that English Club featured "many fun activities like games and quizzes, its content was outdated".

4.4 The Individual Differences of the Online Listening Web-based Applications

There were slightly divergent opinions regarding the individual differences of DailyDictation. While most students recognized the versatility of the application, a few others complained about the audio recordings. In terms of flexibility, S1 shared his view that, "It is very worthwhile, and recommended for self-study or shadowing. The app is easy for beginners to access". A similar response was also observed in S2 and S6's journal, which said "It is easy to correct mistakes and remember, especially suitable for weak English learners" and "The application is suitable for those with basic listening skills who want to upgrade to higher levels". S7 and S8, on the other hand, believed that DailyDictation included "multiple listening modes suitable for most users". This was explained in the S4 report, "There are many different topics, serving various learning purposes, age groups, and exam preparation needs. What I like most is the answer check feature after listening, and the voice chat function that helps users conveniently improve their speaking skills. There are answers for learners to correct mistakes themselves". However, there were issues related to audio recordings that the application developers need to address. S3 commented that "the speed adjustment mode makes it usable, and easy to access and use, but it is not very engaging, may get boring quickly". Another respondent who also shared this viewpoint further stated that she did not want to return to this website because the speaker swallows words in some recordings. It should provide clearer voices for beginners, and reduce excessive hints in answer checking". Regarding the answer checking, this student suggested "it needs improvement because just one correct word reveals the whole sentence; hints should be reduced so users can replay and find answers themselves". Apart from the two main abovementioned aspects, other minor features contributing to the learner's difference were mentioned in the journals included:

"The app is entirely in English, difficult for beginners. It should add Vietnamese for easier understanding of new words." (S9)

"It includes interesting topics with clear audio. I can catch words after about 5 listening times. A good site that is suitable for 15-minute daily practice."

It was commonly reported that Parotto was a great application for students of any level and interest. As 3 noted, "Listening/pronunciation topics are interesting and match personal preferences. Lots of content matches personal interests, but some short videos require purchase. It is easy to transcribe and replay multiple times. The accuracy check is quick and helps beginners improve their listening faster. The application can be used for dictation practice and shared with others due to its engaging nature". Once again, the entertaining value of this application was mentioned in S2 and S4's journals. According to them, it is an "excellent website suitable for all ages, easy to learn, easy to understand, and highly entertaining", and "learning through images and videos is truly effective for me. It makes studying less boring and more engaging". Such positive responses can be explained by the report of S7:

"The application offers a good experience, diverse content, and it is easy to find interesting videos. Good interaction supports listening and knowledge. The application highlights mistakes and allows dictionary access."

In addition to the utility of Parotto, one notable emerging theme was collaboration, which allowed participants to connect and interact with their peers. For instance, S10 emphasized that "chat feature adds interaction, makes learning fun"; meanwhile, S8 appreciated the "friendly online chat community". These students also stressed the correction

feature of the application which "checks the correctness word by word, so there is no need to write full sentences".

English Club was able to cater to different learners' needs despite potential limits. As expressed by S5, the application was more appropriate for learners at higher levels. She wrote in her journal, "I like the answer-checking feature. The application was suitable for those with existing listening skills who want to improve further". Similarly, S8 stressed the lack of explanation for learners' errors when stating that "the application does not help understand mistakes. There is no error correction or pronunciation, only new vocabulary". Compared to the other websites, English Club also offered collaboration and various materials to serve different students' needs. This was evident in S4 and S7's comments:

"The application features community support."

"Within each skill, it provides clear definitions, improvement methods, effective learning strategies, and exercises for practice. It also offers links to YouTube, online eBooks, and reliable knowledge sources for further learning."

5. Discussion

The findings of this study demonstrate that the usability of web-based dictation tools is intrinsically linked to their pedagogical effectiveness. Although all three platforms aimed to improve listening comprehension, their success depended on the balance between *technical usability* and *pedagogical usability* (Hadjerrouit, 2010). Parroto emerged as particularly effective due to its technology-oriented design and multimedia integration, which aligns with the principles of Integrative CALL, where multimedia facilitates authentic practice and learner engagement (Chen & Zhang, 2011). This outcome resonates with prior research emphasizing the importance of authentic, interactive listening activities (Chang et al., 2018; Ur, 2024). Learners' appreciation of replay and feedback features further supports findings in MALL scholarship, which highlight autonomy and personalized support as key drivers of language learning (Huong & Bui, 2024; Lee & Xiong, 2023).

Conversely, English Club's cluttered and academically rigid interface was poorly received, echoing concerns raised by Erdogan & Uzun (2010) and Alhabdan (2021) regarding the neglect of usability in language learning websites. Despite its rich content, the platform's information overload contributed to frustration and decision fatigue, consistent with Lim's (2014) observations on the negative impact of excessive input. DailyDictation, while accessible for beginners, was criticized for its repetitive nature, which risks diminishing learner motivation. This finding reinforces Rost's (2000) argument that task diversity is essential for sustaining engagement. Taken together, the results suggest that effective dictation tools must not only function reliably but also provide multimodal, timely feedback that scaffolds learners within their Zone of Proximal Development (ZPD) (G.-Z. Liu et al., 2011; Huong & Bui, 2024).

For learners, the study highlights the importance of selecting platforms that balance technical and pedagogical usability. Features such as adjustable audio speed and instant accuracy checks empower learners to manage their own progress, reflecting the personalized feedback benefits noted by Golonka et al. (2014). More broadly, the findings underscore the growing significance of learner autonomy and self-regulation in digital learning environments (Alzieni, 2020; Brandt, 2020). Web-based dictation tools extend learning beyond the classroom, enabling students to tailor practice to their individual strengths, weaknesses, and learning styles.

For ESL teachers, the abundance of digital resources presents both opportunities and challenges. To avoid decision fatigue, teachers should adopt structured frameworks for usability evaluation rather than relying on subjective judgments. Applications that provide scaffolded activities (pre-, while-, and post-listening) and authentic input are more effective in preparing learners for spontaneous, real-world communication. Additionally, teachers should consider generational differences in technological preferences, as younger learners respond more positively to animated interfaces and vivid visuals than to text-heavy layouts.

For developers, the findings emphasize the pedagogical value of integrating adjustable playback, animated visuals, and timely feedback. Dictation tools should evolve beyond repetitive exercises to incorporate varied, authentic tasks that foster listening strategies and communicative competence. Ensuring device compatibility and seamless technical performance is also critical to maximizing pedagogical value.

6. Limitations

Several limitations should be acknowledged. First, the sample size was small, consisting of only ten non-English-major students in one university, which restricts the generalizability of the findings. Second, the study duration was relatively short, with participants using the platforms for only one week. This may not have been sufficient to observe long-term improvements or to determine whether the novelty effect of engaging platforms would diminish over time. Third, the reliance on self-reported journals and photo observations introduces subjectivity and potential bias. Finally, the study focused on only three specific web-based applications, meaning other potentially effective tools were excluded.

7. Recommendations

Future research should expand the sample size and include learners from diverse educational and cultural backgrounds to enhance generalizability. Longer testing periods would allow for the examination of sustained impacts on listening comprehension and learner motivation. Employing mixed-methods approaches that combine qualitative reflections with quantitative performance data could provide a more comprehensive evaluation of platform effectiveness. Researchers should also explore the potential of AI-driven personalization and adaptive feedback to optimize dictation tools for individual learner needs. For developers, recommendations include integrating varied and authentic tasks, enhancing device compatibility, and ensuring smooth technical performance to maximize pedagogical value.

8. Conclusion

This study examined the usability of three web-based dictation platforms – DailyDictation, Parroto, and English Club – through the dimensions of accessibility, presentation, task diversity, and learner differences. The findings underscore that well-designed dictation tools can meaningfully support ESL listening comprehension by offering clear interfaces, engaging activities, and responsive feedback. At the same time, technical shortcomings and repetitive exercises highlight the need for continuous refinement.

Dictation, long recognized as a versatile pedagogical technique, acquires renewed prevalence in the digital age when integrated into CALL and MALL environments. The results confirm its potential to foster attentive listening, vocabulary acquisition, and learner autonomy,

while aligning with broader literature on authentic input and interactive design. Importantly, the study demonstrates that usability is not merely a technical consideration but a pedagogical one: learners' ability to navigate, engage, and personalize their experience directly shapes their listening outcomes.

For educators, the implication is clear – dictation platforms should be selected not only for their content but also for their design quality and adaptability to learners' needs. For developers, the challenge lies in balancing technical innovation with pedagogical usability, ensuring that tools remain accessible, engaging, and responsive to diverse learner populations. Future research should extend beyond short-term usability testing to investigate long-term impacts, larger participant groups, and the integration of AI-driven personalization.

Ultimately, this study reinforces the enduring value of dictation as a bridge between listening comprehension and broader language development, while highlighting the importance of thoughtful design in maximizing the pedagogical potential of web-based learning tools.

Appendix

Usability testing tasks

Exploratory task

Please take 5 minutes to explore the sites freely. If you need to register to explore, please do so. Pay attention to the **interface design** (labels, colours, and banners), ease of navigation, and the types of listening materials available.

Specific tasks

Daily Dictation	English Club	Parroto
1. Select a 'Short Story' exercise. 2. Adjust the audio delivery speed to 0.8x. 3. Type directly into the listening activity box. 4. Click the check button to receive your score breakdown.	1. Choose a 'Medium' dictation. 2. Listen to the audio once without typing. 3. Use the second and third readings to complete the text. 4. Check your answers against the provided transcript and identify one new vocabulary word you learned.	1. Pick a short video clip. 2. Use the 'repeat' or 'slow down' features to transcribe the dialogue. 3. Verify your accuracy using the built-in feedback system. 4. Report if the interactive features made the difficult parts easier to understand.

Open-ended tasks

Daily Dictation	English Club	Parroto
1. Find a topic that genuinely interests you (e.g., news, stories). 2. Practice with it for 10 minutes using your own strategy—such as shadowing or multiple replays. 3. Reflect on whether this site feels like a tool you would use daily for self-study.	1. Use the site to find a dictation that matches your current English level. 2. After completing it, explore the related 'Dictation Tips' or 'Grammar' links. 3. Decide if these additional resources help you understand why you made certain mistakes.	1. Search for a video clip related to a hobby you have. 2. Practice dictation with it. 3. After finishing, explain how the combination of visual (video) and audio cues helped or hindered your listening comprehension compared to text-only dictation.

#129 VIETNAM'S ESL TRANSITION: ADAPTING STRUCTURED LITERACY IN MICRO-LEVEL MATERIAL DESIGN FOR PRIMARY CLASSROOMS

Pham Trang Thu[1], Phan Hoang Thuy Linh[2]

Abstract

As Vietnam transitions from English as a Foreign Language (EFL) to a Second Language (ESL), primary students often face systemic phonetic barriers – specifically coda deletion, monosyllabic processing, and tonal interference – rooted in L1 influence. Despite this strategic shift, current communicative textbooks seem to lack the micro-level decoding methodologies required for ESL proficiency. This study investigates the compatibility of foundational Structured Literacy (SL) routines, extracted from the HMH Into Reading curriculum, with the Vietnamese phonetic context. Employing qualitative document analysis, the research utilizes a mapping matrix to evaluate how four core routines dismantle L1-induced errors. The analysis demonstrates that "Tap and Count" and "Sound-by-Sound Blending" can effectively disrupt whole-syllable guessing and enforce released stops, directly mitigating coda deletion. Furthermore, "Continuous Blending" and "Echo Reading" can facilitate coarticulation and recalibrate sentence-level prosody to override ingrained Vietnamese tonal habits. Ultimately, the study proposes a tripartite Adaptation Framework for Scripted Instruction, providing explicit "I do – We do – You do" bilingual scaffolds for Teacher's Guides. This research contributes a micro-instructional lens to material design, offering an actionable, systemic approach to bridge the gap between phonemic awareness and oral fluency, thereby establishing a foundation for future experimental interventions in ESL-emerging classrooms.

***Keywords*:** structured literacy, cross-linguistic influence, phonological awareness, scripted instruction, material design.

1. Introduction

1.1. Policy and Instructional Context

Vietnam is pursuing a shift from English as a Foreign Language (EFL) toward English as a Second Language (ESL) in schools, established as a national objective in Conclusion No. 91-KL/TW (Politburo, 2024) and consistent with the 2018 General Education Curriculum for English (Ministry of Education and Training, 2018). The EFL-to-ESL transition here refers to this educational ambition rather than an established sociolinguistic condition; at the primary level it increases the need for oral-decoding foundations supporting intelligible communication.

1.2. Vietnamese-Related Phonological Barriers and Research Focus

This study focuses on three L1-induced phonological barriers—coda deletion, monosyllabic processing, and prosodic transfer—examined through cross-linguistic influence (CLI), which concerns how previously acquired patterns affect additional-language processing and production (Odlin, 1989; Jarvis & Pavlenko, 2008). Each was selected for its theoretical link to Vietnamese–English structural differences and its correspondence to an observable instructional demand within foundational literacy routines. Communicative instruction is

[2] *University of Languages and International Studies, Vietnam National University, Ha Noi.*

central to Vietnam's ESL-oriented ambition but may not specify how teachers should address coda omission, undifferentiated word processing, or L1-shaped prosody, whereas Structured Literacy (SL) offers a relevant micro-instructional lens (Fallon & Katz, 2020). This study therefore examines four routines from *HMH Into Reading Grade 1 Instructional Routines*: Tap and Count the Sounds, Blending: Sound-by-Sound, Blending: Continuous, and Echo Reading (Houghton Mifflin Harcourt, 2017). Prior work has documented Vietnamese learners' difficulties with final consonants, phonemic awareness, and prosody but has not mapped foundational decoding routines onto these barriers or converted such analysis into bilingual scripts; addressing this gap is the study's contribution.

1.3. Research Purpose and Questions

This qualitative document analysis investigates the theoretical compatibility of the four selected SL routines with coda deletion, monosyllabic processing, and prosodic transfer among Vietnamese primary learners. It further develops a Tripartite Adaptation Framework for bilingual I do – We do – You do teacher guidance. Two research questions guide the study:

RQ1. Which foundational routines in the *HMH Into Reading Grade 1 Instructional Routines* show theoretical compatibility with the L1-induced phonological barriers of Vietnamese primary learners?

RQ2. How can a conceptual adaptation framework be proposed to translate these routines into bilingual scripted instruction for Vietnamese teacher's guides?

2. Literature Review

2.1. Cross-Linguistic Influence and Foundational English Decoding

Cross-linguistic influence (CLI) is the principal lens for examining how Vietnamese learners' existing knowledge may shape their early processing and production of English. Odlin (1989) defines transfer as influence arising from similarities and differences between a target and previously acquired languages, and Jarvis and Pavlenko (2008) extend it to perception, production, and processing. Learners may not simply fail to produce unfamiliar English features; they may reconstruct English through patterns functional in Vietnamese but insufficient for English decoding and oral fluency.

CLI should not, however, explain every non-target-like production: Selinker's (1972) interlanguage recognizes evolving approximations not all attributable to the first language, so the study focuses only on its three barriers. CLI also bears on early decoding—Koda (2005) argues that second-language reading builds on prior literacy experience, learners approaching a new writing system with established procedures—which suggests English phoneme-by-phoneme decoding may require explicit attention where familiar L1 routines do not foreground individual phonemes within a monosyllable.

2.2. Vietnamese–English Phonological Barriers

2.2.1. Coda deletion and final-consonant production

A frequently identified difficulty for Vietnamese learners concerns word-final consonants. Vietnamese permits a more restricted range of codas than English, so learners may omit, reduce, or reshape English word-final material. Nguyen (2007) identifies final consonants as a significant difficulty, and Disney and Le (2024), analysing speech from sixteen Vietnamese adult learners, found expected word-final /s/ and /z/ omitted in 28.4% of cases, particularly in morphologically marked forms and consonant clusters. Their findings show omission cannot be attributed solely to L1 transfer, since phonological complexity and

morphological function also matter. Because this evidence concerns sibilants and morphological markers rather than stops, its extension to final-stop instruction here is an analytical inference rather than a direct empirical claim.

Although these studies involve older learners, they provide a defensible basis for coda-focused instruction at the primary level. In beginning decoding, retaining a final consonant is necessary for producing the full sound sequence a word represents: omitting the final consonant in sit or cat loses part of the word form. The objective is not that every English final stop be audibly released in natural speech, but that early instruction make final stops salient enough to notice, retain, and practise as components of the target word—a distinction that matters when analysing routines for coda-related errors.

2.2.2. Monosyllabic processing and phonemic awareness

The second barrier concerns learners' access to the internal sound structure of short English words. Foundational literacy relies on phonemic awareness: learners must recognize that a word such as cat consists of separate phonemes that can be identified and blended. Learners entering through an established L1 system may not automatically employ the same phonemic decomposition, and Koda's (2005) approach supports the view that prior literacy experience influences additional-language word processing. Monosyllabic processing is therefore a plausible instructional challenge; learners may need explicit support moving from repeating a complete syllable toward identifying individual phonemes rather than a measured characteristic of all learners; it grounds the examination of whether materials make phoneme-level analysis observable and teachable.

This issue is closely related to coda deletion: where a short word is treated as an undivided oral form, a vulnerable final consonant may go unnoticed or be omitted without correction, whereas a routine requiring learners to account physically or orally for each phoneme makes the final sound part of the expected response. Phonemic segmentation is thus relevant to decoding accuracy and to more stable word-final production.

2.2.3. Prosodic transfer and connected oral reading

The Vietnamese–English contrast also operates at the prosodic level. Vietnamese uses syllable-level pitch contrastively, whereas English relies substantially on stress, prominence, rhythm, and intonation across syllables, words, and phrases. Because lexical tone and metrical stress are distinct systems without direct equivalence, the study uses the broader term prosodic transfer for the influence of L1 prosodic experience, including the salience of Vietnamese syllable-level pitch on learners' processing of English prominence and connected speech, rather than claiming lexical tone is transferred onto English stress.

Le (2021) found that L1 Vietnamese speakers differed from English-speaking participants under particular stress and intonation conditions, indicating that Vietnamese prosodic experience may influence learners' interpretation of English prominence cues. Nhat and Hien (2025) treated sentence stress, intonation, and connected-speech features as important dimensions of Vietnamese learners' pronunciation development. These studies do not establish how Vietnamese primary children read English sentences aloud, but they support including sentence-level oral modeling here. If prosodic transfer concerns the carry-over of L1-shaped prosodic habits into English, learners require clear English models that can be heard, repeated, and internalized; an oral-reading routine requiring imitation of modeled pronunciation and expression is therefore theoretically relevant to the prosodic dimension.

2.3. Structured Literacy and Scripted Scaffolding

Structured Literacy (SL) is relevant because it emphasizes explicit, systematic instruction in spoken- and written-language structures. Fallon and Katz (2020) describe SL as integrating spoken-language components, including phonology and sound–symbol relations into literacy teaching. Although discussed mainly in English-dominant contexts, its principles are pertinent here: learners are guided through sequenced procedures, features are made explicit, and feedback can target observable responses.

The study does not assume that an SL programme developed for native English-speaking children can be adopted unchanged in Vietnam, where primary learners acquire English as an additional language within a distinctive curricular and phonological context. The relevant question is whether particular foundational routines display mechanisms compatible with Vietnamese-related barriers; in the selected handbook, the four routines operationalize sound segmentation, sequential blending, continuous blending, and modeled oral reading (Houghton Mifflin Harcourt, 2017). The adaptation is also supported by the Gradual Release of Responsibility model, in which instruction moves from teacher modeling toward guided participation and independent performance (Pearson & Gallagher, 1983); the I do – We do – You do sequence provides the structure through which compatible HMH mechanisms become bilingual teacher-facing scripts.

2.4. Research Gap

Existing literature establishes that Vietnamese learners may have difficulty with English word-final consonants and prosodic processing, while cross-linguistic literacy theory supports attention to the transfer of prior routines into English decoding, and research on SL and gradual-release instruction grounds explicit, sequenced procedures. However, no located study systematically maps foundational SL routines onto Vietnamese phonological barriers and converts the compatibility judgments into bilingual scripted guidance for primary teachers. The study addresses this gap by analysing the four HMH routines against coda deletion, monosyllabic processing, and prosodic transfer. Its contribution is conceptual and material-oriented: a theoretically grounded basis for adapting explicit micro-instructional routines to Vietnam's ESL-emerging primary context and future classroom validation.

3. Methodology

3.1. Research Design

This study adopted a theory-informed qualitative document analysis to examine the compatibility of selected foundational Structured Literacy (SL) routines with L1-induced phonological barriers relevant to Vietnamese primary learners. Document analysis suits this aim because it enables systematic examination of stated purposes, procedural sequences, model language, and implied learner actions (Bowen, 2009), and it fits an exploratory, theory-building phase that necessarily precedes classroom intervention: a routine's theoretical compatibility with a barrier must be established before its classroom effects can be tested. The analysis was conceptual rather than experimental, examining whether observable mechanisms aligned with the framework's barriers rather than measuring learner performance. Compatibility was defined as the extent to which a routine required learners to perform a phonological or oral-reading operation relevant to the targeted difficulty; the focus was thus on instructional affordances—what each routine makes learners attend to, produce, combine, or imitate.

3.2. Documentary Corpus and Routine Selection

The primary corpus was the HMH Into Reading Grade 1 Instructional Routines handbook (Houghton Mifflin Harcourt, 2017), selected for its explicitly structured routines, stated purposes, materials, steps, and model teacher language, supporting micro-level analysis of how phonological instruction is operationalized. Four routines were purposively selected for their direct correspondence to the study's abstract and research questions: Tap and Count the Sounds, Blending: Sound-by-Sound, Blending: Continuous, and Echo Reading. A routine was included only when it explicitly involved phonological or oral-reading activity, contained observable procedures, and could be mapped onto at least one targeted barrier. Because the analytical interest lies in mechanisms rather than labels, the unit selected was the procedure exhibiting the relevant mechanism, which in one case is a step within a larger routine: the tap-and-count procedure is documented within the High-Frequency Words routine rather than as a discrete routine, and is treated here as a focal unit for its phoneme-segmentation mechanism (see Section 4.2, note). Other routines were excluded when their primary mechanism did not bear on the three barriers: the Vocabulary routine (p. R12) targets word meaning rather than phonological operations; the Syllabication: VCCV Pattern routine (p. R17), though it involves blending, operates on two-syllable words and so falls outside the study's monosyllabic scope; and Choral Reading (p. R25) was treated only as a possible supplement to Echo Reading, since the abstract specifies four core routines. This screening preceded scoring, so selection was governed by mechanism and barrier scope rather than by an expectation of high scores. The analysis nonetheless remains subject to some selection bias, since the four retained routines were identified in advance as phonologically relevant; this is acknowledged in Section 5.4.

3.3. Analytical Categories and Unit of Analysis

The unit of analysis was the micro-instructional routine episode, a bounded sequence in which the source specifies a teacher action, an expected learner response, and a target spoken-language feature. Each episode was examined for its purpose, procedural steps, sample language, learner demand, phonological level, and relevance to the Vietnamese context. Three a priori barrier categories were retained from the fixed framework: coda deletion and final-stop production (difficulty retaining or articulating English word-final consonants); monosyllabic processing (treating one-syllable words as undivided units rather than phoneme sequences); and prosodic transfer (carry-over of Vietnamese-shaped prosodic patterns into English connected oral reading). These categories were not generated from the HMH material; they served as the lens for evaluating compatibility. Four focal episodes were delimited, one per routine; where a procedure recurred across host routines, it was treated as a single unit defined by its mechanism rather than counted separately.

3.4. Analytical Procedure

The analysis proceeded through four stages. First, each routine's procedural components were extracted: instructional purpose, teacher and learner actions, model word or phrase, and operating level (phoneme, word, or connected oral reading). Second, each routine was coded for its primary mechanism and mapped onto the barrier it most directly addresses, with the routine-by-routine rationale presented in the Findings.

The four evaluation criteria were developed by the authors specifically for this analysis rather than adopted from an existing instrument. Their design follows a distinction common in materials evaluation, between a routine's intrinsic suitability for a learning objective and the practical demands of delivering it, separating two analytically independent questions: whether a routine's required learner action is theoretically aligned with a targeted barrier, and how

demanding it would be to adapt for a Vietnamese teacher's guide. Mechanistic alignment operationalizes the first, assessing whether the required action corresponds to the operation a barrier defines. Teacher feasibility and resource feasibility capture the practical dimension, the demand on the teacher's delivery and on materials, while adaptation requirement captures the modification needed to address L1–L2 distance. The 0–2 scale marks absent, partial, and strong presence of each criterion, avoiding a finer gradation that document evidence could not reliably support; the band thresholds (7–8 High, 4–6 Conditional, 0–3 Limited) let a routine be judged Conditional on practical grounds even when its mechanism was strongly aligned.

Third, each routine was scored on the four criteria using the 0–2 scale and band thresholds described above. Finally, routines assessed as compatible were grouped into phonemic segmentation, coda-to-word blending, and prosodic oral modeling, each operationalized through bilingual I do – We do – You do prompts informed by the Gradual Release of Responsibility model (Pearson & Gallagher, 1983; Fisher & Frey, 2014).

3.5. Trustworthiness and Scope of Interpretation

Analytical transparency was supported by an extraction-and-coding record linking every compatibility judgment to an observable routine feature; predetermined categories and explicit criteria reduced unsystematic interpretation. Coding proceeded in two stages: the primary author conducted the initial extraction and compatibility coding against the predetermined criteria, after which the second author reviewed each judgment against the corresponding documented feature. Discrepancies were resolved through discussion until agreement was reached, and the coding table was retained as an audit trail. Because the second author's review followed rather than preceded the initial coding, the procedure constitutes verification coding rather than fully independent double-coding; independent inter-coder analysis and expert review are identified in Section 5.4 as steps for future validation. Because the study analysed documents rather than outcomes, its findings concern theoretical compatibility and material-design potential. The active functions named in the abstract are therefore interpreted throughout as projected instructional functions requiring classroom validation, not demonstrated effects; where the abstract uses such verbs for concision, the findings qualify each as an instructional affordance evidenced in the documents. For the same reason, the abstract's term tonal interference denotes what this paper analyses more precisely as prosodic transfer (Section 2.2.3).

4. Findings

4.1. Overview of the Findings

The analysis identified a coherent relationship between the four routines and the three L1-induced barriers, monosyllabic processing, coda deletion and final-stop difficulty, and prosodic transfer, operating at different linguistic levels in a progression from phoneme awareness to word construction and connected oral reading. Consistent with the methodological scope, the judgments below describe projected instructional functions evidenced in the documents, not measured effects. As Table 1 shows, Tap and Count the Sounds and Blending: Continuous were rated High, whereas Blending: Sound-by-Sound and Echo Reading were rated Conditional because adaptation depends on additional teacher-facing support, not on any weakness in their mechanism.

Table 1

Compatibility of Selected HMH Routines with Vietnamese-Related Phonological Barriers

HMH routine	Documentary evidence	Targeted Vietnamese-related barrier	Identified mechanism	Judgment
Tap and Count the Sounds	Learners tap and count the sounds in can as /k/ /ă/ /n/ (p. R13).	Monosyllabic processing and whole-syllable guessing	Auditory-tactile phonemic segmentation	High, 8/8
Blending: Sound-by-Sound	Learners construct sit incrementally and include final /t/ before producing the whole word (p. R15).	Coda deletion and final-stop difficulty	Sequential phoneme accountability and coda-focused attention	Conditional, 6/8
Blending: Continuous	Learners blend mat without breaks before producing the complete word (p. R16).	Difficulty with word-level synthesis (inability to assemble identified phonemes into a complete word), with coda retention as a secondary concern	Continuous phonological synthesis	High, 7/8
Echo Reading	Learners repeat teacher-modeled oral reading while imitating pronunciation and expression (p. R24).	Prosodic transfer in connected oral reading	Modeled prosodic imitation	Conditional, 5/8

Note. Scores range 0–8 across four criteria. Bands: 7–8 = High, 4–6 = Conditional, 0–3 = Limited. Conditional ratings reflect implementation and adaptation demands, not weak mechanistic alignment; the mechanisms of Blending: Sound-by-Sound and Echo Reading are strongly aligned with their targeted barriers. Page references (R13–R24) are to Houghton Mifflin Harcourt (2017).

4.2. Tap and Count the Sounds: Making Phonemes Explicit within Monosyllabic Words

The first finding concerns the compatibility of Tap and Count the Sounds with the barrier of monosyllabic processing. In the HMH routine, learners are directed to represent each sound in the target word physically and orally. In the documented example, the word can is segmented into /k/ /ă/ /n/, with one finger-tapping movement assigned to each sound before learners identify the total number of sounds in the word (Houghton Mifflin Harcourt, 2017, p. R13)[1]. The analytical significance of this routine lies in the learner action it requires: a learner cannot complete the task by repeating can as a single memorized oral form, because the routine requires the word to be decomposed into three separately accountable units. This procedural demand corresponds directly to the study's definition of monosyllabic processing, in which a learner approaches an English one-syllable word as an undivided sound block rather than as a sequence of phonemes.

[1] *In the source handbook, "Tap and Count the Sounds" is not a standalone routine but a step within the High-Frequency Words routine (Houghton Mifflin Harcourt, 2017, p. R13; the worked example is can) and within Heart Words (p. R35). It is isolated here as a unit of analysis for its phoneme-segmentation mechanism; the label is retained for consistency with the abstract, and its application to general decoding is an analytical extension rather than a use prescribed by HMH.*

The routine scored 8/8 (High). Its mechanism aligned directly with the targeted barrier, the tapping action externalized phonemic structure observably, and it required no specialised resources and only minimal adaptation for bilingual guidance. Within the framework, Tap and Count the Sounds is therefore the clearest routine-level response to whole-syllable guessing, transforming internal sound analysis into a visible, monitorable classroom action.

4.3. Blending: Sound-by-Sound: Foregrounding the Word-Final Consonant

The second finding concerns Blending: Sound-by-Sound and its compatibility with coda deletion and final-stop difficulty. In the documented example, sit is not presented immediately as a complete oral form; learners are guided through a successive sequence in which individual sounds are introduced and blended until the final /t/ is incorporated (Houghton Mifflin Harcourt, 2017, p. R15). This makes the coda instructionally salient: the final consonant is neither optional nor embedded in undifferentiated whole-word repetition but is separately represented, elicited, and required in the completed blend. The routine thus activates sequential phoneme accountability and coda-focused attention, and a learner who omits the final /t/ produces an incomplete response the routine immediately exposes.

The mechanism of this routine is thus strongly aligned with coda deletion, consistent with the abstract's characterization of sound-by-sound blending as effective for foregrounding the coda. Its overall compatibility was rated Conditional (6/8) for implementation reasons rather than weak relevance: in the Vietnamese context, a teacher's guide would need explicit support for modeling final consonants clearly and avoiding productions in which the final sound is omitted or followed by an unintended vowel. The abstract's "released stops" should be read in an instructional rather than strict phonetic sense: the routine makes the word-final consonant salient and accountable within the decoding sequence, not audible release as a phonetic target, and does not establish how learners realize final stops across all connected-speech environments. Blending: Sound-by-Sound is therefore directly compatible with coda-focused instruction, provided implementation is supported by Vietnamese-specific teacher prompts and final-consonant monitoring notes.

4.4. Blending: Continuous: Moving from Segmented Sounds to Complete Word Production

The third finding concerns Blending: Continuous. In the HMH procedure, learners blend a word's sounds without breaks, as in the documented treatment of mat, before producing the complete word (Houghton Mifflin Harcourt, 2017, p. R16). Unlike the two preceding routines, it requires sustaining the full sound sequence in a single production. The mechanism, continuous phonological synthesis, is relevant to learners who identify individual sounds but fail to assemble them smoothly; it also supports coda-focused instruction when sequenced after sound-by-sound work, since a final consonant made explicit earlier must be retained within uninterrupted production.

The routine scored 7/8 (High): its mechanism was explicit, its resource demands low, and its core adaptable without redesign. The main adaptation concerned target-word selection—continuous blending should use words with vulnerable final consonants, so smooth production does not come at the expense of coda retention. Blending: Continuous thus links phoneme-level attention with complete word production, providing the transitional step between explicit coda attention and later oral fluency work.

4.5. Echo Reading: Providing a Model for Sentence-Level Prosody

The fourth finding concerns Echo Reading and prosodic transfer. The teacher reads a portion of text aloud and learners repeat it while imitating pronunciation and expression

(Houghton Mifflin Harcourt, 2017, p. R24). Unlike the earlier routines, it operates beyond isolated phonemes or words, targeting modeled oral production within phrases or sentences. The analysis identified modeled prosodic imitation as its central mechanism, corresponding to prosodic transfer because it provides an external English model against which learners' connected reading can be shaped—relevant to the abstract's claim that sentence-level prosody can be recalibrated through structured modeling and repetition.

Echo Reading received a Conditional judgment (5/8). It requires learners to imitate a model, but the source does not ensure the model suits Vietnamese learners' prosodic needs: its value depends on accurate teacher pronunciation, phrasing, prominence, and intonation, or on reliable recorded models and phrase-marked scripts. Echo Reading therefore carries the strongest implementation condition among the four, requiring more extensive adaptation than the phoneme- and word-level routines.

4.6. Integrated Finding: A Three-Level Instructional Progression

Across the four routines, the analysis identified a three-level progression: Tap and Count the Sounds supports phonemic segmentation of monosyllabic words; the two blending routines jointly support coda-inclusive word construction and continuous synthesis; and Echo Reading extends toward modeled sentence-level prosody. This progression is not prescribed by the source handbook. Although each routine is documented in *Into Reading*, their organization into a single phoneme-to-prosody progression is a conceptual reconstruction by the present authors, drawing on Structured Literacy's principle of systematic, cumulative sequencing rather than an ordering stated in the source. On this basis, the progression supports the Tripartite Adaptation Framework for Scripted Instruction, a Phonemic Segmentation Scaffold, a Coda-to-Word Blending Scaffold, and a Prosodic Oral-Fluency Scaffold, elaborated in the Discussion.

In relation to RQ1, the findings show that all four selected routines demonstrate theoretical compatibility with at least one identified Vietnamese-related barrier, although two require conditional implementation support. In relation to RQ2, the findings establish the documentary basis for translating these routines into bilingual I do – We do – You do teacher-guide scaffolds, which is developed further in the Discussion.

5. Discussion

5.1. From Routine Compatibility to a Micro-Instructional Progression

Read as a staged sequence, the routines suit the Vietnamese context because the three barriers occur at related but distinct levels of oral decoding: phoneme-level segmentation (Tap and Count the Sounds), word-level construction and synthesis (the two blending routines), and connected-speech modeling (Echo Reading). This staging is consistent with Koda's (2005) view that additional-language literacy processing is shaped by established L1 routines and with evidence that English word-final consonants are vulnerable in Vietnamese learner speech (Disney & Le, 2024), linking coda awareness with complete spoken-word formation rather than isolated articulation.

At the connected-speech level, Echo Reading structures imitation of modeled pronunciation and expression, extending support toward phrasing and prosody—supported by evidence that Vietnamese prosodic experience can influence English stress processing (Le, 2021)—though its compatibility depends more on implementation quality. Together, the routines suggest foundational oral fluency may be supported through increasingly complex

demands, and this staged interpretation links the document analysis to the study's material-design contribution.

5.2. Translating Compatibility into Bilingual Scripted Instruction

The findings support the proposed Tripartite Adaptation Framework for Scripted Instruction, reorganizing the four routines around three functions: Phonemic Segmentation, Coda-to-Word Blending, and Prosodic Oral Fluency. The first adapts Tap and Count the Sounds into brief bilingual procedures requiring learners to hear, tap, and identify the phonemes in short words, so practice does not rely on whole-word repetition. The second combines the two blending routines: learners produce the final consonant as part of the word and then retain it while blending continuously—well suited to Vietnamese teacher's guides because it lets teachers anticipate errors such as final-consonant omission or an unintended vowel after a coda. The third adapts Echo Reading for connected production by specifying phrase boundaries, prominent words, and an oral model to imitate, with recorded models or annotated scripts where necessary. Because the framework supports rather than works against Vietnam's ESL-oriented direction, the bilingual prompts are temporary scaffolds: the first-language gloss makes a task instruction unambiguous in a large class, while the target action—segmenting, blending, or imitating—is performed in English. The scripts confine Vietnamese to brief procedural cues and error-monitoring notes rather than the modeled language itself, and these cues can be faded as learners gain familiarity so English becomes the sole language of practice.

Across the three components, the I do – We do – You do sequence provides a practical structure: the teacher models the target action, learners practise with support, then apply it independently while the teacher monitors anticipated L1-related difficulties—consistent with the Gradual Release of Responsibility model (Pearson & Gallagher, 1983; Fisher & Frey, 2014). The implication is not to replace communicative instruction with decoding routines but to strengthen communicative materials by inserting short, targeted routines before or within speaking and oral-reading activities, connecting pronunciation instruction to curriculum design rather than leaving it to unscripted correction (McGregor & Reed, 2018).

The following compact example is an author-constructed illustration of the Coda-to-Word Blending component, not an excerpt from the analysed corpus; because the HMH source is an English-only handbook, the bilingual scripting is part of the proposed adaptation rather than of the documentary data. It illustrates the intended register: short, command-like bilingual prompts suited to large Vietnamese classes, avoiding word-by-word translation. *I do*: "Listen: /s/ … /ĭ/ … /t/ → sit. Watch my mouth on the last sound." (Nghe cô: /s/ … /ĭ/ … /t/. Nhìn miệng cô ở âm cuối.) *We do*: "Blend with me—don't drop the last sound." (Đọc nối cùng cô—đừng bỏ âm cuối.) *You do*: "Your turn. Say the whole word. Is the last sound there?" (Đến lượt em. Đọc cả từ. Có âm cuối chưa?)

5.3. Implications for Primary English Materials and Teacher Support

The analysis has two immediate implications for materials development. First, primary English teacher's guides should make predictable phonological difficulties visible at the level of procedure: instead of directing teachers only to "repeat," "read aloud," or "practise pronunciation," materials should indicate the target sound feature, the expected learner response, and the likely L1-related error to monitor. Second, barriers require different support: phonemic segmentation and word blending can work through simple bilingual prompts, gestures, and selected target words, whereas prosodic modeling is more demanding because its value depends on model accuracy, so materials incorporating Echo Reading should provide

phrase-marked sentences, short audio demonstrations, or teacher preparation notes. If primary learners are to use English increasingly for communication, materials must support the sound-level and prosodic foundations that make oral communication intelligible; the framework adds this support without displacing communicative goals.

Translating these routines into Vietnamese primary classrooms also depends on contextual conditions a document analysis cannot resolve. Teachers' own English pronunciation proficiency is most consequential, since Echo Reading and the prosodic component supply value only insofar as the modeled delivery is accurate, the principal reason recorded models and phrase-marked scripts are proposed. Class size and lesson time constrain implementation: the routines are brief by design, but large classes and crowded schedules mean they must be embeddable in a few minutes rather than treated as separate lessons. Alignment with the existing communicative textbook matters too, because the framework is inserted into current materials rather than replacing them, requiring the routines to attach to words and texts learners already encounter. Finally, age-appropriate engagement is relevant for Grade 1 learners, for whom the tactile and choral character of the routines is an advantage but sustained phoneme-level work must stay short and playful. These conditions do not weaken the theoretical compatibility established above, but they qualify the move to classroom use and define what subsequent piloting would examine.

The contribution must be read within several limitations. First, it analyses four selected routines from one handbook and so does not evaluate the complete HMH programme or Structured Literacy as a whole. Second, it does not compare the routines with currently used Vietnamese primary English textbooks; claims about a need for stronger micro-level decoding support should be understood as a design rationale rather than the result of a completed textbook audit. Third, being qualitative document analysis rather than classroom intervention, it establishes that the routines contain mechanisms theoretically compatible with Vietnamese-related barriers but does not demonstrate that they improve learner production—a distinction especially important for Echo Reading, whose contribution depends on model accuracy, teacher preparation, and implementation conditions.

The next phase should begin with expert review of the bilingual framework by specialists in Vietnamese–English phonology, primary English education, and materials design. Following revision, a small-scale classroom pilot could examine teacher usability, learner participation, and the feasibility of embedding the routines in regular communicative lessons, after which intervention research could evaluate changes in phoneme segmentation accuracy, word-final consonant retention, word-level blending accuracy, and sentence-level oral-reading prosody, alongside teacher usability and student engagement.

6. Conclusion

This study examined whether four foundational Structured Literacy routines from HMH Into Reading Grade 1 are theoretically compatible with three L1-induced phonological barriers facing Vietnamese primary learners—monosyllabic processing, coda deletion, and prosodic transfer—and how compatible routines might be translated into bilingual scripted guidance. The analysis indicates that the four form a coherent phoneme-to-prosody progression, all compatible with at least one barrier and two requiring conditional implementation support. On this basis it proposes the Tripartite Adaptation Framework for Scripted Instruction as an operationally specified, theoretically justified, and explicitly non-validated basis for future testing. Its value lies not in claiming demonstrated learning gains but in offering materials designers a micro-instructional lens for embedding explicit decoding support within Vietnam's ESL-emerging, communicatively oriented classrooms.

#132 EXPLORING AI SELF-EFFICACY IN EFL STUDENTS: IMPLICATIONS FOR LEARNING PERFORMANCE

Phuong Vo Thi Bich[1]

Abstract

The integration of Generative AI (GenAI) has created a paradigm shift in English language learning as it offers transformative benefits, as well as ethical and academic challenges. While previous research focused on how often students use AI tools, a significant gap in understanding how students perceive their capacity to effectively engage with AI tools exists. This study investigated students' AI usage patterns and their confidence in engaging with AI in learning contexts reflected through five key dimensions: AI-assisted learning, anthropomorphic interaction, emotional comfort, technical and prompting skills, and critical evaluation of AI outputs. The study adopted quantitative design. To collect the data, an online questionnaire was administered to 150 English-majored and non-English majored students. The findings indicated that the students demonstrate moderate to high levels of AI self-efficacy, particularly in using AI as a learning support tool. However, lower levels of confidence were observed in more advanced competencies, such as prompt engineering and critical evaluation of AI-generated content. The findings provide empirical insights into students' readiness to engage with GenAI and offer implications for educators to foster more effective, critical, and responsible AI use in language learning.

Keywords: AI self-efficacy, EFL students, academic performance

1. Introduction

In recent years, the rapid integration of generative artificial intelligence (GenAI) has created a paradigm shift in language education. With its various tools such as ChatGPT, Gemini, or DeepSeek, it is believed that the use of GenAI supports learners in enhancing language skills, particularly writing, speaking and communication, as well as reading and

[1] *Phuong Vo Thi Bich, M.A., Faculty of Foreign Languages, HCMC University of Foreign Languages – Information Technology, HCMC, Vietnam; Email: phuongvtb@huflit.edu.vn*

translation. Firstly, studies have shown that AI-powered tools played a central role in assisting learners to improve their writing proficiency through providing instant feedback, helping them generate new ideas, structure writing process, enrich vocabulary (Hartwell & Aull, 2023), and proofread grammar-related mistakes (Waer, 2021; Zhao, 2022). Furthermore, GenAI, especially chatbots, offer a non-judgmental learning environment, and can simulate roleplays which help students enhance their speaking fluency and pronunciation (Yuan & Lyu, 2024; Ismail & Alharkan, 2024; Kittredge et al., 2025; Dong et al., 2022). In addition, GenAI enables simplifying texts and translating complex information between different languages effortlessly, leading to improvements in reading and translation skills (Celik et al., 2025; Wang & Fussell, 2026).

In addition, because AI-generated feedback is timely and well-structured, it would give students a sense of task completion which significantly enhances students' self-efficacy. In this context, self-efficacy serves as a mediating factor and contributes to the behavioral intentionality of students and leads to the academic success (Zhou & Wang, 2026; Shahat et al., 2025; Qin et al., 2026). In addition, the use of AI applications can create a supportive and low-stress learning environment, which may help lower foreign language anxiety (Yuan & Lyu, 2024; Pertiwi et al., 2025; AlTwijri & Alghizzi, 2024). On the other hand, through the implementation of GenAI tools, personalization of learning and motivation for studying will be achieved (Liu et al., 2026).

However, although there were so many benefits considering the utilization of GenAI, many scholars also identified some potential drawbacks. Firstly, excessive dependency on AI-driven technologies to complete tasks like writing and translating with ChatGPT will make learners metacognitively lazy and, hence, hinder their critical and creative thinking, problem solving, and independent reasoning (Sardi et al., 2025; Zhai et al., 2024). Secondly, the utilization of AI-driven technologies was associated with several ethical concerns like cheating, plagiarism, bias in algorithms, and difficulty in capturing cultural nuance (Almusharraf et al., 2025; Wang & Fussell, 2026; Bećirović et al., 2025).

In the context where AI tools are increasingly accessible and their benefits and risks become more evident, AI self-efficacy has become a crucial factor in determining whether students can engage with these tools meaningfully and achieve academic success. AI self-efficacy refers to students' internal belief in their ability to use them effectively (Rajapakse et al., 2024). In essence, AI self-efficacy affects the decision to perform an activity, the degree of commitment to the activity, and the level of persistence when faced with difficulties (Xia, 2026). Highly efficacious learners treat difficult tasks as challenges and not obstacles. They also actively employ AI tools, set themselves high goals, and monitor their learning process (Gao et al., 2025; Bećirović et al., 2025).

In addition, regarding tasks such as writing, students with high AI self-efficacy demonstrate greater readiness in searching for, analyzing, and internalizing feedback from artificial intelligence systems (Thurman, 2026). Rather than being passive in the face of AI-generated outputs, they use it as a tool to improve themselves and exhibit stronger feedback literacy and autonomy (Almusharraf et al., 2025). Moreover, AI self-efficacy has been shown to have a direct impact on one's educational achievement. There exists a significant and direct correlation between an individual's academic self-efficacy and his or her learning outcomes in AI-mediated settings (Xu et al., 2024). In combination with an appropriate environment, it improves learners' proficiency and task performance (Zhou & Wang, 2026; Shahat et al., 2025).

While the adoption of AI technology may create stress for learners, self-efficacy serves as a strong coping resource. Students with high self-efficacy tend to experience considerably lower levels of learning anxiety when using AI technology (Tang et al., 2026; Qin et al., 2026). By alleviating fear and emotional distress, self-efficacy contributes to freeing up cognitive capacities, enabling students to engage in deep learning and avoid stress (Xu et al., 2024; Yan et al., 2025). Lastly, one of the risks related to the use of AI is its negative effects on learning independence. High levels of dependency on AI might cause students to depend excessively on the technology to complete academic tasks instead of doing so themselves. Nevertheless, those students with high AI self-efficacy adopt a proactive attitude towards the use of AI and utilize it to achieve their learning goals (Zhang et al., 2024). At the same time, those students whose self-efficacy is low and who doubt their own capabilities resort to AI as a compensatory strategy, which results in the risk of dependency (Huang & Mizumoto, 2024).

Considering the potentials and challenges of AI tools integration for learners and the gaps in previous studies, which mainly investigated AI acceptance, AI usage patterns, or skills-related outcomes, this study focuses on students' perceived capacity to use AI tools across different levels from basic learning support to prompting and critical evaluation. This study considers AI self-efficacy as a multidimensional construct and aims to examine which dimensions have the strongest impact on students' academic performance.

This study was conducted for the purpose of exploring the relationship between AI self-efficacy and academic performance in EFL contexts. It aimed at examining the current levels of AI self-efficacy among EFL students across five specific dimensions: AI-assisted learning, anthropomorphic interaction, emotional comfort, technical and prompting skills, and critical evaluation. Secondly, it seeks to evaluate the predictive power of AI self-efficacy on the academic performance of EFL students.

The current study seeks to answer the following research questions:

To what extent do EFL students demonstrate AI self-efficacy across the five dimensions?

To what extent does AI self-efficacy significantly predict the academic performance of EFL students?

2. Literature review

2.1. Defining AI self-efficacy in education

The term AI self-efficacy has been described as "a person's sense of efficacy to accomplish certain activities or go through certain scenarios involving AI technologies" (Zhang et al., 2025, p. 4). It refers to the confidence and assurance of a learner concerning their ability to effectively arrange, undertake, and engage with the use of AI technologies to accomplish a set goal (Gao et al., 2025; Yuan & Lyu, 2024). Rooted in Bandura's social cognitive theory, which proposes that self-efficacy determines the actions of a person including motivation, effort, and persistence, this concept has been modified and tailored to meet the requirements of current AI (Zhang et al., 2025). In education settings, AI self-efficacy refers to students' belief in themselves to independently work with AI technologies and learn how to solve their academic problems efficiently (Zhang et al., 2025; Gao et al., 2025; Cong-Lem et al., 2025). For instance, in writing, AI self-efficacy entails the degree to which students believe in their capability to use AI technologies to write successfully (Cong-Lem et al., 2025; Shen & Tao, 2025). A student with high levels of AI self-efficacy is more likely to be proactive while

working with AI technologies. They are able to cope with difficulties in their studies and experience less classroom and learning-related anxiety (Yuan & Lyu, 2024; Gao et al., 2025).

2.2. Dimensions of AI self-efficacy

Previous studies have characterized AI self-efficacy as a multidimensional construct that covers operational, cognitive, affective and metacognitive dimensions. The first dimension of AI self-efficacy reflects learners' confidence in interacting with AI tools. It involves learners' technical and prompting skills as well as their understanding of how AI functions, its mechanisms, and the cognitive processes behind AI tools (Bećirović et al., 2025). Cognitive dimension reflects learners' confidence in utilizing AI as an intellectual partner to achieve learning goals. This dimension includes the use of AI to support learning, research, and self-regulation activities such as goal setting, planning and monitoring progress (Shen & Tao, 2025). The affective dimension of AI self-efficacy comprises comfort and anthropomorphic interaction, which reflects learners' beliefs in their own capability to effectively interact with AI agents that imitate human dialogue. This dimension requires in learners necessary resilience to use AI without technological stress (Wang & Chuang, 2024). Last but not least, metacognitive and ethical dimension ensures that learners use AI in a productive and ethical manner. It requires critical evaluation of AI outputs and learners' ability to detect factual inaccuracies, algorithmic biases, and hallucinations (Almusharraf et al., 2025). In addition, ethical and responsible integration of AI tools into learning is also required because it reflects learners' confidence to navigate ethical dilemmas such as plagiarism, data privacy and ensures that learners use technology within established boundaries (Bećirović et al., 2025).

Other researchers also suggest context-specific dimensions such as productive and receptive efficacy, or writing efficacy (Liu et al., 2026; Shen & Tao, 2025). For instance, for productive and receptive efficacy, learners distinguish between their confidence in using AI tools for active output of speaking and writing skills or comprehension tasks such as listening and writing (Liu et al., 2026). On the other hand, for academic writing, self-efficacy is broken down into smaller steps in which AI tools are involved in the learning process such as brainstorming, linguistic rules, and self-regulation (Gao et al., 2025).

Within the current study, AI self-efficacy is referred to as a multidimensional construct encompassing five main dimensions of AI assistance, anthropomorphic interactions, comfort, technical and prompting skills, and evaluation of AI-generated outputs. These dimensions reflect not only whether a learner uses AI, but also how effectively, confidently, and ethically they integrate it into their own learning pathway.

2.3. The role of AI self-efficacy in language education

The literature demonstrates consistent positive relationships between the level of AI self-efficacy and students' academic results and output quality in English courses. Specifically, academic self-efficacy among EFL learners working in an AI-assisted environment positively impacts their English learning achievements to a high degree with the maximum value in one of the structural equation models is equal to 0.940 (Xia, 2026). Students who believe in their abilities to use various technological tools including the generative AI software are employing particular writing strategies based on their use. These actions improve L2 writing proficiency and satisfaction levels among EFL students.

Moreover, AI self-efficacy acts as an engine of learner motivation and multidimensional engagement through behavioral, cognitive, and affective processes. According to self-determination theory, using AI-based tools that are customized for one's needs allows for the fulfillment of basic psychological needs for competence, thus stimulating

autonomous, intrinsic motivation in the learner (Liu et al., 2026). For instance, using ChatGPT in an organized manner within EFL classrooms has been found to positively affect students' ideal L2 self and L2 experience motivations, resulting in enhancing the relationship between writing self-efficacy and motivational orientations of learners (Huang & Mizumoto, 2024). Moreover, self-efficacy is related to learning grit; those who show more grit will have more mastery experiences in using AI tools, thus enhancing their self-efficacy.

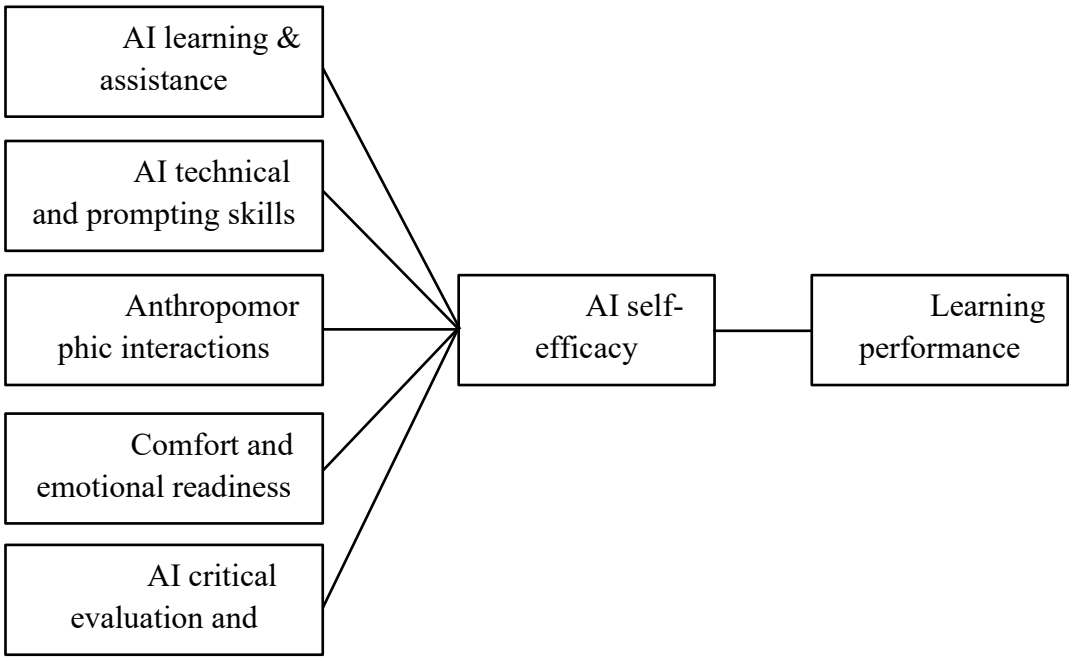
Finally, within the framework of the technology acceptance model (TAM), self-efficacy is an essential construct that links perception of the AI-based tools by the learners to their actual behavior and foreign language learning. Specifically, the higher EFL students perceive the generation AI-based tool to be as easy and useful to employ, the stronger will be their self-efficacy in terms of the tool use, which, in turn, will predict their intention to use it further (Almusharraf et al., 2025).

2.3. The relationship between AI self-efficacy and academic performance

Previous studies have revealed an obvious correlation between AI self-efficacy and academic performance in which academic performance can be predicted by AI self-efficacy (Teng, 2025). As seen from the findings of the study by Xia (2026) who used structural equation modeling in researching English as a Foreign Language (EFL) students, there was a huge path coefficient (β=0.940) of students' academic self-efficacy with regard to their learning outcome when utilizing generative AI technology. High AI self-efficacy enables students to be certain about their capability to reach academic goals, hence putting them in a position to make necessary efforts and persevere in the learning process using AI technologies (Zhang et al., 2025). It has been similarly noted that students with high self-efficacy predict positive test outcomes (Hao et al., 2025).

However, important cautions when considering how one's AI self-efficacy impacts their academic performance in general are also noticed. Whereas Bećirović et al. (2025) demonstrated that one's AI self-efficacy indeed plays a significant role in predicting the level of quality of the generated AI output (β=0.229), it appears that its influence on the overall academic performance of students is not as significant and can be considered merely positive, yet statistically insignificant (Bećirović et al., 2025). An important risk should be noted in this context. If the application of students' AI self-efficacy results only in producing prepackaged outputs, and does not involve necessary mental operations like analyzing, reading, questioning, and problem-solving, then AI usage could have a detrimental effect on learning outcomes (Xia, 2026). This is because although students might seem highly self-confident in the use of AI technology, their self-confidence is only aimed at acquiring outputs.

2.4. Conceptual framework



The conceptual framework of AI self-efficacy in the current study encompasses five components: AI learning and research assistance, AI technical and prompting skills, anthropomorphic interactions, comfort and emotional readiness, and technical and prompting skills, AI critical evaluation and responsible use. Firstly, AI technical and prompting skills represent the foundational, technical confidence required to navigate AI systems effectively. It includes not only learners' technological understanding but also their practical application of AI tools. Secondly, anthropomorphic interactions measure learners' comfort and effectiveness in treating AI as a conversational partner, virtual tutor, or collaborative peer. Thirdly, AI learning and research assistance reflects learners' confidence in using AI as an intellectual partner to achieve specific academic and research tasks. Fourthly, the affective dimension of AI self-efficacy is characterized by learners' comfort and emotional readiness associated with

AI usage. Highly efficacious learners perceive AI as a non-judgmental partner, which creates a psychologically safe environment that significantly reduces foreign language anxiety and fear of negative evaluation and increases learners' perceived control of AI tools as well as enjoyment. Finally, AI critical evaluation and responsible use reflect learners' confidence in applying higher-order thinking to review, question, and interpret AI-generated outputs. Efficacious users trust their ability in detecting algorithmic biases, factual inaccuracies. In addition, this dimension also measures learners' ability to resist dependency on AI, in which learners tend to blindly accept AI feedback or use it as a shortcut to replace genuine learning. Another critical characteristic of AI efficacious learners is reflected in their confidence in navigating ethical decisions related to plagiarism and data privacy and the use of technology in a responsible way within academic environments.

This conceptual framework was adapted from Wang and Chuang's (2024) four-dimensional framework comprising assistance, anthropomorphic interaction, comfort, and technological skills. However, an important fifth dimension, AI critical evaluation and responsible use, was added to ensure learners' confidence leads to efficient and ethical integration of AI tools into learning. In this conceptual framework, AI technical and prompting skills serve as the foundational engine. Once a learner feels technically capable, their comfort and emotional readiness are activated, which in turn facilitates smooth anthropomorphic interaction, lowering anxiety and making the technology feel accessible and safe. These foundational and affective dimensions empower learners to utilize AI for deep learning and research assistance. But in order for this aid to translate into real academic success, the whole process must be guided by the critical analysis and responsible use of AI. In total, these five components make up an AI self-efficacy framework, determining not only the frequency of AI tool usage, but also the quality of its correlation with successful academic outcomes.

Figure 2.1.

A conceptual framework of AI self-efficacy (adapted from Wang and Chuang, 2024)

3. Methodology

3.1. Pedagogical settings & participants

This study was conducted with the participation of 150 students from HCMC University of Foreign Languages – Information Technology. The students were currently attending different courses in the second semester of the academic year 2025-2026. Convenience sampling was used for the current study. Below is a table describing the participants' demographic information.

Table 3.1.

The participants' demographic information (n= 150)

Variables		**Number**	**Percentage**
Gender	Male	36	24%
	Female	114	76%
Major	English	114	76%
	Non-English	36	24%
Year	First year	112	74.7%
	Second year	38	25.3%
Scores	Excellent	72	48%
	Good	37	24.7%
	Fair	31	20.7%
	Poor	10	6.7%

Demographic characteristics of participants were provided in Table 3.1. There were totally 150 participants in this sample. With respect to gender, female participants comprised 76%, while male participants constituted 24% of the sample. English-majored students comprised 76%, while non-English-majored participants comprised 24%. In regard to academic year, freshmen comprised 74.7%, while sophomores comprised 25.3% of the participants. In terms of academic performance, most participants performed excellently. They constituted 48% of the sample. Those who performed very well and well comprised 24.7% and 20.7%, respectively. Poor performers comprised only a minor portion of the participants (6.7%). Overall, the sample largely comprised female, English-majored freshmen with high academic performance. Although the sample is heavily weighted toward female participants and English language majors, this imbalance indeed reflects the genuine demographic characteristics of university level EFL programs.

3.2. Design

This study employed a quantitative research design utilizing a cross-sectional survey methodology. This approach was chosen over qualitative or mixed-methods design because it's suitable for quantifying the perceptions of behaviors of a large student population, which ensure objectivity. In addition, by using a structured survey, this study can statistically analyze how specific dimensions of AI self-efficacy interact within a large number of participants. Specifically, quantitative data was collected through an online survey with the participants. The purpose of the survey is to measure the current level of AI self-efficacy of the participants. Quantitative data was collected via an online questionnaire delivered through the LSM Moodle system of the university. The questionnaire was adapted from the framework designed by Wang and Chuang (2024), with the addition of a fifth dimension incorporated based on

literature review of the current literature about AI literacy. The questionnaire included 44 items and was divided into three main parts. The first part aimed at collecting students' demographic information and their academic performance characterized by the midterm scores of the current subjects. The second part investigated the students' current level of AI usage including frequency, purposes, and perceived effectiveness and AI usage pattern including using AI as writing assistance, learning support and analytical tasks. The third part measured students' AI self-efficacy focusing on the five dimensions of AI including learning and research assistance, AI technical and prompting skills, anthropomorphic interactions, comfort and emotional readiness, and AI critical evaluation and responsible use.

Reliability scores of the questionnaire are presented on Table 3.2 below:

Table 3.2.

Reliability of the instrument

Dimension	Cronbach's Alpha	Number of items
Learning and research assistance	0.834	5
AI technical and prompting skills	0.626	2
Anthropomorphic interactions	0.853	5
Comfort and emotional readiness	0.870	6
AI critical evaluation and responsible use	0.836	4

In addition, midterm grades used in the current study were self-reported by the students, based on the scores provided by their instructor. Given that these grades originate from different courses, threat to internal validity is mitigated by a highly standardized grading structure across all courses. Specifically, midterm scores comprise a uniform weight distribution consisting of 10% attendance, 30% self-study, and 60% progress tests.

3.3. Data collection & analysis

Quantitative data were analyzed utilizing statistical tests on SPSS 26. Descriptive statistics in terms of frequency, percentage, mean, and standard deviation were used for summarizing demographic information about participants, extent of use of AI technology, and levels of AI self-efficacy. Correlation analysis via Pearson correlation was used to analyze the relationship between self-efficacy and academic performance. In addition, linear regression was used for analyzing the predictive effect of self-efficacy with regard to academic performance of the learners.

4. Findings

4.1. AI usage pattern among the participants

Table 4.1.1.

Students' purposes of AI use

Purposes of use	Frequency	Percentage
Writing / correcting grammar / editing English texts	129	86%
Summarizing learning materials	110	73.3%
Practicing speaking and pronunciation	51	34%

Translating	85	56.7%
Finding ideas or outlines for essays / presentations	123	82%
Doing quizzes / exam preparation	33	22%

Table 4.1.1 shows the goals students have in mind when using AI technologies in their English studies. The first goal mentioned by 86% of the respondents is associated with the usage of AI in the processes of writing, proofreading, and editing their English texts. Thus, it can be concluded that students use AI mostly as a means of developing their writing skills. Another goal of using AI tools by students is connected with finding some ideas and creating outlines for essays or presentations. The percentage of students who use AI in this case was equal to 82%, which demonstrates that artificial intelligence technologies can play a vital role during the stage of preparing an essay or presentation. It should be added that 73.3% of students used AI to create summaries of educational materials. Furthermore, over 50% of the participants utilized AI for translating English text into Russian, which can also help students learn the language better. However, there were fewer students who used artificial intelligence for practicing speaking skills and pronunciation (34%) and preparing for exams/quizzes (22%). Overall, the results indicate that students employ AI primarily for text-related and academic purposes, which include improving writing and studying course materials. Consequently, AI can be considered a tool for generating and understanding languages rather than a tool for practicing speaking skills.

Table 4.1.2

Perceived effectiveness, dependency and revision degree (n = 150)

Dimensions	**Levels**	**Frequency**	**Percentage**
Frequency of use	Sometimes	2	1.3%
	Often	74	49.3%
	Very often	74	49.3%
Perceived effectiveness	Moderately effective	28	18.7%
	Effective	68	45.3%
	Very effective	54	36%
Perceived dependency	Not dependent at all	2	1.3%
	Slightly dependent	10	6.7%
	Moderately dependent	71	47.3%
	Dependent	63	42%
	Highly dependent	4	2.7%
Revision degree	Minor revision needed	8	5.3%
	Moderate revision needed	63	42%
	Substantial revision needed	62	41.3%
	A lot of revision needed	17	11.3%

Table 4.1.2 reflects the opinions of the respondents about their AI usage for learning English. Generally speaking, students reported quite a high frequency of using AI. All but one

respondent used AI tools often or very often, whereas most participants used AI very often. As far as perceived effectiveness is concerned, the majority of respondents believed that AI tools were effective or very effective for learning English. It means that the majority of respondents had a good impression about the utility of using AI in the process of learning. When it comes to the degree of dependence, the majority of students reported that they had a moderate or relatively high degree of dependence on AI. The biggest percentage was reported for moderately dependent students. Next, there was a high percentage of dependent students. Considering the degree of revision is concerned, it is possible to note that most students reported a need for moderate or considerable revision of the results produced by AI.

4.2. AI self-efficacy among the participants

Table 4.2.

Students' AI self-efficacy (n=150)

Dimensions	**Mean**
AI learning & research assistance	4.20
Anthropomorphic interaction	3.85
Comfort & emotional readiness	4.11
AI technical and prompting skills	3.05
AI critical evaluation and responsible use	2.90
AI self-efficacy	3.62

Table 4.2 reveals students' level of AI self-efficacy. As can be seen, the students' overall AI self-efficacy level is at the mean score of 3.62. Based on the interval classification scale (1.00 – 1.80 Very Low; 1.81 – 2.60 Low; 2.61 – 3.40 Moderate; 3.41 – 4.20 High; 4.21 – 5.00 Very High), this level of confidence is categorized at the high level. Among the five dimensions of AI self-efficacy, AI learning & research assistance occupies the highest rank with the mean score of M = 4.2 (high level). This result shows that students are confident in using AI as a support tool to solve learning problems and increase their productivity.

Comfort & emotional readiness and anthropomorphic interaction rank second and third with M = 4.11 (high level) and M = 3.85 (high level). Students are confident in communicating with AI as if it were a human through conversational flow. In addition, they also demonstrated a high level of emotional ease and reduced anxiety when interacting with AI tools. In addition, students' AI technical and prompting skills are at an average level with M = 3.05 whereas AI critical evaluation and responsible use rank last with the mean score of 2.90 (average level). This lower level reveals that students often struggle with complex prompts and have difficulties judging the accuracy, bias, and reliability of AI-generated contents.

In general, while students demonstrate high levels of confidence in utilizing AI for basic learning and research assistance, their self-efficacy regarding critical evaluation and responsible use is noticeably lower. This suggests a significant gap in terms of confidence among the students. This is because while the students were very confident, comfortable, and prepared to use AI tools effectively for performing learning tasks, their self-assurance about their ability to use AI technology and prompting engineers were not at the same level.

4.3. The relationship between AI self-efficacy and academic performance

Table 4.3.1.

Correlation between AI self-efficacy and academic performance

Correlation		AI learning & research assistance	Anthropomorphic interaction	Comfort & emotional readiness	AI technical and prompting skills	AI critical evaluation and responsible use
Scores	Pearson correlation	-.152	.13	-.040	.285**	.340**
	Sig. (2-tailed)	.064	.878	.624	.000	.000
	N	150	150	150	150	150

The correlation between AI self-efficacy dimensions and student's academic performance is represented in Table 4.3.1. It can be observed that there were only two significant correlations found between the AI self-efficacy dimensions and student's scores – the dimension AI technical and prompting skills and the dimension AI critical evaluation and responsible use. Thus, AI technical and prompting skills demonstrated a positive correlation, which indicates that those students who felt more self-assured in writing prompts and utilizing AI in technical ways obtained higher academic scores. AI critical evaluation and responsible use was positively correlated with higher student's performance, which means that students who were able to critically evaluate the material generated by AI performed better.

However, AI learning and research support, anthropomorphic engagement, and emotional preparedness did not have any statistical association with the performance of the students. It means that only finding AI useful, comfortable interactions with AI, and being emotionally prepared to use AI alone cannot contribute to higher achievement at school. All in all, the results seem to indicate that there is a stronger link between better academic achievements and students' high-level AI competencies, namely, prompting and critical assessment.

Table 4.3.2.

Results of multiple regression analysis examining the effects of AI self-efficacy dimensions on academic performance

Variables	B	β	t	Sig
AI learning & research assistance	-0.278	-0.136	-1.879	.062
Anthropomorphic interaction	-0.010	-0.006	-0.077	.939
Comfort & emotional readiness	-0.128	-0.063	-0.867	.387
AI technical and prompting skills	0.400	0.321	4.395	.000***
AI critical evaluation and responsible use	0.456	0.389	5.303	.000***

Statistic	Value
R	0.497
R^2	0.247
Adjusted R^2	0.221

F	9.451
Sig. (F)	.000***
N	150

*Note: *p < .05, **p < .01, ***p < .001*

The effects of self-efficacy on learning outcomes have been investigated using linear regression analysis in Table 4.3.2 below. The linear regression model has been proven to be statistically significant at F=9.451, p<.001 with $R^2 = 0.247$ or an explanatory power of 24.7% in predicting students' performance. The regression analysis indicates that general AI self-efficacy does not predict academic success. Instead, its impact is dependent on specific, high-level competencies. Out of the five factors considered, technical prompting skills and critical evaluation turned out to be important positive predictors of academic performance, while help, anthropomorphism, and comfort failed to be statistically significant. More precisely, technical proficiency and ability to engineer prompts played a positive part in the influence exerted on the dependent variable ($\beta = 0.321$, $p < .001$), which means that the greater technical expertise and proficiency is in terms of creating appropriate prompts, the higher dependent variable becomes. It is worth noting that the AI critical evaluation and use of AI turned out to be the strongest predictor of this outcome ($\beta = 0.389$, $p < .001$), which demonstrates the importance of critical evaluation and use in achieving high academic performance. In contrast, such variables as help, anthropomorphism, and emotional comfort did not prove to be statistically significant at all, giving p-values of .062, .939, and .387 respectively.

5. Discussion

The present study was carried out with the aim of studying students' AI self-efficacy level and its relationship with learning performances. According to the findings, there are several important points which could be highlighted.

First of all, in relation to students' interaction with AI for learning purposes, the findings reveal that students engage with AI tools at a high level across writing, learning support, and analytical tasks, confirming that AI is no longer a novelty but a routine academic instrument. These findings are consistent with the results obtained by Cong-Lem et al. (2025), who investigated English-majored students in Vietnam, also reported a high level of interaction with AI (42% use it regularly, 8% use AI daily whereas 45% use it occasionally). Besides, Fauzi et al. (2025) states that students' interactions with AI are positively correlated with their attitudes and willingness to use it in the future. In general, the results point to a pattern in which students use AI more proficiently for improving writing skills and facilitating learning processes rather than using it as an aid for critical reasoning. Moreover, these findings correspond to the trend within higher education where students are actively using AI not only for personal assignments such as helping with writing but also entering into an ecosystem of various tools that they use frequently to achieve learning goals.

Secondly, the results show that the students had a relatively high level of self-efficacy with respect to AI, meaning that they believed that they were able to use AI tools in order to support their learning and academic activities. Similar results were found in the study conducted by Almusharraf et al. (2025), who claimed that EFL students in Saudi Arabian universities demonstrated high levels of AI self-efficacy with M= 3.77. Particularly, the students expressed high levels of self-assurance in using AI for idea generation and improving writing skills. In addition, the same pattern was observed in the research conducted by Yuan and Lyu (2024), which involved Chinese students. However, there is still evidence of an existing confidence gap. Students were generally confident in the use of AI to facilitate general

learning but were only moderately confident about their technical and prompting competencies, with the lowest being related to critical evaluation and responsible usage. It is evident that students have confidence in their basic knowledge and application of AI technology rather than more complex competencies, including the ability to develop prompts, control output, spot bias, and evaluate AI-generated content for accuracy. The findings mirror those in a similar study conducted by Hao et al. (2025). Despite their positive perception of AI as beneficial and easy to utilize, the self-efficacy levels of Chinese university students stayed relatively low. In addition, the use of GenAI more often was not linked to higher levels of confidence. As stated in the study, the reason for this phenomenon may lie in students' poor exposure to AI technologies, access limitations, and lack of institutional guidance on proper integration of AI technology in learning processes.

Lastly, the findings from the regressions indicate that academic performance is associated with AI self-efficacy, specifically with higher-order competence of AI technical and prompting skills and AI critical evaluation and responsible use within AI self-efficacy. This result aligns with Xia's (2026), who studied the effects of self-efficacy on the academic achievements of students in relation to generative AI. Furthermore, the same result was obtained by Hao et al. (2025) during their research on the connection between self-efficacy and predictions of students' academic performance in tests. Therefore, the results of the current study can be confirmed by the above literature evidence. This means that the students who have higher self-efficacy are more inclined to be successful in their studies due to the high motivation for mastering AI tools.

On the other hand, it becomes clear that not all dimensions of AI self-efficacy affect the same way. Indeed, academic outcomes depend on students' technical competence and prompting abilities, alongside critical evaluation and proper utilization of AI-generated text. Thus, merely perceiving AI technology comfortably and as an assisting tool cannot lead to improvement of learning outcomes. The key point here refers to the possibility of controlling AI interactions, generating appropriate prompts, evaluating AI-generated outputs, and making ethical decisions while working with AI. In such a manner, it seems that academic success may differ from the frequency of AI utilization. In fact, it was demonstrated that high self-efficacy positively influences interaction with AI technologies, although frequent utilization does not necessarily result in successful learning.

Overall, it is important for educators to realize the major pedagogical implications of the results that students must not just be encouraged to use AI in their studies, but also taught how to use AI wisely, effectively, and ethically. If learners are able to take their AI-based activities to a higher level through developing competencies such as prompting and evaluating, their learning experience becomes far more valuable.

It follows from the results of this study that AI self-efficacy plays a significant role in motivating students to work with technologies based on artificial intelligence while high-level competencies such as technical prompting and critical evaluation play an even more important role in influencing academic performance. These results show that it is crucial for educators to encourage their learners to engage in reflective activities related to AI use in the educational process. In other words, learners' AI self-efficacy can contribute to improved academic achievement only when confidence is accompanied by meaningful engagement with AI. Students should use AI as a collaborative learning tool to support reasoning, reflection, revision, and knowledge construction rather than merely to produce ready-made answers.

6. Conclusion & recommendations

In conclusion, the present study shows that the use of AI tools by EFL students is characterized by sufficient confidence. Furthermore, academic success is mostly associated with the ability to utilize technology and prompt writing, combined with critical assessment and proper application. This implies that it is the ability of students to create appropriate prompts, assess, correct, and validate AI output, as well as apply AI in an ethical manner that is likely to make them succeed academically. On the other hand, being familiar with AI and considering AI to be a helpful assistant is unlikely to lead to higher academic success.

From the results, some important implications were drawn. Firstly, the major implication for students is that it is not enough to become proficient in using AI often; they should focus on how to use AI effectively. Specifically, this involves critical analysis and verification of what has been produced by AI rather than copying AI suggestions without assessing and improving them. With the finding that education must move beyond simply giving students access to AI technologies, instructors must directly educate students on appropriate prompting techniques, AI output evaluation, and ethical use of AI. Students should be required in their assignments to detail their use of AI, modifications made, and evaluations of the output quality.

For educational institutions, the implications are that they must move beyond just providing AI technology access to developing students' AI competency. This involves creating AI competency frameworks, embedding AI literacy into educational programs, and establishing guidelines for responsible use of AI. Institutions should also focus on educating educators about AI pedagogy and assessment using AI so that it can be utilized responsibly.

In summary, mere access to AI technology is not sufficient in terms of its effective integration in EFL learning. Students require the necessary competency to be able to employ AI technology in an effective manner.

#134 INTEGRATING CHATGPT INTO EFL WRITING INSTRUCTION: EFFECTS OF THE MEDIATING ROLE OF STUDENTS' PERCEPTIONS AND PERCEIVED ACADEMIC WRITING PERFORMANCE

Nguyễn Thị Thiên Phương[1], *Nguyễn Thị Ngọc Uyển*[2]

Abstract

Generative AI tools, particularly ChatGPT, are rapidly reshaping how students approach academic writing, especially among EFL learners. Beyond providing language assistance, these technologies help reduce the pressure associated with generating ideas and structuring academic texts in English. However, the prior pieces of research have not fully clarified the mechanisms through which ChatGPT can improve students' perceived academic writing performance (PAWP), particularly the mediating role of students' perceptions in this relationship. Using data collected from 291 EFL students, this study applied PLS-SEM and bootstrapping techniques through SmartPLS4 to examine the proposed research model. The results show that the use of ChatGPT positively affects students' perceptions, which greatly enhance the degree of improvement in PAWP. Of particular interest is the direct positive effect of the tool on writing outcomes, suggesting that the effect of the tool is not merely perceptual but also directly impacts the writing process itself. These findings add to the expanding body of research on AI in education and the Technology Acceptance Model in the context of generative AI. The research also highlights the importance of increasing AI literacy in higher education and offering students explicit instructions on the ethical use of AI tools to improve academic success.

***Keywords**:* ChatGPT, academic writing performance, EFL students, perception toward AI, PLS-SEM

1. Introduction

1.1. The context of study

Higher education is undergoing a transformation due to the rapid growth of generative AI, especially in learning activities and academic writing practices. Among these technologies, ChatGPT has received much attention because of its ability to help students generate ideas, polish their language and provide instant feedback (Kasneci et al., 2023). Importantly, many universities are starting to see AI as a tool to support learning rather than simply a source of plagiarism or academic misconduct (Dwivedi et al., 2023). For EFL students this influence would seem to be even greater. In addition to critical thinking and logical argument skills, English academic writing involves good use of academic vocabulary and internationally accepted writing conventions. As a result, students increasingly use AI tools to reduce the stress of writing and to accomplish their academic duties effectively.

[1] *MA, University of Labour and Social Affairs, Campus 2, HCM City, nguyenthithienphuong78@gmail.com; phuongntt@ldxh.edu.vn*

[2] *MA, University of Labour and Social Affairs, Campus 2, HCM City, uyenntn@ldxh.edu.vn*

Nevertheless, previous studies have primarily examined the effects of ChatGPT, students' perceptions, or the writing support provided by AI in isolation. Empirical evidence simultaneously examining the relationships among ChatGPT integration, students' perceptions, and improvements in PAWP within a single mediation model remains limited, particularly in the context of EFL learners.

1.2. The rationale for the study

Although ChatGPT has been increasingly adopted, its actual effectiveness in improving PAWP remains a subject of debate. Some studies (Lo, 2023) have found that AI tools can also help students communicate ideas and produce writing more effectively. On the other hand, some scholars suggest that the over-reliance on AI may reduce the critical thinking and the academic independence of the students (Tlili et al., 2023). One of the largest gaps in the literature is the role of learners' perceptions. More specifically, limited evidence is available on how students' perceptions shape the relationship between ChatGPT use and academic writing performance. As a result, the broader educational impact of generative AI has not yet been fully understood.

1.3. Research gap

Although numerous studies have highlighted the potential of ChatGPT to support academic writing by facilitating idea generation, improving language use, and assisting with text revision (Kasneci et al., 2023; Dwivedi et al., 2023), empirical findings regarding how this technology influences learning outcomes remain inconclusive. Previous research has largely examined individual aspects of ChatGPT use, such as the extent of its adoption, students' attitudes or perceptions toward AI, or its role in supporting academic writing. Comparatively little attention has been paid to investigating the relationships among ChatGPT integration, students' perceptions toward ChatGPT, and PAWP within a single mediation framework.

Another limitation of the existing literature concerns the measurement of academic writing outcomes. Many studies rely on learners' self-reported evaluations of their writing performance without clearly distinguishing between PAWP and objectively assessed writing quality. As a result, the educational benefits of ChatGPT may be overstated if the subjective nature of these measures is not adequately acknowledged.

To address these gaps, the present study develops and tests a mediation model in which ChatGPT integration influences PAWP indirectly through students' perceptions toward ChatGPT. By examining this psychological mechanism, the study provides a more comprehensive understanding of how AI-supported learning contributes to students' writing development. It also extends the literature on technology acceptance by offering empirical evidence on the adoption of generative AI in higher education, particularly in the context of EFL academic writing.

1.4. Research objectives

This study aims to examine how the integration of ChatGPT influences PAWP of EFL students in the context of the growing use of generative AI in higher education. In addition, the research investigates the effects of students' perceptions toward ChatGPT in order to better explain how these perceptions shape the effectiveness of AI-assisted academic writing. The study therefore goes beyond evaluating the technological benefits of AI and also explores the cognitive and perceptual processes involved when students interact with AI tools in academic settings.

1.5. Research contributions

In theory, the study contributes to the literature on AI in education and expands the Technology Acceptance Model by explaining the impact of ChatGPT on the basis of students' perceptions instead of focusing on the effectiveness of the technology. The study also empirically supports a mediating model in the EFL context, helping to clarify the role of perception in shaping performance in academic writing. Methodologically, the study contributes by providing further empirical evidence from the use of PLS-SEM in higher education contexts in Asia. It thereby contributes to the growing body of research on AI-aided learning in developing economies.

2. Literature Review and hypothesis development

2.1. Literature Review

2.1.1. Integrating ChatGPT into academic settings

The development of ChatGPT is changing the way students view academic writing, especially in the EFL context. Unlike traditional grammar checkers, ChatGPT can be utilized to assist at any stage of the writing process, from brainstorming, to editing, to structuring arguments (Kasneci et al., 2023). It is a language support tool for many EFL learners and a way of reducing the stress of writing in academic English.

Another key aspect of generative AI is the opportunity for a more personalized learning experience. Students get immediate feedback and are able to adjust their writing to their needs and learning styles (Chan & Hu, 2023). Writing skills, including coherence and organization, therefore tend to improve noticeably (Zhai, 2023). Such developments indicate that ChatGPT is becoming part of the contemporary academic practices rather than merely a technical support tool.

2.1.2. Students' Perceptions of ChatGPT

In the present study, students' perceptions (PER) represent learners' overall evaluation of ChatGPT as a learning tool. Drawing on the Technology Acceptance Model (TAM), this construct encompasses perceived usefulness, perceived ease of use, attitude toward using ChatGPT, and learning satisfaction. Rather than examining these dimensions separately, the study conceptualizes them as indicators reflecting students' overall perceptions of ChatGPT in academic writing, consistent with previous AI and educational technology studies. The students' perceptions towards ChatGPT is important to how they adopt and use AI for learning activities. The construct students' perceptions toward ChatGPT (PER) based on the Technology Acceptance Model, proposed by Fred Davis (1989), is used in this study, where perceived usefulness and perceived ease of use are the main factors affecting the technology acceptance. Students who see ChatGPT as a tool that can help them to generate ideas, improve their language and support them in academic writing are more likely to develop positive attitudes towards AI. Likewise, when the tool is easy to use and provides rapid responses, students tend to engage with the technology more actively.

In addition, this study extends the original TAM framework by incorporating attitude and learning satisfaction in order to better capture students' experiences within AI-supported learning environments. These perspectives suggest that perception is not merely a personal evaluation of technology but also a cognitive mechanism that can influence the academic outcomes of EFL learners.

2.1.3. Perceived Academic Writing Performance (PAWP)

PAWP is the ability to produce a logical, accurate and consistent written work according to international academic standards. This is often a difficult skill for EFL students, as they have to juggle grammar, academic vocabulary and the organization of argument all at once. Lo (2023) found that AI-assisted writing tools can improve the quality of student writing by providing language suggestions, correcting errors, and helping students develop their content. But not all students gain equal benefit from these benefits. An important question is how students understand and use AI for academic writing.

2.2. Hypothesis Development

2.2.1. Hypothesis H1: ChatGPT Integration and Students' Perceptions

The Technology Acceptance Model suggests that users who view a technology as easy to use and useful tend to have positive attitudes toward the technology (Davis, 1989). ChatGPT can help students in academic writing to overcome challenges related to developing ideas, grammatical accuracy, and essay organization. Such advantages are expected to enhance students' perceptions of AI usefulness and usability (Sallam, 2023). Also, students' satisfaction with their learning experiences may be enhanced by instant feedback and tailored help (Chan & Hu, 2023). From these considerations the following hypothesis is proposed:

H1*: The integration of ChatGPT enhances students' perception of ChatGPT*

2.2.2. Hypothesis H2: Perceptions of Students and Academic Writing Performance

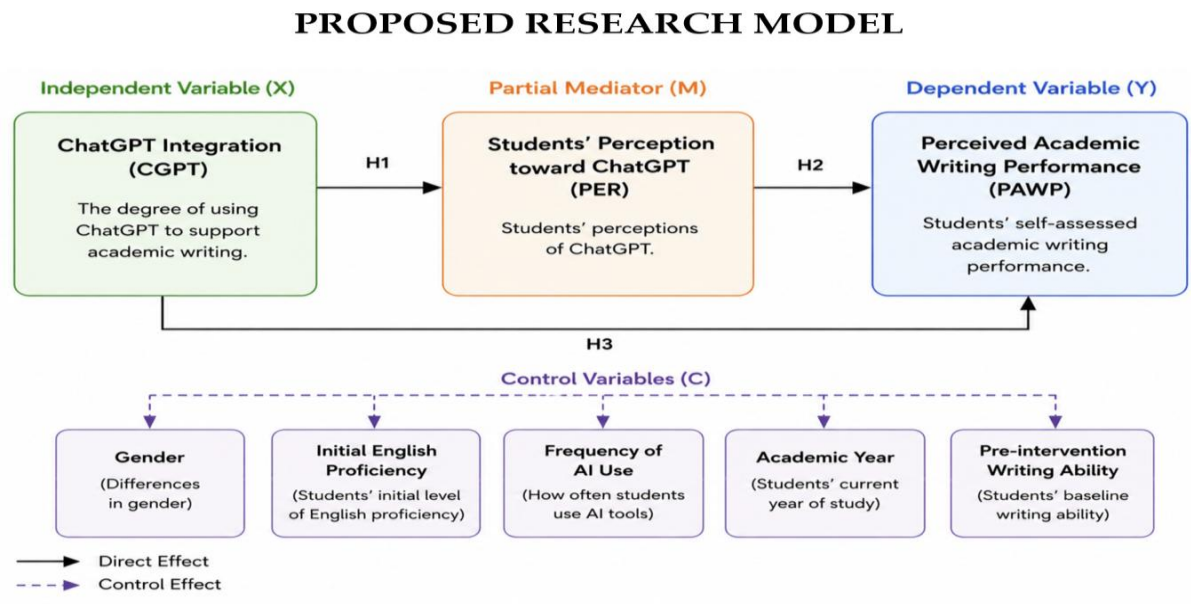
When students have positive views of ChatGPT, they are more likely to use the tool actively and effectively in the academic writing process. Such engagement can improve content organization, use of academic vocabulary, and development of arguments in English (Dempere et al., 2023).

It is important to note that positive perceptions may also improve the confidence and motivation to learn of EFL students. If students perceive AI as an accessible and helpful tool, they are more likely to be active participants in the writing process, rather than using AI as a simple replacement for doing assignments. This reasoning leads us to the following hypothesis:

H2*: Positive student perceptions toward ChatGPT have positive effects on* ***PAWP***

2.2.3. Hypothesis H3: ChatGPT Integration and Academic Writing Performance

ChatGPT may influence students' academic writing performance through the support in the writing process itself, as well as through the students' perceptions. The tool can help learners to generate ideas in a more efficient way, improve grammatical accuracy and suggest structures that are appropriate to conventions of academic writing (Kasneci et al., 2023). Immediate feedback can help improve coherence and organization of their essays as well as lessen the pressure of writing in English for EFL students. Similarly, Lo (2023) found that AI-assisted writing tools have a positive relationship with the quality of students' academic writing. Based on these arguments, the following hypothesis is formulated:



H3*: The presence of ChatGPT has a positive impact on* ***PAWP****.*

2.2.4. Hypothesis H4: The Mediating Role of Students' Perceptions

The Technology Acceptance Model states that perception is a vital mechanism to link technology use and learning outcomes. In this paper, ChatGPT is considered not only as a technical support tool, but also as a factor influencing students' assessment and acceptance of AI in academic contexts.Once positive perceptions are made, students are likely to use ChatGPT more frequently and more effectively throughout the writing process. This indicates

that perception may mediate the relationship between ChatGPT integration and academic writing performance. (Sallam, 2023). However, as AI is also expected to have a direct effect on writing performance, the mediating effect is expected to be partial rather than full. From this reasoning we propose the following hypothesis:

H4**: Students' perceptions mediate the relationship between ChatGPT Integration and **PAWP

3. Methodology

3.1. Research Design

This study used a quantitative method to explore the relationships between ChatGPT integration (CGPT), student perceptions (PER), and Perceived Academic Writing Performance (PAWP) in the context of higher education. A cross-sectional survey design was employed to obtain the perceptions and usage patterns of EFL students towards ChatGPT at a particular point of time.

The analysis was conducted using Partial Least Squares Structural Equation Modeling (PLS-SEM) due to the method's suitability for predictive research models with mediating variables (Hair et al., 2022). Another strength of PLS-SEM is that it allows for the simultaneous evaluation of the measurement model and structural model, which is particularly suitable for the investigation of learner behavior in AI-enhanced educational environments.

3.2. Research Sample and Data Collection

The participants were 291 undergraduate non-English-major students from the University of Labor and Social Affairs (Campus 2), Vietnam, who were enrolled in compulsory English courses. Data were collected by using a convenience sampling technique through an online questionnaire via Google Forms; and the survey link was distributed to students through their course instructors. Participation was voluntary, and all responses were anonymous. After screening for data analysis, a total of 291 valid responses were retained. Several procedural steps were taken to reduce the risk of common method bias. Participants were assured of the anonymity and confidentiality of their responses and informed that there were no right or wrong answers in the survey. Also, the items of the questionnaires were written in a clear and

straightforward manner in order to minimize the misunderstanding and response bias. These measures improved the reliability of self-reported data used in the study.

Several demographic and background variables, including gender, English proficiency level, frequency of AI use, and prior writing ability, were coded numerically to support additional analyses such as MGA or ANOVA when necessary.

Table 1

Sample profile

Variable Group	Category	N	Percentage (%)
Sample size (n)	Total valid responses	291	100.000
Gender	Male	128	43.986
Gender	Female	163	56.014
English Proficiency	Very low	26	8.935
English Proficiency	Low	52	17.869
English Proficiency	Intermediate	122	41.924
English Proficiency	High	62	21.306
English Proficiency	Very high	29.000	9.966
AI Use Frequency	Very infrequent	34.000	11.684
AI Use Frequency	Infrequent	52.000	17.869
AI Use Frequency	Moderate	103.000	35.395
AI Use Frequency	Frequent	68.000	23.368
AI Use Frequency	Very frequent	34.000	11.684
Academic Year	First year	78.000	26.804
Academic Year	Second year	70.000	24.055
Academic Year	Third year	77.000	26.460
Academic Year	Fourth year	66.000	22.680
Prior Writing Ability	Very low	4.000	1.375
Prior Writing Ability	Low	26.000	8.935
Prior Writing Ability	Intermediate	90.000	30.928
Prior Writing Ability	High	116.000	39.863
Prior Writing Ability	Very high	55.000	18.900

***Note**: N = 291; grouping variables are numerically coded in the dataset.*

3.3. Measurement Scales

All study variables were measured using a five-point Likert scale ranging from “strongly disagree” to “strongly agree.” The CGPT construct examined the extent to which ChatGPT assisted students in academic writing, including support for idea generation, language editing, writing completion, and ease of interaction during the writing process. Meanwhile, the PER construct was developed based on the Technology Acceptance Model (TAM), covering dimensions such as perceived usefulness, perceived ease of use, positive attitude, and learning satisfaction.

PAWP was measured by several aspects of writing quality such as accuracy of grammar, coherence and cohesion, vocabulary use, writing organization and Overall writing improvement. These measurement scales not only captured students' ability to use technology effectively but also reflected how they engaged with academic writing in an EFL learning environment.

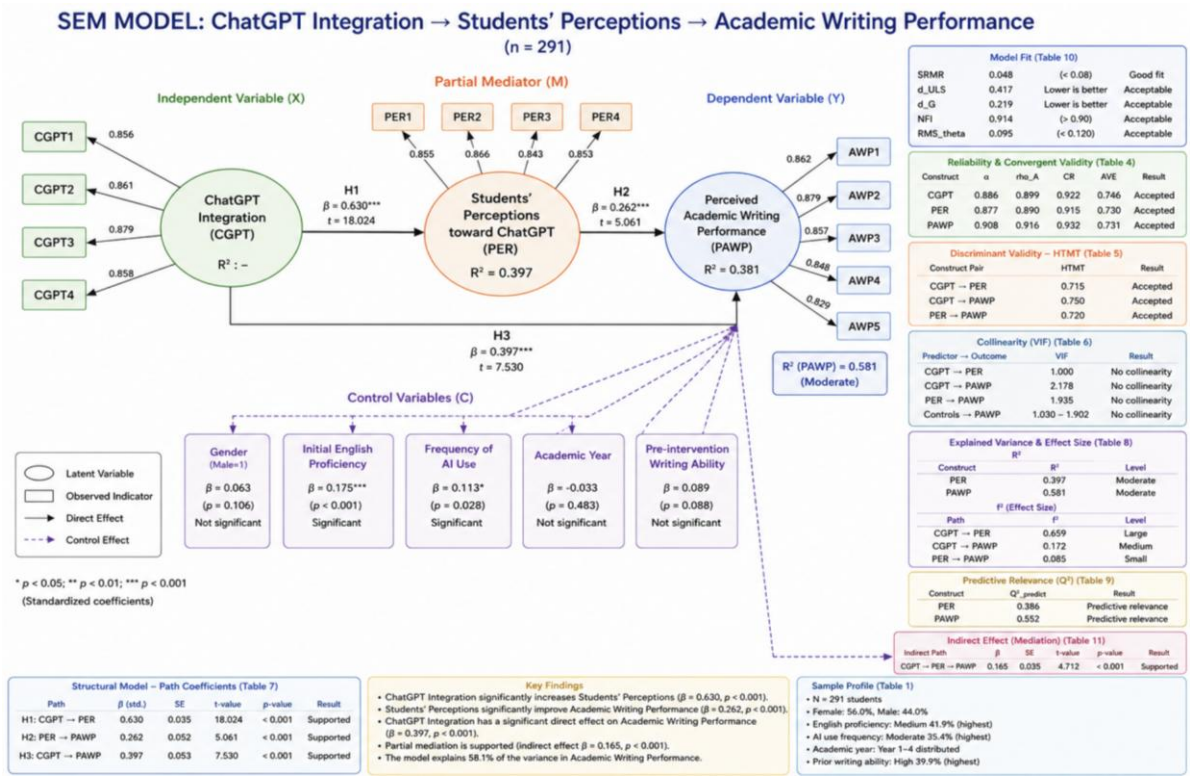
The outer loading values for all indicators exceeded the recommended threshold of 0.70, indicating satisfactory indicator reliability within the PLS-SEM model.

Table 2

Measurement items and outer loadings

Construct	Item	Measurement Content (Shortened)	Mean	SD	Outer loading	Conclusion
CGPT	CGPT1	Idea generation support	3.137	1.260	0.856	Retained
CGPT	CGPT2	Language editing support	3.007	1.268	0.861	Retained
CGPT	CGPT3	Writing completion support	3.189	1.279	0.879	Retained
CGPT	CGPT4	Ease of interaction	3.134	1.267	0.858	Retained
PER	PER1	Perceived usefulness	3.052	1.265	0.855	Retained
PER	PER2	Perceived ease of use	3.131	1.222	0.866	Retained
PER	PER3	Positive attitude	2.959	1.231	0.843	Retained
PER	PER4	Learning satisfaction	2.952	1.228	0.853	Retained
PAWP	PAWP 1	Grammar accuracy	3.052	1.257	0.862	Retained
PAWP	PAWP 2	Coherence and cohesion	2.918	1.295	0.879	Retained
PAWP	PAWP 3	Vocabulary use	3.003	1.222	0.857	Retained
PAWP	PAWP 4	Writing organization	3.076	1.274	0.848	Retained
PAWP	PAWP 5	Overall writing improvement	2.997	1.250	0.829	Retained

***Note**: All outer loadings exceed the 0.70 threshold.*



3.4. Data analysis method

The data were analyzed using SmartPLS 4 with the Partial Least Squares Structural Equation Modeling (PLS-SEM) approach. The evaluation process consisted of two main stages: assessment of the measurement model and assessment of the structural model.

For the measurement model, several indicators were examined, including outer loadings, Cronbach's alpha, Composite Reliability, Average Variance Extracted (AVE), and the Heterotrait-Monotrait ratio (HTMT), in order to evaluate the reliability and discriminant validity of the constructs.

In the structural model assessment, hypothesis testing was conducted through bootstrapping with 5,000 resamples. Model fit, explanatory power and predictive relevance were assessed using indices such as SRMR, R2, f2 and Q2. In addition, Variance Inflation Factor (VIF) values were assessed to reduce the possibility of multicollinearity among the research variables.

4. Results

4.1. Mmeasurement model Assessment

The measurement model was evaluated in terms of reliability, convergent validity, discriminant validity, and multicollinearity following the guidelines proposed by Hair et al. (2022). The results showed that all the constructs met the recommended standards. Cronbach's Alpha and Composite Reliability were greater than 0.70 and all AVE values were above the cut-off value of 0.50.

The results revealed that the measurement scales possessed good reliability and strong convergent validity. PAWP has the highest Composite Reliability value (0.932) among the constructs which indicates the high level of internal consistency among the observed indicators of PAWP.

To assess the possible effects of common method bias, a Harman's single-factor test was carried out. The largest factor accounted for 38.4% of the total variance which was lower than the recommended cutoff of 50%, suggesting that common method bias was less likely to be a serious concern in this study. Moreover, all the complete collinearity VIF values were below 3.30, which provides additional evidence for the absence of significant bias due to self-reported data.

Furthermore, all HTMT values were lower than 0.85, confirming satisfactory discriminant validity and indicating that the constructs were conceptually distinct from one another.

Table 3

Reliability and convergent validity

Construct	Number of Items	Cronbach's Alpha	rho_A	CR	AVE	Conclusion
CGPT	4.000	0.886	0.899	0.922	0.746	Accepted

PER	4.000	0.877	0.890	0.915	0.730	Accepted
PAWP	5.000	0.908	0.916	0.932	0.731	Accepted

***Note**: Cronbach's Alpha and CR exceed 0.70; AVE exceeds 0.50.*

In addition, discriminant validity was evaluated using the Heterotrait-Monotrait Ratio (HTMT) of correlations.. As presented in Table 4, all HTMT values were below the recommended threshold of 0.85, confirming that the constructs in the model were clearly distinguishable from one another. These findings indicate that the variables represented separate concepts and that no significant overlap among the constructs was observed.

Table 4

Discriminant validity

Construct Pair	Comparison	HTMT	Conclusion
CGPT	PER	0.715	Accepted
CGPT	PAWP	0.750	Accepted
PER	PAWP	0.720	Accepted

***Note**: HTMT values are below 0.85 indicating discriminant validity.*

To check for any multicollinearity between the constructs, Variance Inflation Factor (VIF) values were tested. From the VIF results in Table 5, all values were less than the threshold of 3.30, indicating that there was no serious multicollinearity issue in the model. The finding supports the stability and reliability for the regression coefficients of the structural model.

Table 5

Collinearity assessment

Predictor Variable	Dependent Variable	VIF	Conclusion
CGPT	PER	1.000	No collinearity
CGPT	PAWP	2.178	No collinearity
PER	PAWP	1.935	No collinearity
Gender	PAWP	1.030	No collinearity
English Proficiency	PAWP	1.552	No collinearity
AI Use Frequency	PAWP	1.902	No collinearity
Academic Year	PAWP	1.254	No collinearity
Prior Writing Ability	PAWP	1.599	No collinearity

***Note**: VIF values are below 3.30, indicating no serious collinearity issue.*

4.2. Structural Model Assessment

The structural model was examined using the bootstrapping procedure with 5,000 resamples in SmartPLS 4. The findings revealed that all three main hypotheses were supported at the significance level of $p < 0.001$. Specifically, the integrated ChatGPT had a positive impact on students' perceptions ($\beta = 0.630$). This means that the use of AI enhanced students' perceived usefulness and perceived ease of use. Furthermore, students' perceptions had a positive effect on PAWP ($\beta = 0.262$). This finding highlights the important role of perception in improving academic writing outcomes.

Apart from the indirect effect, the integration of ChatGPT also had a direct positive effect on PAWP (β = 0.397). This indicates that AI tools can directly help students in generating ideas, improving language, and better organization of written content. Among the control variables, only English proficiency and frequency of AI use had statistically significant effects on PAWP.

The results of R^2 showed that the model has a moderate explanatory power of 0.397 for PER and 0.581 for PAWP. Furthermore, the path from CGPT to PER produced a large effect size (f^2 = 0.659). All Q^2 values were greater than zero, confirming that the model possessed satisfactory predictive relevance for the endogenous constructs.

Table 6

Structural model results

Path	β	SE	t-value	p-value	LLCI	ULCI	Conclusion
H1: CGPT → PER	0.630	0.035	18.024	<0.001	0.558	0.694	Supported
H2: PER → PAWP	0.262	0.052	5.061	<0.001	0.162	0.362	Supported
H3: CGPT → PAWP	0.397	0.053	7.530	<0.001	0.294	0.497	Supported
Gender → PAWP	0.063	0.039	1.617	0.106	-0.012	0.138	Not significant
English proficiency → PAWP	0.175	0.048	3.662	<0.001	0.083	0.268	Significant
Frequency of AI use → PAWP	0.113	0.051	2.197	0.028	0.013	0.214	Significant
Academic year → PAWP	-0.033	0.047	-0.701	0.483	-0.125	0.060	Not significant
Prior writing ability → PAWP	0.089	0.052	1.704	0.088	-0.012	0.192	Not significant

***Note**: Bootstrapping with 5,000 subsamples; standardized coefficients are reported.*

The results indicated that the integration of the AI system had a direct positive effect on PAWP (β = 0.397), suggesting the supportive role of AI in idea generation, language editing, and the organization of academic writing. Among control variables, only English proficiency and AI use frequency were statistically significant predictors of PAWP.

Moreover, the model showed moderate explanatory power with R2 of 0.397 for PER and 0.581 for PAWP. CGPT and PER were significantly related to each other with a large effect size (f^2 = 0.659). The effect of PER on PAWP was relatively weak.

Table 7

Coefficient of Determination and Effect Size (R^2, f^2)

Indicator	Variable / Path	Value	Level
R^2	PER	0.397	Moderate
R^2	PAWP	0.581	Moderate
f^2	CGPT → PER	0.659	Large
f^2	CGPT → PAWP	0.172	Medium
f^2	PER → PAWP	0.085	Small

f^2	Gender → PAWP	0.009	Very small
f^2	English_Proficiency → PAWP	0.047	Small
f^2	AI_Use_Frequency → PAWP	0.016	Very small
f^2	Academic_Year → PAWP	0.002	Very small
f^2	Prior_Writing_Ability → PAWP	0.012	Very small

***Note**: r2 = explanatory power f2 = predictor level effect size.*

Regarding model fit, the SRMR value is 0.048 (Table 8) which is below the recommended threshold of 0.08. The model fits well the observed data.

Table 8

Model Fit Indices (SRMR)

Index	Value	Reference Threshold	Conclusion
SRMR	0.048	<0.080	Good fit
d_ULS	0.417	Lower is better	Acceptable
d_G	0.219	Lower is better	Acceptable
NFI	0.914	>0.900	Acceptable
RMS_theta	0.095	<0.120	Acceptable

***Note**: SRMR below 0.08 indicates acceptable model fit.*

The results of indirect effect in Table 9 indicate that PER partially mediates the relationship between CGPT and PAWP, as the indirect effect was statistically significant (β = 0.165; p <0.001). In addition, the bootstrap confidence interval did not include zero, thereby confirming the role of cognitive perceptions in translating AI integration into improved PAWP.

Table 9

Indirect effects / mediation results

Indirect effects	β	SE	t-value	p-value	LLCI	ULCI	Conclusion
CGPT → PER → PAWP	0.165	0.035	4.712	<0.001	0.099	0.237	Partial mediation supported

***Note**: The bootstrap confidence interval excludes zero, supporting partial mediation.*

5. Discussion

5.1. The Effect of CGPT on PER

The results indicate that CGPT has a positive effect on PER, suggesting that students' experiences with the chat-based generative AI have changed EFL learners' perceptions regarding the role of AI in the academic setting. An aspect worth mentioning is the chatbot's capacity to give almost instant feedback on grammar, vocabulary and essay organization, which may enhance students' perceptions of the technology as both practical and user-friendly.

In addition, ChatGPT seems to function as a type of cognitive scaffolding, guiding students through the various stages of the academic writing process. Such support can help reduce cognitive load, so that students can devote more attention to argument construction and improving coherence in their writing. These results are in line with the study by Kasneci et al. (2023) who argued that generative AI has strong potential to deliver personalized learning support within higher education environments

5.2. The direct effect of CGPT on PAWP

The findings revealed that CGPT has a direct influence on PAWP. This suggests that ChatGPT contributes to EFL students' academic writing not only through their perceptions of the technology but also through direct support during the writing process itself.

One possible reason is its reduced cognitive load for students when they write in English. ChatGPT helps learners to focus more on idea generation and academic reasoning by assisting with language correction and providing content-related suggestions. In the same way, the tool promotes self-regulated learning, as learners can autonomously revise, edit and improve their writing thanks to the immediate feedback. As a result, students are able to improve coherence and cohesion, essay organization, and use of academic vocabulary in their writing assignments.

5.3. The partial mediating role of PER

The results suggest that PER partially mediates the relationship between CGPT and PAWP. This suggests that the success of ChatGPT is not necessarily due to the technical capabilities of AI but rather to students' perceptions and interactions with the technology in an academic setting. When learners have a positive perception of the tool, they are more likely to use the tool actively and effectively during the process of academic writing.

However, the mediating role of PER was not complete but partial, indicating that ChatGPT still has a direct effect on PAWP. In other words, AI seems to be providing cognitive support and direct assistance in academic tasks (e.g., grammar correction, paper structuring, academic expression improvement).

6. Theoretical implications of the study

This study contributes to the growing AI-in-education literature by clarifying the mechanism through which ChatGPT influences PAWP via students' perceptions. Unlike many earlier studies that mainly emphasized the technical or ethical dimensions of AI, the present findings suggest that the effectiveness of generative AI also depends on how learners perceive, adopt, and interact with the technology in academic environments.

From a theoretical perspective, the study extends the TAM within the context of generative AI. The findings indicated that perceived usefulness and perceived ease of use are associated not only with technology acceptance but also with academic outcomes, particularly PAWP. In addition, PER is conceptualized as a higher-order construct consisting of usefulness, ease of use, attitude, and satisfaction, allowing for a more comprehensive understanding of students' learning experiences in AI-supported educational settings.

The partial mediating role of PER also reveals that AI has more than a cognitive support; it could also have a direct effect on learning processes and the achievement of academic tasks. The findings offer further empirical evidence for research on EFL learning and AI-supported education in the context of higher education in Asia.

7. Practical implications

The results of the PLS-SEM indicate that ChatGPT has a significant impact on students' perceptions and PAWP. The results indicate that universities should not adopt a prohibitive attitude towards AI but should include AI literacy in education programs. Students need to be trained in how to write effective prompts, critically evaluate academic sources, and understand the limitations of AI in order to use the technology in a more informed and reflective way. This is in accordance with the arguments presented by Kasneci et al. (2023)

Additionally, as PER only partially mediated the relationship between ChatGPT and PAWP, the results suggest that ChatGPT affects students' writing not only by their perception of the technology but also by providing direct assistance in academic tasks. This is why educational institutions need to set clear guidelines for ethical use of AI to reduce risks associated with plagiarism and over-reliance on AI-generated content. As Dwivedi et al. argue, it is important for students to be aware of the difference between using AI as a support tool and AI as a total replacement of independent academic thinking.

The findings also indicate that although ChatGPT should be regarded as a writing assistant, it should not be regarded as a replacement for academic writing per se. Faculty can encourage critical engagement by requiring students to submit early drafts, AI-generated feedback, and reflective self-assessments as part of the writing process. These practices can be useful for strengthening critical thinking, and for supporting the development of academic writing skills.

8. Limitations and future research directions

The study has made a contribution but has a number of limitations that should be considered in interpreting the findings. Firstly, the cross-sectional design describes the relationship between variables at one point in time, this limits the ability to show clear causal relationships between. Second, the data were collected through self-report surveys, and, therefore, the results may be influenced by personal perceptions and response bias. Specifically, the PAWP variable mainly reflects students' subjective evaluations rather than actual writing scores or instructor ratings, and therefore may not fully capture learners' authentic academic writing ability. Although Harman's single-factor test and the full collinearity VIF assessment suggested that common method bias was not a serious concern, these statistical procedures cannot completely eliminate the possibility of common method variance inherent in self-reported cross-sectional data.

Moreover, convenience sampling restricts the generalizability of the findings to other EFL contexts. Because the participants were recruited from a single university in Vietnam, the findings should be interpreted with caution when generalizing to students from other institutions or educational settings. In addition, the use of voluntary participation may have introduced self-selection bias, as students who were more interested in or familiar with ChatGPT might have been more willing to participate in the survey. The present study was not able to fully capture differences between groups of students in academic culture, digital competence, and the level of access to AI technologies. Furthermore, although the questionnaire items were adapted from validated instruments, the absence of formal pilot testing and/or expert review should also be acknowledged as a methodological limitation, as additional evidence of content validity could further strengthen the measurement instrument.

Future research can overcome these limitations by adopting longitudinal designs to study the evolution of AI usage behaviors over time. The inclusion of instructor evaluations or standardized writing rubrics would also be useful in providing a more objective measure of academic writing performance. Furthermore, techniques such as measurement invariance assessment and MGA in PLS-SEM and variables like AI literacy and technology readiness might help in improving the explanatory power of future research models.

9. Conclusion

The study demonstrates that ChatGPT has a significant influence on PAWP through both direct effects and indirect effects mediated by learners' perceptions. This indicates that the success of AI in education depends not only on technological capabilities but also on how

students perceive, evaluate and use AI tools in the learning process. When students develop positive perceptions of ChatGPT, they are more likely to use the tool proactively to generate ideas, refine language use, and improve the organization of academic writing.

The findings also indicate that ChatGPT serves not only as a technical support tool but also as a factor that can directly influence students' learning and academic writing processes. In this sense, generative AI may help reduce the pressure associated with writing in English while simultaneously encouraging greater self-regulation and the development of academic thinking skills.

Theoretically, the study extends the TAM in the context of AI in education and adds more empirical evidence to the EFL literature, especially in higher education settings in developing economies. Practical implications The findings demonstrate that the appropriate integration and management of ChatGPT as a writing assistant can be effective in university learning environments. Hence, higher education institutions should pay more attention to AI literacy and ethical use of AI to help students use AI as a learning support tool instead of over-reliance on the technology.

#135 AN ANALYSIS ON EFL VIETNAMESE SOPHOMORES PRONUNCIATION IN A SPEAKING COURSE

Tran Thi Minh Thu[1]

Abstract

This study aims to investigate the pronunciation features of EFL second year university students in a speaking course, focusing on consonant production and prosodic elements such as word stress and intonation. To demonstrate the significant difficulties that learners encountered during producing English speech, the two participants were asked to perform both read-a-loud tasks and speaking tasks. Data from recorded speech were analyzed base on the phonological frameworks of previous research (Roach, 2009; Rogerson-Revell, 2011; Cruttenden, 2014). The findings reveal that the participants have the tendency of omitting the final sounds such as -s and -ed, and have troubles in producing a good English intonation, affecting their communicative effectiveness. Consistent with prior research (Derwing & Munro, 2005; Yates, 2017; Pourhosein, 2016), this small qualitative case study underscores the importance of targeted pronunciation instruction, calling for further research to implement pedagogical interventions which emphasize prosodic features and final consonants to enhance students' overall spoken proficiency.

***Keywords*:** Vietnamese EFL learners, pronunciation, consonants, word stress, intonation

1. Introduction

Pronunciation has caught a lot of attention of many researchers when it comes to learning English. Noticeably, L2 learners have to put a lot of efforts to improve their pronunciation as it is a difficult part of English learning process (Pourhosein, 2016). Besides, it is claimed that pronunciation plays a crucial part in supporting learners' understanding through spoken communication (Derwing & Munro, 2005; Yates, 2017). Thus, the importance of English pronunciation is taken into account in both learning and teaching process. In relations to pronunciation features, stress and consonants are supposed to play important parts in a comprehension conversation. Noticeably, Vietnamese students usually made errors in these aspects of pronunciation, which causes the difficult understanding in communicating with native speakers.

Previous studies have consistently reported that Vietnamese learners of English experience difficulties with English final consonants and consonant clusters due to substantial phonological differences between Vietnamese and English (Nguyen & Newton, 2020; Hien, 2024; Bui et al., 2021). Research has also shown that suprasegmental features such as word stress and intonation remain challenging for Vietnamese learners because Vietnamese is a tonal language and does not employ stress and intonation in the same manner as English (Yates, 2017). Although these pronunciation difficulties have been documented, much of the existing research has focused on larger groups of learners and quantitative descriptions of error types.

Sophomore English majors represent an important population for investigation because they have already received substantial English instruction and are expected to participate in increasingly demanding speaking courses. At this stage, persistent pronunciation difficulties may affect their future academic performance, professional communication, and language development. Furthermore, examining pronunciation within a speaking-course context has pedagogical value because the findings can directly inform classroom pronunciation instruction. Hence, this paper aims to explore these aspects related to Vietnamese learners' pronunciation and some appropriate recommendations for pronunciation teaching in Vietnam.

2. Literature review

The paper analysis will be based on the pronunciation features stated below:

2.1. Consonants

In terms of English pronunciation, Rogerson-Revell (2011) suggested that there are 24 consonants described as the table below:

Table 1

English consonants phonemes

Place of articulation / Manner of articulation	Bilabial	labiodental	dental	Alveolar	Palato-alveolar	Palatal	Velar	Glottal
PLOSIVE	p b			t d			k g	
FRICATIVE		f v	θð	s z	ʃʒ			h
AFFRICATE					ʧ ʤ			
NASAL	m			n			ŋ	

It can be seen that the consonants are classified into manner and place of articulation. Additionally, these consonants are divided into voiced group (/b/, /m/, /w/, /v/, /d/, /z/, /n/, /l/, /r/, /j/, /g/, /ʒ/, /dʒ/, /ŋ/, /ð/) and voiceless group (/p/, /f/, /t/, /s/, /k/, /h/, /ʃ/, /tʃ/, /θ/). Noticeably, the consonants made up a large proportion for ending sounds in English, especially for s rule pronunciation and past tense verbs pronunciation. These ending sounds are usually known as codas (final consonants) which is a crucial part in the syllable structure (Roach, 2009). Moreover, consonants clusters happen when there are two or more consonants combined together (Roach, 2009). In comparison to Vietnamese, most of the consonants share the same sounds (see Appendix A), so it is likely that Vietnamese can produce consonant clusters accurately. However, it is claimed that L2 learners usually struggle with pronouncing the final sounds relating to English rules. Thus, it is necessary to carry out the errors and give feedback to learners for further improvement in their pronunciation.

2.2. Final consonant articulation among Vietnamese learners

Regarding pronunciation production, this has been proved that second language learners were affected by their mother tongue to some extent. Although Vietnamese and English shared some consonants such as /b, d, k, m, n, f, v, s, z, h, l/ (Pham & McLeod, 2016), Vietnamese does not have the habit of pronouncing final sounds, leading to the ignorance of final sounds or difficulties articulating these sounds among Vietnamese second language learners (Nguyen & Newton, 2020). As mentioned above, consonants are divided into voiceless and voiced consonants, along with consonant clusters, which poses challenges for non-native learners (Al-khresheh, 2024). Following the consonants categories described as above (Rogerson-Revell, 2011), Cummins (2015) stated that most English words ended with these consonants, except for except for /h/, /r/, /w/ and /j/. In addition to this, Knight (2012) listed final consonant sounds as below:

/p/ - sheep, stop, cheap

/b/ - transcribe, crab

/t/ - start, smart, seat, meat, wet

/d/ - ride, sad, bread, road,

/k/ - pick, speak, peak

/f/ - leaf, belief, roof, half, sniff

/v/ - leave, arrive, live, love, five

/θ/ - earth, health, worth

/ð/ - breathe, clothe, with

/s/ - stress, goes, rice, bus, six

/z/ - these, plays, buzz, prize

/tʃ/ - teach, watch, much

/dʒ/- bridge, large, village

/m/- come, some, warm, time

/n/ - than, man, sun, tin, cone

/ŋ/ - sing, spring, wrong, wing

/l/ - pool, smile, veil, call, girl

/ʒ/ - message, garage, massage

/g/ - beg, dog, clog, bag

/ʃ/ - crash, wash, rush

In addition to this list, the researcher categorized final consonants into two groups, namely pre-final and post-final consonants.

Pre-final includes: /m/, /n/, /ŋ/, /l/, /s/

Post-final includes: /s/, /z/, /t/, /d/, /θ/

The study of Bui et al. (2021) examined how Vietnamese learners pronounced these consonants stated above. The researchers found out that most learners mispronounced these sounds or omitted them when encountering these consonants during their productive speech. In some cases, learners also substituted these sounds, leading to the misunderstanding or incorrectness to listeners. As a result, these are common errors in pronouncing ending sounds among Vietnamese second language learners.

Another study from Hien (2024) showed that Vietnamese learners had difficulties pronouncing ending sounds of English words due to the differences between Vietnamese and English consonants systems. The study collected data from five participants representing different Vietnamese regional accents. Participants were asked to read aloud a paragraph provided by the researcher and submit their recordings via email. The findings revealed that learners frequently omitted unfamiliar or challenging final consonants and inserted a schwa vowel into final consonant clusters. For example, lives was pronounced as /lɪvəz/ and leaves as /liːvəz/. The participants also tended to simplify final consonants by modifying them to resemble sounds found in their native language. Additionally, the quality of two recordings was compromised by background noise, making accurate phonetic analysis difficult.

Although there are various pronunciation topics, many researchers seem to disregard these common errors in pronouncing final consonants among Vietnamese second language learners. Specifically, students who majored in English Language also encountered these errors in their pronunciation, leading to the need of further research in this aspect and appropriate pedagogical practices for improvements in this field.

2.2. Word Stress and Intonation

2.2.1. Word stress

Cruttenden (2014) referred the concept of stress as ‘the syllable or syllables of a word which stand out from the remainder are said to be accented, to receive the accent’. Additionally,

there are four main factors that is made to recap syllable prominence or stress (Rogerson-Revell, 2011):

1. Loudness
2. Pitch change
3. Quality of sound
4. Length of sound

Previous research suggests that Vietnamese learners often demonstrate reduced pitch variation, inaccurate stress placement, and difficulties with English prosodic features because English stress patterns differ substantially from Vietnamese phonological organization (Yates, 2017; Rogerson-Revell, 2011). It is considered that pitch change is the most important part to recognize the stressed and unstressed syllables. Hence, learners are supposed to have native-like voice if they correctly process these four parts in making word stress.

2.2.2. Intonation

In terms of broader aspects of stress, Rogerson-Revell (2011) defined this as prosody or speech melody which builds up English intonation. To specify English intonation, Rogerson-Revell (2011) provided the main structure as below:

- Thought groups/Tone units (the division of utterances into smaller chunks or meaningful units)
- Nuclear stress placement/Tonicity (the accentual function of intonation)
- Tone choice (Rise-Fall/pitch movement)

As Roach (2009) suggested, English intonation enables learners to engage with attitudinal, accentual, grammatical, discourse function which support their second language uptake. Therefore, it is important for learners to take into account these aspects of pronunciation for improving their articulation. Hence, this paper will apply these features to make a clear examination of Vietnamese learners' pronunciation.

2.4. Research questions:

Collectively, previous studies suggest that final consonants, word stress, and intonation remain problematic for Vietnamese learners of English. However, existing research has largely focused on identifying error patterns in broader learner populations. Few studies have provided an in-depth qualitative examination of how these pronunciation features appear across both controlled and spontaneous speaking tasks among university English majors. Therefore, the present study addresses this gap through a small-scale case analysis of two Vietnamese EFL sophomores.

a. What consonant difficulties do Vietnamese EFL sophomores encounter during both their read-a-loud and free speaking task?

b. What are some common mistakes do Vietnamese EFL sophomores make regarding English word stress and intonation?

c. What are the possible implications of these pronunciation difficulties for communicative effectiveness?

3. Methodology

3.1. Research design and procedure

This study employed a qualitative descriptive case-study design to examine the pronunciation features and difficulties of EFL sophomores in a speaking course at a university. The purpose of the study was not to generalize findings to all Vietnamese EFL learners but to provide an in-depth examination of pronunciation features exhibited by two information-rich cases. A case-study approach was considered appropriate because it allows detailed analysis of naturally occurring pronunciation patterns across different speaking tasks and generates pedagogical insights that may inform pronunciation instruction.

The participants are asked to record their pronunciation for this paper analysis. The speakers are given an English passage to read, and they are required to give a free speech. Before the process of recording, the participants have filled in the consent form and questionnaire to give their background information. The analysis is carried out based on the data given by the learners.

3.2. Participants

There were two Vietnamese EFL sophomores taking part in this qualitative case study. The participants were chosen based on their on-going assessment results from their lecturer within their classroom. Purposive sampling was employed to select two information-rich participants for detailed analysis. To ensure a representative cross-section for most Vietnamese EFL sophomores, the two learners with the same proficiency level (B2) were identified as fairly good pronunciation and good pronunciation according to their lecturer. The participants' native language is Vietnamese, and they had studied English as a compulsory subject through Vietnamese education system for approximately ten years. The two participants are majoring in English language, and they provided rich qualitative data that allowed for an in-depth examination of pronunciation features commonly reported in previous studies on Vietnamese learners of English. The purpose of this selection was not to represent the broader population of Vietnamese EFL sophomores but to examine persistent pronunciation difficulties among learners who had already achieved relatively high levels of English proficiency.

Because both participants shared similar educational backgrounds and proficiency levels, the findings were interpreted as exploratory rather than representative. It is possible that learners with different proficiency levels or learning experiences may demonstrate different pronunciation patterns.

3.3. Data collection instruments

A free speaking task (see Appendix B) and reading passages adopted from (Fairbanks, 1960; Darley et al., 1975) were deployed as primary instruments to assess learners' pronunciation. The two reading passages were selected since it contains numerous final consonants, consonant clusters, plural markers, and multisyllabic words, making it suitable for examining consonant production and word stress patterns. An oral test acted as free speaking task to obtain the data of phonetic nature for the analysis of targeted sounds. The free speaking task had only one part with 4 questions following the familiar topic that learners studied during their speaking course (described in appendix B). This task allows learners to perform spontaneous speech and manage their language production, supporting this study obtain a more comprehensive understanding of their pronunciation strengths, weaknesses, and learning goals. Read-aloud passages adapted from a pronunciation assessment text were used to elicit controlled speech. The passage contained a variety of consonant sounds, final consonants, consonant clusters, multisyllabic words, and opportunities for intonation patterns. This task enabled the researcher to identify pronunciation difficulties under relatively controlled conditions.

3.4. Data analysis

All recordings were transcribed and repeatedly listened to for detailed phonological analysis. This study examined the two learners' pronunciation based on the framework proposed by Roach (2009), Rogerson-Revell (2011), and Cruttenden (2014) as mentioned in the literature review. The analysis mainly focused on final consonants articulation, word stress, and intonation. Particular attention was paid to the pronunciation of plural and third-person singular markers (-s/-es) and past tense markers (-ed), as these structures frequently pose difficulties for Vietnamese learners (Disney & Le, 2024).

To improve analytical reliability, all recordings were transcribed and reviewed multiple times using a consistent coding sheet focusing on final consonants, word stress, and intonation. Pronunciation errors were identified according to the phonological descriptions provided by Roach (2009), Rogerson-Revell (2011), and Cruttenden (2014). Because the study was exploratory and small-scale, formal inter-rater reliability was not conducted. This limitation is acknowledged and should be addressed in future research.

Regarding validity, the combination of read-aloud and free-speaking tasks enabled the study to examine pronunciation features under both controlled and spontaneous speaking conditions. The selected tasks were considered appropriate because they provided opportunities for the production of final consonants, multisyllabic words, stress patterns, and intonation structures relevant to the research questions.

4. Analysis and discussion

4.1. Consonants

As can be heard from the recordings, all the participants can pronounce /s/, /h/, /g/, /f/, /b/, /n/, /m/, /r/, /w/ the same as native speakers. In comparison to L1, these sounds share the same sound in Vietnamese (see Appendix A), so it is obvious that learners can articulate these sounds correctly. With regard to the consonant clusters, the participants seemed to have a good performance of pronouncing them. However, during reading a passage aloud, the participants did make errors for some consonants (as described in table 1), namely /z/, /t/, /tʃ/. Interestingly, these participants are supposed to mostly pronounce incorrectly these sounds since their proficiency is B2.

Table 2

Errors in pronouncing consonants sounds (reading aloud passage)

Consonants	Errors
/z/	Instead of pronouncing [z] for the words observe /əbˈ**z**ɜːv/ and ooze /uː**z**/, speaker 1 pronounced [s] for these words: /əbˈ**s**ɜːv/, /uː**s**/ (RP Speaker 1, 0:22)
/t/	The speaker 1 did not pronounce it clearly for the word twice in the passage, she got a half sound of /t/ and a half sound of pronouncing 'ch' in Vietnamese. (RP Speaker 1, 0:34)
/tʃ/	The speaker 2 mispronounced the word arch /ɑːr**tʃ**/, she said /eɪ**k**/ instead. (RP Speaker 2, 0:15)

Noticeably, Vietnamese learners seem to fail in pronounce the final codas correctly, especially for the s rules pronunciation. As can be heard from the recordings, the learners pronounce /s/ for all of the words ending with s. In both reading aloud the passage and free speech, learners made no differences of final consonant sounds (/z/, /s/, /ɪz/) for words belonging to the s rules pronunciation. Interestingly, learners also did not produce correctly /t/, /d/ for the verbs in -ed form. The most salient feature can be found that /t/ was mostly unaspirated for words ending with 't' as well as words engaging with -ed rule.

Table 3

Final consonants errors

Feature	Target tokens	Errors	Error rates
/z/	15	10	66.7%
/ɪz/	8	5	62.5%
/d/	12	7	58.3%
/t/	14	6	42.9%

Table 3 demonstrates that the greatest pronunciation difficulties occurred in the production of English morphophonemic final consonants, particularly /z/ (66.7%) and /ɪz/ (62.5%), followed by the past tense marker /d/ (58.3%) and the voiceless marker /t/ (42.9%). These findings indicate that the learners' errors were not randomly distributed across English consonants but were concentrated on grammatical morphemes realized through word-final consonants. This pattern supports the phonological framework proposed by Roach (2009) and Rogerson-Revell (2011), who argue that English codas carry not only phonetic information but also important grammatical meanings such as plurality, third-person singular agreement, and past tense. Consequently, inaccurate realization of these final consonants extends beyond segmental pronunciation problems and may affect the comprehensibility during spoken interaction.

The comparatively high error rate for the past tense marker /d/ (58.3%) further demonstrates the interaction between phonological complexity and grammatical processing. Unlike lexical consonants, English regular past tense endings require learners to simultaneously retrieve morphological information and apply context-dependent allophonic rules (/t/, /d/, or /ɪd/). Such dual processing increases cognitive demands during speech production, particularly in spontaneous communication. According to Disney and Le (2024), Vietnamese learners frequently omit or simplify word-final /s/ and /z/ because these sounds contribute little to lexical identification in Vietnamese but play a substantial grammatical role in English. A similar explanation may account for the omission of /d/ observed in the present study. During speech production, learners appear to prioritize lexical meaning over grammatical accuracy, resulting in the deletion or reduction of less perceptually salient morphemes. This observation also aligns with Bui et al. (2021), who reported that Vietnamese university students consistently omitted or substituted English final consonants despite several years of formal English instruction.

Table 4

Errors in pronouncing final consonant sounds (reading passage (RP) and free speech (FS))

Final sounds	Errors
/**z**/ Speaker 1: **clings** (RP, 0:19), **quivers** (RP, 0:31), **plays** (RP, 0:35), **couples** (FS, 0:45) Speaker 2: **colors** (RP, 0:12), **gods** (RP, 0:59)	/**s**/ was produced instead
/**ɪz**/ Speaker 2: **increases** (RP, 1:43), **causes** (RP, 1:29), **enhances** (FS, 0:16)	/**s**/ was produced instead
/**t**/ Speaker 1: **utmost**, **respect**, **pronounced** (RP, 0:27, 0:28, 0:24) Speaker 2: **sunlight** (RP, 0:02), **caused** (RP, 1:17), **passed** (RP, 1:08), **paste** (FS, 0:09)	/**t**/ was unaspirated
/**d**/ Speaker 1: **urged** (RP, 0:52) Speaker 2: **formed** (RP, 1:34), **colored** (RP, 1:42), **observed** (RP, 1:47)	/**d**/ was omitted

With regard to L1, there are no equivalent sounds for /tʃ/ in Vietnamese. As Nation and Newton (2020) proposed that the sound system of learners' first language literally influence their second language sounds. Additionally, L2 learners can find difficulty in articulating L2 phonemes which are not in L1. Therefore, it is understandable that the two participants cannot pronounce /tʃ/ correctly. The same situation happens for producing final sounds of s rules and -ed rules as Vietnamese does not have ending sounds system as English. Therefore, Vietnamese learners struggle to pronounce these final codas accurately.

4.2. Word stress and Intonation

Depending on the recordings, it is obvious that learners mostly did not make stress on words as well as give an inaccurate English speech melody. It can be seen that learners usually omitted word stress, made wrong tone groups division and incorrect tonic placement during speech.

**Examples for incorrect word stress: (Similar patterns happen for L2 Speaker 2)*

Native speakers	L2 Speaker 1
During reading passage (RP): Ancient /ˈeɪnʃənt/ (0:10) Several /ˈsevərəl/ (0:13) Feeling /ˈfiːlɪŋ/ (0:24)	She made no stress without any pitch change. /eɪnʃənt/ /sevərəl/ /filɪŋ/
During free speech (FS):	She made no amplitude for the stress parts.

Music /ˈmjuːzɪk/ (0:12)	/mjuːzɪk/
Melody /ˈmelədi/ (0:32)	/meloʊdi/

**Examples for incorrect speech melody (L2 Speaker 1):*

The tonic (phrasal stress) marked by pitch movement:

The thought groups marked by: //

During reading passage: (RP Speaker 1, 0:17)

Native speaker: A **long**,// **flowing beard clings** to his **chin**,// giving those// who **observe** him a **pronounced feeling** of the **utmost respect**.//

L2 Speaker 1: A long, flowing **beard clings** to his **chin**,// giving those// who observe him a pronounced feeling of the// **utmost**// **respect**.

During free speech: (FS Speaker 1, 1:03)

Native speaker: It **shows** that// he **wants** everyone to **have respect** for everybody//because **everybody** is **equal**.//

L2 Speaker 1: It shows that he wants// everyone to have// uhm **respect** for everybody// because everybody is equal.//

As the analysis above, the participants usually make incorrect tonic stress and the phrasal stress. It can be seen that the speaker gave the incorrect tone groups division, although there is a comma between 'a long' and 'flowing beard', she did not make the pause for it. Furthermore, it seems that the learner used the same tone to speak for both reading a loud and free speech, and she did not really make any rise-fall movement. In this case, the sounds the speaker produced are likely to be affected by the L1 sounds' system as she spoke without any intonation. According to Nation and Newton (2020), age is one of the factors affecting the learning of another sound system. Besides, when learners get older, their first language is more stable, which causes the disruption in their perception of second language. Therefore, these learners have the tendency to put their Vietnamese tones in speaking English words or producing English prosody since they are adults and advanced in L1. As a result, learners did not put stress placement into words and produce incorrect intonation. This will cause the misunderstanding during conversation as well as the providing of an incomprehensible speech.

4.3. Learners' pronunciation goals and settings

Both participants reported a desire to achieve native-like pronunciation for future employment opportunities and international communication. Although these goals reflect learners' personal aspirations, contemporary pronunciation research suggests that intelligibility and comprehensibility may represent more realistic instructional objectives than native-like pronunciation (Derwing & Munro, 2005). Consequently, pronunciation instruction should prioritize features that contribute most directly to successful communication, particularly final

consonants, word stress, and intonation. As the analysis below, it seems that learners can communicate with English native speakers to some extent. Although the learners have studied English for more than 10 years, they still have troubles in their pronunciation and moderate level of listening comprehension. As the description above, the listeners may find some difficulties to be fully understood the messages they conveyed. Therefore, the learners still need to practice more as well as find some appropriate methods for further development in their pronunciation to achieve their goals.

4.4. Limitations

Several limitations are acknowledged during the analysis in this study. First, there were only two participants in this research, which limits the generalizability of the broader population of Vietnamese EFL learners. Despite allowing detailed phonological analysis from the speech recordings, this study acknowledge the lack of other additional data sources, such as interviews, classroom observations or listener judgements. Therefore, further studies should implement these methods to gain deeper insights into the causes and consequences of challenges that second language learners encounter when articulating these pronunciation features. Additional limitations include the absence of inter-rater reliability procedures, the lack of acoustic analysis, and the absence of listener judgments regarding comprehensibility and other aspects. As pronunciation analysis may involve subjective interpretation, future studies should incorporate multiple raters and listener-based measures to strengthen analytical rigor.

Second, this study focused on some specific pronunciation aspects, namely consonants, words stress and intonation. There are other pronunciation features that need considering such as vowels, rhythm, speech rate, and connected speech. Hence, further research should take these aspects into account to extend the scope of current investigation.

Finally, the study adopted a descriptive approach and did not examine the effectiveness of any pronunciation intervention. Future studies may implement instructional interventions as well as pedagogical practices mentioned below to determine whether targeted pronunciation training can improve Vietnamese learners' pronunciation of final consonants and prosodic features.

5. Pedagogical implications

With the analysis and discussion above, several pedagogical implications emerge. As these learners had difficulties pronouncing final sounds, practical tasks with explicit instructions on final consonants should be carefully designed and implemented during speaking courses. According to (Knight, 2012; Nguyen & Newton, 2020), greater emphasis should be made to final sounds to support communicative effectiveness. Therefore, teachers should provide explicit instruction regarding the pronunciation rules of /s/, /z/, /ɪz/, /t/, /d/, and /ɪd/, followed by extensive communicative practice. Activities such as minimal-pair discrimination, information-gap tasks, dictation exercises, and peer correction can help learners develop greater awareness of these sounds. Some of these activities were included in the feedback (see Appendix C) for these learners to improve their pronunciation after taking part in this study.

Regarding practices for word stress and intonation improvements, previous researchers have suggested that suprasegmental instruction contributed significantly to these pronunciation features (Derwing & Munro, 2005; Yates, 2017). As described in the findings, both participants struggled to stress English words correctly and have appropriate intonation, leading to the need

of integrating stress placement, tonic stress, and pitch movement tasks into their current speaking course (see Appendix C).

As for further development in this field, pronunciation instruction should be integrated into communicative speaking activities rather than taught in isolation. By embedding pronunciation practices within meaningful interactions, learners can develop greater control over pronunciation features while simultaneously improving their communicative effectiveness.

6. Conclusion

In summary, this qualitative case study investigated the pronunciation features of two Vietnamese EFL sophomores through a read-aloud task and a free-speaking task. Drawing on the phonological frameworks of Roach (2009), Rogerson-Revell (2011), and Cruttenden (2014), the study examined consonant production, word stress, and intonation patterns. The findings revealed that the participants had the tendency of omitting the final sounds and had troubles in producing a good English intonation. Despite articulating many English consonants and consonant clusters correctly to some extent, the learners experienced persistent difficulties with final consonants, particularly those associated with plural, third-person singular, and past tense verbs. In addition to this, both learners demonstrated limited control of English word stress and intonation, frequently producing speech with reduced pitch variation and inaccurate stress placement. These errors have made an impact on the communicative effectiveness and raise the awareness of the importance of final sounds articulation. These pronunciation patterns may have implications for communicative effectiveness; however, further research incorporating listener judgments is needed to verify this relationship. The findings of this study also align with previous studies (Disney & Le, 2024; Bui et al., 2021; Minh et al., 2024), calling for further research in this field. To support Vietnamese sophomores in improving their pronunciation, this paper provided some pedagogical implications to raise awareness of L2 Vietnamese learners about these two aspects of pronunciation. Therefore, it is necessary for both learners and teachers to pay attention to these pronunciation features and have appropriate methods for improvements.

Free speaking task: Questions

1. Tell me what is your favorite song
2. Can you tell me more about it?
3. Have you eaten any weird food?
4. How was your feeling when you ate these kinds of food?

Read-aloud task:

The Rainbow Passage

When the sunlight strikes raindrops in the air, they act as a prism and form a rainbow. The rainbow is a division of white light into many beautiful colors. These take the shape of a long round arch, with its path high above, and its two ends apparently beyond the horizon. There is , according to legend, a boiling pot of gold at one end.

People look, but no one ever finds it. When a man looks for something beyond his reach, his friends say he is looking for the pot of gold at the end of the rainbow.

Throughout the centuries people have explained the rainbow in various ways. Some have accepted it as a miracle without physical explanation. To the Hebrews it was a token that there would be no more universal floods. The Greeks used to imagine that it was a sign from the gods to foretell war or heavy rain. The Norsemen considered the rainbow as a bridge over which the gods passed from earth to their home in the sky. Others have tried to explain the phenomenon physically. Aristotle thought that the rainbow was caused by reflection of the sun's rays by the rain. Since then physicists have found that it is not reflection, but refraction by the raindrops which causes the rainbows. Many complicated ideas about the rainbow have been formed.

The difference in the rainbow depends considerably upon the size of the drops, and the width of the colored band increases as the size of the drops increases. The actual primary rainbow observed is said to be the effect of super-imposition of a number of bows. If the red of the second bow falls upon the green of the first, the result is to give a bow with an abnormally wide yellow band, since red and green light when mixed form yellow. This is a very common type of bow, one showing mainly red and yellow, with little or no green or blue.

The Grandfather Passage

You wished to know all about my grandfather. Well, he is nearly ninety-three years old; he dresses himself in an ancient black frock coat, usually minus several buttons; yet he still thinks as swiftly as ever. A long, flowing beard clings to his chin, giving those who observe him a pronounced feeling of the utmost respect. When he speaks, his voice is just a bit cracked and quivers a trifle. Twice each day he plays skilfully and with zest upon our small organ. Except in the winter when the ooze or snow or ice prevents, he slowly takes a short walk in the open air each day. We have often urged him to walk more and smoke less, but he always answers, “Banana oil!” Grandfather likes to be modern in his language.

Appendix C

Feedback and recommendation for learners

Overall, your pronunciation is clear but it still has some problems that need to be addressed. Firstly, let’s look at your pronunciation strengths:

- Almost of the consonants are pronounced correctly, both voiced or voiceless.
- 70-80% of your vowels are articulated well
- The consonants clusters are produced well

As mentioned below, it is good for you to keep up these strong points in your pronunciation and practice more to develop your voice like native speakers. However, there are weaknesses about your pronunciation that you also need to work on:

- Incorrect final sounds for s rules pronunciation (/s/, /z/, /iz/) and past-tense regular verbs pronunciation (/t/, /d/, /id/)
- Incorrect word stress
- Incorrect intonation

It is good for you to listen to your recordings by yourself again and notice the errors mentioned above. You can see that you have produced only /s/ as final sounds for all the words ending with s. Additionally, you have omitted the final sounds for past tense verbs and some word stress. Besides, there is no pitch change of English during your speech and you are likely to use same tone when producing speech. Therefore, this may cause misunderstanding when you communicate with English native speakers. Hence, it is necessary for you to carry out these problems for your further pronunciation development.

Here are some activities that are suggested to help you improve your pronunciation:

1. Final sounds:

Activity: *Work with your friends. Listen to your partner speaking a group of words and find out the word with different final sounds.*

plays hands words peas buses hills

cats sleeps sits hats picks drops

You and your friends take turns, create a piece of paper with groups of words like this beforehand and keep practice together.

2. Word Stress:

Activity:

a. Listen to the following words and write the number of syllables in each word

Considerably ____ Social ____

Explanation ____ Understandable ____

Breakable ____ Expectancy ____

Immediately ____ Melody ____

b. Listen again and circle the stressed syllable in each word. Then practice saying these words to your partner. Check your partner's stress.

This activity will help you to get used to making word stress. You and your friends should take turns and practice together.

3. Intonation:

Activity: *You and your friend have been shopping. Make a conversation about what you purchased using the information given below:*

A: What / you / got?
B: I / buy / shoes / two pairs / jeans / hat / T-shirt / this bag.
A: Quite a lot. I only / buy / couple / T-shirt / sneakers / my upcoming vacation.
B: You / buy / that jacket?
A: Which one? One / I / try on / Tommy's?

Pay attention about your voice when to rise and fall during practicing. After that, you and your partner should check your intonation through watching a video which native speakers do the same scenario. This activity literally can help you have a better intonation.

#136 THE PEDAGOGICAL IMPACT OF ARTIFICIAL INTELLIGENCE TOOLS ON ENGLISH MAJORS' WRITING SKILLS AT HO CHI MINH CITY UNIVERSITY OF FOREIGN LANGUAGES - INFORMATION TECHNOLOGY

Nguyễn Minh Tuấn [1]

Abstract

The increasing use of Artificial Intelligence (AI) tools in education has begun to reshape writing instruction in English language learning contexts. However, there is still limited research on how English-major students in Vietnam perceive the use of these tools, particularly at Ho Chi Minh City University of Foreign Languages - Information Technology (HUFLIT). This study explores third-year English majors' perceptions and self-reported experiences regarding the use of AI tools in writing through a mixed-methods approach. Data were collected from a questionnaire completed by 169 students and semi-structured interviews with eight participants. The findings indicate that many students perceive AI tools as beneficial for supporting various aspects of writing, particularly grammar, vocabulary, and idea organization. Participants also reported that AI tools helped them generate ideas, identify errors, and revise their drafts more efficiently. At the same time, some students expressed concerns that excessive reliance on AI tools could reduce opportunities for independent thinking and negatively affect their confidence in writing. Overall, the study suggests that students generally view AI tools as valuable support for the writing process when used appropriately. The findings highlight the

[1] *M.A., Faculty of Foreign Languages, Ho Chi Minh City University of Foreign Languages - Information Technology, email: tuannm@huflit.edu.vn*

importance of promoting a balanced and guided integration of AI tools in English writing instruction.

Keywords: Artificial Intelligence tools, writing skills, English majors, language learning

1. Introduction

1.1 Background and Statement of the Problem

In recent years, Artificial Intelligence (AI) has become more common in education, especially in English language learning. Many students now use AI-powered applications such as ChatGPT, Gemini, Grammarly, and QuillBot to support their writing. These tools can help users correct grammar mistakes, improve vocabulary, generate ideas, and receive quick feedback during the writing process.

Writing is often considered one of the most difficult skills in learning English because students need not only good grammar and vocabulary but also the ability to organize ideas clearly and think critically. For third-year English majors, writing is especially important because they are required to complete more advanced academic tasks such as essays, reports, and research assignments. Because of this, many students use AI tools to assist them in different stages of writing, from brainstorming ideas to revising and editing their work.

Recent studies indicate that AI-assisted writing tools can support language learners in several aspects of writing. From students' perspectives, these tools are often considered useful for improving grammar, expanding vocabulary, generating ideas, organizing ideas, and providing immediate feedback during the writing process. However, most existing research tends to focus mainly on the advantages of using AI tools. In comparison, fewer studies have examined students' perceptions of possible challenges and risks, such as overreliance on AI-generated content, reduced opportunities for independent thinking, loss of creativity, and lower confidence in their own writing skills. In addition, although research on AI-assisted writing has been growing internationally, there is still a lack of studies focusing specifically on English-major students in Vietnamese universities.

Although these technologies can make writing more convenient and time-saving, there are still concerns about their influence on students' actual writing ability. Some students believe AI tools help improve the quality of their writing, while others worry that depending too much on technology may reduce independent thinking, creativity, and confidence in writing. In addition, research on the impact of AI tools on English-major students in the Vietnamese university context is still limited, especially at Ho Chi Minh City University of Foreign Languages - Information Technology (HUFLIT).

1.2 Research Objectives and Questions

This study aims to investigate the pedagogical impact of AI writing tools on the writing skills of third-year English majors at Ho Chi Minh City University of Foreign Languages - Information Technology (HUFLIT). In particular, the study explores how often students use AI tools in writing tasks, how these tools affect different aspects of writing skills, and whether AI usage influences students' confidence in writing.

To achieve these objectives, the study addresses the following research questions:

1. To what extent do AI tools influence students' writing skills in terms of grammar, vocabulary, coherence, and idea development?
2. How frequently do third-year English majors use AI tools in writing tasks?
3. How do AI tools influence students' confidence and learning experiences in English writing?

1.3 Significance of the study

This study is expected to contribute both theoretically and practically to the field of English language education. Theoretically, it provides more information about how AI tools influence the writing skills of English-major students in the Vietnamese university context.

Practically, the findings may help students better understand both the advantages and possible disadvantages of using AI tools in writing. The study may also provide useful suggestions for teachers on how to integrate AI tools into writing instruction in a balanced and effective way. In addition, the findings may serve as a useful reference for future research related to AI-assisted language learning and writing instruction.

1.4 Scope of the Study

The study examines students' use of AI-assisted writing applications such as ChatGPT, Gemini, Grammarly, QuillBot, and other similar tools. It mainly explores how these technologies influence students' writing performance in terms of grammar, vocabulary, coherence, organization, and idea development.

The participants of the study are limited to third-year English-major students at HUFLIT. Therefore, the findings may not be generalized to students from other majors or educational institutions.

2. Literature Review

2.1 AI tools in English writing

2.1.1 Definition and types of AI writing tools

In recent years, AI tools have become increasingly common in English language learning, especially in writing. AI writing tools are applications that use artificial intelligence to help learners during the writing process. Some popular examples are Grammarly, QuillBot, and ChatGPT. These tools can support students by checking grammar, suggesting vocabulary, paraphrasing sentences, generating ideas, and giving feedback on writing.

Many students use AI tools at different stages of writing. For example, students may use them to brainstorm ideas before writing, improve sentence structures while drafting, or correct grammatical mistakes after finishing a paragraph. Because of these functions, AI writing tools are now widely used by university students to make writing tasks easier and more convenient.

2.1.2 Theoretical perspectives on AI-Assisted writing

The use of AI tools in writing can be explained through several learning theories. One important theory is constructivism. According to Hausfather (1996), learners develop knowledge through interaction, guidance, and feedback. In AI-assisted writing, students interact with AI tools and receive suggestions or corrections that may help them improve their writing skills.

Another related theory is cognitive learning theory. Sweller (1988) explains that reducing cognitive load can help learners focus more on higher-level thinking tasks. In writing,

AI tools may reduce the pressure of lower-level tasks such as grammar correction or spelling, allowing students to focus more on idea development, organization, and coherence.

These theories suggest that AI tools can support the learning process and improve writing performance. However, the effectiveness of AI-assisted writing still depends on how students use these tools in their learning.

The theoretical perspectives discussed above provide a foundation for the variables investigated in this study. According to constructivist theory, AI tools can function as supportive learning resources that provide feedback and guidance, enabling students to participate more actively in the writing process. This perspective is reflected in the study's examination of students' perceptions of writing support, feedback, confidence, and overall learning experiences. In addition, cognitive learning theory suggests that AI tools can help reduce the cognitive load associated with lower-level writing tasks, such as grammar checking and vocabulary selection, allowing students to focus more on developing and organizing their ideas. However, excessive dependence on AI-generated assistance may negatively affect students' autonomy, creativity, and ability to solve writing problems independently. Therefore, the questionnaire and interview questions were developed to explore both the perceived benefits and the potential concerns related to the use of AI-assisted writing tools.

2.1.3 Benefits of AI tools in writing

Many researchers have found that AI tools can positively support students' writing development. Kessler (2018) states that automated feedback systems help learners improve grammatical accuracy because students can quickly identify and correct mistakes in their writing. Similarly, tools such as Grammarly and ChatGPT may help students improve vocabulary use, sentence structure, and overall writing organization.

Several studies also show that AI tools can support students during the revision process. Hwang et al. (2023) and Seufert et al. (2021) found that AI-generated feedback helps learners revise drafts and organize ideas more effectively. Since students can review and edit their work independently, AI tools may also encourage learner autonomy.

Besides improving writing quality, AI tools may also increase students' motivation and engagement in learning. Kukulska-Hulme and Shield (2008) suggest that technology-supported learning environments encourage independent learning outside the classroom. Similarly, Zhai et al. (2024) argue that AI-supported educational tools can increase students' participation and motivation because they provide quick feedback and personalized support.

Other researchers, such as Nazari et al. (2021) and Utami and Winarni (2023), found that students who regularly use AI tools often feel more confident when completing writing tasks. This suggests that AI tools may support not only writing performance but also students' attitudes toward learning English writing.

2.1.4 Challenges of AI tools in writing

Although AI tools provide many advantages, researchers have also identified several challenges related to their use. One major concern is that students may become too dependent on AI tools. Zhai (2022) argues that overreliance on AI may reduce students' critical thinking ability and limit their ability to express original ideas independently.

Similarly, Ranalli (2018) suggests that when learners rely too much on AI support, they may become less able to evaluate their own writing without technology. Zou et al. (2023) and

Yan (2023) also warn that excessive use of AI tools may weaken independent writing ability and increase the risk of plagiarism.

Another issue is that AI-generated feedback may not always be fully accurate or detailed. According to Su et al. (2023), AI feedback often focuses mainly on grammar and vocabulary rather than deeper aspects of writing such as creativity, idea development, or contextual meaning. Therefore, AI tools cannot completely replace teacher feedback in the writing classroom.

In addition, Warschauer and Grimes (2008) point out that too much dependence on automated systems may reduce interaction between teachers and students, which plays an important role in developing communication and critical thinking skills. Syuhra, Chandra, and Rosalina (2025) further explain that students need proper guidance when using AI tools because misuse of these technologies may negatively affect learning outcomes.

2.2 Previous studies on AI tools and writing skills

Many previous studies have explored the relationship between AI tools and English writing skills. Most studies show that AI-assisted writing can help students improve grammar, vocabulary, and organization in writing. Researchers generally agree that immediate feedback from AI tools helps students revise their writing more efficiently and produce more accurate texts.

At the same time, some studies have discussed the possible negative effects of AI-assisted writing. Several researchers argue that students who rely too heavily on AI tools may become less independent in writing and may not fully develop critical thinking skills. In addition, some studies suggest that AI-generated feedback still cannot fully replace teacher feedback because it may lack contextual understanding and detailed explanation.

Previous research has also shown that AI tools may positively affect students' motivation, confidence, and engagement in learning. Many students consider AI tools useful because they provide quick support and personalized feedback during writing tasks. However, most previous studies focus only on specific aspects of writing, such as grammar or vocabulary, and only a limited number of studies combine writing performance with students' personal experiences and opinions.

Therefore, more research is still needed to better understand how AI tools influence students' writing skills in different educational contexts, especially among English-major students in Vietnam.

2.3 Research Gap

Although previous studies have highlighted various benefits of AI-assisted writing, such as support for grammar improvement, vocabulary development, feedback, and revision, relatively few studies have examined both the advantages and potential drawbacks of AI use within the same research framework. In particular, limited research has explored students' perceptions of how AI tools affect their confidence, autonomy, creativity, and reliance on technology during the writing process.

Moreover, studies focusing on English-major students in Vietnamese universities are still limited, especially those using a mixed-method approach to investigate both quantitative trends and students' personal experiences. As AI-assisted writing tools are becoming increasingly common in higher education, it is important to gain a deeper understanding of

students' perceptions to support the effective and responsible integration of AI into language learning.

Therefore, this study aims to investigate English-major students' experiences and perceptions of AI-assisted writing by examining four related dimensions: AI tool use, perceived writing support, perceived concerns, and students' confidence and learning experiences.

3. Research Methodology

3.1 Research design

This study used a mixed-method research design to investigate the impact of AI tools on the writing skills of third-year English-major students at HUFLIT. The study also explored students' perceptions and experiences of using AI tools in writing activities.

A mixed-method approach was considered appropriate because the study aimed not only to examine students' writing performance through numerical data but also to understand their attitudes, opinions, and experiences related to AI-assisted writing. By combining quantitative and qualitative methods, the researcher was able to obtain a broader understanding of how AI tools influence students' writing skills.

3.2 Participants

The questionnaire survey involved 169 third-year English-major students at Ho Chi Minh City University of Foreign Languages – Information Technology (HUFLIT). These students had already completed several writing courses and were familiar with using AI tools in academic writing tasks. Convenience sampling was used in this study because the participants were easily accessible during the data collection period and voluntarily agreed to take part in the research. While this method allowed for efficient data collection, it may also lead to selection bias, as those who chose to participate might differ from those who did not. Therefore, the findings should be interpreted carefully and cannot be generalized to all English-major students in Vietnam. Instead, the results mainly reflect the perceptions and experiences of third-year English-major students at HUFLIT.

For the qualitative phase, eight students were selected to participate in semi-structured interviews. The interviews were conducted to gain a deeper understanding of students' experiences and perceptions of AI-assisted writing. The participants shared their opinions about the advantages and challenges of using AI tools in their writing process.

3.3 Research instruments

This study used two main research instruments: questionnaires and semi-structured interviews. The combination of these instruments allowed the researcher to collect both quantitative and qualitative data.

According to Wasti et al. (2022), mixed-method research helps researchers gain a more comprehensive understanding of a research problem by combining statistical data with personal experiences and opinions. Therefore, questionnaires were used to collect general information and numerical data, while interviews were used to gather more detailed insights from participants.

3.3.1 Questionnaire

The questionnaire was used to collect information about students' experiences and perceptions of using AI tools in writing. Questionnaires are commonly used in educational research because they allow researchers to collect data from a large number of participants

within a short period of time (Breakwell, Barnett, & Wright, 2020). The questions mainly focused on students' frequency of AI tool usage, their attitudes toward AI-assisted writing, and their perceptions of how AI tools affect their writing skills.

A pilot study involving 10 students was conducted prior to the main survey. Based on the participants' feedback, several items in the questionnaire were revised to improve clarity, simplify the wording, and reduce potential ambiguity. These adjustments helped ensure that respondents could better understand the questions and provide more accurate responses. Although questionnaires are useful for collecting statistical information, they may sometimes limit the depth of responses because participants often provide short answers (Kumar, 2023). Therefore, interviews were included to support and expand the quantitative findings.

3.3.2 Semi-Structured interviews

After the questionnaire survey, semi-structured interviews were conducted with eight participants. The purpose of the interviews was to explore students' experiences and opinions in greater detail. According to Creswell (2014), interviews are useful for collecting detailed information through direct interaction with participants. In this study, the interviews helped clarify students' views about the benefits and challenges of using AI tools in English writing.

However, interviews may sometimes be influenced by researcher bias because participants' responses can be affected by the interviewer's reactions or behavior (Kvale, 2009). For this reason, the researcher attempted to remain neutral throughout the interview process.

3.4 Data collection procedures

In the first phase, the questionnaire survey was distributed online through Google Forms over a period of two months. Clear instructions were provided to help participants complete the questionnaire accurately. Participants were also informed that all responses would remain confidential.

In the second phase, follow-up interviews were conducted with eight students who had completed the questionnaire survey. They were conducted in person at the university to encourage direct interaction between the researcher and participants. With participants' permission, the interviews were audio-recorded and video-recorded for research purposes. The interview data were later transcribed and analyzed to support and explain the quantitative findings more clearly.

3.5 Data analysis procedures

3.5.1 Quantitative data analysis

The quantitative data collected from the questionnaires were analyzed using SPSS Statistics 20. Descriptive statistics such as frequencies, means, and standard deviations were used to summarize participants' responses and identify general trends in the data.

For the Likert-scale questions, responses were coded and analyzed using statistical measures including percentage, mean, and standard deviation. These statistical results helped identify students' perceptions of the usefulness of AI tools in improving their English writing skills.

Cronbach's Alpha analysis was conducted in SPSS to examine the reliability of the questionnaire items. The questionnaire included three main constructs: students' perceptions

of AI in writing, writing development, and concerns. Each construct consisted of five items measured using a five-point Likert scale.

Table 1

Cronbach's Alpha of perceptions' items

Reliability Statistics	
Cronbach's Alpha	Number of Items
0.810	5

Table 2

Cronbach's Alpha of writing developments' items

Reliability Statistics	
Cronbach's Alpha	Number of Items
0.849	5

Table 3

Cronbach's Alpha of concerns' items

Reliability Statistics	
Cronbach's Alpha	Number of Items
0.844	5

As shown in Table 1, the Cronbach's Alpha value for the "perceptions" items was 0.810, indicating that the items had good reliability. In Table 2, the "writing development" items achieved a Cronbach's Alpha value of 0.849, which showed a high level of internal consistency among the items. Similarly, Table 3 presents the Cronbach's Alpha value of the "concerns" items, which was 0.844, indicating good reliability as well.

According to Nunnally (1978), a Cronbach's Alpha value above 0.70 is considered acceptable for research studies. Therefore, all constructs in this study were considered reliable, and all questionnaire items were retained for further data analysis.

3.5.2 Qualitative data analysis

The qualitative data collected from the interviews were analyzed using thematic analysis. First, the researcher reviewed the interview recordings and transcripts carefully. After that, the responses were coded to identify recurring ideas and common themes related to students' experiences of using AI tools in writing.

The themes identified from the interviews were then used to support and explain the quantitative findings. This helped the researcher better understand how AI tools influence the writing skills and learning experiences of third-year English-major students.

4. Findings

4.1 Quantitative findings

Figure 1

The frequency of using AI tools in writing skill

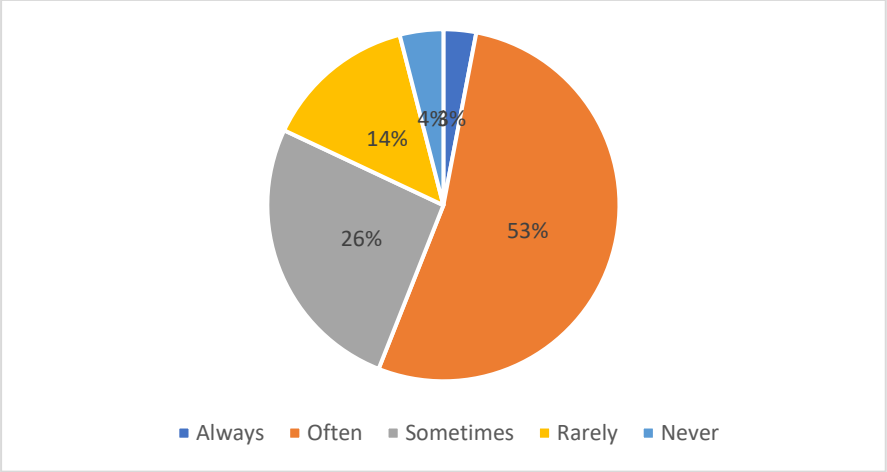

Figure 1 presents the frequency of AI tool usage among students in learning and completing writing tasks. As shown in the findings, most participants reported that they often use AI tools, representing 53% of the responses. In addition, 26% of the respondents indicated that they sometimes use AI tools, while 14% reported rarely using them. Only a small proportion of students were found at the two opposite ends of usage frequency. Specifically, 3% of the participants stated that they always use AI tools, whereas 4% answered that they never use them. Overall, the results show that AI tools are widely adopted among third-year English-major students.

Figure 2

The types of AI tools used in writing skill

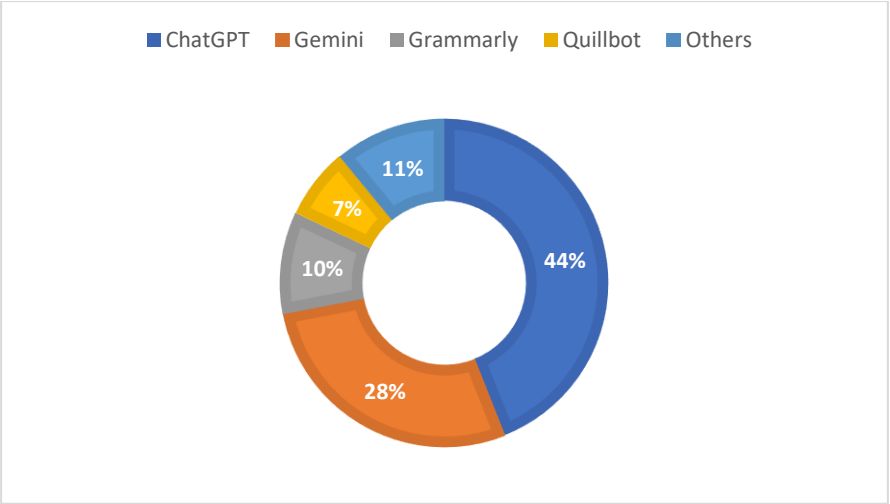

Figure 2 shows the AI tools most frequently used by students in their writing activities. According to the findings, ChatGPT was the most commonly used tool, accounting for 44% of the responses. The second most frequently used tool was Gemini, which represented 28% of the responses. Meanwhile, 11% of the participants reported using other AI tools for writing support. In addition, Grammarly accounted for 10% of the responses, while QuillBot was the least frequently used tool, with only 7%. Overall, the findings indicate that AI-powered writing assistants, especially ChatGPT and Gemini, are widely used among third-year English-major students

Table 4

Students' perceptions of AI tools in writing skill

Students' Perceptions of AI Tools	Degree of agreement					Mean	Stand. Dev.
	SD	D	N	A	SA		
Generating ideas	0%	3%	20.1%	51.5%	25.4%	3.99	0.76
Providing clear, useful feedback	0%	3.6%	18.3%	56.2%	21.9%	3.96	0.74
Learning from personal mistakes	0%	1.8%	20.7%	53.3%	24.3%	4.00	0.72
Saving time	0%	2.4%	26%	50.3%	21.3%	3.91	0.75
Challenging students	0%	1.8%	27.2%	46.7%	24.3%	3.93	0.77

Table 4 presents students' perceptions of AI tools in English writing activities. Overall, the findings show that students had positive perceptions toward the use of AI in writing, with all items receiving relatively high mean scores ranging from 3.91 to 4.00.

Among the five statements, "Learning from personal mistakes" obtained the highest mean score (M = 4.00, SD = 0.72), indicating that students found AI tools useful in identifying and correcting writing errors. In addition, students also showed positive perceptions of AI tools in generating ideas (M = 3.99, SD = 0.76) and providing useful feedback (M = 3.96, SD = 0.74). The findings further revealed that AI tools were considered helpful in saving time and supporting the writing process.

In general, the results suggest that third-year English-major students viewed AI tools as beneficial in supporting various aspects of English writing, especially idea generation, feedback, and error correction.

Table 5

Perceived writing support from AI tools

Impacts of AI Tools	Degree of agreement					Mean	Stand. Dev.
	SD	D	N	A	SA		
Grammar accuracy	0%	1.8%	16.6%	52.7%	29%	4.09	0.72
Vocabulary expansion	0%	2.4%	8.3%	47.9%	41.4%	4.28	0.72
Coherence and organization	0%	3%	14.2%	50.3%	32.5%	4.12	0.76
Idea development	0%	3%	13.6%	56.8%	26.6%	4.07	0.72
Writing process	0%	4.7%	14.2%	53.8%	27.2%	4.04	0.79

Table 5 indicates students' experience of the impact of AI tools on the development of English writing skills. Overall, the findings indicate that students had positive perceptions toward the use of AI tools in writing, as all aspects received relatively high mean scores ranging from 4.04 to 4.28.

Among the five aspects, vocabulary expansion achieved the highest mean score (M = 4.28, SD = 0.72), suggesting that students perceived AI tools as helpful for supporting vocabulary use during the writing process. In addition, students also reported positive perceptions regarding coherence and organization (M = 4.12, SD = 0.76), grammar accuracy (M = 4.09, SD = 0.72), and idea development (M = 4.07, SD = 0.72). The writing process received the lowest mean score among the five aspects (M = 4.04, SD = 0.79), although the result still reflected a generally positive attitude.

In general, the findings suggest that third-year English-major students generally perceived AI tools as valuable sources of support across different stages of the writing process, especially vocabulary use, grammar improvement, and writing organization.

Table 6

Students' concerns regarding AI-Assisted writing

Concerns of using AI Tools	Degree of agreement					Mean	Stand. Dev.
	SD	D	N	A	SA		
Dependence on AI tools	0%	3%	13.6%	49.1%	34.3%	4.15	0.76
Reduced writing practice	0%	1.8%	14.8%	54.4%	29%	4.11	0.71
Increased writing anxiety	0%	1.2%	15.4%	46.7%	36.7%	4.19	0.73
Reduced learning autonomy	0%	3%	12.4%	47.3%	37.3%	4.19	0.76
Reduced creativity	0%	3.6%	8.9%	53.8%	33.7%	4.18	0.74

Table 6 shows students' concerns about the use of AI tools in English writing activities. Overall, the findings indicate that students were aware of several possible negative effects of AI-assisted writing, as all items received relatively high mean scores ranging from 4.11 to 4.19.

Among the five concerns, "Increase mistake anxiety" and "Influence learning autonomy" achieved the highest mean scores (M = 4.19), suggesting that many students were worried about becoming less confident and more dependent on AI support during the writing process. Furthermore, students also expressed concerns about weakened creativity (M = 4.18, SD = 0.74) and dependence on AI tools (M = 4.15, SD = 0.76). Although "Decrease regular practice" received the lowest mean score (M = 4.11, SD = 0.71), the result still reflected a relatively high level of concern among the participants.

In general, the findings suggest that while third-year English-major students recognized the benefits of AI tools in writing, they were also concerned about several potential disadvantages, particularly dependence on technology, reduced learning autonomy, and weakened creativity.

4.2. Qualitative findings

The qualitative findings are presented to further explain and support the quantitative results discussed in Section 4.1. The interview data provide a deeper understanding of students' perceptions of AI-assisted writing by exploring both the benefits and concerns associated with

the use of AI tools. By offering detailed explanations and personal experiences, the qualitative findings complement the survey results and contribute to a more comprehensive interpretation of the study's findings.

Theme 1: *AI tools help improve students' writing quality*

The interview findings showed that AI tools play an important role in helping students improve the quality of their writing. Many participants mentioned that AI tools such as ChatGPT, Gemini and Grammarly help them identify grammar mistakes, improve vocabulary use, and make their sentences clearer and more natural. Students also explained that AI-generated feedback helps them revise their writing more effectively and learn from their mistakes.

One participant stated "*AI tools correct grammar mistakes and suggest more academic words and natural expressions. Because of that, my writing becomes clearer and more structured*." (Participant 1)

Similarly, another student told "*They provide suggestions for clearer expressions and more formal vocabulary. Because of that, I can gradually improve my writing ability*." (Participant 2)

Another participant also mentioned "*AI tools help me improve vocabulary and sentence structure, and I can learn from my mistakes*." (Participant 6)

These responses explain the quantitative results presented in Table 5, in which grammar accuracy and vocabulary expansion received relatively high mean scores. While the survey results show that students generally viewed AI tools as helpful for writing-related tasks, the interview data provide specific examples of how students used AI-generated feedback to identify language errors, revise their drafts, and improve their writing. As a result, the qualitative findings offer a deeper understanding of the factors contributing to students' positive perceptions of AI-assisted writing support.

Theme 2: *AI tools support brainstorming and idea development*

Another important finding from the interviews was that AI tools help students generate and develop ideas during the writing process. Many participants explained that they often use AI tools when they have difficulty starting a writing task or when they need additional information and ideas related to a topic.

According to the participants, AI tools can provide useful suggestions, examples, and different perspectives, which help them understand the topic better and organize their ideas more clearly before writing.

One participant explained "*I usually use ChatGPT to generate ideas when I don't know how to start my writing.*" (Participant 1)

Another student stated "*I use AI tools when I need help with ideas or when I don't understand a writing topic clearly*." (Participant 3)

Similarly, another participant shared "*AI tools help me have more information for my ideas, and sometimes their ideas are better than mine*." (Participant 6)

These responses suggest that AI tools are especially helpful during the early stages of writing. They help students overcome difficulties in brainstorming, develop ideas more effectively, and feel more confident when starting their writing tasks.

Theme 3: *Concerns about overreliance on AI tools*

Besides the positive effects of AI-assisted writing, several participants also expressed concerns about becoming too dependent on AI tools. Some students believed that frequent use of AI could reduce their independent thinking, creativity, and confidence when writing without technological support.

One participant mentioned "*Sometimes I depend too much on AI tools, especially when I do not have ideas for writing.*" (Participant 4)

Another student shared "*When I use AI too often, I feel less confident writing by myself because I always want to check AI suggestions first*." (Participant 7)

Similarly, another participant explained "*AI tools are helpful, but sometimes I feel that my creativity becomes weaker because I rely on their ideas too much*." (Participant 5)

These findings indicate that although students recognized many benefits of AI tools, they were also aware of several possible negative effects related to overreliance on technology. Some participants felt that excessive use of AI tools could reduce regular writing practice and weaken their ability to think and write independently. The findings also suggest that students still value creativity and independent learning in the writing process, even when using AI-assisted technologies.

5. Discussion

5.1 Positive impacts of AI tools on writing skills

The findings of this study indicate that most third-year English-major students had positive perceptions toward the use of AI tools in writing activities. Many students believed that AI tools helped improve important aspects of writing, especially grammar accuracy, vocabulary use, coherence, and idea development. Among these aspects, vocabulary improvement received the highest mean score, which suggests that students found AI tools particularly useful for choosing more appropriate and academic vocabulary in their writing.

The finding that vocabulary expansion received the highest mean score may be explained by the direct and noticeable support that AI tools provide during writing. Compared with more complex writing skills, such as idea development and organization, vocabulary improvement is often easier for students to recognize and evaluate. AI tools can quickly suggest synonyms, academic vocabulary, and alternative expressions, enabling students to make immediate changes to their writing. Therefore, students may perceive vocabulary-related support more positively than other types of writing assistance.

Students' positive perceptions of AI-generated feedback may also be related to its accessibility and immediate availability. Unlike traditional feedback from teachers, which may take time to receive, AI tools can provide suggestions instantly while students are writing. This immediate feedback can help students identify language errors and revise their work more efficiently. As a result, students may view AI feedback as a useful and convenient source of support, especially when working on academic writing tasks independently.

The interview findings also supported the quantitative results. Several participants mentioned that AI tools such as ChatGPT, Grammarly, and Gemini helped them correct grammatical mistakes, improve sentence structure, and organize ideas more clearly. In addition, many students explained that AI tools were helpful during the brainstorming and revision stages because they provided useful suggestions and examples that made writing tasks easier to complete.

These findings are consistent with previous studies discussed in the literature review. Kessler (2018) stated that AI-generated feedback helps learners identify and correct writing errors more effectively. Similarly, Hwang et al. (2023) and Seufert et al. (2021) found that AI-supported feedback systems can support students in revising and organizing their writing more efficiently. The findings of the current study also support Kukulska-Hulme and Shield (2008), who argued that technology-supported learning environments can encourage learner autonomy and independent learning.

5.2 Concerns about overreliance on AI tools

Although students recognized many benefits of AI tools, the findings also revealed several concerns related to overreliance on technology. Many participants agreed that excessive use of AI tools could reduce regular writing practice, weaken creativity, and influence learning autonomy. Some interview participants also mentioned that they felt less confident writing independently without AI support.

These findings are similar to previous studies on the negative effects of AI-assisted writing. Zhai (2022) argued that overreliance on AI tools may reduce learners' critical thinking ability and independent writing skills. Likewise, Ranalli (2018) suggested that students who depend too heavily on automated feedback systems may become less confident in evaluating and improving their own writing independently.

Overall, the findings suggest that AI tools can provide useful support for writing development when they are used appropriately. However, students should use these technologies in a balanced way in order to avoid becoming too dependent on AI during the writing process.

6. Conclusion

The study investigated the pedagogical impact of AI tools on the writing skills of third-year English majors at HUFLIT. Based on the findings, the study showed that AI tools are commonly used by students in English writing activities. Many participants reported using applications such as ChatGPT, Gemini, Grammarly, and QuillBot to support different stages of the writing process, including brainstorming ideas, correcting grammar mistakes, improving vocabulary, and revising drafts.

The findings also indicated that most students had positive perceptions toward AI-assisted writing. Both the quantitative and qualitative results showed that students believed AI tools helped improve grammar accuracy, vocabulary use, coherence, organization, and idea development. In addition, many participants stated that AI tools helped them save time and complete writing tasks more effectively. The interview findings also revealed that students considered AI tools helpful for generating ideas and improving the clarity of their writing.

However, the study also identified several concerns related to the overuse of AI tools. Many students believed that depending too much on AI could reduce regular writing practice, weaken creativity, and affect independent learning. Some participants also mentioned that they felt less confident writing without AI support. These findings suggest that although AI tools provide many advantages, students still need to use them carefully and in a balanced way.

Overall, the study suggests that AI tools can positively support the writing development of English-major students when they are used appropriately. AI tools should be viewed as supportive learning resources rather than replacements for students' own thinking and writing ability.

Based on the findings, several recommendations can be made. First, teachers should provide students with guidance on how to use AI tools effectively and responsibly in writing activities. Students should be encouraged to use AI mainly for support, such as checking grammar, improving vocabulary, and developing ideas, instead of depending on AI to complete entire writing tasks. Second, students should continue practicing independent writing in order to strengthen their critical thinking, creativity, and confidence in writing. Finally, future research may investigate the impact of AI tools on other English language skills or involve students from different universities to provide broader understanding of AI-assisted language learning.

7. Limitations and Future Directions

This study has several limitations that should be acknowledged. The main limitation is that it did not directly measure students' actual writing performance. Instead, the findings were based on students' perceptions and self-reported experiences of using AI tools in writing. Therefore, the results should not be interpreted as evidence that AI tools objectively improve writing ability.

A second limitation is related to the use of self-report data. The questionnaire and interview responses may be affected by self-report bias, as participants relied on their own understanding and memory of their experiences. As a result, the reported perceptions may not fully represent their actual writing behavior.

Third, the study used convenience sampling and focused only on third-year English-major students at Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT). This sampling method may introduce selection bias because participation depended on students' availability and willingness to take part.

Another limitation is related to the qualitative phase. Although the interviews provided useful insights into students' experiences, only eight students were included. A larger and more diverse interview sample could have offered a broader range of perspectives on AI-assisted writing.

Based on these limitations, several directions for future research are suggested. First, future studies should include more objective measures of writing performance, such as writing tasks and analytic scoring rubrics, to examine whether students' perceived benefits of AI are reflected in their actual writing outcomes. Second, future research could compare students who use AI tools with those who do not, in order to better understand the specific impact of AI on the writing process. Longitudinal studies are also recommended to explore how students' perceptions, writing practices, confidence, and dependence on AI change over time. In addition, studies with participants from different universities, disciplines, and educational contexts would help improve the generalizability of the findings. Finally, future research may further investigate the relationships between AI use and factors such as learner autonomy, creativity, writing confidence, critical thinking, and AI literacy.

#139 STUDENT EXPECTATIONS OF ENGLISH LANGUAGE TEACHERS: NAVIGATING THE SHIFT TO VIETNAM'S ESL TRANSITION AND AI INTEGRATION

Nguyễn Lê Uyên[1]

[1] *Nguyễn Lê Uyên, MA in TESOL, Faculty of Foreign Languages, HUFLIT, HCM City, Vietnam; Email: uyennl@huflit.edu.vn*

Abstract

In today's digital age, the amazing development of AI represents an unprecedented information revolution, permeating every profession especially English language teaching and learning. Alongside, Vietnam's transition of English from a foreign language to a second language has pushed a significant navigation in teaching and learning. These two simultaneous circumstances are profoundly changing the approach to English learning at all ages, particularly among Vietnamese students. Therefore, instructors at undergraduate level must re-evaluate their teaching methods and seek appropriate, engaging, and essential approaches for students' English language learning. This study aims to explore requirements and expectations of students regarding English language instructors' teaching methods in the era of AI and English becoming a second language in Vietnam. Based on a ten-question online survey using Google form carried out by 391 students majoring in English language from the Faculty of Foreign Languages at HUFLIT, its target is to identify the irreplaceable values and capabilities of instructors in English language teaching within the AI integration. The findings demonstrate students' preference for teachers as mentors, emotional supporters, cultural mediators, and soft-skill developers. As a result, instructors need to develop innovative methods to inspire learners, share learning pathways, and cultivate students' cultural as well as emotional intelligence when learning and using English.

Keywords**:** English Language Teaching, ESL Transition, AI Integration, Teacher Roles, Student Expectations

1. Introduction

We are living in an era where Artificial Intelligence (AI) is weaving itself into every aspect of life. Simultaneously, English Language Teaching (ELT) in Vietnam is shifting profoundly from a Foreign Language (EFL) to a Second Language (ESL) framework. Currently, we are in a transitional phase from EFL to ESL which is planning a nationwide implementation within several years. Policymakers in Vietnam recognized that English competence is a vital drive for international integration and economy growth. Therefore, the status of English has been altered officially and become an institutionalized medium of communication, collaboration, and global citizenship.

Inevitably, the explosion of AI tools has fundamentally changed traditional English language learning behaviors. University students today are digital natives who no longer rely solely on classroom teachers to access linguistic data, practice pronunciation, or verify grammatical accuracy. Free AI applications can provide personalized writing feedback, instant translation, and simulated conversation practice, so learners possess an unprecedented degree of language learning autonomy. Consequently, the non-stop rise of AI and the transition of Vietnam's emerging ESL landscape and has created an uncharted territory and immediate challenges for higher education. In an ESL-oriented classroom, students require high-level communicative competencies, critical thinking, and professional soft skills rather than only knowledge providing. The traditional and lecture-heavy pedagogical model is losing its efficacy to today learners when AI can perform basic linguistic corrections with instant response and flawless patience. To navigate this shift successfully, educators must understand the evolving expectations and changing psychology of students. Severe disconnect between classroom instruction and the actual needs of the future workforce may be created if educators fail to adapt curriculum design and teaching methodologies aligning with student realities.

While previous studies have examined the AI usage, teacher roles, and learner autonomy separately, this study explores the changing division of labor between AI tools and human teachers from students' perspective by examining what they expect from teachers under the combined pressure of AI integration and ESL transition. Therefore, this study is to investigate university student expectations regarding their English language teachers amidst the concurrent navigation toward an ESL framework and AI integration in Vietnam. To achieve its overall goal, the study is organized to answer three research sub-questions:

- What specific roles do students expect from their English teachers in the current AI-driven environment?
- To what extent do students believe AI tools should be integrated into English language pedagogy as Vietnam is shifting toward an ESL system?
- What human-led teaching qualities do students perceive as irreplaceable by AI in their language learning journey?

2. Literature Review

2.1. The shift from traditional to modern roles of English language teachers

2.1.1. From knowledge provider to strategic mentor

According to King (1993), the traditional educators function as ***"a sage on the stage"*** with the primary repository of raw information. As higher education environments evolve, the role of an instructor must change to foster critical engagement which is ***"a guide on the side"*** who actively structures spaces for collaborative knowledge construction. Moreover, as digital platforms decentralize how structural knowledge is accessed the primary value proposition of university faculty is forced to fundamentally reorganize from basic content delivery to high-level pedagogical support and structural instruction (Zawacki-Richter et al., 2019). Additionally, Nguyen (2021) highlights that within the regional context of Vietnam the transition away from teacher-centered instructional legacies requires a deep reconfiguration of traditional teacher identities as the absolute knowledge authority.

2.1.2. From task-bound compliance to competency-based innovation

Kluckhohn and Strodtbeck (1961) establish that through the framework of value orientations, legacy language classrooms operate on a ***"Doing" orientation*** that maximizes immediate, structured task actions over developmental progression. However, according to Hofstede and Hofstede (2005), while short-term orientation frameworks rely heavily on universal guidelines of right versus wrong, long-term oriented environments prioritize situational adaptability and structural perseverance. Therefore, classroom structures must adapt to lower power distance expectations, allowing flat-hierarchy consultation to replace top-down compliance when an educational system transitions toward active real-world utility. Similarly, Kluckhohn & Strodtbeck (1961) note that to align with contemporary competency goals, the pedagogical focus must pivot toward a ***"Growing"' orientation*** which prioritizes the internal intellectual evolution of each learner. Beckett & Miller (2006) add that by integrating professional simulations and media creation, innovative educators shift learner expectations from basic passive comprehension to institutionalized workforce competencies. The changing framework of English teaching is inline with results from previous studies, so this research will explore the exact applications in Vietnam's situation.

2.2. How AI should be integrated into English language pedagogy

2.2.1. In class: a co-facilitator for real-time critical thinking and collaboration

Huang et al. (2023) highlight in their analysis that AI integration forces a move away from assessing simple linguistic output to evaluating high-level cognitive processes. They stress that AI applications push language education toward fostering high-order thinking skills, critical evaluation, and creativity rather than simply testing memory or basic language mechanics. They also advocate for treating AI as a partner in the learning process, and pedagogy should focus on collaborative problem-solving and prompt-engineering literacy, where students learn to co-create and critically analyze AI-generated content.

Chassignol et al. (2018) emphasize that AI's primary function in the classroom environment is helping teachers save time in routine content delivery and grading and focus on more complex, interactive, and personalized human coaching. Furthermore, Chan and Colloton (2024) argue higher education must adapt to the presence of AI by reshaping in-class hours into active workshops, more complex, interactive, and personalized human coaching. That is the similar scenario of Vietnamese classroom orientation in higher education.

2.2.2. At home: a personalized "linguistic sandbox"

According to Koraishi (2023), for students who are too intimidated to speak in class, interacting with AI provides a low-stakes environment because it offers a non-judgmental space for language production, effectively mitigating foreign language speaking anxiety by removing the fear of negative social evaluation by peers or instructors. In addition, Stockwell (2021) defines the ideal out-of-class digital ecosystem as one that extends learning beyond the physical boundaries of the institution, empowering learners to manage their own linguistic remediation and practice schedules autonomously to build student independence and prepare for real-life interaction. Concurrently, Godwin-Jones (2024) and Zhai (2023) discuss using AI language models at home to manage the heavy lifting of grammar drilling, spell-checking, and foundational editing. This is a fact that Vietnamese students are rushing for using AI to improve English language themselves at la ow cost and high comfort.

2.3. Irreplaceable qualities of human-led teaching in English language pedagogy

2.3.1. Emotional Intelligence (EQ) and relational encouragement

According to Dörnyei & Ushioda (2011), as language learning requires long-term psychological persistence, a teacher's role cannot be reduced to only transmission of content but an active source of motivational support which deeply depends on the interpersonal rapport and authentic encouragement generated between the teacher and the learner. Furthermore, automated tools may correct structural errors, but they cannot replace the emotional support and interpersonal rapport required by learners (Mercer & Dörnyei, 2020). Consequently, Mercer and Dörnyei (2020) emphasize the contemporary language pedagogy must prioritize the socio-emotional well-being and active engagement of the learner - a position that requires educators center on creating a safe, humanistic space for students' growth. Similarly, Vietnamese students are increasingly showing their needs for teachers as mentors and emotional supporters.

2.3.2. Cultural bridge and social intelligence in communication

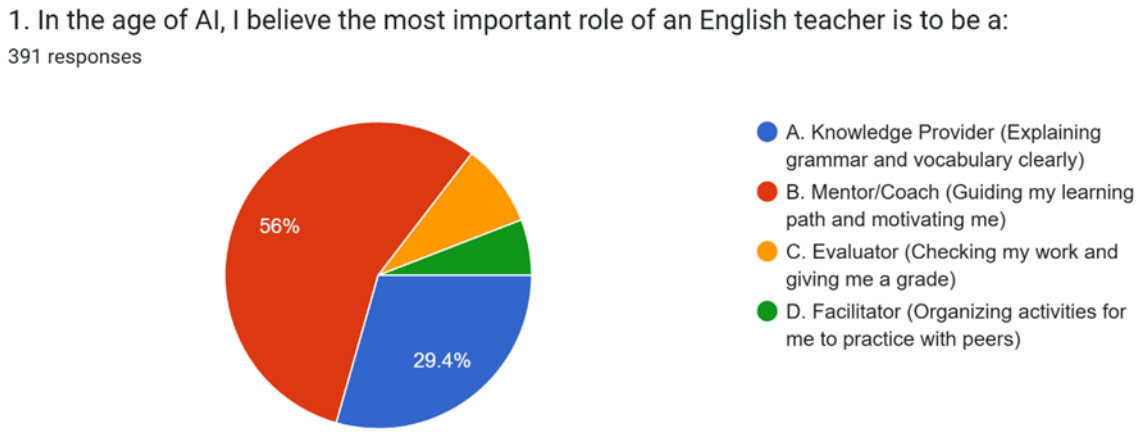
The theoretical model of Vygotsky (1978) implies that linguistic competencies are co-constructed within a cultural context which means dialogue with a human mentor is structurally superior to isolated interactions with static machine intelligence. Furthermore, Byram (1997) establishes that authentic intercultural communicative competence requires learners to develop specific cultural attitudes, critical awareness, and the social intelligence to navigate diverse human relationships. He also concentrates on the must of instructors serving as a cultural

bridge, guiding students through the sociolinguistic complexities that automated translation models ignore. In this context, effective intercultural communication also requires learners to interpret meaning appropriately across social and cultural contexts, including situational appropriateness and non-verbal cues (Byram, 1997). Such social intelligence cannot be developed from statistical text models alone because appropriate communicative choices are bound to real-world social consequences and human relationships, which requires a human mentor possessing authentic social intelligence and lived cultural experience.

3. Methodology

A mixed-method (mainly quantitative survey with one qualitative open-ended item) was adopted in this study to capture student expectations, mapping out how learners perceive the boundary between machine-driven automation and human-led mentorship amidst emerging AI integration and the shifting ESL landscape in Vietnam. The nine closed questions, using a 5-point Likert scale or multiple-choice grids, and one open-ended question were distributed through online communication. The instrument development relies on three sub-research questions and a literature framework. In more detail, items 1 to 3 explore expected teacher roles, while questions 4 to 6 show the extension of applying AI in students' learning, and the third examination of irreplaceable human teachers' qualities is covered by numbers 7 to 9. The last question, which is open ended, pertains to students' concept of "*a perfect English language teacher*", allowing participants to elaborate freely in their own words. It provides unconstrained qualitative depth in their expectations for future English language teachers. The questionnaires were checked once again by the author's colleague before being sent to participants.

The population for this study comprises 391 undergraduate English majors at the Faculty of Foreign Languages at HUFLIT (Ho Chi Minh City University of Foreign Languages and Information Technology), Vietnam. They are students from the first to final years in their undergraduate program who have learned with this paper's author in some courses, and they were recruited voluntarily online. They have all gone through the English language foundation stage and are fluent users of AI in their learning.

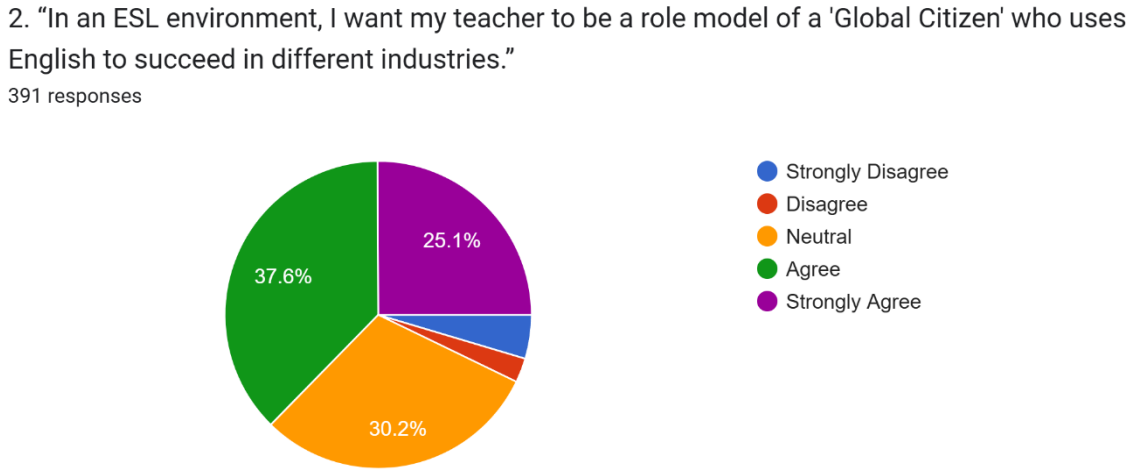


The data collection was bounded within a one-week period (in May 2026) to ensure responses were anonymous and consistent in maintaining objectivity. The collected data were extracted into a centralized spreadsheet and then cleaned to remove incomplete or duplicate entries. Each item was analyzed independently and later synthesized to address the three sub-research questions. For item number 10, data were subjected to iterative cycles of open coding; similar phrases were clustered into codes, which were synthesized into themes to explain the reasons behind quantitative trends.

4. Results

This section includes findings of a survey carried out online by 391 English language students at Faculty of Foreign Languages at HUFLIT, Vietnam.

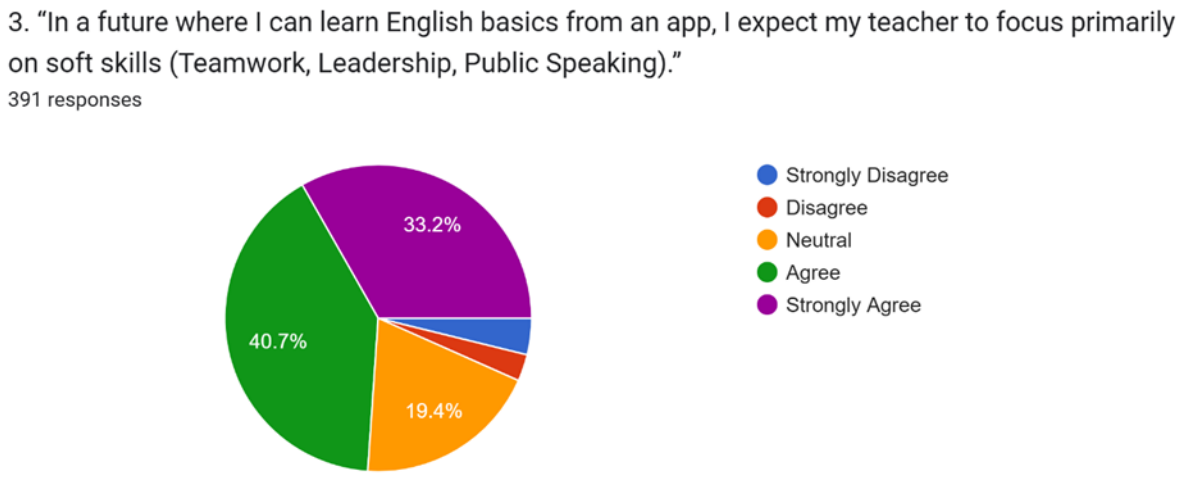
Figure 1



The most important role of an English language teacher

The findings reveal a noticeable shift in students' expectations of teachers, moving from traditional teacher-centered roles toward more supportive and learner-centered functions. Most respondents (56%) identified the role of mentor or coach as the most important, suggesting that students increasingly expect teachers to provide guidance, motivation, personalized support, and assistance in navigating their learning journey. The role of knowledge provider ranked second, accounting for 29.4% of responses. Although this proportion is considerably lower than that of the mentor/coach role, it still represents nearly one-third of the sample, indicating that students continue to value teachers' expertise in explaining complex language concepts, correcting misunderstandings, and providing professional insights that AI may not always deliver effectively. In contrast, the roles of evaluator and facilitator received much lower levels of support, with approximately 8.7% and 5.9% of respondents selecting these options, respectively. In brief, this pie chart provides similar findings comparing with that of King (1993). The data suggests that students are actively pushing away from the traditional, transmissive ***"sage on the stage"*** (the 29.4% legacy expectation) and demanding a ***"guide on the side"*** who acts as a strategic mentor (56%).

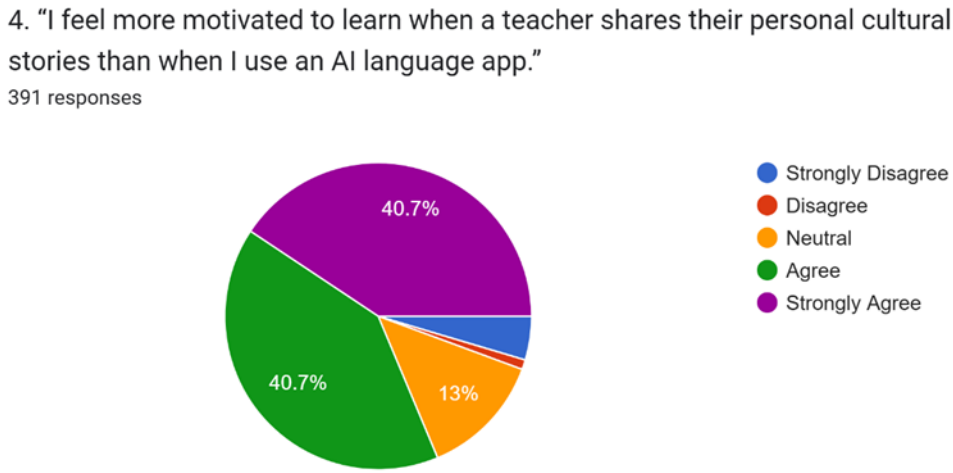
Figure 2



The "Global Citizen" role of an English language teacher in an ESL environment

As clearly shown, the largest proportion of respondents selected "Agree" (37.6%), while a further 25.1% chose "Strongly Agree," resulting in a combined positive response rate of 62.7%. This indicates that nearly two-thirds of the participants expect English language teachers not only to possess strong language proficiency but also to serve as role models who can illustrate how English facilitates success in international communication, career development, and cross-cultural interactions. Meanwhile, 30.2% of respondents remained neutral, representing a substantial proportion of the sample. In contrast, only a small minority expressed negative views, with approximately 3.3% disagreeing and 3.8% strongly disagreeing, accounting for a combined total of 7.1% of responses. In conclusion, this strong positive shift (62.7% combined agreement) directly follow Byram's (1997) ***Intercultural Communicative Competence*** framework. As Vietnam navigates its emerging ESL transition, students look to their lecturers not just for local text comprehension, but to act as lived cultural mediators who model how to negotiate diverse professional industries globally.

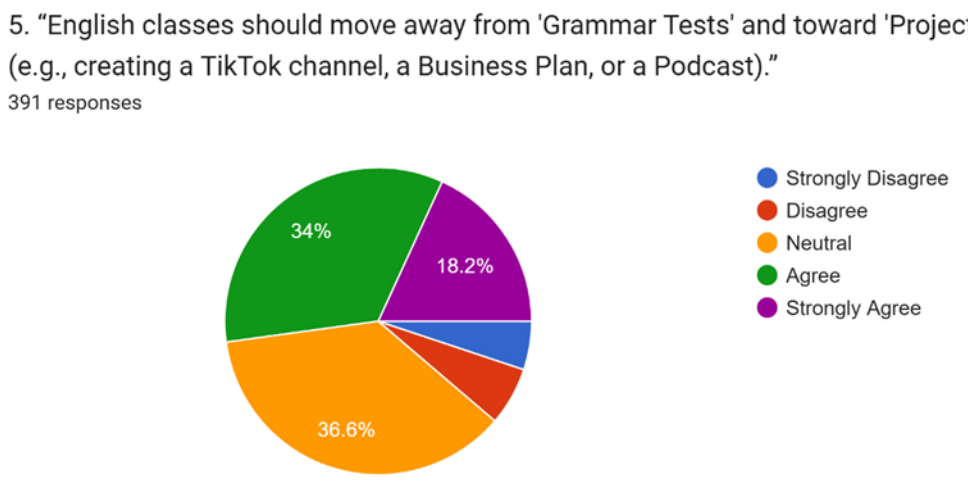
Figure 3



The students' need for soft skills practicing in class

The largest proportion of respondents selected "Agree" (40.7%), while a further 33.2% chose "Strongly Agree," resulting in a combined agreement rate of 73.9%. This overwhelming majority indicates that most learners expect teachers to devote greater attention to fostering soft skills that cannot be easily acquired through language-learning applications alone. Meanwhile, 19.4% of respondents selected the neutral option, suggesting that although many students support this shift in teaching priorities, a notable proportion remain uncertain about the extent to which soft skills should be integrated into English language education. In contrast, only a small minority expressed disagreement, with approximately 3.3% disagreeing and 3.4% strongly disagreeing, accounting for less than 7% of the total responses. In general, this is a shift from a task-bound ***"Doing" orientation*** to a ***"Growing" orientation*** (Kluckhohn & Strodtbeck, 1961). Because automated apps can efficiently triage linguistic baselines asynchronously at home (Godwin-Jones, 2024), students need valuable in-class human hours dedicated to socio-adaptive human competencies.

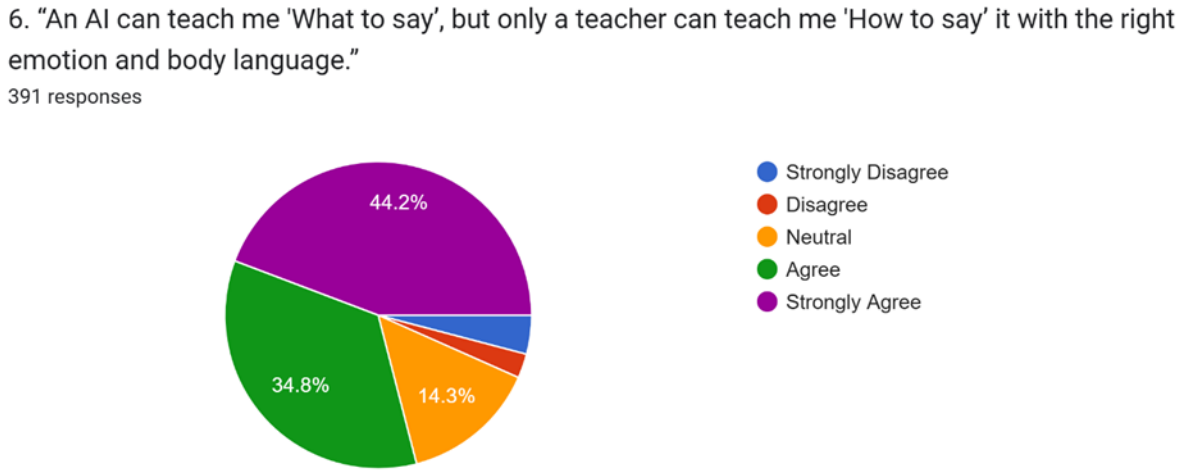
Figure 4



The importance of sharing teacher's personal cultural experiences

The findings indicate a very strong preference for human interaction and authentic cultural engagement in the language learning process. A majority of respondents expressed positive attitudes toward the statement, with 40.7% selecting "Agree" and another 40.7% choosing "Strongly Agree." Combined, these categories account for 81.4% of all responses, demonstrating that a substantial majority of learners find teachers' personal experiences and cultural narratives more motivating than the use of AI-based language learning applications. Meanwhile, 13% of respondents selected the neutral option, indicating that some learners were uncertain or believed that both teachers and AI applications can play complementary roles in supporting motivation. In contrast, only a very small minority expressed negative views, with approximately 1.0% disagreeing and 4.6% strongly disagreeing. All these results are consistent with Dörnyei and Ushioda's (2011) ***model of relational motivation***. It proves that long-term second language learning stamina cannot be sustained by cold data transfer; it is a dynamic process sparked by real human chemistry, vulnerability, and shared personal narratives.

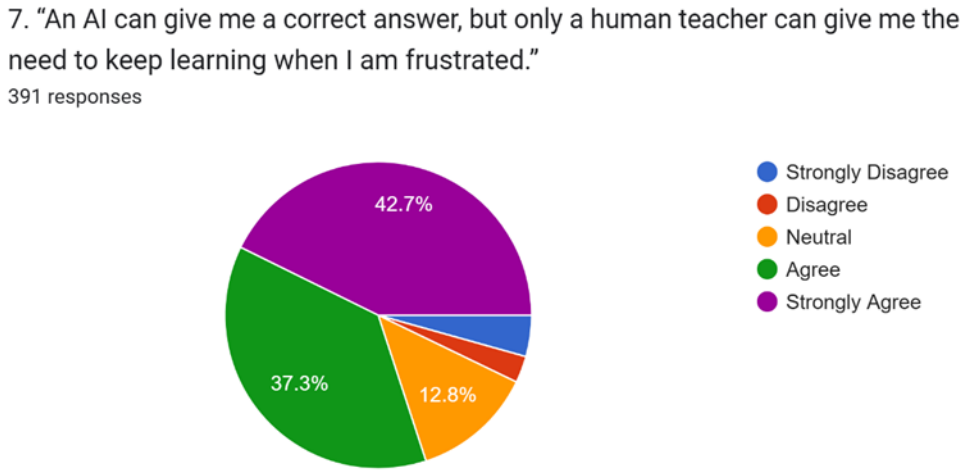
Figure 5



The preference for Project-based Learning to Grammar Tests

The largest proportion of respondents selected the neutral option (36.6%), indicating that a considerable number of students remain undecided about replacing traditional grammar-focused assessments with project-based activities. Nevertheless, positive responses outweighed negative ones, with 34% of participants agreeing and 18.2% strongly agreeing with the statement. Combined, these categories account for 52.2% of all responses, suggesting that more than half of the respondents support a shift toward more practical, creative, and application-oriented learning experiences. In contrast, only a relatively small proportion of participants expressed disagreement, with approximately 6.9% selecting "Disagree" and 4.3% choosing "Strongly Disagree," resulting in a combined negative response rate of 11.2%. In general, the 52.2% combined agreement aligns directly with Beckett and Miller (2006) regarding ***Project-Based Second Language Education***. The heavy neutral chunk (36.6%), however, likely reflects the systemic friction noted by Nguyen (2021): changing institutional testing habits from short-term memorization (Hofstede's STO) to authentic task outputs can trigger learner uncertainty when students are highly conditioned by traditional exam structures.

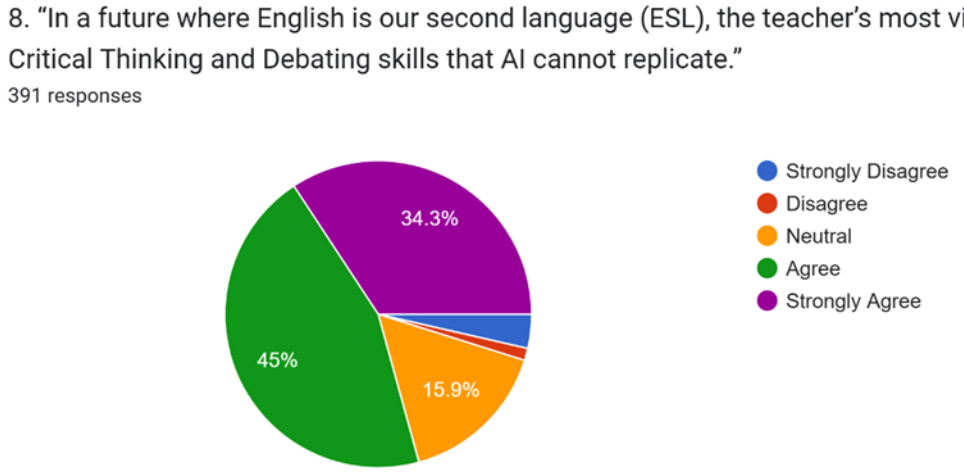
Figure 6



The preference for learning "how to say" to "what to say"

The highest percentage of responses fell into the "Strongly Agree" category, accounting for 44.2% of the total survey sample, which was closely followed by the "Agree" cohort at 34.8%. Combined, these two figures represent a resounding 79.0% of the total respondents who acknowledged that while AI can sufficiently guide learners on factual content (what to say), human teachers remain vital for mastering delivery skills (how to say). In stark contrast, only 14.3% of the surveyed individuals maintained a "Neutral" stance on the matter. The remaining segments represented the dissenting opinions, which altogether comprised less than 8% of the data; specifically, those who expressed "Strongly Disagree" and "Disagree" accounted for approximately 4.3% and 2.4% respectively, highlighting a minimal resistance among the sample to the premise of the statement. In sum, this item's result reinforces Byram's (1997) emphasis on the social and cultural dimensions of communicative competence. While advanced large language models are exceptional at rectifying syntactic errors ("what to say"), students recognize that the situational appropriateness and non-verbal subtext ("how to say it") require a human mentor with lived social experience.

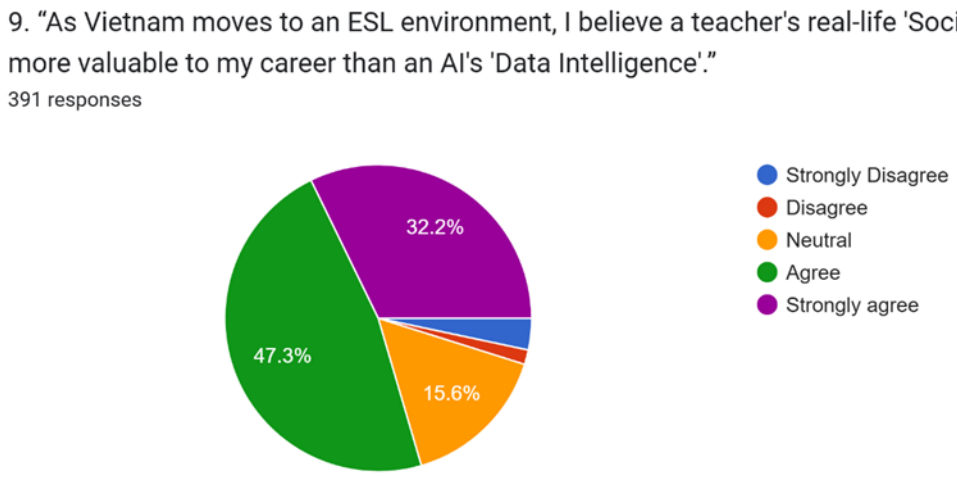
Figure 7



The importance of Encouragement from an English language teacher

To break down the figures, 42.7% of the respondents expressed the highest level of conviction by selecting "Strongly Agree", while a substantial 37.3% chose "Agree". Together, this cumulative 80.0% dominates the chart, validating the hypothesis that technical correctness alone cannot replace a teacher's emotional support. On the other hand, the proportion of individuals remaining "Neutral" was limited to 12.8%. The remaining minority who questioned the statement accounted for less than one-tenth of the total sample, with 4.3% of respondents stating they "Strongly Disagree" and a mere 2.9% opting for "Disagree", demonstrating that opposition to the psychological necessity of human educators is statistically minimal. Overall, this is in line with Mercer and Dörnyei's (2020) emphasis on the socio-emotional dimensions of language learning. Language acquisition is emotionally volatile; when students experience cognitive blocks due to anxiety, they require the high emotional intelligence and empathy of a human mentor (Mercer & Dörnyei, 2020) to lower their affective filters.

Figure 8



The importance of practicing Critical Thinking and debating skills in class

The “Agree” category emerged as the largest segment, accounting for exactly 45% of the total distribution, while the “Strongly Agree” cohort constituted 34.3%. Together, these two figures represent a substantial cumulative majority of 79.3%, indicating a robust belief that pedagogical priorities must evolve toward skills that surpass automated capabilities. Conversely, the proportion of individuals who maintained a “Neutral” attitude stood at 15.9%. Dissenting viewpoints were minimal, collectively representing less than 5% of the survey population; specifically, the “Strongly Disagree” and “Disagree” sectors accounted for minor fractions of approximately 3.5% and 1.3% respectively, confirming that resistance to this predicted shift in ESL instruction is statistically negligible. In brief, this result is consistent with Huang et al. (2023). Since generative technology can instantaneously fabricate a grammatically flawless essay or script, the instructor's modern role must shift away from checking low-level mechanics to fostering high-order critical evaluation, and active dialectic debate.

Figure 9

The comparison between Social Intelligence and Data Intelligence

It is highly apparent that a substantial majority of the surveyed individuals expressed a positive attitude toward this notion, reinforcing the perceived superiority of human interpersonal skills over algorithmic data processing in a developing professional landscape, while neutral and negative stances remained in the minority. In detail, the “Agree” cohort constituted the largest share of the dataset, representing nearly half of the total distribution at 47.3%. This was supported by an additional 32.2% of participants who registered a “Strongly Agree” response, bringing the cumulative positive consensus to a significant 79.5%. In contrast, the proportion of individuals who maintained a 'Neutral' position was limited to 15.6%. Active opposition to the statement was extremely minimal, accounting for less than 5% of the total sample; specifically, those who chose “Strongly Disagree” made up approximately 3.5%, while the “Disagree” category recorded the lowest frequency at a mere 1.4%, indicating that skepticism regarding the premium placed on human social intelligence is statistically negligible. In general, this finding serves as a firm support to Vygotsky’s (1978) ***Social Constructivism.*** Students are declaring that as language is a social tool meant to navigate real human relationships in the workforce, learning it requires a co-facilitated, socially intelligent environment. They gracefully accept AI’s “data intelligence” as a supportive backend, but guard the upper-level pedagogical space for human-to-human interaction.

Figure 10

The qualities of a "Perfect English Teacher"' of the year 2030

Core Pedagogical Theme / Phrase	Exemplary Student Phrase	Frequency of Repetition (N=391)
Communication Skills over Grammar	*"Helps every student become a confident communicator instead of only teaching grammar rules."*	**117**
Personalized Learning & Individual Needs	*"Focuses more on students' individual needs and personalized teaching methods."*	**94**
Creativity & Classroom Engagement	*"Uses interactive games, technology, and creative projects to make learning interesting."*	**73**
Critical Thinking Facilitator	*"Guides students to improve critical thinking, evaluation, and problem-solving."*	**70**
Real-life & Workforce Application	*"Focuses on real-life English skills, career readiness, and practical applications."*	**70**
Strategic Mentor & Guidance	*"Acts as a mentor who gives guidance rather than just acting as a traditional knowledge provider."*	**63**
Source of Motivation & Inspiration	*"An inspiring presence that motivates students to achieve their long-term language goals."*	**62**
Empathy & High Emotional Intelligence (EQ)	*"Possesses high emotional intelligence to understand student frustration and provide psychological encouragement."*	**39**
Holistic Soft Skills Developer	*"Uses class time to automate mechanical grading and focus entirely on developing soft skills."*	**19**

By coding and counting similar answers (using Excel software) and grouping them into themes with exemplary phrases, the spontaneous and wide range expectation of students about *"perfect English language teachers"* are simplified into the above table. It can be explored from the table that the highest repetition belongs to ***Communication Skills*** (117 counts). This suggests that students recognize the official shift toward an ESL environment where functional, real-world spoken fluency vastly outweighs legacy, task-bound grammar drilling. About the ***"Guide on the Side"*** validation**, Personalized Learning** (94), **Critical Thinking** (70), and **Mentorship** (63) score highly which proves an alignment with King's (1993) framework. Students are explicitly asking for teachers to abandon the "Knowledge Provider" monopoly and step into the role of a strategic coach. Concerning ***the Irreplaceable Human Factor,*** even though technology is mentioned, the demand for ***Motivation*** (62) and ***Empathy/EQ*** (39) show that students openly state a teacher's value lies in providing the safe psychological space and encouragement which an AI platform cannot simulate.

5. Discussion

The findings of this study demonstrate a profound shift in undergraduate expectations of English language lecturers within the Vietnamese higher education context. As advanced

digital systems democratize baseline language mechanics, students are actively re-evaluating the instructional division of labor between human educators and artificial intelligence.

5.1. The operational shift from knowledge provider to strategic mentor

The quantitative data validate the theoretical transition from a traditional ***"sage on the stage"*** to a modern ***"guide on the side"*** (King, 1993). When asked to define the primary role of an English teacher in the age of AI (Item 1), a decisive majority (56%) selected ***"Mentor/Coach"***, while only 29.4% favored the legacy role of ***"Knowledge Provider"***. This structural pivot is corroborated by Item 3, where 73.9% of respondents (Agree and Strongly Agree combined) expect instructors to focus primarily on high-level soft skills like teamwork, leadership, and public speaking rather than language basics. However, the neutral group may suggest that students are interested in innovation but still uncertain about replacing familiar assessment practices and the traditional role of teachers as a knowledge provider. Viewed through the value orientation framework of Kluckhohn and Strodtbeck (1961), these percentages indicate an institutional shift from a task-bound ***"Doing" orientation*** (focused on immediate test compliance) to a student-centric ***"Growing" orientation*** (focused on long-term capability). Students openly expect human-led class hours to be liberated from mechanical instruction, a demand further reflected in the qualitative data where ***Personalized Learning & Individual Needs*** (n = 94) and ***Strategic Mentorship*** (n = 63) emerged as dominant criteria for the future "Perfect Teacher".

5.2. Curricular Innovation: Navigating the Emerging ESL Landscape

As Vietnam actively transitions from an EFL toward a formalized ESL framework to cultivate global citizenship, student demands for structural curricular design have evolved. A significant majority of participants (52.2%) expressed agreement or strong agreement that language classes should move away from standard grammar examinations toward complex project-based Learning (item 5), such as producing podcasts or business plans. Furthermore, 79.3% of undergraduates agree that in an ESL ecosystem, the teacher's most vital job is to cultivate critical thinking and debating skills that algorithms cannot replicate (Item 8). This orientation aligns clearly with Hofstede's (2005) conceptualization of a ***Long-term Orientation***, wherein educational success is measured by situational adaptability and real-world utility rather than short-term rote recall. The evidence proves that students no longer view the classroom as an isolated syntactic training ground, but rather as an incubator for professional readiness, which is echoed in the qualitative findings ranking ***Communication Skills over Grammar*** (n = 117) and ***Real-life & Workforce Application*** (n = 70) as the highest student priorities.

5.3. The Irreplaceable Human Core: Emotional and Social Intelligence

The most impressive data emerges around the affective and socio-cultural dimensions of language acquisition, exposing the strict limitations of artificial intelligence. While AI tools are recognized for their data intelligence, students display a massive preference for human interaction when navigating the vulnerable process of learning a language. Specifically, 81.4% of students feel more motivated when an instructor shares personal cultural experiences and lived narratives than when interacting with an AI language application (Item 4). 80% agree that while AI can provide accurate technical answers, only a human teacher can deliver the authentic ***"Encouragement"*** needed to overcome learning frustration (Item 7). This data provides support for Dörnyei and Ushioda's (2011) emphasis on motivation and Mercer and Dörnyei's (2020) emphasis on socio-emotional engagement, suggesting that sustained linguistic stamina requires genuine human empathy and psychological validation.

Furthermore, communication is recognized as a deeply contextual, symbolic phenomenon rather than a simple transactional data transfer. This is evidenced by Item 6, where a striking 79% of participants agreed that *"An AI can teach me 'What to say', but only a teacher can teach me 'How to say' it with the right emotion and body language."* This realization is reinforced by Item 9, where 79.5% of respondents asserted that a human teacher's real-world ***"Social Intelligence"*** is vastly more valuable to their careers than an AI's ***"Data Intelligence."***

Consequently, the human teacher remains entirely irreplaceable as a lived cultural bridge (Byram, 1997) and a model for intercultural communicative competence (Byram, 1997) – which is reinforced by the qualitative clusters identifying ***Empathy and High EQ*** (n = 39) and ***Social Intelligence*** as core human pillars.

6. Conclusion

6.1. Empirical and theoretical summary

This study maps the evolving expectations of N = 391 undergraduate English majors in Vietnam against the dual backdrops of rapid artificial intelligence integration and an official transition toward an ESL educational framework. The data demonstrate a structural consensus: modern language learners do not view AI as a replacement for human educators, but rather as a tool to catalyze a long-awaited pedagogical evolution. Students explicitly relegate lower-level, mechanical linguistic triage - such as basic grammar explanation and automated text corrections - to machine datasets, viewing out-of-class AI interactions as a safe, low-stakes "linguistic sandbox" to lower foreign language anxiety. Concurrently, this spatial division of labor completely redefines the institutional value proposition of the human lecturer. The physical university classroom is no longer expected to operate as a transmission hub for rote data delivery. Instead, students decisively demand that human educators step into roles as strategic mentors, cultural mediators, and coaches of advanced soft skills. The overwhelming majority of participants emphasize that while an algorithm operates on "data intelligence", it remains decoupled from the affective, socio-cultural, and relational realities of language acquisition. True linguistic fluency, pragmatic delivery, and professional confidence are co-constructed through human interaction, relying on a teacher's real-world "social intelligence", empathy, and relational encouragement. Ultimately, the "Perfect English Teacher" of the future is not defined by their mastery over syntactic rules, but by their high emotional intelligence and capacity to guide students toward becoming global citizens.

6.2. Limitations of the study

While this study provides robust data-driven insights, several structural limitations must be acknowledged:

- **Geographic and institutional sample isolation**

The sample size (N = 391) was strictly recruited from a single private university in Ho Chi Minh City via convenience sampling. Consequently, the findings may not fully represent student expectations in public universities or institutions located in rural and suburban regions of Vietnam, where resource access and baseline digital literacy may differ.

- **Static cross-sectional design**

The data capture student expectations at a single point in time. Because generative artificial intelligence technologies and national ESL policies are evolving at an accelerated pace, student attitudes and reliance on digital tools may shift dynamically over a longer timeline.

- **Self-reported data bias**

The study relies heavily on self-reported survey perceptions. While useful for mapping internal attitudes, student expectations of what they want from a curriculum do not always directly correlate with objective measures of learning efficiency or actual academic performance.

- **Instrumental insufficiency**

The questionnaire is short and developed by the author basing on a simple framework of three sub-research questions, so it lacks full reliability and validity. The study also relies on one open-ended question for qualitative data, which limits the depth of interpretation. Another concern is that the findings capture broad student expectations rather than detailed explanations of why students hold these views.

6.3. Recommendations for future research

To build upon the empirical foundations established by this study, future research should explore the following avenues:

- **Longitudinal inquiries**

Future studies should deploy longitudinal research designs to track how undergraduate expectations, prompt literacy, and AI dependencies evolve over their four-year university trajectory as generative tools become deeply normalized in secondary education.

- **Comparative institutional analyses**

Expanding data collection to include a comparative analysis between private and public universities, as well as northern, central, and southern regional institutions, would provide a more generalized national mapping of the ESL transition.

- **Multi-perspective triangulation**

Future projects should actively capture faculty perspectives, exploring the institutional challenges, anxieties, and training deficiencies experienced by university lecturers as they attempt to transition from traditional “knowledge providers” to “strategic mentors”. Moreover, future research should include interviews, focus groups, or classroom observation to triangulate survey findings.

In brief, future studies could compare student and teacher expectations, examine whether AI literacy changes students’ expectations over time, or test whether redesigned teacher roles actually improve learner engagement, communication confidence, and critical thinking. This would move the research beyond perception mapping toward pedagogical evaluation.

The Future of English Learning in the AI & ESL Era

Section 1

The Teacher as a Personal Brand & Evolving Role

1. In the age of AI, I believe the most important role of an English teacher is to be a:

- Knowledge Provider (Explaining grammar and vocabulary clearly)
- Mentor/Coach (Guiding my learning path and motivating me)
- Evaluator (Checking my work and giving me a grade)
- Facilitator (Organizing activities for me to practice with peers)

2. In an ESL environment, I want my teacher to be a role model of a *'Global Citizen'* who uses English to succeed in different industries.

- Strongly Disagree
- Disagree
- Neutral
- Agree
- Strongly Agree

3. In a future where I can learn English basics from an app, I expect my teacher to focus primarily on soft skills (Teamwork, Leadership, and Public Speaking, etc.)

- Strongly Disagree
- Disagree
- Neutral
- Agree
- Strongly Agree

Section 2

Pedagogical Innovation & Practicality

4. I feel more motivated to learn when a teacher shares their personal cultural experiences and stories than when I use an AI language app.

- Strongly Disagree
- Disagree
- Neutral
- Agree
- Strongly Agree

5. English classes should move away from *'Grammar Tests'* and toward *'Project-Based Learning*'.

- Strongly Disagree
- Disagree
- Neutral

- Agree
- Strongly Agree

6. An AI can teach me *'What to say'*, but only a teacher can teach me *'How to say'* it with the right emotion and body language.

- Strongly Disagree
- Disagree
- Neutral
- Agree
- Strongly Agree

Section 3

The Irreplaceable Human Element

7. An AI can give me a correct answer, but only a human teacher can give me the *'Encouragement'* I need to keep learning when I am frustrated.

- Strongly Disagree
- Disagree
- Neutral
- Agree
- Strongly Agree

8. In a future where English is our second language (ESL), the teacher's most vital job is to teach Critical Thinking and Debating skills that AI cannot replicate.

The "Dream" Classroom

10. Describe the *'Perfect English Teacher'* of the year 2030. What do they do differently than teachers today?

#140 RETHINKING ASSESSMENT IN THE SHIFT FROM EFL TO ESL: A CRITICAL REVIEW OF NO-EXAM CLASSROOMS

Thi Thanh Thao Nguyen[1], Thi Dieu Duyen Le[2], Thi Hong Tham Chau[3], Thanh Tinh Bui[4], Van Doan Tran[5]

Abstract

This article critically examines the growing interest in "no-exam" classrooms within the transition from English as a Foreign Language (EFL) to English as a Second Language (ESL) in Vietnam. While traditional exam-based assessment is increasingly viewed as misaligned with communicative and context-sensitive language use, alternative approaches that emphasize continuous, evidence-based assessment are often presented as inherently superior. Drawing on perspectives from language testing, sociocultural theory, and contemporary assessment scholarship, this paper argues that the shift from exams to evidence does not resolve longstanding tensions in assessment but rather redistributes them. In particular, issues of validity, reliability, learner agency, and institutional accountability remain central. The paper proposes a reconceptualised assessment framework that integrates multimodal evidence, feedback processes, and evaluative judgement to navigate the inherent trade-offs associated with these constraints. It concludes that the future of TESOL assessment lies not in abandoning exams, but in developing hybrid systems that acknowledge and negotiate the tensions between pedagogical relevance and institutional credibility.

***Keywords*:** assessment reform, no-exam classroom, evaluative judgement, ESL transition, feedback processes

1. Introduction

The ongoing shift from English as a Foreign Language (EFL) to English as a Second Language (ESL) in Vietnam necessitates a fundamental reconsideration of how language learning is assessed. As educational priorities increasingly emphasize communicative competence, real-world language use, and functional multilingualism, traditional assessment systems, which have been largely dominated by high-stakes examinations, appear increasingly misaligned with these goals (Fulcher, 2010). While exams have historically been associated with objectivity, comparability, and institutional accountability, their capacity to capture the dynamic, socially situated, and developmental nature of language use remains contested (Messick, 1989; Fulcher, 2010).

This misalignment reflects a deeper epistemological tension between the nature of language and the logic of assessment. Language is not a static body of knowledge to be reproduced under time pressure, but a socially mediated and evolving capacity shaped through interaction, feedback, and meaningful communicative practice (Vygotsky, 1978). Yet, exam-based systems continue to conceptualize language as discrete, decontextualized knowledge, privileging accuracy and performance under constrained conditions. As a result, learners may succeed in examinations while remaining unable to use language effectively in authentic contexts.

[1] *Corresponding author, International Institute, Ho Chi Minh City University of Economics and Finance, Vietnam, Email: thaonnt2@uef.edu.vn*
[2] *Faculty of Foreign Languages & Oriental Studies, Yersin University of Da Lat, Vietnam*
[3] *Faculty of Foreign Language, Nguyen Tat Thanh University, Vietnam*
[4] *Foreign Languages and Informatics Center, Dong Thap University, Vietnam*
[5] *Faculty of Foreign Languages, Ho Chi Minh City University of Industry and Trade, Vietnam*

This tension is further reinforced by the institutional functions of assessment. In many systems, including Vietnam, exams serve not only pedagogical purposes but also certification, selection, and social mobility. Their deep entrenchment within educational structures makes them resistant to change, even when their limitations are widely acknowledged.

In response, a growing body of scholarship in TESOL and educational assessment has questioned the dominance of summative testing, advocating for formative and sustainable approaches to assessment that extend beyond immediate performance (Boud & Falchikov, 2007; Carless, 2015). More recent work highlights learner engagement in assessment, particularly through co-regulation of learning and learners' capacity to make evaluative judgements (Andrade & Brookhart, 2019; Tai et al., 2018). Within this broader shift, "no-exam" classrooms have emerged as a provocative alternative.

However, such approaches are often framed in overly optimistic terms. Rather than treating them as solutions, this article argues for a reconceptualization of assessment itself, one that seeks to manage its enduring tensions rather than to resolve them. By critically examining the shift from exam-based to evidence-based assessment, it explores both the potential and the limitations of no-exam classrooms in the context of the EFL-to-ESL transition.

2. Rethinking Assessment: From Exams to Evidence

The notion of "no-exam" classrooms is frequently interpreted as a rejection of assessment. In practice, however, it represents a transformation in how assessment is conceptualized and enacted. Rather than eliminating evaluation, these approaches redistribute it across time, tasks, and interactions, shifting from a single, high-stakes event to an ongoing process of evidence collection and interpretation. This shift can be conceptualized as a movement from a "snapshot" model of assessment to a longitudinal, evidence-based model, as summarized in Table 1. The two outer columns are presented as contrasting ideal types rather than mutually exclusive options; the third column sketches a hybrid model that draws selectively on both and anticipates the integrated framework developed in Section 4.

Table 1.

From Snapshot Testing to Longitudinal Evidence

Traditional Exam Model	Evidence-Based (No-Exam) Model	Hybrid (Integrated) Model
Single high-stakes performance	Continuous, low-stakes evidence	Periodic anchor points set within continuous evidence
Time-limited, decontextualized tasks	Contextualized, interaction-based tasks	Authentic tasks under partly standardized conditions
Focus on accuracy and correctness	Focus on communicative effectiveness	Accuracy and communicative effectiveness weighted together
Product-oriented	Process + product oriented	Process and product, with selective benchmarking
One-time measurement	Development over time	Development tracked through recurring checkpoints

Traditional exam-based assessment operates within a measurement paradigm, assuming that language ability can be quantified through standardized tasks administered under controlled conditions. This approach prioritizes reliability and comparability, ensuring that all

learners are assessed using the same criteria. However, such standardization often requires the simplification of complex constructs, reducing communicative competence to discrete, measurable components (Fulcher, 2010).

This reduction has important consequences. By focusing on what can be easily measured, exams may neglect aspects of language use that are more difficult to quantify, such as interactional competence, pragmatic appropriateness, and strategic communication. As a result, there is a risk of construct under-representation, where the assessment fails to capture the full range of abilities it claims to measure (Messick, 1989).

In contrast, evidence-based assessment models expand the range of evidence used to evaluate learning, incorporating spoken interactions, written outputs, reflective accounts, peer feedback, and teacher observations. This allows for a more comprehensive and context-sensitive representation of language ability. However, this shift from measurement to evidence introduces new challenges. Unlike exam scores, which produce clear and comparable outcomes, evidence-based assessment relies on interpretive judgment, raising questions about reliability, transparency, and fairness.

Furthermore, this shift redefines assessment as an interpretive and context-dependent practice rather than a purely technical process of measurement. In traditional systems, knowledge is treated as something that can be sampled and generalized across contexts, aligning with a positivist view of assessment. However, when assessment is based on multiple forms of evidence, this epistemological foundation becomes less stable.

One key issue is the problem of commensurability. Different forms of evidence, such as interaction, written production, and reflection, do not easily translate into a single metric. Unlike test scores, which are designed to be comparable, these forms of evidence are inherently heterogeneous. This raises the question of whether assessment should prioritize comparability or embrace the richness and contextuality of evidence, even at the expense of standardization.

This tension is particularly salient in ESL-oriented contexts, where language use is situated and context-dependent. If communicative competence varies across contexts, interlocutors, and purposes, then reducing it to a single score may be inherently reductive. Evidence-based approaches respond to this by embracing variability rather than controlling for it, but this also complicates decision-making in institutional settings where comparable outcomes are required.

Another critical issue concerns the temporal dimension of assessment. Traditional exams capture performance at a specific moment, whereas evidence-based assessment tracks development over time. While this allows for a more nuanced understanding of learning, it raises questions about what counts as representative performance, that is, whether assessment should privilege peak performance, typical performance, or improvement.

Finally, the redistribution of assessment across time and contexts alters the relationship between assessment and learning. In exam-driven systems, assessment often functions as a terminal event. In evidence-based models, it becomes embedded within ongoing activity. While this integration is pedagogically desirable, it also blurs the boundary between formative and summative assessment, raising questions about how and when evaluative judgments should be made.

3. Theoretical and Critical Perspectives

The move toward no-exam assessment is often justified through established theoretical frameworks, including sociocultural theory, constructivism, and Assessment for Learning.

While these perspectives provide strong support for alternative approaches, they also reveal underlying tensions that complicate their implementation.

From a sociocultural perspective, learning is inherently social and mediated through interaction (Vygotsky, 1978). Language competence emerges through participation in communicative practices, where meaning is co-constructed between individuals. This challenges the validity of traditional exams, which isolate learners from interactional contexts. However, it also complicates the notion of individual assessment. If performance is co-constructed, it becomes difficult to determine the extent to which it reflects individual ability. This raises important questions about attribution, fairness, and the role of assessment in evaluating individual learners.

Constructivist theory further conceptualizes learning as an active process of meaning-making (Piaget, 1970; Boud & Falchikov, 2007). Knowledge is not reproduced but constructed through engagement with tasks and experiences. This challenges the epistemological assumptions of exam-based assessment, which often treats knowledge as stable and transferable. However, constructivism also implies that learning is inherently variable, shaped by individual experiences and interpretations. This variability complicates the application of standardized assessment criteria and raises questions about how consistency can be achieved without oversimplifying the learning process.

Assessment for Learning (AfL) emphasizes the central role of feedback in supporting learning (Black & Wiliam, 1998). Carless (2015) extends this perspective by highlighting dialogic feedback, where learners actively engage with feedback processes. More recent work emphasizes learners' capacity to interpret and use feedback effectively, particularly through the development of evaluative judgement (Tai et al., 2018). These perspectives support the integration of assessment into learning processes and align with the principles of no-exam classrooms.

However, they also introduce new challenges. The emphasis on learner agency assumes that learners possess the skills and dispositions necessary to engage with feedback. In contexts where students are accustomed to exam-driven systems, this assumption may not hold. Without explicit support, learners may struggle to interpret feedback or to translate it into meaningful action. As a result, the effectiveness of no-exam approaches may depend on the development of new forms of assessment literacy among both teachers and students.

From a validity perspective, Messick (1989) argues that assessment must accurately represent the construct it claims to measure. In communicative language teaching, this construct is inherently complex and context-dependent. While no-exam approaches attempt to enhance construct validity by incorporating multiple forms of evidence, they simultaneously reduce standardization. This creates a tension between validity and reliability that cannot be fully resolved.

Moreover, the shift toward evidence-based assessment reconfigures power relations within the classroom. Traditional exams position teachers as evaluators and students as subjects of evaluation. In contrast, no-exam approaches emphasize collaboration, reflection, and shared responsibility. While this may be pedagogically desirable, it also challenges established roles and may create uncertainty for both teachers and learners.

Taken together, these theoretical perspectives suggest that no-exam assessment is not a straightforward solution, but a reconfiguration of existing dilemmas. It foregrounds issues of interpretation, agency, and context, while introducing new challenges related to consistency, scalability, and institutional alignment.

A further layer of complexity emerges when these theoretical perspectives are considered not only as justifications for alternative assessment, but as lenses for critique. While sociocultural theory emphasizes interaction and mediation, it does not necessarily provide clear guidance on how to evaluate individual performance within collaborative contexts. If learning is distributed across participants and tools, then assessment must account for this distribution. However, most educational systems continue to require individual certification, creating a structural tension between theory and practice.

The same critique applies to constructivist accounts. Because they treat learning trajectories as individualized, they support personalized, process-oriented assessment but sit uneasily with the notion of common standards. If learning is inherently individualized, then the application of uniform assessment criteria may risk misrepresenting learners' achievements. This raises a critical question: to what extent should assessment prioritize comparability over representational accuracy?

The concept of feedback literacy further complicates this picture. While Tai et al. (2018) emphasize the development of evaluative judgement, which underpins learners' ability to interpret and use feedback effectively, this capacity cannot be assumed and must be explicitly taught and scaffolded. In contexts where students have been socialized into exam-oriented systems, the transition to feedback-rich environments may require significant adjustment. Without such support, learners may struggle to engage with feedback, leading to superficial or ineffective use of assessment information.

Moreover, the emphasis on learner agency in no-exam approaches may obscure the continued influence of institutional and cultural structures. While students may be encouraged to take ownership of their learning, their actions remain shaped by broader expectations, including grading systems, curriculum requirements, and future opportunities. In this sense, agency is not simply a matter of individual choice, but is mediated by systemic constraints.

From a critical perspective, it is also important to consider how power operates within assessment systems. Traditional exams centralize authority in the hands of institutions and examiners, while no-exam approaches redistribute some of this authority to teachers and learners. However, this redistribution is not neutral. It may create new forms of inequality, particularly if learners differ in their ability to engage with reflective and self-directed processes. Students with stronger metacognitive skills or greater access to support may benefit disproportionately, raising concerns about equity.

Finally, the shift toward evidence-based assessment can be understood as part of a broader movement toward what Boud and Falchikov (2007) describe as sustainable assessment. This approach emphasizes the development of learners' capacity to evaluate their own work beyond formal education. While this represents an important goal, it also requires a redefinition of success in education, with a shift from performance on tests to the ability to engage in ongoing learning. This has far-reaching implications not only for assessment practices, but for the purposes of education itself.

4. Toward a Reconceptualised Assessment Framework

Rather than framing the debate as a binary choice between exam-based and no-exam approaches, a more productive perspective is to reconceptualize assessment as a system that integrates multiple forms of evidence while remaining responsive to institutional and pedagogical demands. The question is therefore not whether exams should be retained or removed, but how different assessment practices can be combined to better reflect the complexity of language learning in ESL-oriented contexts.

This reconceptualization requires a shift from viewing assessment as a tool for measurement to understanding it as a system of practices that mediate learning, evaluation, and decision-making. In traditional exam-based models, assessment is largely separated from instruction and designed to produce standardized outcomes. In contrast, evidence-based approaches embed assessment within learning processes, emphasizing development, interaction, and feedback. However, as the previous discussion has shown, neither approach is without limitations.

At the core of this issue lies a set of persistent tensions that cannot be fully resolved, but must instead be managed. One such tension lies between validity and reliability. While evidence-based assessment enhances construct validity by capturing authentic and context-sensitive language use, it often reduces standardization, making it more difficult to ensure consistency across learners (Messick, 1989). Conversely, traditional exams achieve high reliability through controlled conditions, but risk under-representing the construct of communicative competence.

A related tension exists between authenticity and comparability. Tasks that closely resemble real-world language use are inherently variable, shaped by context, interlocutors, and purpose. While this variability reflects the nature of language, it complicates efforts to compare learners on a common scale. Similarly, there is a tension between flexibility and accountability. Evidence-based systems allow for adaptation to learners' needs and trajectories, but institutions often require clear, comparable outcomes for purposes of certification and progression.

Rather than attempting to eliminate these tensions, a reconceptualised approach to assessment makes them explicit and seeks to balance them through principled design. To address these tensions, a reconceptualised framework for ESL assessment can be proposed, integrating key principles that balance validity, reliability, and pedagogical relevance (see Table 2).

Table 2.

A Reconceptualised Framework for ESL Assessment: Key Design Principles and Implications

Principle	Description	Implication
Multimodal Evidence	Combines product, process, and interaction	Reduces reliance on single performance
Longitudinal Assessment	Tracks development over time	Reflects learning as progression
Analytic Criteria	Uses clear rubrics	Enhances transparency and consistency
Feedback Integration	Embeds feedback in learning cycles	Supports continuous development
Learner Agency	Involves reflection and self-assessment	Promotes self-regulated learning

Table 2 outlines a reconceptualised assessment framework that seeks to balance competing demands within ESL-oriented contexts. Rather than privileging a single form of evidence, the framework emphasizes multimodality, drawing on product, process, and interactional data to provide a more comprehensive representation of language ability. This approach aligns with calls to enhance construct validity by capturing the complexity of communicative competence.

At the same time, the inclusion of analytic criteria and structured rubrics reflects the need for transparency and consistency in evaluation. While evidence-based approaches often prioritize authenticity, without clear criteria they risk becoming opaque or inconsistent.

Analytic frameworks therefore play a crucial role in mediating between flexibility and standardization, providing a shared basis for interpretation while allowing for contextual variation.

The integration of feedback as a central component of assessment further shifts the focus from judgment to development. Rather than functioning solely as an evaluative endpoint, assessment becomes part of an ongoing cycle of feedback and improvement (Carless, 2015). However, as noted earlier, this shift depends on learners' capacity to engage with feedback effectively. The emphasis on learner agency must therefore be accompanied by explicit support for the development of evaluative judgement (Tai et al., 2018).

Importantly, the framework does not resolve the tensions identified earlier, but redistributes them. For example, increasing the use of authentic, interaction-based tasks may enhance validity but reduce comparability across learners. Similarly, promoting learner autonomy may support engagement, but also introduce variability in how assessment is enacted. These trade-offs are not shortcomings of the framework, but inherent features of assessment in complex learning environments.

In practice, this suggests the need for hybrid models that combine elements of both traditional and alternative approaches. Rather than eliminating exams entirely, they can be repositioned within a broader system of evidence, where their role is complemented by ongoing, process-oriented assessment. Such models allow for the retention of standardization where necessary, while also incorporating richer forms of evidence that better reflect communicative competence.

A brief scenario illustrates how such a model might convert heterogeneous evidence into a defensible final grade. Suppose an institution requires a single end-of-term mark for an ESL speaking course. A teacher might allocate that mark across three weighted strands: 40% to interactional evidence gathered over the term (recorded pair and group tasks, judged against an analytic rubric for fluency, interactional management, and pragmatic appropriateness), 30% to a portfolio of process evidence (drafts, self-assessments, and responses to feedback), and 30% to a standardized end-of-term task that satisfies the institution's demand for comparability. Because the interactional strand is the least standardized, it is the one most in need of safeguards: at least two interaction samples are rated, a second rater reviews a sample of borderline cases, and the rubric is shared with learners in advance so that judgements remain transparent. Where the standardized task and the interactional record diverge sharply, the discrepancy is not averaged away but flagged for review, prompting the teacher to ask whether the exam under-represented the learner's communicative competence or whether the continuous evidence was inflated by uneven task conditions. The final grade is therefore not a precise calculation but a principled, auditable judgement, with the weighting scheme making explicit how interactional data and institutional metrics have been balanced.

Ultimately, a reconceptualised approach to assessment requires a shift in how assessment is understood: not as a problem to be solved through technical refinement, but as a practice that must be continually negotiated in relation to changing educational goals and contexts. In ESL-oriented environments, where language use is inherently dynamic and situated, this negotiation becomes central to the design of meaningful and credible assessment systems.

5. Conclusion: Reframing Assessment in the EFL-to-ESL Transition

The transition from EFL to ESL contexts represents more than a shift in language policy; it entails a fundamental rethinking of what it means to know and use a language. As

communicative competence becomes the central goal of language education, assessment practices must evolve to reflect this shift. Traditional exam-based systems, while efficient and standardized, may no longer be sufficient to capture the complexity of language use in real-world contexts.

No-exam classrooms offer a compelling response to this challenge by emphasizing continuous, evidence-based assessment aligned with learning processes. However, as this paper has argued, they should not be viewed as a complete replacement for exams, but as part of a broader reconceptualization of assessment. They highlight important limitations of traditional systems, but also introduce new tensions related to reliability, workload, learner readiness, and institutional constraints.

In the context of the EFL-to-ESL transition, the key challenge is not whether to retain or remove exams, but how to design assessment systems that are both pedagogically meaningful and institutionally viable. This requires a shift from viewing assessment as a tool for measurement to understanding it as a complex, context-dependent practice that supports learning while maintaining credibility.

Ultimately, the future of TESOL assessment lies not in choosing between exams and no-exam approaches, but in developing integrated systems that balance competing demands. By acknowledging and engaging with these tensions, rather than attempting to eliminate them, language educators can move toward more valid, equitable, and sustainable forms of assessment in ESL-oriented contexts.

#142 ENGLISH-MAJOR STUDENTS' READINESS FOR REAL WORLD ENGLISH USE IN AN ESL-ORIENTED CONTEXT: A CASE STUDY AT HUFLIT

Loan Nguyen Thi Thanh[1]

Abstract

This study aims to investigate English-major students' readiness for real-world English use in an ESL-oriented context at HUFLIT University, focusing on three dimensions: communicative competence, willingness to communicate, and L2 self-confidence. Data were collected from 160 English-major students using a questionnaire. Descriptive statistics were employed to examine learners' overall readiness and their distribution across the three dimensions. In addition, one-way ANOVA was conducted to explore differences in readiness across academic year and self-rated English proficiency, while Pearson correlation analysis was used to examine the relationships among the three dimensions. The findings revealed that students reported a high level of perceived readiness toward ESL orientation. While no significant differences were found across academic years, the level of readiness varied significantly according to English proficiency levels. Furthermore, strong positive correlations were identified among the three dimensions. These findings suggest that enhancing learners' readiness to use English as a second language requires not only the development of language competence but also the fostering of confidence and a supportive environment that encourages active communication. The study examines perceived readiness rather than actual real-world English performance.

***Keywords*:** learner readiness, ESL-oriented context, willingness to communicate, L2 self-confidence

1. Introduction

English has increasingly become a global means of communication, particularly in academic, professional, and international contexts. In response, language education has gradually shifted from a focus on grammatical knowledge toward the ability to use English for real-world communication. In Vietnam, English has traditionally been taught as a foreign language within the Expanding Circle (Kachru, 1985). However, recent policy developments indicate a shift toward a context in which English is expected to function as a second language across a wide range of educational system (Decision No. 2371/QĐ-TTg, 2025). Despite this orientation, English language education in Vietnam remains largely exam-oriented, with limited opportunities for authentic communication (Nguyen et al., 2018). As a result, learners may not be sufficiently prepared to use English in real-life contexts.

The concern of using English as second language is especially relevant in higher education, where English-major students are expected to become future users. English language instruction in Vietnamese universities is typically divided into English-major and non-English-major programs, with the former placing English as the central focus of study (Hoang, 2010). In order to apply English in various working areas including translation, teaching, and business, English major students are educated not only language skills but also knowledge in linguistic, culture and literature. However, despite this intensive training,

[1]*Nguyen, Thi Thanh Loan (Corresponding author), Lecturer, Department of English Language Studies, Faculty of Foreign Languages, HUFLIT, Ho Chi Minh City, Vietnam; Email: loanntt@huflit.edu.vn*

persistent limitations remain. Studies indicate that only a small proportion of graduates achieve sufficient proficiency for professional use, while others continue to face difficulties in speaking, reading, and writing (Vo et al., 2018; Tran & Nguyen, 2023; Dang et al., 2021).

While previous studies have largely focused on language proficiency and learning outcomes, limited attention has been paid to learners' readiness to use English in real-world contexts. In other words, existing studies in this field have mainly examined what English-major students can do linguistically, while this study examines whether they feel ready to use English beyond the classroom in an ESL-oriented context. Moreover, little is known about whether English-major students, who are expected to function as future users of English, are adequately prepared for this shift. Therefore, this study aims to investigate English-major students' readiness for real-world English use in an ESL-oriented context.

The current study draws on three research questions:

1. To what extent are English-major students ready for real-world English use in an ESL-oriented context?

2. To what extent does learners' readiness differ across academic year, and self-rated English proficiency?

3. What are the relationships between communicative competence, willingness to communicate, and L2 self-confidence in shaping learners' readiness?

2. Literature Review

2.1. From EFL to ESL in Language Education

Global Context: Early efforts to classify varieties of English in Second Language Acquisition (SLA) research are often associated with Kachru's (1985, 1992) Three Circles model, which categorizes English use into the Inner, Outer, and Expanding Circles, broadly aligning with English as a Native Language (ENL), English as a Second Language (ESL), and English as a Foreign Language (EFL). According to Schneider (2003, 2007), in Outer Circle countries where English functions as a second language, it has been historically institutionalized and is used across various domains of daily life. In contrast, in Expanding Circle contexts, English is typically learned as a foreign language and is mainly confined to formal education, although it may also serve as a lingua franca in international communication. Furthermore, in SLA, a foreign language is introduced as "the learning of a nonnative language in the environment of one's native language", while a second language refers to "the learning of nonnative language in the environment in which that language is spoken" (Gass & Selinker, 2001, p. 5).

However, the distinction between EFL and ESL is fluid and context dependent. A study of International Corpus of Learner English (Gilquin & Granger, 2011) reveals that learners, who are traditionally categorized as EFL users, sometimes experience learning conditions closer to ESL contexts. The blurring is contributed by several factors including academic years, teaching methods, EMI use, teacher input quality, the exposure to English outside the classroom, and English language media access. Therefore, EFL and ESL are better understood as points along a continuum rather than as clear separations.

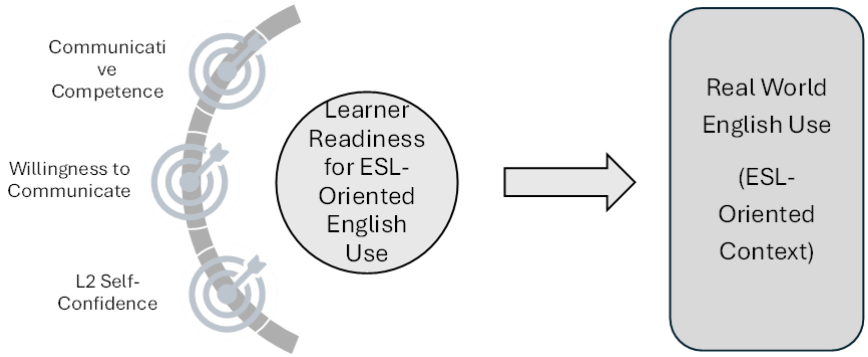
Local Context: Traditionally, Vietnam has been categorized in the Expanding Circle, where English has been taught in school as formal subjects (Kachru, 1985). After the 1986 Economic Reforms, the country increased integration into the global economy, considering English as a tool for economic development and international engagement (Do, 2000). Later,

the National Foreign Language Project 2020 has further promoted English instruction through standardized proficiency benchmarks, and alignment with international frameworks (Nguyen et al., 2018). More recently, a noticeable shift in policy orientation has emerged, the Decision No. 2371/QĐ-TTg, formally introduces ESL within the educational system. According to this direction, English is expected to function as a second language, supporting communication in various domains. This change should be viewed as part of a continuum-based development. However, a key question regarding learners' readiness toward using English beyond the classroom still has been underdetermined.

2.2. English-major Students as Future English Users

In Vietnamese higher education, English language studies are commonly divided into English- major and non-English major programs. While non-English major program is designed for students in different majors using English as a support, English- major students undertake English as the core component of their studies (Hoang, 2010). This program emphasizes the practical application of English in various professional contexts such as translation, education, administration, media, tourism, and international business. Therefore, these students are expected to achieve strong communicative competence across a range of situations, including cross-cultural and international workplaces. During four academic years, they are trained to integrate language skills with many soft skills in respond to the demand of globalization. In fact, they are considered as future English users who English as a tool for international communication and collaboration.

However, only a small number of English- major graduates reach a level sufficient for professional use. Particularly, students find difficulties with speaking because of limited exposure to authentic communicative environments (Vo et al., 2018). They also have struggle with reading comprehension due to the lack of vocabulary, background knowledge, and motivation (Tran & Nguyen, 2023). In addition, current studies indicate such English- major students' challenges in linguistic competence in their overall communicative ability (Dang et al., 2020). These limitations can be explained by the remains of exam-oriented, grammatical accuracy and test performance emphasis (Nguyen et al, 2018). The lack of real-life English environments further constrains their ability to use the language confidently and effectively as a second language. These current conditions raise a controversial question: While there is an increasing effort on ESL-oriented use of English in Vietnamese educational system, whether English- major students are fully prepared for the demands of ESL-oriented context?



2.3. Learner Readiness for Real-world English Use

Learner readiness is commonly defined as learners' ability to acquire knowledge and initiate behavioral changes that lead to effective learning outcomes (Chorrojprasert, 2020). Conceptually, learner readiness is a multidimensional construct encompassing both psychological–educational and developmental dimensions (Lightbown & Spada, 1999). The former involves learners' cognitive abilities, motivation, attitudes, and self-regulation, while the latter refers to their stage-based capacity to process and acquire linguistic features in sequence.

Building on this perspective, this study adopts a conceptual framework in which learner readiness toward an ESL-oriented paradigm is conceptualized as the integration of communicative competence, willingness to communicate, and self-confidence use of English in real world communication.

Figure 1

Conceptual framework of learner readiness for ESL-oriented English use.

The three dimensions are not independent constructs but dynamically interact to shape learners' readiness for real-world English use. Communicative competence provides the linguistic and sociocultural resources necessary for effective communication. However, possessing competence alone does not guarantee actual language use. Learners must also perceive themselves as capable of communicating successfully. In this sense, communicative competence can foster L2 self-confidence because learners who believe they have adequate language ability are more likely to feel secure in engaging in interaction. Higher levels of self-confidence, in turn, tend to increase learners' willingness to communicate, as confident learners experience less anxiety and are more prepared to initiate and sustain conversations. Willingness to communicate then serves as the immediate antecedent of actual language use by activating learners' linguistic resources in authentic situations. Therefore, learner readiness in an ESL-oriented context should be understood as the result of a dynamic interplay among competence, confidence, and willingness to communicate rather than the product of any single dimension.

Communicative competence refers to the ability to use English in real life situations successfully. According to Savignon (2018), language proficiency should be evaluated based on learners' ability to communicate in meaningful contexts rather than grammatical or lexical tests. This ability varies depending on communicative purposes and practical contexts. Therefore, it requires learners to initiate interaction and respond appropriately in authentic situation (McGroarty, 1984). Although communicative competence includes sociocultural norms and patterns of interaction within the target language community, without supporting factors, having such ability does not ensure that learners will use language effectively (Clément, 1980).

The second dimension of learner readiness in an ESL-oriented context is willingness to communicate, which is considered as one of the most predictors of actual L2 use. Learners who are willing to communicate tend to join in interaction and practice the target language actively (MacIntyre et al., 1998). Therefore, this factor has been positioned as a primary goal of ESL education because the aim of this orientation is to encourage learners to use English for meaningful situations. In this case, willingness to communicate is a bridge between communicative competence and performance. Although communicative competence encompasses linguistics, learners must have willingness to communicate to activate these competencies in real interaction (Scarcella et al., 1990).

Although willingness to communicate is significant, it strongly depends on learners' level of L2 self-confidence, which can be understood as learners' perception of their own competence and ability to successfully use the target language (Tunçel, 2015). Self-confidence

reflects both self-assurance and cognitive evaluation of one's communicative capability. Learners who perceive themselves as good communicative competence tend to engage in interaction because self-confidence has been identified as a key predictor of willingness to communicate (Bensalem & Thompson, 2021). In ESL-oriented contexts, self-confidence becomes more crucial because without such confidence, learners' ability to translate linguistic knowledge into meaningful communication may be constrained.

3. Methodology

To capture the general pattern of learner readiness, this study adopted a quantitative research design. A quantitative approach was considered appropriate because the study aimed to measure students' perceived readiness across three predefined dimensions and to examine differences and relationships among variables in a systematic and objective manner. The use of a survey enabled the collection of standardized and quantifiable data from a relatively large number of participants, thereby facilitating statistical comparisons across groups and identifying relationships among communicative competence, willingness to communicate, and L2 self-confidence.

Participants

The participants of this study were 160 English-major students at HUFLIT, regardless of gender, academic year, or self-rated English proficiency. A convenience sampling approach was employed because it enabled access to available participants within the institutional context and facilitated data collection from a relatively large number of students. However, because participation depended on accessibility and willingness to participate, the sample cannot be considered fully representative of all English-major students at HUFLIT or of Vietnamese English-major students in general. Therefore, the findings should be interpreted within the specific context of the present study.

Instrument

This study used a bilingual survey presented in both English and Vietnamese to ensure clarity and facilitate participants' comprehension. There were two main sections, in which section two included three sub dimensions. Initially, there were 21 items in the survey. However, after piloting and cleaning, the final number of included items was 17.

Table 1.

Structure of Survey After Pilot

Survey (17 items in total)

Demographic Information (3 items)			Learner Readiness (14 items)		
Gender (1 item)	Academic Year (1 item)	Self-rated English Proficiency (1 item)	Communicative Competence (4 items)	Willingness to Communicate (5 items)	L2 Self-Confidence (5 items)
			Cronbach's alpha = .732	Cronbach's alpha = .924	Cronbach's alpha =.895

The first sections included 3 items. These items were used to collect demographic information, including gender, academic year, and self-rated English proficiency. Reponses from these items provided background information about the participants and supporting the description of the sample.

The second section of the questionnaire focused on measuring learners' readiness for real-world English use. This section employed a 5-point Likert scale ranging from strongly disagreement to strongly agree. The survey items were developed based on the study's conceptual framework, and were organized into three dimensions: Communicative competence, willingness to communicate, and L2 self-confidence. Initially, this section consisted of 18 items, with 6 items for each dimension. Then, a pilot study was conducted to evaluate the clarity and comprehensibility of the items, as well as the reliability of the scale. Based on the pilot results, 3 items were removed to ensure that the Cronbach's alpha for each dimension exceeded 0.70 and that no corrected item–total correlation fell below 0.30.

Data Analysis Process

Firstly, the data collected were analyzed using IBM SPSS Statistics version 27. First, the internal consistency of the survey was re-examined using Cronbach's alpha, with all scales demonstrating acceptable reliability (Cronbach's alpha >.7).

Secondly, descriptive statistics, including mean scores and standard deviations, were calculated to determine the overall level of learners' readiness for real-world English use. The analysis was then extended to compare mean scores across the three dimensions to identify the most and least developed aspects of readiness.

Thirdly, a one-way ANOVA was conducted to examine whether there were statistically significant differences in learners' readiness across different groups including academic years and English self- rated proficiency level.

Finally, correlation analysis was employed to explore the relationships among communicative competence, willingness to communicate, and L2 self-confidence of learners' readiness.

4. Results

Reliability Check

The internal consistency of the three dimensions was examined using Cronbach's alpha. The results showed that all constructs demonstrated high levels of reliability, with alpha coefficients exceeding the recommended threshold of 0.70, ranging from .833 to .906. In addition, all items across the three dimensions reported Corrected Item–total Correlations above 0.30, indicating that each item contributed meaningfully to its respective construct. Overall, these findings confirm that the instrument is reliable and appropriate for further statistical analysis.

Descriptive Analysis

The overall mean score of students' readiness for real-world English use was 3.73 (SD = 0.70), indicating a high level of readiness. However, the standard deviation suggests a certain degree of variation, which showed that not all learners demonstrate the same readiness level.

Table 2

General Learner Readiness for Real-World English Use

Dimensions of Learner Readiness	N	Min.	Max.	Mean	SD
Communicative Competence	160	2.00	5.00	3.7188	.68322
Willingness to Communicate	160	1.6	5.00	3.8925	.75565
L2 Self-Confidence	160	1.4	5.00	3.5662	.85773

Overall	160	2.17	5.00	3.7258	.70058

As shown in Table 2, learner readiness varies across three dimensions. While willingness to communicate has the highest mean score (M = 3.89, SD = .76) and followed by communicative competence dimension (M=3.72, SD=.683), L2-self-confidence positions at the bottom of the rank (M = 3.57, SD = .86). This pattern suggests that although learners are generally willing to engage in communication, they still lack confidence of using English in real world context. The result highlights the role of psychological factors in shaping English using behavior.

One-way ANOVA Analysis

Regarding academic year, Levene's test confirmed that the assumption of homogeneity of variances was met (p = .817). The one-way ANOVA showed no statistically significant difference in overall readiness among students from different academic years (F (3, 156) = 1.54, p = .206).

Post-hoc analysis using Tukey's HSD test also revealed no significant differences between any pairs of groups (all p > .05), suggesting that students' readiness remains relatively consistent across academic years.

Table 3

One-way ANOVA by English Proficiency Level

Proficiency Level	N	Mean	SD
Beginner	6	3.6667	1.044
Intermediate	88	3.5617	.6841
Upper-intermediate	61	3.8973	.6123
Advanced	5	4.5933	.5648
Total	160	3.7258	.7006
One-way Anova		F=5.895	p<.001

In contrast, a significant difference was found across levels of self-rated English proficiency. Levene's test indicated that the assumption of homogeneity of variances was satisfied (p = .094). The ANOVA results revealed a statistically significant difference among the groups (F (3, 156) = 5.90, p < .001), indicating that learners' readiness varies according to their English proficiency levels.

Post-hoc analysis using Tukey's HSD test showed that students at the intermediate level reported significantly lower readiness compared to those at the upper-intermediate (p = .016) and advanced levels (p = .006), while no significant differences were found among the remaining groups.

Correlation Analysis

Table 4

Pearson Correlations among Learner Readiness Dimensions

	Communicative Competence	Willingness to Communicate	L2 Self-Confidence
Pearson Correlation	1	.721**	.781**

Communicative Competence	Sig. (2-tailed)		.000	.000
Willingness to Communicate	Pearson Correlation	.721 **	1	.756**
	Sig. (2-tailed)	.000		.000
L2 Self-Confidence	Pearson Correlation	.781**	.756**	1
	Sig. (2-tailed)	.000	.000	

***. Correlation is significant at the 0.01 level (2-tailed).*

Pearson correlation analysis was conducted to examine the relationships among the three dimensions of learner readiness. The results revealed significant positive correlations among all variables ($p < .001$). Specifically, communicative competence was strongly correlated with willingness to communicate ($r = .721$, $p < .001$) and self-confidence ($r = .781$, $p < .001$). In addition, willingness to communicate was also strongly associated with self-confidence ($r = .756$, $p < .001$).

The three dimensions are interconnected closely and the relationship among them is positive, which demonstrates the study's conceptual framework. Based on this finding, learner readiness is a multidimensional construct where communicative competence, willingness to communicate, and L2 self-confidence influence each other.

5. Discussion

RQ1

English-major students' readiness for real-world English use

The findings suggest that English-major students at HUFLIT generally perceived themselves as being ready for real-world English use. The relatively high level of perceived readiness may reflect students' positive learning experiences and their exposure to communicative activities during their studies. Therefore, these explanations should be considered tentative rather than definitive conclusions. As Chorrojprasert (2020) explains in a similar study conducted in Thailand, rather than staying focuses on language knowledge, creating a real communicative environment and motivate learners to take part in is the core idea to push their readiness in practicing language.

The comparatively lower level of L2 self-confidence deserves particular attention. Although students reported a high willingness to communicate, limited confidence may prevent them from translating this willingness into actual language use. Learners may be psychologically prepared to engage in communication but still hesitate to participate in authentic interactions because they doubt their linguistic abilities. This finding suggests that willingness to communicate alone is insufficient to ensure real-world English use if learners do not perceive themselves as capable language users.

However, the variation among learner readiness indicates a uniform distribution. While large numbers of learners have well-prepared in English using, some of them still face challenges when shifting from English used in classroom, EFL, to a more authentic English beyond the classroom, ESL-oriented environment. Therefore, readiness for English real-world communication is a complex construct that combines not only linguistic competence but also psychological and contextual factors.

RQ2

Learner readiness differs across academic years and English proficiency

The level of leaner readiness toward using English in real-world context does not develop effectively in a linear manner because the findings show there is no significant differences within learners' year of study. It demonstrates that even senior students might have less readiness than junior students if they remain a limitation of authentic communication opportunities. In other words, simply advancing through academic years within a training program does not automatically translate into greater preparedness for using English as a second language.

In contrast, there is a great difference across self-rated English proficiency levels which is noted as one of a critical factor in shaping learner readiness. Students, who determine themself at the beginner and intermediate level, report lower readiness compared to those, who refer themselves as upper-intermediate and advanced English user. This is because perception can shape decision making (Delgado, 2021). When learners believe that they have good control over their language, they are more likely to feel confident and engage in communication. In contrast, learners with lower proficiency evaluation may experience hesitation that might hinder their willingness to communicate. Rather than indicate the practical English proficiency of learners, the finding focuses on the way they self-evaluate their L2 capacity. Their real current English level might not as the same as they are self-rated, but it reflects their belief about their ability leading to their willingness to communicate. This finding aligns with MacIntyre's (1994) Willingness to Communicate model, referring that when learners perceive their communicative competence, they tend to decrease the communication anxiety and increase communicative motivation, resulting in ready to raise their voices.

Overall, the significant factor to improve learner readiness here is the combination of language competence and learners' awareness of their ability, rather than relying on academic progression.

RQ3

The relationships between communicative competence, willingness to communicate, and L2 self-confidence in shaping learners' readiness

Learner readiness should not be considered as a single construct because there is a strong positive relationship among three dimensions. Particularly, communicative competence is a central dimension that leads to confident feeling and engagement in communication. For instance, when learners aware of their English competence, they belief that they can use English effectively. This motivation plays as a momentum that push learners to participant in real English communication context. The more they are willing to engage in such situations, the more readiness they are building. This interconnection supports the assumption that linguistic ability and perception set a foundation upon other behavioral factors are built.

The strong association between self-confidence and willingness to communicate further highlights the importance of psychological factors in SLA. Even when learners have well-prepared linguistic knowledge, their confident feelings might heavily affect their communicative engagement. Based on the findings of this study, self-confidence acts like a facilitator that encourages learners to activate their language abilities into practical communicative behaviors. Therefore, enhancing learner readiness toward using English as second language requires not only language competence improvement but also supportive environment where learners can foster their confidence.

Furthermore, it is important to note that proficiency in the present study was self-rated rather than objectively measured. Therefore, the significant differences across proficiency groups may reflect students' perceptions of their own language ability rather than their actual

level of English proficiency. This interpretation strengthens the theoretical argument of the study because perceived competence is closely associated with L2 self-confidence and willingness to communicate. Learners who believe they are competent are more likely to feel confident and engage in communication, regardless of their objectively measured proficiency.

The findings of this study provide several pedagogical implications for English language education in ESL-oriented contexts. First, language programs should move beyond an exclusive focus on linguistic competence and place greater emphasis on developing learners' confidence and willingness to communicate. Teachers should create supportive and low-anxiety environments where students can use English meaningfully without excessive concern about making mistakes. Second, because academic year was not significantly associated with readiness, English programs should integrate authentic communication opportunities across all years of study rather than assuming that readiness will develop naturally over time. Finally, since students with lower self-rated proficiency reported lower levels of readiness, additional support should be provided through scaffolded communicative activities, gradual exposure to real-world English use, and confidence-building strategies that encourage active participation in communication.

6. Conclusion

The findings suggest that English-major students generally perceived themselves as being ready for real-world English use. However, the study does not provide direct evidence regarding the effectiveness of the curriculum or instructional practices that may contribute to such perceptions. Within three dimensions, willingness to communicate emerged the most developed, suggesting that current pedagogical approach has included friendly environment where learners feel free to practice English. In addition, the difference across English proficiency levels highlights the need to pay attention to learners' linguistic capacity improvement because it is also one of main factor that affect their level of readiness. Strong positive correlations among communicative competence, willingness to communicate, and L2-self-confidence further confirm that improving learner readiness needs a combined activation of cognition, affection, and behavior.

The study has three limitations. First, most of the participants employed in this study are students in year 3 and year 4, while students in year 1 and year 2 remain fewer amounts. This unequal distribution might influence the ANOVA results. Second, despite the effort to recruit as many participants as possible in such context, the study was conducted in a single institution, which limits the generalizability of the findings. Therefore, while the findings provide valuable insights into learner readiness in a specific context, they might not fully capture the diversity of experiences across different institutions or learner groups. Third, the significant differences across proficiency levels should be interpreted with caution because the beginner and advanced groups consisted of only six and five participants, respectively, which may have reduced the stability of the statistical estimates.

Improving from current limitation, future research should enlarge the numbers of participants in different institutions to provide a more comprehensive understanding of learners' readiness toward English as second language using. In addition, a qualitative approach, such as interview or classroom observation, should be added to deeper exploration of learners' experiences, perceptions, and challenges in using English in real-world contexts. By combining a mixed-method approach and a larger research scope, future studies can develop holistic understanding and suggest more practical pedagogical implications for supporting learners in ESL-oriented context.

Nguyen, Thi Thanh Loan is a full-time lecturer at the Faculty of Foreign Languages, HUFLIT University, Vietnam. She holds an MA in Education with a major in TESOL and has over 10 years of teaching experience. Her research interests include AI applications in language teaching and English as a Second Language (ESL). She has published in international conference proceedings on language research and teaching with AI. Her current work focuses on students' readiness for real-world English use in ESL-oriented contexts.

#144 ENGLISH PHARMACEUTICAL TERMINOLOGY AT LHU FACULTY OF PHARMACY: CURRENT USAGE, LEARNING DIFFICULTIES, AND PEDAGOGICAL IMPLICATIONS

Nguyen Huu Thinh[1], *Pham Huu Duc*[2]

Abstract

English pharmacology terms become increasingly significant as a means of preparing pharmacy students for both academic study and professional communication in modern health care environments. This research explores the way students at Lac Hong University (LHU) are exposed to and learn English pharmaceutical terms, their problems and difficulties and the methods of teaching which can help to overcome these difficulties. The research is based on a mixed-method approach with questionnaires being filled in by 80 students and semi-structured interviews being conducted with 10 participants (Babar, 2015). The quantitative analysis was based on such factors as exposure and usage of the language, knowledge level, difficulties in studying and difference between academic years, while qualitative analysis was applied to detect certain themes in the respondents' experiences. As for the survey findings, the exposure and usage level is moderate (M = 3.97), while knowledge and confidence are only average (M = 3.03). Learning difficulties are high (M = 4.25). In terms of exposure, the highest was found in the internships or professional observations (M = 4.55, SD = 0.50). On the other hand, from interviews, limited opportunities for practicing, continued dependence on translation, and more contextual teaching were highlighted. For academic years, there is no significant difference in competence in terms of exposure to pharmacy terminology, F (2, 77) = 0.903, p = .410, eta squared = .023. In addition, it is proposed that the teaching of pharmacy terminology should not remain at the level of theoretical exposure but proceed to the stage of practice in professional situations. Pedagogical implications include CLIL-based approach, case-based learning, pronunciation help, scaffolding of ESP module lessons, and appropriate assessments.

***Keywords*:** English pharmaceutical terminology, ESP, CLIL, pharmacy education, learning difficulties, mixed-methods research

1. Introduction

English is one of the principal languages used for science, medicine, and pharmacy purposes. Nowadays, pharmacy students find it necessary to study English textbooks and articles, to obtain drug information and guidelines in English (Aulton & Taylor, 2022; DiPiro et al., 2020; Murphy, 2022). Hence, it is not any more a choice of advantage to be proficient in the terminology of English pharmacy; it becomes essential to succeed at the academic level and prepare for work. Terminology plays an important role in such fields as reading, reporting, prescriptions, advising patients, and communicating with colleagues from other health care specialties. Mistakes in the use of technical terms may cause a lack of understanding, inaccurate communication, and even patient safety issues (Beardsley et al., 2020). The matter becomes more complicated for Vietnamese students in connection with the growing internationalization of health care education.

[1]*Nguyen Huu Thinh, Lac Hong University*
[2] *Pham Huu Duc, School of Languages, International University -- VNU HCMC*

In the case of Lac Hong University (LHU), pharmacy students come into contact with the English terminology via courses in the discipline, reference books, and internship assignments, facilitated by a context of program in which there is provision for professional training facilities (Faculty of Pharmacy, Lac Hong University, 2020). Nevertheless, being in contact with the terms does not mean that they will use them confidently and correctly. Quite a number of students have problems with comprehending, memorizing, pronouncing and using the terms properly.

1.1 Problem statement

While LHU pharmacists' students learn pharmaceutical English vocabulary in the classroom setting, they still have difficulty applying it in a consistent manner in various learning and practice contexts. The acquisition process seems to promote recognition of vocabulary items rather than their context-based use, particularly when the context involves dealing with patients and communicating with colleagues. The pedagogical challenge here is that students learn the vocabulary passively without building communicative skills required for using it in a professional setting (Beardsley et al., 2020; Rutter, 2021).

1.2 Research objectives

The research was carried out in order to investigate the use of pharmaceutical terminology in English by pharmacy students at LHU, to determine the problems associated with acquisition and use of pharmaceutical terminology by the students, to examine the students' perceptions of their acquisition and use of pharmaceutical terminology, and to make some pedagogical suggestions.

1.3 Research questions

The study addressed the following questions:

1) What difficulties do students encounter in learning and using pharmaceutical terminology in academic and practicum settings?

2) What are students' perceptions of learning and using English pharmaceutical terminology?

1.5 Delimitations

The research is limited to pharmacy students in the Faculty of Pharmacy at Lac Hong University. The research examined the use, comprehension, and difficulties in learning English pharmaceutical terminology. The results of the quantitative data collection were gathered from questionnaires while the results of the qualitative data collection were from interviews. Hence, the research is not meant to measure the level of competence in terminology or generalize across all pharmacy students in Vietnam.

2. Literature review

2.1 Pharmaceutical terminology

Pharmaceutical terminology means the specific linguistic framework employed in describing drugs, dosage forms, mode of action, methods of manufacture, pharmacokinetics, and applications of drugs in treatment (Aulton & Taylor, 2022; Arnold, 2020). Pharmaceutical terminology is normally characterized by precision, systematicity, and international use, but at the same time, it is challenging for students since it is characterized by complex vocabulary, which has its origins in the Latin and Greek languages (Chabner, 2023; Duy, 2025). Besides, most of the pharmaceutical terms are not only used as labels, but they also convey vital conceptual distinctions (Allen & McPherson, 2023; DiPiro et al., 2020).

Another problem is the complexity and accuracy of professional language. In pharmacy, even slight discrepancies in the use of terms can point to significant discrepancies in the route of administration, drug formulation, contraindications, or interactions (Preston, 2019; Aulton & Taylor, 2022). For international students who use English as their second language, the problem is intensified by the requirement to comprehend all these factors at once.

2.2 ESP and terminology learning

The English for Specific Purposes (ESP) focuses on the learning process in terms of its direct relation to the needs of learners both in academic and professional spheres. For pharmacy studies, ESP could assist in teaching technical language, not through mere memorizing wordlists, but through its application in real practices of reading, discussion, report writing, and other actions typical for pharmacists' profession (Babar, 2015; Beardsley et al., 2020). Also, an approach to learning through ESP pays much attention to the needs analysis, task authenticity, and communication purposes. For the case of pharmacy students, the target language domain would be specific for the discipline rather than everyday conversation (Babar, 2015). Thus, good ESP assistance would bridge the gap between lexical competence and actual language use through the practical application of the terminology.

2.3 CLIL and pharmacy education

CLIL is another effective approach that can be considered as it combines content and language learning. In pharmacy education, CLIL may comprise using English materials, bilingual teaching, or performing certain tasks which require processing and conveying of disciplinary content in English (Allen & McPherson, 2023; Mahato & Narang, 2018). It is quite appropriate for such situations when professional knowledge becomes available through international resources. CLIL is an effective pedagogical approach as it does not perceive language learning as a separate activity from content learning. On the contrary, it stimulates learners to acquire content and language at the same time. In case of pharmacy education, such an approach can help to promote more in-depth involvement in learning terminology as it will allow placing terms into the context of problem-solving and analysis (Allen & McPherson, 2023; Mahato & Narang, 2018).

2.4 Related studies

Research and professional literature have found that terms in the medical and pharmaceutical field tend to be challenging due to their length, morphology, pronunciation challenges, and contextual understanding (Chabner, 2023; Bonsell, 2024). In addition, they have pointed out that a theory-driven approach does not ensure that students will be adequately prepared for professional communication when it comes to terminology (Beardsley et al., 2020; Rutter, 2021). This means that the existing research highlights the common dichotomy between terminology recognition and use as an important challenge. Furthermore, it indicates that terminology acquisition is not only an issue of learning vocabulary but also a larger educational challenge that includes curriculum design, exposure, and practice opportunities (Babar, 2015; Beardsley et al., 2020). This approach is critical for the current study as it provides an understanding of students' challenges from different perspectives.

3. Methodology

3.1 Research design

This study used a mixed methods approach that involved the collection of both quantitative and qualitative data (Babar, 2015). The quantitative method was used for identifying trends in the usage of terminologies, their understanding, and their level of

difficulty, while the qualitative method was used to probe into the experiences of the learners and their explanations.

3.2 Participants

A total of 80 pharmacy students from the Faculty of Pharmacy, LHU were interviewed. Among them, 52 students were females and 28 were males. According to the academic year, 6 students belonged to Year 2, 53 students were from Year 3, and 21 students were from Year 4. Also, 10 interviewees were responsible for the interview data. Based on the interview file, one may assume that those people had some experience related to pharmacists and pharmacological language.

3.3 Research instruments

Two tools were employed in the research. A questionnaire consisting of 20 five-point Likert scale items investigated the frequency of exposure and use, level of understanding and confidence, learning difficulties, and preferred pedagogical assistance forms. Interviews in a semi-structured manner were conducted to explore the perceptions of participants about commonly used terms, contexts of their use, learning difficulties, opportunities to practice, teaching methods, and improving instructions. The questionnaire was divided into four major themes: frequency of exposure and use (Questions 1-5), self-perceived understanding and confidence (Questions 6-11), learning difficulties (Questions 12-17), and pedagogical preferences (Questions 18-20).

3.4 Reliability and validity considerations

Reliability and validity measures for the instrument need to be provided for the paper to be suitable for publication (Babar, 2015). Based on preliminary reliability estimates for the present dataset, the instrument demonstrates low values of internal consistency across several different groups of items. For instance, Cronbach's alpha is equal to 0.049 for all 20 items of the questionnaire, 0.109 for the five items that refer to exposure and use, -0.395 for the six items measuring understanding and confidence, 0.174 for the six items on the difficulty level, and -0.043 for the three items assessing pedagogical support. These numbers indicate that one should not treat the instrument as a reliable unified scale now. This matter should be addressed. If the paper is published in a journal in the future, one needs to demonstrate additional proof of content validity, piloting, and re-development of the items and the scales before making claims regarding the psychometric properties of the instrument.

3.5 Data analysis

Descriptive statistics such as mean, standard deviation, frequencies, and percentages were used for quantitative data analysis. An analysis was carried out comparing the students' year levels in the case of the self-reporting understanding/confidence composite variable. The one-way analysis of variance technique was used to determine whether there is a significant difference in self-reporting competencies in terms of academic years. Thematic analysis was used for qualitative data. As opposed to coding all utterances in the qualitative interview process, the analysis focused on recurring themes concerning memorizing, pronunciation, translation, practice, reading, speaking, internship, and suggestions for improvement.

4. Findings

4.1 Difficulties students encounter in learning and using pharmaceutical terminology

The survey reveals four key trends. First, the participants claimed a fairly high level of exposure and usage of English pharmacological terms (M = 3.97). Second, self-assessed levels

of comprehension and mastery of the knowledge were quite average (M = 3.03). Third, the difficulties of acquiring knowledge were very high (M = 4.25). Fourth, there was a high demand for pedagogical assistance (M = 4.21). It can be concluded that frequent encounters with terminology do not guarantee comprehension and proficiency in it.

4.2 Frequency and contexts of terminology use

Students reported different levels of exposure in different contexts, as can be seen in Table 1.

Table 1

Contexts of terminology exposure and use (N = 80)

Context	M	SD
Specific subjects	3.61	0.49
Reading textbooks or study materials	3.54	1.01
Practical courses or laboratories	3.56	0.87
Internship or professional observation	4.55	0.50

The highest mean score was observed in internship or professional practice (M = 4.55, SD = 0.50). In this respect, it can be concluded that the exposure to English drug terminology is most intense in a situation where students are getting nearer to professional practices. At the same time, the mean scores for other academic disciplines, books, and practical disciplines were less intense. Therefore, one can assume that terminology becomes particularly relevant when students are dealing with professional activities.

4.3 Self-reported understanding and confidence

The students' level of understanding and confidence lagged behind the amount of exposure that they had received. The composite of the six items on understanding and confidence was classified into broad bands of performance as shown in Table 2.

Table 2

Distribution of self-reported understanding and confidence

Level	Frequency	Percentage
Very poor	0	0.0
Poor	4	5.0
Average	72	90.0
Good	4	5.0
Very good	0	0.0

The highest percentage of students belonged to the average category (90%), and only 5% belonged to the 'good' category and 5% belonged to the 'poor' category. None of the respondents belong to the category of 'very good' and 'very poor'. It is evident that there is a concentration towards the middle category: students have knowledge about the terms used in pharmaceuticals, but very few of them think they are proficient or not proficient.

4.4 Learning difficulties

The survey identified several major difficulties, as this can be seen in Table 3.

Table 3

Main learning difficulties

Type of difficulty	M	SD	Rank
Pronunciation	4.51	0.50	1
Using terms in practical contexts	4.42	0.50	2
Memorizing meaning	4.36	0.66	3
English background affects learning	4.24	0.68	4
Distinguishing similar terms	4.21	0.76	5
Limited access to specialized literature	3.76	0.92	6

Pronunciation was identified as the top rated difficulty (M= 4.51, SD = 0.50) followed closely using the terminology in practical situations (M= 4.42, SD = 0.50) and memorization of meaning (M= 4.36, SD = 0.66). This indicates that the difficulty does not lie just in the identification of the technical terminologies when presented in written form.

4.5 Comparison across academic years

A comparison of the understanding/confidence composite in different academic years shows only small differences, as can be seen in Table 4.

Table 4

Self-reported understanding and confidence by academic year

Academic year	N	M	SD
Year 2	6	3.11	0.36
Year 3	53	3.00	0.30
Year 4	21	3.08	0.24

This descriptive pattern reveals very little difference in values from year to year, where Year 2 students have a mean value of 3.11, Year 3 students have 3.00, and Year 4 students have 3.08. To investigate if these differences were significant, a one-way ANOVA test was performed, which is shown in Table 5.

Table 5

ANOVA for self-reported understanding and confidence by academic year

Source	SS	df	MS	F	p	eta squared
Between groups	0.148	2	0.074	0.903	.410	0.023
Within groups	6.321	77	0.082	—	—	—
Total	6.469	79	—	—	—	—

ANOVA was not found to be statistically significant with F (2, 77) = 0.903, p = .410. The effect size was small (eta squared = 0.023). Consequently, the working hypothesis

predicting an association between the students' academic year and their perceived terminological competence could not be supported by the data set used.

4.6 Qualitative themes from interviews

The interview data corroborated and expanded upon the survey data. A number of recurring themes emerged from the interview responses. The first theme was the importance of practice. Practice-related terminology was very frequent in the interview corpus, which indicates that the lack of practice opportunity is an important issue. The second theme was memorization and remembering, which is consistent with the survey data that indicated remembering meaning to be an important difficulty. The third recurring difficulty from the interviews was pronunciation, which corroborates the quantitative result that pronunciation is the greatest difficulty among all difficulties. The fourth issue that emerged from the interviews was the prevalence of references to reading compared to the rare mentions of speaking, which indicates that vocabulary is usually learned receptively rather than interactively. Finally, translation and bilingual terminology were mentioned as an issue multiple times, corroborating the survey results that indicate that the use of English - Vietnamese terminology helps both students and teachers learn new words. Overall, these themes prove that the terminology learning difficulties are not merely lexical in nature, but also pedagogical and situational

5. Discussion

For addressing the first research question, the results point to rather high exposure to the English pharmacy vocabulary used in practice by the participants of the study. At the same time, this frequency is not accompanied by the same level of knowledge and competence. This disparity between the relatively high exposure and use mean (3.97) and considerably lower understanding and confidence mean (3.03) implies that the students perceive vocabulary more easily than they understand, utilize and work with it.

It is significant since pharmacy requires not only awareness of the written terminology but also its correct pronunciation, distinguishing of the related concepts, and proper usage in communication. According to the results of this study, pronunciation, applicability, and memorizing are the top three difficult areas in learning pharmacy terminology. It means that terminology acquisition in this field includes linguistic, conceptual, and communicative aspects (Chabner, 2023; Beardsley et al., 2020). Year-level data was equally illuminating. Early versions of the manuscript assumed that students at higher levels of academic year would perceive themselves as more competent owing to accumulated experience. The present data set, on the other hand, indicates small and non-statistically significant differences between different years. It should be noted that this does not imply that experience is unimportant. What it implies is that the year level itself cannot necessarily lead to greater perceptions of competence.

Regarding the second research question, one can understand how the interview responses relate to this finding. Students often mentioned lack of practice, dependence on translations, and preference of reading over speaking. Such comments suggest that, despite increased exposure to terms, the process of translating their passive knowledge into active professional usage is not adequately facilitated. It could be used to explain why self-assessment of proficiency was found to be centered around the mean value. The other significant implication relates to the method used for assessment. The poor reliability estimates indicate that questionnaire measures several different constructs, not a stable one. Thus, the results cannot be generalized; however, the instrument can still be used as a descriptive measure.

6. Pedagogical implications

These results have some practical implications on how to teach and design curricula in connection with Targeting pronunciation in a systematic way, increasing realistic practice opportunities, moving away from rote learning techniques, creating scaffolding of ESP, enhancing CLIL-based integration, and assessment aligned with communicative usage.

As far as targeting pronunciation goes, pronunciation is the most highly rated difficulty, so term teaching has to include pronouncing terms systematically and not as an addition. It can involve marking syllables, practicing stress, repeated pronunciation, teacher modeling, sound support, and quick oral check-ups. In the field of pharmacy, the ability to pronounce things correctly is not only language skills but also professionalism (Beardsley et al., 2020).

Regarding using terms in realistic contexts, the application of terms in practical situations turned out to be the second greatest challenge, thus instructors should create assignments where learners have to use the terms in real problem-solving. Discussions of cases, interpreting prescriptions, small role-plays, counselling activities and the interpretation of interactions between medications may be used to bridge the gap between memorization and applying terminology (DiPiro et al., 2020; Preston, 2019; Rutter, 2021).

To move away from memorization approaches only, the results of interviews and surveys show that memorization-based learning processes still dominate in terminology learning. Even though memorization techniques can be helpful when learning technical vocabulary, it should be combined with other skills such as morphological analysis, contextual usage, practicing retrieving and reusing terminology (Chabner, 2023; Duy, 2025).

To provide scaffolding of ESP, the development of the English for Pharmacy module or ESP strand can bring together repeating terms of pharmacology, pharmaceutics, clinical pharmacy, and professional communication in internships. The development of ESP should involve recognition, controlled practice, and performance of simulations in professional practice (Babar, 2015; Beardsley et al., 2020).

For promoting CLIL-based integration, the high frequency of terminology in internships and observations demonstrates that terminology gets meaning only in contextually enriched environment. In this regard, CLIL-based teaching might be helpful in working with pharmaceutical notions and language at once. Subject lecturers might incorporate bilingual glossaries, terminological case tasks, and content-based tasks in English into specialized subjects (Allen & McPherson, 2023; Mahato & Narang, 2018).

In terms of assessment alignment with communicative practice, the assessment is focused mainly on the recall of terms, and students will continue treating terminology learning as the memorization process. At the same time, if the assessment will include explanation, oral reporting, case interpretation, and reformulation of information in patient-friendly language, students might start using terminology productively (Babar, 2015; Beardsley et al., 2020).

7. Conclusion

From this research, it can be seen that the knowledge of the English terminology related to pharmaceuticals is an important component of the pharmacy curriculum at LHU; however, the problem of difficulties in comprehending, remembering, pronouncing, and using specialized terminology remains serious.

7.1 Summary of the main findings

Moreover, it is evident from the findings that the pronunciation, application, and memorization of specialized terms are the biggest obstacles. It must also be noted that the

expected year-level effect was not revealed statistically in the current dataset. Consequently, it can be argued that the proposed paradigm shift towards more practical instruction of terminology is justified. In particular, the following methods seem especially relevant: pronunciation assistance, case approach, scaffolding of ESP, CLIL, assessment.

7.2 Limitations

The following are some of the limitations that need to be taken into consideration. The first is that the study was undertaken within one organization only, hence limiting its generalizability. The second is that the study results are based on self-report data rather than performance measurement. The third is that the sample used for interviews was quite small and should not be considered as representative but as an illustration. The fourth is the lack of reliability of the questionnaire. In other words, the reliability of the questionnaire was quite low. Therefore, the survey can only be viewed as a descriptive instrument rather than as a scale.

7.3 Future research

The studies should consider expanding the investigation to multiple settings and comparing programs with various degrees of English integration. The studies should also incorporate quantitative data on terminological competence, which may take the form of vocabulary tests, pronunciation tests, role-playing exercises, or other performance measures. An experimental study or a quasi-experimental study will be particularly relevant when testing the impact of ESP modules, CLIL-inspired integration, case-based learning, and simulation training on the usage of terminological units (Babar, 2015; Bonsell, 2024). The subsequent studies will need to reconsider and validate the questionnaire used. Through item revision, piloting, and factor analysis, the researchers will be able to ascertain whether terminology exposure, terminology understanding, difficulty of terminological units, and support needs should be considered separate dimensions.

#146 EXPLORING THE EFFECTS OF SPEAKEASY AI APPLICATION ON SPEAKING FLUENCY AMONG FIRST-YEAR ENGLISH-MAJOR STUDENTS AT HUFLIT

Nguyen Thi Huyen Tran[1]

Abstract

AI-powered speaking applications have been gaining more traction in recent years. They are more engaging than traditional ones because they usually come with interactive elements designed to grab learners' attention and motivate them to practice speaking consistently. As such, many teachers have started using tech apps as teaching aids. This research aims to assess the effectiveness of SpeakEasy AI on students' speaking development. SpeakEasy AI is an AI-powered web-based application that allows learners of English to practice speaking through various modes – chatting in real-time with the bot, taking part in speaking simulation tests, and uploading speech audio recordings to get speaking scores. A mixed-method experimental approach was adopted, involving 80 first-year English-major students from HUFLIT who were majoring in English. The experimental group was asked to use SpeakEasy for 12 weeks, while the control group was taught with conventional teaching. Both groups took pre-tests and post-tests and answered questionnaires. The application's effects were measured via statistical analysis and compared with those of traditional teaching methods. Several students were also interviewed to obtain qualitative data. The results showed that students who used SpeakEasy significantly outperformed those in the control group in terms of fluency and overall speaking proficiency. The students who used the app also reported positive attitudes towards the application, especially speaking anxiety reduction and increased confidence. Data from the interview suggested other benefits in addition to improved speaking performance and provided some insights into improving the application. More studies are needed to determine the long-term effect of the application on different populations of EFL learners.

Keywords: SpeakEasy AI app, AI-powered chatbot, speaking fluency, speaking competency, EFL learners.

1. Introduction

1.1 Background and Statement of the Problem

Speaking ability is arguably one of the most crucial components in mastering English as a second language. Not only does speaking underlie most language skills and enable learners to communicate, but it also builds confidence and social skills in students that allow them to thrive in virtually every situation (Baker & MacIntyre, 2000). However, many learners feel uncomfortable and experience anxiety when speaking English. According to Amoah and Yeboah (2021), students hesitate to speak in class because they are afraid of making mistakes that may make them look bad in front of others. They are also worried that their classmates or teachers might give negative feedback. Engeström (2015) suggested that a person's emotional state can influence their ability to express ideas clearly. Feelings such as insecurity, shyness, nervousness, and worry often appear and make students interrupted utterances. He also revealed that another factor contributing to speaking challenges is learners' limited exposure to English-speaking environments as they have few opportunities to practice the language in authentic communicative contexts.

Teachers therefore play an important role in creating a supportive language environment where students feel secure to practice speaking. They can encourage students to speak both inside and outside the classroom by providing different language situations and social contexts. In addition, AI-powered applications can assist students by giving them more opportunities to practice communication. Artificial Intelligence (AI) technologies have been implemented into educational classrooms and have become useful tools to improve speaking proficiency within second language acquisition, such as English as a Foreign Language (EFL). The implementation of AI into EFL can be seen through tutoring systems, speech recognition applications, and virtual conversation partners. By allowing immediate feedback, realistic conversations, and personalized learning, these tools can help overcome existing issues as well as help cultivate oral skills.

In recent years, several applications for practicing English speaking skills have entered the market. The majority of them are based on Automatic Speech Recognition technology (ASR). ASR can provide instant feedback to learners regarding pronunciation and speaking performance. This technology became one of the most frequently used approaches in CALL due to its instant feedback system (Liakin, Cardoso, & Liakina, 2017; McCrocklin, 2016). Applications like ELSA Speak or Duolingo are some of the most popular applications for language learners. However, each application focuses on a particular area of language learning. For example, ELSA Speak has been widely used as an AI-based tool designed primarily to improve learners' pronunciation accuracy through automatic feedback (Karim et al., 2023; Kumalasari & Wulandari, 2025). By contrast, Duolingo focuses more on vocabulary development and basic grammar practice through short, gamified learning activities that encourage repeated practice and learner engagement (Loewen et al., 2019). Although ASR technology allows students to detect and correct pronunciation mistakes, meaningful conversational practice with AI assistants is often only available in premium paid versions. This creates a practical limitation for teachers who want to apply these tools in large classes with diverse groups of students, as not all learners can afford paid subscriptions.

In addition, although speaking chatbots have given way to promoting speaking practice among students because they can create a personalized learning environment (Jeon, 2024), they struggle to simultaneously function as both interactive conversational agents and reliable assessment tools where students can experience standardized test environment and receive comprehensive evaluation. Specifically, they do not offer students a centralized environment

in which to complete IELTS-related speaking activities, take the IELTS speaking test, and receive scores based on defined assessment criteria. Students, therefore, have to utilize different applications for IELTS speaking practice and assessment.

SpeakEasy AI was created to overcome these drawbacks. The application aims to simulate, support practice, and evaluate English speaking skills. SpeakEasy AI accomplishes this goal by delivering an AI-driven web-based platform that offers real-time speaking practice and feedback. This allows users to have a genuine speaking experience. SpeakEasy AI can also simulate speaking test environments to help learners prepare for speaking exams and assess them using standard rubrics such as IELTS, VSTEP or custom rubrics.

1.2 Research Objectives and Questions

The purpose of this study is to gain a better understanding of the effectiveness and user experience of the SpeakEasy AI application as a speaking instruction tool through the lens of students' fluency ability in speaking performance and their perspectives.

To achieve the purpose of the study, the following research questions were formulated:

1. To what extent does the SpeakEasy application improve students' speaking fluency?

2. What are the students' perceptions of using the SpeakEasy application in learning speaking skills?

1.3 Significance of the study

This study offers an insight into the effects of integrating an AI-powered application on enhancing the speaking fluency of English-major students in the Vietnamese university context. The study may also provide viable suggestions for educators on how to inccorporate an AI application as a supplementary tool for English speaking practice and test preparation. In addition, the findings of this study will contribute to the growing body of research supporting the integration of AI-powered applications into EFL speaking instruction.

1.4 Scope of the Study

This tudy was limited to examining the effectiveness of SpeakEasy AI application in improving the speaking fluency of first-year English-major students at HUFLIT. It focused on one AI-powered speaking application, one speaking criterion (Fluency and Coherence), one institutional context and over a 12-week intervention. Therefore, the results may not be applicable to students from other academic majors and educational institutions.

2. Literature Review

2.1 Speaking Fluency

Segalowitz (2010) defines speaking fluency as a three-component model consisting of cognitive fluency, utterance fluency, and perceived fluency. The first aspect, cognitive fluency, refers to how efficient speakers can access and process language, involving accessing vocabulary, encoding grammar, and producing sounds for speech. Compared to native speakers, second language (L2) learners' cognitive fluency is less developed because this process is controlled instead of being automatic. The increased cognitive effort leads to greater self-monitoring, slower speech and more frequent pauses. The second aspect, utterance fluency, is a feature that is observable and measurable. It encompasses the number of words or syllables articulated per minute, the quantity of syllables produced between pauses, and how often the speakers pause, hesitate or correct themselves. Cognitive fluency and Utterance fluency can enhance if language proficiency develops. In other words, if speakers have a large

pool of vocabulary, more solid grammar, and have a frequent use of them, they can retrieve the vocabulary and grammar faster and thus limit the frequency and the length of pauses (Tavakoli et al., 2020). Perceived fluency is related to the subjective assessment of listeners about a speaker's fluency, basing on the smooth, natural, and effortless level of the speech.

Some factors which adversely affect speaking fluency include limited linguistic ability such as insufficient vocabulary and grammar, infrequent listening and speaking practice, and a tendency to think in the native language while speaking (Alaraj, 2017). In addition, other affective factors such as the level of anxiety, motivation and learners' attitudes influence how effectively learners express themselves in real conversations. In other words, students' fixed mindset about their language capability and previous negative experiences may discourage them from actively participating in speaking activities (Bárkányi, 2021). In addition, the anxiety in speaking situations can interfere with the ability of learners to retrieve vocabulary automatically and may lead to excessive self-monitoring, thereby impeding cognitive fluency. Pabro-Maquidato (2021) also indicates that heightened anxiety is associated with increased pauses, hesitation, and errors, leading to reduced utterance fluency. Therefore, encouraging a growth mindset and establishing a supportive classroom atmosphere can help alleviate this fear. Brown (2017) highlights that improving fluency requires a supportive and low-pressure environment where learners are exposed to familiar topics, focus on meaning rather than form, and are encouraged to speak at a faster pace.

2.2 The application of AI in the field of EFL speaking instruction

A number of studies have been conducted to investigate the potentials and impacts of AI-powered tools on improving speaking skill. Qiao and Zhao (2023) examined the effects of AI-based instruction integrated with Duolingo application on four main components of speaking skills using IELTS speaking band descriptors: fluency, vocabulary, accuracy, and pronunciation and also the impact on self-regulation. The study was implemented with 93 Chinese EFL students of intermediate level during 13-week course using experimental design and pre- and post-test using standardized IELTS test. The experimental group received AI-based instruction with Duolingo application while the control group attended a traditional speaking course. Results showed that the experimental group performed better than the control group on four components of L2 speaking skills, along with self-regulation. As students practiced speaking repeatedly and reviewed vocabulary, they were able to remember words faster and construct grammatical forms more efficiently.

Celik et al. (2025) examined a very similar premise as they sought to understand if ChatGPT could be used as a virtual speaking tutor for EFL learners to improve speaking performance and self-efficacy. Forty-four sophomore university students enrolled in an advanced English course participated in the study and were randomly assigned to an experimental and control group. Whereas students in the control group received traditional classroom instruction, students in the experimental group practiced speaking with ChatGPT's voice-based conversation feature inside and outside of class. Results indicated that the experimental group significantly outperformed the control group on both speaking performance and confidence in speaking abilities. Additionally, learners shared positive perceptions about the experience, specifically noting flexibility, instant feedback, and repeated practice as benefits of using ChatGPT as a speaking tutor. However, some learners noted that ChatGPT did not offer the emotional support many human teachers provide.

Kang (2022) conducted a study of the impacts of Replika - an AI software offering oral-visual interaction with a 3D avatar on the speaking ability and affective characteristics of 61 ESL learners in an American college. The study employed a mixed-methods approach, in

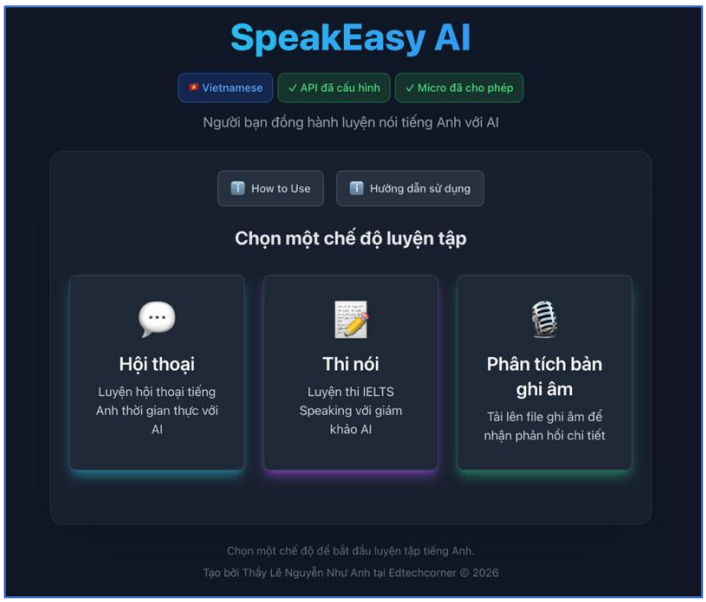
which quantitative data were collected from the speaking tests and questionnaires, and qualitative data were obtained from the in-depth interviews. The findings revealed that both the experimental group using a paid version of the app and the control group interacting with native speakers achieved speaking enhancement, but the former showed more improvement on accuracy, fluency and coherence. Furthermore, learning via the app was found to be more beneficial for low-level students while practicing with native speakers was more effective for the high-level ones. In terms of affective aspects, the low-level students in the EG reported reduced stress and anxiety, as well as increased motivation, all of which were not observed by those in the CG.

Another study by Azizimajd (2023) also examined the effectiveness of Replika app into speaking activities on speaking fluency and Foreign Language Speaking Anxiety of 60 Iranian students of upper-intermediate level in 6 weeks. Experimental design using one-way and two-way ANCOVA was conducted, showing that students practicing with Replika surpassed the conventional class in terms of speaking fluency. In particular, they could produce longer utterances, reduce hesitation and pauses thanks to the tool's interactive and repetitive design. Also, they became less anxious in English speaking.

2.3 Research Gap

Taken together, the existing literature on the integration of AI-powered applications in speaking instruction provides valuable insights into their roles in enhancing many aspects of speaking ablility. Common features such as immediate and customized feedback, interactive learning experiences, real-time interaction and continuous practice have made significant contributions to improving spoken communication skill. In particular, AI-driven applications have been found to develop cognitive fluency (Qiao and Zhao, 2023) and utterance fluency (Azizimajd, 2023). Besides, these tools have been reported to effectively reduce stress and anxiety while boosting learners' motivation and confidence, thereby enabling them to communicate with ease and express ideas comfortably (Kang, 2022; Azizimajd, 2023; Celik et al., 2025). However, learning speaking through AI-based applications proved to to be more effective for low-level students than for the high-level ones (Kang, 2022). It was also observed that AI-driven tools does not provide the same level of emotional support as human teachers and therefore cannot substitute teachers in the language learning process (Celik et al., 2025).

Taking the aformentioned findings into consideration, the existing research on AI-based applications has shown some gaps that need to be tackled. First, while their findings have mainly focused on the overall effectiveness of AI applications in improving speaking ability, little attention has been paid to their impacts on specific sub-component such as fluency. Secondly, the use of interactive conversational feature in many platforms is often restricted to paid versions, making the implementation in large-scale classroom impractical. Another limitation is the lack of IELTS standardized testing environments where learners take IELTS simulated speaking test and receive criteria-based feedback. As a result, learners have to rely on separate platforms for speaking practice and assessment, highlighting the need for the provision of all-in-one solutions. Furthermore, studies investigating the effectiveness of AI-powered speaking applications on speaking fluency among English-major Vietnamese students in university context are still limited, especially those employing a mixed-method approach to explore students' perceptions through both quantitative and qualitative methods.



In response to the identified gaps and given the challenges that the researcher encounters in teaching speaking skill in the current context, this study aims to examine the effectiveness of SpeakEasy AI in enhancing speaking fluency and to capture students' subjective perspectives towards using this technological tool in their English learning.

2.4 SpeakEasy AI application

SpeakEasy AI is a web-based application developed as a part of Edtech Corner, an initiative that aims to bring unique technological educational tools to aid in English Language Teaching and Learning. It utilizes Google GenAI and Gemini 2.5 Flash Model and incorporates native-audio-preview using the live API, which allows audio to be sent and received natively without requiring it to go through text first. SpeakEasy AI aims to provide learners with AI-powered practice, testing and evaluation all in one place. To keep things accessible and affordable to learners, SpeakEasy AI was designed to be free and serverless. All a user needs to do is input their API key (ex. Gemini API).

Figure 1

Screenshot of SpeakEasy AI application

Real-time communication is one of the fundamentals behind SpeakEasy AI. Students can converse with AI-driven agents who provide immediate response, then they receive instant scores and feedback. Evaluation metrics can be preselected based on industry standard frameworks like IELTS or VSTEP or even customized rubrics. Another way to practice with SpeakEasy is through the “Simulated Test” mode, where learners can practice under test-like conditions that mimic conditions for IELTS, VSTEP or customized classroom assessments. This helps students get comfortable with the various test formats and helps them learn how to pace themselves. Learners can also control the difficulty of conversation topics and choose from different AI voices

3.Research Methodology

3.1 Pedagogic settings, Participants and Instrumentation

The research was conducted at Ho Chi Minh City University of Foreign Languages - Information Technology (HUFLIT). The questionnaire survey involved 80 first-year English-major students enrolled in English Listening and Speaking courses. These classes were assigned by the Department of Foreign Languages during Semester 1 of the 2025–2026

academic year. One class served as the experimental group and the other as the control group, with 40 students in each. Both groups followed the same course structure, attending weekly sessions lasting three hours over a 12-week period.

In class, students received topic-based vocabulary words, focused grammar structures, and speaking instruction. Students were then given homework to practice speaking questions taught in class as well as a model IELTS speaking question on that topic. Students in the experimental group practiced speaking outside of class using the SpeakEasy AI app. They completed speaking activities on the app that were automatically scored and given feedback based on IELTS speaking criteria. Students submitted notes of their conversation with the chatbot as well as generated feedback from the app as a Word doc through Moodle for the instructor to track their progress outside of class. Students in the control group took a traditional approach to practicing and assessing speaking. Students recorded themselves speaking and submitted their spoken responses as audio files on Moodle for the instructor to assess using IELTS-based marking criteria..

3.2 Research design

The study employed a quasi-experimental mixed-methods design, combining quantitative evidence from pre- and post-tests with qualitative data from questionnaires and interviews to examine both the impacts of SpeakEasy AI on students' speaking fluency and their perceptions of the tool.

3.3 Data collection

3.3.1 Pretest and Posttest

The study employed a pre-test and post-test to measure the effectiveness of the intervention, using IELTS speaking assessment. The speaking questions in the pre-test and post-test were selected from the Cambridge Practice Test. Students' performances were evaluated based on the official IELTS speaking band descriptor (see Appendix 1) across four criteria: fluency and coherence, lexical resources, grammatical range and accuracy and pronunciation. For the purpose of statistical analysis, the scores related to "fluency and coherence" criterion were extracted.

The pretest was implemented after students had completed their first speaking lesson in order to minimize potential bias caused by students' unfamiliarity with test format. The posttest was conducted on the last day of the course. To enhance scoring reliability, all responses were recorded and subsequently assessed by a second rater - another lecturer who is also an experienced IELTS instructor. The Correlation between the scores given by the two raters are shown in the following tables.

Table 1

Correlation between pre-test scores given by two raters (n = 80)

	Rater 1	**Rater 2**	**Sig. (2-tailed)**
Rater 1	1	0.907	< 0.001
Rater 2	0.907	1	

Table 2

Correlation between post-test scores given by two raters (n = 80)

	Rater 1	Rater 2	Sig. (2-tailed)
Rater 1	1	0.927	< 0.001
Rater 2	0.927	1	

The Pearson correlation analyses showed that the correlation coefficients for both the pre-test and post-test scores assigned by the two raters exceeded 0.9 ($p < .001$). These findings indicate a strong positive relationship, reflecting a high degree of consistency in the raters' scoring. Therefore, the averaged scores from the two raters were considered reliable and objective for further statistical analyses, minimizing the potential influence of differences in rater scores.

3.3.2 Questionnaires

To explore students' perspectives on SpeakEasy AI, a questionnaire was developed using Google Form. It was structured into three section: Section 1 - Demographic information, Section 2 -Students' Perspectives on the effectiveness of SpeakEasy AI, Section 3 - Students' motivation when using SpeakEasy AI. The survey was implemented online, and its internal consistency was evaluated using Cronbach's alpha, as shown in the following table.

Table 3

Reliability of the Questionnaire (n = 40)

Part	Number of items	Cronbach's Alpha
Part II: Effectiveness of SpeakEasy AI	12	0.89
Part III: Motivation	6	0.86

The results of the reliability analysis indicates that all Cronbach's alpha coefficients exceeded 0.70. This demonstrated satisfactory reliability and strong internal consistency of the questionnaire, ensuring the suitability of the instrument used in the study.

3.3.3 Interview

The aim of the interviews was to examine learners' attitudes toward using SpeakEasy AI application for speaking practice, especially its effects on fluency. A structured format was used, in which all participants responded to the same set of questions in a consistent order. Five students were randomly chosen and labeled S1 to S5, and individual online interviews were conducted via Microsoft Teams to ensure privacy and encourage open sharing.

4. Findings

4.1 Fluency and Coherence Pretest and Posttest

4.1.1 Independent sample t-test of pretest results.

A descriptive statistics and an Independent samples t-test were employed to analyze the pre-test scores of the criterion "fluency and coherence" between the the control group (CG) and experimental group (EG) as presented in the following table. Before conducting the analysis, the assumption of normality was checked through Normal Q-Q plots. The plots indicated that the data from both groups were approximately normally distributed, suggesting that the requirement for parametric testing was satisfied.

Table 4

Descriptive Statistics of the Groups (n = 80)

Group	Sample size	Mean ± Standard Deviation
CG	40	5.03 ± 0.48
EG	40	4.89 ± 0.4

Table 5

Independent t-test results for Pre-test scores between the two groups (n = 80)

	Mean Difference	t	df	p (2-tailed) (sig.	95% CI
Equal variances assumed	0.13	1.37	78	0.17	(-0.06; 0.33)

** Levene's test for equality of variances: F = 0.42, p (sig.) = 0.51 (> 0.05), variances are assumed equal).*

The Levene's test produced a p-value of 0.51, which was higher than 0.05, indicating that the score variances of the two groups were similar. Therefore, the assumption of equal variances for the independent samples t-test was satisfied.

Independent samples t-test resulted in a t-score of 1.37 with 78 degrees of freedom and a p-value of .17. Because the p-value was greater than .05, there was no statistically significant difference between the experimental group's pre-test scores (M = 4.89, SD = 0.40) and the control group's pre-test scores (M = 5.03, SD = 0.48). Therefore, students in each group were similarly fluent and coherent prior to the intervention.

4.1.2 Independent sample t-test of posttest results.

An independent samples t-test was conducted for comparing EG and CG based on their post-test scores in the "fluency and coherence" criterion to check the efficacy of the proposed method. Normal Q-Q plots were employed to verify the normality assumption prior to running the statistical analysis. The results indicated that the score distributions were approximately normal in both groups which allowed parametric tests to be conducted.

Table 6

Descriptive Statistics of the Groups (n = 80)

Group	Sample size	Mean ± Standard Deviation
CG	40	5.48 ± 0.46
EG	40	5.86 ± 0.49

Table 7

Independent t-test results for Post-test Scores between the two groups (n = 80)

	Mean Difference	t	df	p (sig. (2-tailed)	95% CI
Equal variances not assumed	-0.38	-3.5	78	<0.001	(-0.59, -0.16)

** Levene's test for equality of variances: F = 1.46, p (sig.) =0.23>0.05, variances are assumed equal).*

Levene's test for equality of variances resulted in an F value of 1.46 and a p-value greater than 0.05. This result indicates that the variances of scores between both groups were equal. Thus, the equal-variance assumption was met.

Results from independent samples t-test revealed that there was a significant difference between post-test scores of students in the experimental group compared to students in the control group ($t = -3.5$, $df = 78$, $p < .001$). Specifically, students who learned with the SpeakEasy AI application had significantly higher scores compared to students who learned with the traditional teaching method (mean difference = -0.38, 95% CI: -0.59 to -0.16). The results imply that students from the experimental group significantly improved their learning performance. In conclusion, SpeakEasy AI application had a positive effect on students' fluency and coherence and outperformed the traditional teaching method.

4.2 Questionnaires

Forty students in the experimental condition participated in an online questionnaire survey about their experience of using SpeakEasy AI application. 47.5% were female participants and 52.5% were males. Table 8 shows the mean scores and standard deviation (SD) for each item in the questionnaire.

Table 8

Students' perceptions of using SpeakEasy AI (n = 40)

EFFECTIVENESS OF SPEAKEASY AI APPLICATION	MEAN	SD
After using the SpeakEasy AI app, I can speak more fluently.	4.08	0.35
I can retrieve vocabulary and grammar more quickly when speaking	3.9	0.44
The frequency of my pauses and hesitations (e.g., "uhm", "ah") has decreased.	3.93	0.41
The duration of my pauses (if any) has decreased.	4.00	0.39
The frequency of my self-corrections has decreased.	4.03	0.48
I can express my ideas more clearly without stopping in the middle.	4.00	0.39
I can use linking words and discourse markers appropriately in my speech.	4.13	0.46
The SpeakEasy AI app helps improve my score in the "Lexical Resource" criterion.	4.03	0.53
The SpeakEasy AI app helps improve my score in the "Grammatical Range and Accuracy" criterion.	3.83	0.44
The SpeakEasy AI app helps improve my score in the "Pronunciation" criterion.	4.00	0.45
The test simulation feature helps me become familiar with the pressure of speaking tests.	4.18	0.44
The feedback provided by SpeakEasy AI helps me better understand my strengths and weaknesses	4.3	0.51
MOTIVATION OF USING SPEAKEASY AI APPLICATION	**MEAN**	**SD**
SpeakEasy AI is easy to use for speaking practice	4.13	0.51

The conversation feature motivates me to practice speaking more frequently.	4.13	0.46
After using the app, I experience reduced anxiety and pressure when speaking.	4.1	0.44
I feel more confident in communicating in English after practicing with the app.	4.03	0.48
I am satisfied with using the SpeakEasy AI app for speaking practice.	4.03	0.48
I will continue using the app for speaking practice in the future.	4.15	0.42
AVERAGE	4.05	0.29

Effectiveness of SpeakEasy AI for speaking practice

Students had positive perspectives towards the effectiveness of SpeakEasy AI in improving their speaking performance and supporting their speaking practice. The mean scores of most items in the effectiveness section was relatively high, ranging from 3.83 to 4.18 on a 5-point Likert scale.

With regard to fluency improvement, students perceived that thanks to using the application, they could speak more fluently (Mean = 4.08, SD = 0.35), retrieve vocabulary and grammar more quickly while speaking (Mean = 3.9, SD = 0.44), and reduce the frequency of pauses and hesitations during speech (Mean = 3.93, SD = 0.41). In addition, the duration of pauses and the frequency of self-corrections were reported to decline, with both items receiving positive ratings (Mean = 4.0 for the former and Mean = 4.03 for the latter).

Students also reported that SpeakEasy AI helped them employ connecting words and discourse markers better (Mean = 4.13, SD = 0.46), allowing them to speak more coherently and cohesively. Furthermore, speaking without pausing mid-thought received a similarly high score (Mean = 4.00, SD = 0.39), indicating that students were able to maintain fluid communication while performing speaking tasks to some extent.

In addition to their perceived increase in fluency, students agreed that SpeakEasy AI positively impacted their Lexical Resource (Mean = 4.03, SD = 0.53), Grammatical Range and Accuracy (Mean = 3.83, SD = 0.44), and Pronunciation (Mean = 4.00, SD = 0.45). As can be seen, grammatical range and accuracy had a relatively lower mean score compared to the other categories, demonstrating a need for further lecturer intervention in this area.

Furthermore, students found the test simulation useful because it prepared them for the anxiety caused by speaking tests (Mean = 4.18, SD = 0.44). The highest-rated item in this category was that the app benefits students by allowing them to identify their strengths and weaknesses (Mean = 4.3, SD = 0.51). These results revealed the significance of instantaneous and individualized feedback on learners' speaking awareness and self-assessment.

Motivation and Satisfaction

The majority of the items in the motivational section also had high mean scores between 4.03 and 4.15, suggesting students were highly motivated to use SpeakEasy AI to practice speaking.

Students found SpeakEasy AI to be relatively easy to use for speaking practice (Mean = 4.13, SD = 0.51). Students also reported that the conversation feature motivated them to practice speaking more frequently (Mean = 4.13, SD = 0.46). Learners also felt less anxiety and pressure when speaking after using the application (Mean = 4.1, SD = 0.44). These findings

suggest speaking on the SpeakEasy AI platform allowed learners to feel less stress when speaking.

In addition, students felt more confident speaking in English after practicing speaking on SpeakEasy AI (Mean = 4.03, SD = 0.48). Students were also satisfied with SpeakEasy AI (Mean = 4.03, SD = 0.48) and reported they would want to use this application again to practice speaking in the future (Mean = 4.15, SD = 0.42), making this item have the highest mean in the motivation section.

Motivation and Satisfaction

The majority of the items in the motivational section also had high mean scores between 4.03 and 4.15, suggesting students were highly motivated to use SpeakEasy AI to practice speaking.

Students found SpeakEasy AI to be relatively easy to use for speaking practice (Mean = 4.13, SD = 0.51). Students also reported that the conversation feature motivated them to practice speaking more frequently (Mean = 4.13, SD = 0.46). Learners also felt less anxiety and pressure when speaking after using the application (Mean = 4.1, SD = 0.44). These findings suggest speaking on the SpeakEasy AI platform allowed learners to feel less stress when speaking.

In addition, students felt more confident speaking in English after practicing speaking on SpeakEasy AI (Mean = 4.03, SD = 0.48). Students were also satisfied with SpeakEasy AI (Mean = 4.03, SD = 0.48) and reported they would want to use this application again to practice speaking in the future (Mean = 4.15, SD = 0.42), making this item have the highest mean in the motivation section.

4.3 Interview

The researcher carried out a structured interview with five students, coded as S1 to S5, who frequently used the SpeakEasy AI platform. The interviews were conducted online via Microsoft Teams. Students' experiences and perspectives on using SpeakEasy AI to practice their speaking skills were explored through their responses to four interview questions.

The first interview question explored whether students felt less anxious when practicing speaking with SpeakEasy AI and examined the underlying reasons. Overall, all interviewees reported that the application not only helped them feel less nervous and stressful but also made them more comfortable and confident during speaking practice. S1 mentioned that the app interface is user-friendly for beginners as users can choose different difficulty levels and select different AI voices. She added "*The app's voice is friendly and creates less pressure for me when speaking. It also provides specific solutions for improvement, such as correcting vocabulary, grammar, and pronunciation mistakes*". For S3, she considered the app as her friend with whom she could easily communicate and had conversations. She added: "*the app can understand what I mean even when I cannot fully express my ideas in complete sentences*". For S5, he highly appreciated the diversity of AI characters, each of whom has a different voice and different ways of asking questions and listening, which makes the app more interesting. He also emphasized an insightful observation: "*The app knows how to guide the conversation with follow-up questions and provides me with abundant vocabulary, so I do not worry about running out of ideas while speaking*"

The second question investigated whether SpeakEasy AI increased students' motivation to practice speaking English. All respondents expressed positive attitudes toward the application and agreed that it encouraged them to practice more frequently. They are all

pleased that the app is free of charge, does not limit the number of speaking attempts per day like some other applications, and allows them to practice speaking anytime and anywhere as it's available on many electronic devices. S2 stated that her favorite feature is the real-time pronunciation feedback: "*It provides immediate and detailed feedback on word stress and pronunciation. Instead of simply evaluating answers as "correct" or "incorrect," the app points out exactly which syllables need adjustment*". For S3, she was engaged with the natural conversation with the app, emphasizing the variety of topics that the app covered, helping her practice speaking more confidently without feeling bored. Another feature contributing to the increased motivation was mentioned by S4. He valued the speaking evaluation based on the four IELTS criteria: "*After the speaking session, I know my estimated band scores, recognize my weaknesses for improvement, and continue developing my strengths*".

The third question examined which speaking criterion improved the most after using SpeakEasy AI. Although the participants acknowledged their enhancement in terms of pronunciation, grammar, and vocabulary, most interviewees agreed that Fluency and Coherence was the area showing the greatest improvement. S4 reported that thanks to repeated speaking practice with the AI, he was able to remember many vocabulary and retrieve them more quickly during the speech, thereby speaking more smoothly without long pauses. In addition, according to S5, the ability of suggesting appropriate vocabulary and grammar structures enabled him to reduce the frequency of pauses and hesitations which were attributed to a lack of vocabulary and structures.

The final interview question focused on the features of the app that needed improvement and the further expectations the students had for the app. Although students generally held positive views of the application, several limitations were identified. All participants mentioned that the app sometimes interrupted them and moved on to the next question whenever they paused to think, as the system assumed that they had finished their responses. They suggest the app should enhance its speech recognition feature so that it can better determine whether the speaker has completed their response before asking another question. S1 also recommended that the pause time for speakers should be longer to allow users a few seconds to think or pause before continuing. Additionally, S2 pointed out that the app failed to recognize students' speech accurately when the pronunciation was unclear or when there was background noise. In terms of expectations, S2 stated "*I think the app should improve its pronunciation correction feature by providing phonetic transcriptions in the final feedback after each conversation*". S3 also recommended that "*The app should provide a list of vocabulary and sentence structures related to the conversation that has just been completed, so that learners can receive useful language input after finishing their speaking practice*." Moreover, S4 expected that the speaking topics should be updated and more diverse to prepare learners for IELTS test. Finally, S5 also proposed an interesting and worthwhile suggestion "*I think the app could also be suitable for secondary and high school students. It would be even better if there were chatbot characters designed to understand children's psychology and communication style, as this would make the app highly appropriate for children aged 6–10 who are beginning to develop listening and speaking skills in a new language*".

5. Discussion

After 12 weeks of integrating the SpeakEasy AI application in speaking practice activities, the findings suggested that the performance of the experimental group surpassed that of the control group in the post-test. In addition, the post-test mean scores of the EG were substantially higher than those of the pre-test, indicating that SpeakEasy AI exhibited positive contribution to students' speaking performance, particularly in terms of fluency and coherence.

These findings support previous studies on the effectiveness of AI-powered speaking applications in improving learners' oral communication skills (Kang, 2022; Qiao & Zhao, 2023; Azizimajd, 2023).

The second research question investigated students' perceptions of using SpeakEasy AI for speaking practice. The survey findings demonstrated that students were generally in favor of the application. To be more specific, more than 90% of survey participants selected "Strongly Agree" or "Agree" for most questionnaire items related to fluency development and motivation. Regarding speaking fluency, 97.5% of students agreed that SpeakEasy AI helped them speak more fluently. A closer look into the components of speaking fluency revealed that 85% of the participants reported being able to retrieve vocabulary and grammatical structures more quickly during their speech while 87.5% could reduce the frequency of pauses and hesitations as well as shortening the duration of pauses. These findings strongly resonate with Segalowitz's (2010) framework of cognitive fluency and utterance fluency, which emphasizes the importance of rapid vocabulary retrieval, reduced frequency and length of pauses in fluent speech production. Additionally, the findings confirmed the previous findings on faster retrieval of vocabulary and grammar (Qiao and Zhao, 2023), and on the ability of producing longer utterances with fewer hesitations and pauses (Azizimajd, 2023). These quantitative results were also reinforced by the interview findings, where participants reported that thanks to the repeated speaking practice, the suggestions of useful vocabulary and grammar, and the guidance of follow-up questions, SpeakEasy AI not only supported cognitive fluency through faster retrieval of language resources but also improved learners' perceived fluency by maintaining conversational flow and reducing communication breakdowns.

Apart from speaking fluency, the other speaking components also showed improvement. Nearly 90% of respondents agreed that they could develop their vocabulary and refine their pronunciation skill thanks to speaking with the app. However, fewer students achieved the comparable improvement in grammar (80%). This finding suggests that grammar development may require more explicit instruction from lecturers and guided practice rather than relying on AI-supported conversational practice.

It is also notable that the application helped familiarize students with the pressure of the speaking test. In addition, the app's feedback based on IELTS-oriented assessment features enabled them to recognize their strengths and weaknesses more effectively, as reflected in the high agreement rate of 97.5%. This finding indicated that the utilization of SpeakEasy AI app could tackle the limitations of current apps in the market which lack the standardized test-based assessment functions, such as IELTS or V-step, thereby providing learners with an all-in-one solution.

The findings also revealed high appreciation towards the app's role in reducing learners' anxiety. 95% of students agreed that SpeakEasy AI helped lower anxiety and pressure when speaking English and also expressed greater confidence in speaking English after practicing with the app. These findings were consistent with the results from earlier studies by Kang (2022) and Azizimajd (2023). Furthermore, according to Brown (2017), fluency development is more likely to occur in low-pressure and supportive learning environments where learners are encouraged to focus on meaning rather than form. This idea was prevalent in interview responses. Interviewees' answers indicated that the app's features, such as the different voice options, the friendly voice, and easy-to-use app interface created an encouraging environment for learning. Students described the app itself as "a friend" who always understood what they meant even when they answered incompletely and could offer helpful ideas, thus prompting students to try harder to speak.

Regarding motivation and satisfaction, students expressed strong positive attitudes toward SpeakEasy AI, citing easy-to-use functions and convenience for speaking practice. The overwhelming majority of students indicated they would like to use the app again in the future (97.5%), which was one of the highest-rated items on the questionnaire. These results aligned with past studies that identified affordances of AI speaking apps such as providing learners more opportunities to learn conversationally and motivating learners to practice at their own pace (Celik et al., 2025; Kang, 2022). The interview results further explained the previous findings. Students appreciated that the app was free of charge, usable on different devices, and allowed for multiple attempts per day. Students also enjoyed being exposed to various conversation topics. These qualities seemed to positively influence students' repeated speaking practice.

Along with the positive findings mentioned earlier, interviews revealed certain limitations SpeakEasy AI currently faces. Interviewees shared that the application had the tendency to cut students off from answering questions and skip to the next question whenever they stopped talking to think for a few seconds. Participants believed that SpeakEasy's speech recognition software should be able to recognize when a user is merely thinking versus when they are done with their answer. Difficulty with speech recognition was also reported when the student's pronunciation was unclear or there was background noise present. For future updates, participants wanted to see more advanced features such as phonetic spelling for pronunciation corrections, vocabulary recap after conversations, and more current IELTS speaking topics. These findings partially aligned with Celik et al. (2025), who argued that technology-based speaking applications lack certain characteristics only a human teacher can provide and cannot replace the need for a lecturer in language acquisition. While SpeakEasy AI was effective at supplementing students' speaking practice, teacher-led instruction and pedagogical assistance are still necessary for optimal learning.

6. Conclusion

This research aimed to investigate how SpeakEasy AI application influences EFL learners' speaking fluency among first-year English-major students at HUFLIT and also explore their attitudes towards using the application. Quantitative results based on post-test scores demonstrated that after 12 weeks of implementation, the experimental group scored higher than the control group. It can be concluded that using the SpeakEasy AI application as a learning tool has positive effects on students' speaking performance in terms of Fluency and Coherence. According to the survey results, practicing speaking through SpeakEasy AI application allows learners to access words and structures faster, make fewer pauses and shorten their length, and make fewer hesitations and maintain smoother communication flow.

The survey and interview results also revealed that students had overwhelmingly positive attitudes towards speaking practice with SpeakEasy AI. They agreed or strongly agreed that the application made them speak more fluently, feel less nervous, more confident, and more motivated to do speaking practice more often. They particularly enjoyed the application's instant and individualized feedback, its focus on IELTS-task-based speaking practice, conversation practice without the pressure of human judgment, and supplementary speaking practice features such as multiple voice options, vocabulary and grammar recommendations, and follow-up questions that allowed the conversation to flow naturally. These characteristics helped to reduce the learner's affective filter and promote learner engagement when practicing speaking, allowing them to feel more comfortable and confident when communicating in English. It is also noteworthy that out of the categories of speaking that saw improvement, grammar scored the lowest. This indicates that grammar may still need

explicit instruction from the teacher and more practice. Lastly, the interviews provided insight into the learners' experience with SpeakEasy AI. Students found the application flexible and free, and they appreciated that it allowed them to talk about a variety of topics that they enjoyed. Additionally, they felt that the AI characters were nice and friendly.

There are several limitations that should be addressed in this study. Firstly, the sample size was relatively small and consisted of first-year English-major students at HUFLIT only. Future research may expand the sample to students of different backgrounds and in various contexts. Secondly, the length of the intervention was only 12 weeks. As such, future research may implement longer periods of using SpeakEasy AI to examine the long-term impact of the app on learners' speaking fluency. Lastly, this study primarily focused on how SpeakEasy AI could affect speaking fluency and coherence. Studies can be done to further explore how the application can help improve other aspects of speaking, such as pronunciation, grammatical accuracy, or vocabulary building. In addition, some limitations of the application were also discovered throughout the study. Students experienced some problems with the app including occasional interruptions during speaking, speech recognition inaccuracies, outdated IELTS speaking topics, and a need of post-conversation phonetic transcription and vocabulary lists. Therefore, the findings suggest some practical implications for the app developers. Firstly, the speech recognition system should be enhanced to distinguish between thinking pauses and completed responses. Rather than proceeding to the next question, the app should allow the users to customize their response time depending on their proficiency levels. Secondly, the app should improve speech recognition accuracy especially with non-native accents and in environments with background noises. When it comes to pedagogical implications, while waiting for the developers to improve these features, some practical recommendations can be offered to educators. With regard to the app's unwanted interruption, students should divide their longer responses into shorter ones. If the app interrups their answer, they should ask the app to continue the previous conversation and complete the rest of the answer. Regarding the speech recognition issue, students should speak in a quiet environment, check their microphone settings before practice, try to articulate their words clearly, and avoid using the app late at night during peak hours. In addition, the teacher should integrate AI-generated feedback into classroom instruction by asking students to review AI feedback reports and identify repeated pronunciation and grammar mistakes so that the teacher can provide further instruction to help students improve their weaknesses. Furthermore, teachers should provide students with IELTS updated speaking topics and topic-related vocabulary, and encourage students to practice these topics with the app.

Overall, the findings of this study contribute to the growing body of research supporting the integration of AI-powered applications into EFL speaking instruction. SpeakEasy AI application is proved to be an effective supplementary tool that combines speaking practice, test simulation, and criteria-based feedback in a single platform. Therefore, SpeakEasy AI can be considered a promising approach for enhancing speaking fluency and promoting learner motivation in EFL contexts.

Bionote

Nguyen Thi Huyen Tran is currently an EFL lecturer in the Faculty of Foreign Languages at Ho Chi Minh City University of Foreign Languages - Information Technology (HUFLIT). She holds a Master's degree in Applied Linguistics from Curtin University, Australia. She has over 14 years of experience teaching IELTS to non-English-major students at Ho Chi Minh City University of Technology - Vietnam National University Ho Chi Minh City (HCMUT-VNU). Her research interests include Teaching English to Speakers of Other Languages (TESOL) and AI-assisted language learning.

Acknowledgement

The author would like to express her sincere gratitude to Mr. Nguyen Le Nhu Anh, an English lecturer at Ho Chi Minh City University of Education and the founder of Edtechcorner, a platform that provides free AI-powered applications to support English language teaching and learning for both teachers and students. The SpeakEasy AI application investigated in this study was also developed on this platform.

Special thanks are also extended to Mr. Nguyen Le Nhu Anh for his enthusiastic support and for providing valuable background information about SpeakEasy AI, which greatly

contributed to the development of the theoretical framework and the successful completion of this research.

#149 A FEASIBILITY STUDY OF A GLOBALIZATION AND INTERCULTURAL COMMUNICATION PROGRAM AT THE UNIVERSITY OF LANGUAGES AND INTERNATIONAL STUDIES, VIETNAM NATIONAL UNIVERSITY HANOI: A QUINTUPLE HELIX MODEL

Tran Thanh Nhan[1], Vu Thi Kim Ngan[2], Chu Thanh Van[3]

Abstract

This feasibility study on launching the Globalization and Intercultural Communication (GIC) program was initiated to advance the International Relations majors in a Vietnamese transformative context. The study was conducted using a mixed-methods approach, guided by Bronfenbrenner's (1979) multi-layered quintuple-helix ecological system and a tri-dimensional needs analysis model (incorporating Target Situation, Present Situation, and Critical Needs Analysis). It involves documentary analysis of official directives and four existing curricula together with a large-scale needs assessment ($N = 1562$) encompassing five stakeholder groups. Three major findings were identified: a macro promotion of globalization and internationalization in education in governmental policies; a meso institutional readiness supported by highly compatible ongoing courses, sufficient human resources, and the

[3]*Lecturer, Faculty of English Language and Culture, VNU, University of Languages and International Studies, Hanoi, Vietnam*

university ecosystem; and a major interest at the exo and micro layer, suggesting a paradigm shift from language mastery to intercultural competence. GIC curriculum would be competence-based, developing soft, thinking, and professional skills, intercultural competence, and digital/AI literacy. Moreover, it should orient towards practicality and applicability, offering corporate and professional training, fostering multilingualism and intercultural communication, and adopting multidisciplinary or hybrid major–minor structures.

Keywords**:** internationalization, needs assessment, curriculum development, multi-layered ecosystem, a quintuple helix model

1. Introduction

Amid shifting geopolitical landscapes and swift socio-technological transformation, higher education institutions are confronting a dual challenge of preserving their identity while pursuing internationalization (de Wit, 2020; OECD, 1999; Tight, 2022). To address this obstacle, they must renew themselves by upgrading their study programs to address potential opportunities and threats. This study, therefore, examines the feasibility of introducing a novel study program: Globalization and Intercultural Communication (GIC) at the University of Languages and International Studies, Vietnam National University, Hanoi (VNU-ULIS).

Founded in 1955, VNU-ULIS has historically evolved from a specialized language training academy into a comprehensive center for language teacher training, applied linguistics, and international studies. Since its 1993 membership in Vietnam National University, the university has been rebranded as the University of Languages and International Studies to highlight its mission in the internationalization process. VNU-ULIS students and faculty have been appointed to represent the Vietnamese youth and academics to greet numerous delegations of high-ranking leaders. The fact that many alumni hold important positions in the government, the Ministry of Foreign Affairs, the Vietnamese Embassy, leading international universities, and multinational corporations is living evidence of the university's international integration and development.

The institutional drive to launch this new GIC program coincides with a major milestone: the VNU-ULIS's 70th anniversary and the structural consolidation of its international studies. The increasingly significant role of Vietnam in the global arena across socioeconomic, cultural, and political fields is the motive behind this transformative move to prepare agentic human resources for international job opportunities and responsibilities. This research, therefore, was conducted to examine the facilitating conditions created by the Vietnamese government and the university to promote the new program and capture various stakeholders' aspirations via an extensive needs assessment. These objectives are to be addressed using the quintuple helix model that encapsulates the dynamic partnership among five "houses": the state, the university, enterprises, researchers, and the public. To evaluate the overarching feasibility, three research questions are formulated as follows:

(1) What governmental policies and initiatives support the GIC training program?

(2) How can VNU-ULIS address the requirements for launching the new program in terms of curriculum, human resources, and facilities?

(3) What are the stakeholders' interests and anticipation of employment opportunities for GIC graduates?

(4) What recommendations are proposed for GIC curriculum development?

2. Literature review

Feasibility study

Feasibility studies, or pilot studies, are often used to determine whether a new idea, intervention, program, process, or measure is suitable for further testing. In other words, this method allows researchers to assess whether the idea or outcome is appropriate and sustainable (Bowen et al., 2009, p. 2). These studies are often conducted before a main study or in the initial stages of large projects to estimate key parameters necessary for the development of the main research (Arain et al., 2010). They can focus on various aspects such as acceptance, needs, implementation, applicability, adaptation, integration, expansion, or limited-efficacy testing (ibid.). The goal is to answer three main questions: *Can it work? Does it work? Will it work?* (Bowen et al., 2009; Orsmond & Cohn, 2015).

However, this study is set to answer two questions: *Can it work?* and (*How) will it work?* The former is addressed by an analysis of the State and Government policies on globalization and educational international integration goals and the VNU-ULIS capacity to implement the program; the latter is addressed by career-oriented needs as perceived by various stakeholders. Assumingly, there can be consistency among the state's leadership, the university's capacity, and stakeholders' aspirations for GIC curriculum development. Meanwhile, career-oriented needs would be translated into a system of learning units covering knowledge, skills/competencies, and qualities, which may serve as key components of the new curriculum (Agrawal et al., 2016).

The quintuple helix model

The term "triple helix model" has recently been associated with the promulgation of Resolution No. 57-NQ/TW dated December 22, 2024, of the Politburo, which emphasizes the combined efforts of the Party, the entire political system, entrepreneurs, businesses, and the citizens in science, technology, innovation, and national digital transformation. In this technological revolution, the citizens and businesses are considered the center, the subjects, the main resources, and the driving force; scientists are the key factor; and the State plays a leading role in creating the most favorable conditions (Government Electronic Newspaper, 2026). It can be claimed that this tripartite cooperation has transformed Resolution 57-NQ/TW into an endogenous driving force for national, transformative development.

In actuality, Resolution No.57-NQ/TW is being widely implemented in technology, education, and research, with groundbreaking solutions (Lan, 2025; Thach, 2022). Ho Chi Minh City National University is a pioneer in implementing this triple helix model (State - University - Enterprise) to quickly concretize the Resolution into strategies to develop high-quality human resources, enhance global competitiveness, and modernize digital technology infrastructure (Nhan Dan Online Newspaper, 2025). This model has also been implemented elsewhere to evaluate the effectiveness of AI training programs for teachers (Van et al., 2026) or develop high-quality semiconductor human resources (Le et al., 2025). At Tan Trao University, it is adopted to transform the university into a knowledge hub, connecting and spreading innovations for sustainable development (Ha & Cuc, 2025). At Hanoi University of Theatre and Film, the model is adopted to create a mechanism for ordering scientific research projects and creative scientific products to develop the cultural industry (Thi & Binh, 2026).

However, the triple helix model apparently neglects the role of citizens and scientists, as mentioned in Resolution 57-NQ/TW. Other foreign studies also illuminate more complex multi-stakeholder collaborative models in research on social innovation, entrepreneurial ecosystem, and sustainable development (Borrero & Yousafzai, 2024; Carayannis & Campbell,

2012; Cloitre et al., 2023; Morawska-Jancelewicz, 2022). Therefore, the "quintuple helix model", five-stakeholder collaboration: State - University - Researcher/ Expert - Employer - Citizen, was adopted for this study. The difference is that they are clustered into four layers of an ecosystem.

Multi-layered ecosystem conceptual framework

The multi-tiered quintuple helix model based on Bronfenbrenner's (1979) theory of human development's ecosystem lays the theoretical foundation for this study. The framework allows consideration of the reciprocal impacts among policies, institutions, enterprises, academics, and individuals on curriculum development corresponding to the macro, meso, exo, and micro levels. In this superstructure, the macro level focuses on national policies regarding globalization and internationalization of education. The meso level presents the institutional capacity as reflected in the curricula, human resources, and facilities. The exo and micro levels involve employers, industry professionals/researchers who may offer the most authentic perspectives on industry development trends, and students, graduates, and high school students, the direct and potential beneficiaries of the training programs. This multi-layered ecosystem illuminates the interconnections among government policies, institutional implementation, and the occupational requirements of the GIC program.

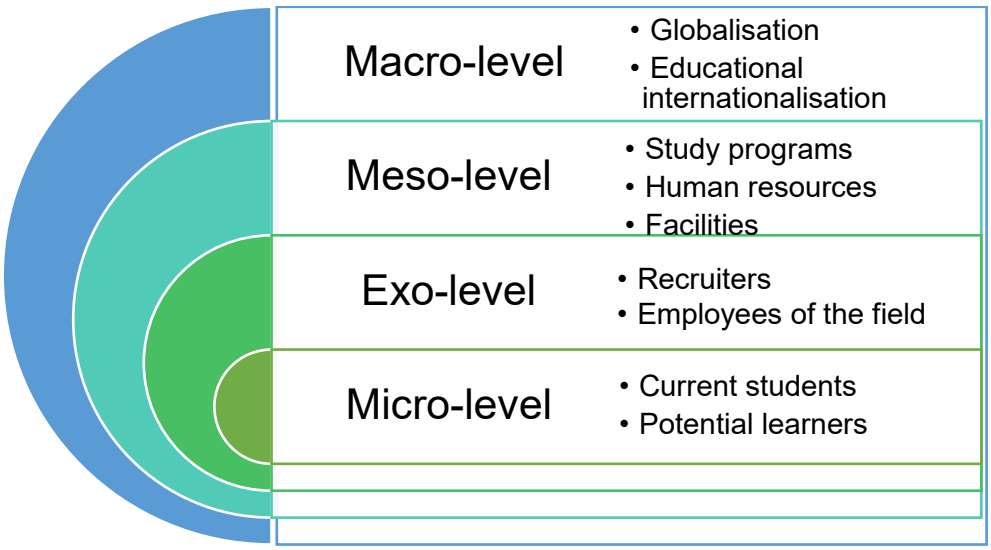

Figure 1: Multi-layered conceptual framework based on Bronfenbrenner's Ecosystem Theory (1979)

3. Research methodology

This study employs a mixed-methods approach in a convergent parallel design to corroborate qualitative and quantitative data. The study is grounded in a multi-tiered ecosystem conceptual framework (Bronfenbrenner, 1979) as mentioned above, and adopts an analytical framework of a tri-dimensional model incorporating Target Situation Analysis (TSA), Present Situation Analysis (PSA) (Chambers, 1980; Hutchinson & Waters, 1987), and Critical Needs Analysis (CNA) (Benesch, 2001).

Data collection

Qualitative data. The qualitative data pool consists of (a) official documents from the state, government, and ministries; (b) four existing curricula and internal evaluation reports on human resources and facilities; and (c) approximately 500 responses to the survey's open-

ended questions. Documentary and thematic analysis were adopted to process and report this data type.

Quantitative data. They were harnessed from a large-scale needs assessment based on a Cognito survey. The questionnaire construct was adapted from a similar prototype designed for the Transnational Cultural and Media Studies program launched by VNU-ULIS in 2023; however, this versatile model incorporated five stakeholder groups into a single survey and targets more experienced, reflective participants who can provide insights into the actual market demands for this major. The snowball sampling technique and social media platforms were used to administer the questionnaire to potential participants.

Participants. After more than 6 months, the form recorded 1580 entries; yet the data cleaning yielded a sample of 1562 valid responses. Notably, the large standard deviations, ranging from 1.30 to 1.62, indicated heterogeneity among stakeholders' opinions. Demographically, the sample included 735 high school students (47.1%), 497 university students (31.8%), 236 employees (15.1%), 40 employers (2.5%), and 54 researchers/experts (3.5%). 78.4% of participants were aged 15-22; those aged 23-40 accounted for 14%; and the group over 41 accounted for 7.6%. Females constituted 64.9%, males 29.9%, and the remaining 5.2% did not want to disclose their gender. Regarding educational level, 67.0% classified themselves as currently studying/having completed high school; 22.7% have a bachelor's degree. Holders of a Master's degree or higher accounted for 7.4%, including 79 Master's degree holders, 31 PhD holders, and 6 Professors/Associate Professors. 2.9% selected the option "Other" to clarify their educational background. Their fields of interest were ranked as follows: languages (26.3%), economics (22%), education (16.8%), technology (9.1%), politics (7.7%), and history (7.4%). Additionally, 168 (10.7%) participants expressed other interests, including graphic arts, real estate, security, diplomacy, international relations, tourism, services, engineering, and robotics.

Career-oriented needs analysis

Long (2005) contended that needs analysis, especially large-scale research, is of high significance in curriculum development to identify the gap between learners' current capabilities (present needs) and the stringent requirements of the target situation (target needs), thereby establishing a basis for developing appropriate objectives, content, and teaching methods. Numerous needs assessment studies have been conducted to develop language curricula, particularly English for Specific Purposes (Andi & Arafah, 2017; Boroujeni & Fard, 2013; Dewi et al., 2023; Kaewpet, 2009; Li, 2014; Long, 2005; Richards, 2009). However, needs surveys to develop an entire undergraduate content-based program are rarely found in the literature.

The needs assessment for the GIC curriculum was, therefore, located within a rigorous analytical framework that combines traditional and modern approaches: TSA, PSA (Chambers, 1980; Hutchinson & Waters, 1987), CNA (Benesch, 2001). Recent studies highlight the combination of TSA and PSA to identify gaps in curriculum development (Dou et al., 2023; Rahman, 2015). Meanwhile, CNA may ensure fairness and democracy by recognizing the contributions of students and working professionals as central subjects of the training process.

Present Situation Analysis (PSA) delves into the macro and meso layers of the human development ecosystem to illuminate current sociopolitical and institutional factors regarding globalization and educational integration. More specifically, PSA would gather information on the state's current political guidelines that could provide the foundation and impetus for

developing the GIC curriculum and reflect VNU-ULIS's capacity to meet the demand to open this major in terms of training programs, human resources, and facilities.

Targeted Needs Analysis (TSA) focuses on identifying what learners need to do in the target situation (Dai, 2026). This is an objective, needs-oriented, product-oriented approach that seeks to specify language skills and professional knowledge necessary for students to perform future jobs (Arnó-Macià et al., 2020; Dou et al., 2023). This career-oriented needs analysis strives to shape objective professional competencies, language skills, and operational benchmarks required of graduates in their future target workplaces.

Critical Needs Analysis (CNA) emphasizes the social, political, and power dynamics in the learning process (Benesch, 2001). This study, therefore, expands its scope to examine governmental and institutional documents and invites contributions to drafting the new curriculum from multiple stakeholders. This multi-dimensional perspective reflects a dynamic, flexible alignment among state governance, institutional operationalization, and citizens' implementation. It also empowers learners to contribute to curriculum development, which is tailored to their future career prospects.

Findings

Governmental policies and initiatives to support the GIC training program

Globalization as a policy. Vietnam joined the World Trade Organization in 2007. Since then, globalization and international cooperation have been regarded as the main driving force for the country's comprehensive development. In 2021, as the country transitioned into a new decade of development, the Communist Party of Vietnam once again affirmed in the Party's 13th National Assembly Document that international integration is an inevitable trend alongside the development of a socialist-oriented market economy (Đảng Cộng sản Việt Nam, 2021). This document outlines policies aimed at proactive and comprehensive international collaboration, enhancing the nation's position, and developing culture in line with national identity.

Also at this turning point, the Government developed the Socio-Economic Development Strategy 2021–2030, with a vision to 2045, with initiatives to innovate the growth model, integrate deeply through participation in global value chains, promote digital transformation, and develop high-quality human resources (Bộ Chính trị, 2021). In the Cultural Strategy to 2030, the Ministry of Culture, Sports and Tourism proposed ways to develop culture by promoting Vietnamese values, preserving national identity, and absorbing the best of humanity, which was approved by Decree 1909/QĐ-TTg (Thủ tướng Chính phủ, 2021) and reinforced in Decree 80 NQ/TW (Bộ Chính trị, 2026). Most recently, the Vietnam 2045 Report by the Ministry of Planning and Investment analyzed global economic trends and policy implications to adapt to geopolitical changes, leverage technological opportunities, and enhance national competitiveness (Viện Chiến lược phát triển, 2024).

Policies on international cooperation in education. In 2018, the Government implemented an open-door policy for education, attracting foreign investment into the sector and encouraging joint training programs through Decree 86/2018/NĐ-CP (Chính phủ Việt Nam, 2018). The documents of the 13th National Assembly of the Communist Party of Vietnam in 2021 affirmed that education is a top national priority and linked educational development to international integration to further promote cooperation, develop high-quality human resources, and strengthen academic exchange. Also in that year, the Ministry of Education and Training issued the Education Development Strategy 2021–2030, with a vision to 2045, demonstrating a determination to fundamentally and comprehensively reform

education, further enhance the role of international cooperation through training partnerships, attract international human resources, and develop a global research network (Báo Điện tử Chính phủ, 2025).

In 2024, Resolution 57-NQ/TW on breakthroughs in national science, technology, innovation, and digital transformation accelerated the country's development and international integration with the power of science and technology, aiming to enhance the nation's position through comprehensive development of national resources, from policies, institutions, infrastructure, and human resources to international cooperation (Ban Chấp hành Trung ương, 2024). Most recently, in Resolution 71-NQ/TW, the Political Bureau concretized the policy of developing higher education in the era of international integration through a strategy of increasing autonomy and building research universities with the goal of comprehensive integration, affirming the pioneering role of Vietnamese education among the top 20 countries in the world, with at least five universities in the Top 100 globally (Ban Chấp hành Trung ương, 2025).

Also in 2025, the Prime Minister issued Decision 2371/QĐ-TTg approving the Project "Making English the second language in schools in the period 2025–2035, with a vision to 2045". This decision has great significance for promoting international cooperation through education, enhancing the competitiveness of human resources, creating conditions for the younger generation to access global knowledge, and aligning with the national development strategy to 2045 (Thủ tướng Chính phủ, 2025). Thus, alongside the strengths of digital transformation, the state and government also affirm the indispensable role of language in the strategy of international integration and building national identity with the vision to 2045.

To recapitulate, the governmental policies signify a strong motive to establish globalization and educational integration as top developmental goals, steering the nation towards modernization, digitalization, and international collaboration. The trio of technological transformation, more extensive global outreach, and English as a second language policy, as postulated by Resolution 57-NQ/TW, Resolution 71-NQ/TW, and Decision 2371/QĐ-TTg, acts as a catalyst for a new era of development in Vietnam.

VNU-ULIS's capacity regarding curriculum, human resources, and facilities

Curriculum. Currently, the university offers training in eight of the world's most popular languages (English, Chinese, Korean, Japanese, French, German, Russian, and Arabic) in two majors: education and/or linguistics. In addition, the university recently launched two new training programs: Transnational Culture and Media Studies and Teaching Vietnamese as a Foreign Language. According to the 2025 plan, VNU-ULIS planned to open six more (Đại học Ngoại ngữ, Đại học Quốc gia Hà Nội [ĐHNN-ĐHGQHN], 2025a). The GIC program is anticipated to intensify internationalization, aligning it with the state policies on globalization and international integration, as synthesized in RQ1.

According to the self-assessment report on the undergraduate English Language program (ĐHNN-ĐHQGHN, 2025b), the curriculum was established based on the university's core values of "innovation, national responsibility, sustainable development" (p. 23) and the educational philosophy of "social construction, comprehensive development, autonomy, liberation, dynamism, and creativity" (p. 17). It serves the missions of "contributing to the development and integration, building and protecting the country through training high-quality human resources, conducting scientific research, implementing innovation, transferring knowledge, providing products and services that meet social needs according to international standards in the fields of foreign language education, linguistics, international studies and some

related social sciences and humanities" (p. 23). The vision for 2045 reflects the university's aspiration to become a highly reputable institution in its fields, not only domestically but also regionally and globally.

International studies is currently a sub-specialization within the English Language major (ĐHNN-ĐHQGHN, 2017). This orientation is clearly stated in Objective 2 as a crucial interdisciplinary knowledge base for creative professional practice and is also manifested in multiple program learning outcomes. However, a more extensive documentary analysis of the four current curricula - English Language, English Pedagogy, Transnational Culture and Media Studies, and Teaching Vietnamese as a Second Language (ĐHNN-ĐHQGHN, 2017, 2019, 2023, 2025) revealed that 92 out of 162 studied subjects (56,8%) (equivalent to 276 credits) have a high degree of compatibility with the GIC orientation. This suggests that VNU-ULIS's training programs are mostly internationalized and can cater to the needs for international integration (Table ***26***).

Table 26.

Level of Compatibility with the GIC Orientation of Subjects in the Four Current Curricula

Block of knowledge	Number of subjects	Level of compatibility		
		NA/1	2	3
General knowledge	***41***	***2***	***14***	***25***
Vietnamese studies	13	2	1	10
Social-emotional competence	10	0	5	5
Digital & multimodal competence	9	0	2	7
Research competence	9	0	6	3
Linguistic and Cultural knowledge	**37**	**0**	**2**	**35**
Linguistic competence	23	0	2	21
International studies	14	0	0	14
Specialized knowledge	**84**	**8**	**44**	**32**
Education	16	6	10	0
Teaching Vietnamese as a foreign language	10	0	10	0
Translation-Interpretation	9	0	1	8
Linguistics-Culture	16	1	12	3
Administration	6	0	2	4
Tourism	8	0	6	2
Transnational Cultural and Media Studies	8	1	3	4
Global Development	11	0	0	11
Total	**162**	**10**	**60**	**92**

N/A: Not available

1. Low compatibility
2. Average compatibility level

3. High level of compatibility

However, courses aligned with the GIC orientation are spread across various knowledge blocks. 60 out of 92 highly compatible courses (65.2%) are within the General and Linguistic and Cultural knowledge blocks, mostly in Linguistic competence (21 subjects) and the International Studies strand (the English Language program) (14 subjects). The remaining (32 subjects) belong to the specialized knowledge block, largely concentrating on the Global Development strand (Transnational Culture and Media Studies program) (11 subjects) and the Translation-Interpretation strand (the English Language program) (8 subjects). Among those highly compatible, specialized subjects, only four are classified as highly practical: *Sustainable Development, Culture and Politics in Business, International Business, and International Commercial Law*; the remaining are highly theoretical and academic. The findings suggest consolidating GIC-oriented subjects into a single study program to strengthen this major.

Human resources. According to ĐHNN-ĐHQGHN (2025), VNU-ULIS's faculty possesses admirable expertise in foreign language education, linguistics, international studies, and related disciplines. Over 70% are doctoral or master's degree holders, many of whom were qualified by prestigious universities in Europe, the United States, Japan, South Korea, China, and Australia. With diverse academic backgrounds and international experience, they work as professional trainers and continuously retrain themselves to stay ahead of the times. Moreover, many faculty members have participated in collaborative projects, academic conferences, and joint research programs to advance their research skills. Their works have been published in prestigious journals, focusing on foreign languages, international studies, regional studies, and other interdisciplinary fields. Faculty members also engage in consulting activities and collaborate with businesses, international organizations, diplomatic agencies, ministries, and departments to find internship and employment opportunities for their students. Their sense of responsibility, dynamism, and integration is crucial in affirming VNU-ULIS's position as a leading training and research institution in the fields of foreign languages and international studies.

In addition to its six permanent PhD and 28 Master's degree holders in international relations, literature and culture, development economics, education, and communication who can serve as GIC course leaders and instructors, VNU-ULIS can also mobilizes a force of visiting lecturers (11 members) including associate professors and PhDs in the fields of politics, diplomacy, linguistics and script studies (Chinese), Oriental studies, philosophy, international economics, international business, financial economics, and business administration. This combination ensures the program's multidisciplinary nature and the connection between theory and practice. This is an important foundation for the development of the GIC program. Furthermore, the GIC program's implementation and management require the participation of program administrators, student management specialists, academic advisors, and technical staff. The university's functional departments and offices manage and support students with administrative tasks, academic advisors offer personalized study strategies, and the technical staff ensures the smooth operation of technological systems for learning, research, and assessment. They are professionally trained to ensure standardized official student services.

Over more than 70 years of formation and development, the university has built a dedicated faculty with sound professional credentials, varied practical experience, and resilient research capabilities. These generations of faculty members have contributed significantly to training high-quality human resources, while simultaneously building their academic prestige. Besides, the visiting lecturers, administrative and student support staff, and international collaboration also play a crucial role in implementing the GIC curriculum. The combination of

in-depth knowledge, practical experience, quality service, extensive cooperation, and a spirit of innovation will ensure the program's quality and prestige, while strengthening the trust of students, society, and international partners.

Facilities. According to ĐHNN-ĐHQGHN(2022), VNU-ULIS is well-equipped with a modern lecture hall system, a multilingual library, smart classrooms, and an information technology system that supports standard, online, and blended learning. According to internal reports, the school operates seven main building blocks serving teaching and learning activities, with a diverse range of classrooms, from standard classrooms of 30-50 m² (170 rooms) to auditoriums of 75-120 m² (22 rooms). All classrooms are equipped with air conditioning, energy-efficient lighting, and audiovisual equipment suitable for teaching and learning languages in a highly interactive environment. Additionally, the school has several high-tech functional rooms: an audiovisual practice room, 2 online learning rooms, 17 language laboratories, and a large lecture hall. These diverse and regularly upgraded classrooms and lecture halls can effectively meet modern teaching requirements, for example, multimedia presentations, seminars, workshops, and simulated United Nations conferences.

In terms of digital facilities, the school also has smart classrooms, labs, online learning rooms, a learning materials production studio, a multilingual library, and a modern IT system. The entire school currently owns over 660 computers used for administrative and educational purposes, 169 projectors, and 705 air conditioners. Wi-Fi is available in all work areas and lecture halls, offering faculty, researchers, and students free internet access. The university's internal network connects to the VNU network and three external systems (FPT, VNPT, and Viettel). To effectively support administrative and management activities, the university operates an official website (www.ulis.vnu.edu.vn) upgraded and reorganized to be more of a management than an information network, an e-office document management software system (https://eoffice.vnu.edu.vn/) connected seamlessly with the VNU network, and a training and student affairs management network (www.daotao.vnu.edu.vn) allowing the university to create timetables, manage records, calculate grades, classify students, and award scholarships.

Furthermore, an online learning management system (LMS) to support the blended learning model has been implemented for many subjects, reducing the burden on physical facilities. The university has also actively invested in technological solutions such as Zoom meetings, Microsoft Teams, Turnitin, and ULIS chatbot to optimize the service quality for learners. The library and the IT & Learning Resources Department retain over 29,000 documents and are connected to national and international databases to ensure rich and up-to-date learning resources. Students and lecturers have access to the physical reading room in the French Faculty building, as well as the in-person and online reading rooms at the VNU-LIC Library and Digital Knowledge Centre. These digital solutions have significantly improved the functionality of classrooms, lecture halls, and information technology infrastructure managed by the Resource Management Centre.

The VNU-ULIS ecosystem also features administrative areas (A1, A5), shared workspaces for lecturers and students (Homies), the International Conference Centre, a physical training and practice area, dormitories, and open spaces to create the best campus experience for students. The administrative buildings A1 and A5 house the offices for faculty leaders and specialized departments. The "Homies" system creates a modern and creative self-study environment for students and lecturers. The International Conference Centre hosts conferences, seminars, and workshops. The dormitories provide sufficient living space and accommodation for resident students. The open spaces offer suitable amenities. The physical training and practice area provides facilities and grounds for cultural, artistic, and sports

activities. The university has recently invested in installing an additional elevator in the main lecture building A2 and opening new access points in lecture building B3 to facilitate faster transitions.

To recapitulate, at the meso layer, VNU-ULIS has sufficient capacity and resources to launch a new GIC program. The four existing curricula contain 92/162 highly compatible subjects. The human resources team, comprising 45 teaching members and other student support staff, can ensure the program's smooth operation. The university is also constantly improving both tangible and intangible infrastructure. Therefore, VNU-ULIS has all the necessary conditions in terms of curriculum, human resources, and facilities to organize and successfully and sustainably implement the GIC program.

The stakeholders' interests and anticipation of employment opportunities for the GIC graduates

Interests in the GIC training program. The International Relations major and the GIC program were recognized by 67% of participants, indicating the brand name's relevance in Vietnam's globalized society. This is considered a favorable starting point to launch the new program and *build* brand recognition. 57% of participants showed interest in the GIC training program, of which 21% expressed strong interest. Notably, the number of neutral (31%) and moderately interested responses (36%) was quite high, indicating the program's potential to attract even more attention with stronger promotion.

To be able to pursue this program, participants identified foreign language skills (M = 3.68, SD = 1.62), understanding of the language and culture associated with that language (M = 3.67, SD = 1.49), and communication knowledge and skills (M = 3.53, SD = 1.37) as the most important knowledge/skills to develop. The second most important group includes world civilization history (M = 3.48, SD = 1.31), understanding of globalization (M = 3.46, SD = 1.43), and intercultural communication skills (M = 3.45, SD = 1.48). Geopolitics (M = 3.42, SD = 1.36), political economy (M = 3.32, SD = 1.37), and international event analysis skills (M = 3.32, SD = 1.38) are the subjects with the lowest mean scores, but this would be associated with the increasingly difficult level of specialized knowledge and skills rather than their declining significance. Apart from the knowledge/skill groups mentioned, learners also need to perfect others necessary for their future work (M = 3.42, SD = 1.39) (Table 27).

Table 27

Knowledge/Skills that Need to be Developed

Knowledge/Skills that need to be developed	*M*	*SD*
Foreign language skills	3.68	1.62
Understanding the language and the culture of that language.	3.67	1.49
Communication knowledge and skills	3.53	1.37
Understanding globalization	3.46	1.43
Cross-cultural communication skills	3.45	1.48
History of world civilization	3.48	1.31
International event analysis skills	3.32	1.38
Geopolitics	3.42	1.36
Political economy	3.32	1.37
Other	3.42	1.39

Career opportunities for GIC graduates. 64% of respondents believed the GIC program could increase their career prospects, with 27% expecting opportunities to rise by 2-19%, 25% predicting a 20-30% increase, and 12% optimistic about a 31-50% surge. On the negative side, 21% thought career opportunities might decline, and 15% had no clear answer to this question.

According to the closed-ended question, the most suitable career paths for GIC graduates are language, culture, and international relations research (M = 3.72, SD = 1.50), translation (M = 3.65, SD = 1.42), teaching (M = 3.64, SD = 1.41), and diplomacy (M = 3.60, SD = 1.48). The second most suitable career paths are development project implementation (M = 3.52, SD = 1.36) and communication/marketing (M = 3.50, SD = 1.32). Politics is considered the least suitable profession (M = 3.41, SD = 1.38), possibly because it is a high-status profession and is often suited to exceptional individuals (Table 28). Notably, less than 10% of survey participants did not comment on this question.

Table 28

Suitable Occupations for GIC Graduates

Suitable occupations for GIC graduates	Valid answers	Don't know	*M*	*SD*
Teaching	1438	124	3.64	1.41
Translation	1437	125	3.65	1.42
Research in language, culture, and international relations	1449	113	3.72	1.50
Implement development projects	1416	146	3.52	1.36
Communications/Marketing	1443	119	3.50	1.32
Politician	1389	173	3.41	1.38
Diplomat	1433	129	3.60	1.48

When it comes to career opportunities for GIC graduates, the participants reflected a more cautious attitude with lower mean scores than in the previous question. Accordingly, significant career opportunities can be found in language, culture, and international relations research (M = 3.36, SD = 1.55), international organizations, non-governmental organizations (NGOs) (M = 3.34, SD = 1.50), development projects (M = 3.28, SD = 1.39), diplomacy (M = 3.28, SD = 1.51), communication/marketing (M = 3.27, SD = 1.36), the foreign-invested sector (M = 3.25, SD = 1.42), and research institutes/centers/higher education institutions (M = 3.25, SD = 1.42). Occupations with less promising career prospects for GIC graduates include translation (M = 3.24, SD = 1.48), private sector (M = 3.23, SD = 1.33), public sector (M = 3.22, SD = 1.31), public administration (M = 3.21, SD = 1.30), politics (M = 3.20, SD = 1.36), and teaching (M = 3.19, SD = 1.45). The number of participants who answered "I don't know" ranged around 10% (

Table **29**).

Table 29.

Career Opportunities for GIC Graduates

Career opportunities for GIC graduates	Valid answer	Don't know		*M*	*SD*
Teaching	1449	113	9	3.15	1.4
Translation	1446	116	4	3.28	1.4
Studies in language, culture, and international relations.	1475	102	6	3.35	1.5

International organizations, non-governmental organizations (NGOs)	1381	181	4	3.30	1.5

However, the thematic analysis of the participants' self-initiated responses reveals a more authentic landscape of the labor market with occupations clustered into eight categories. Diplomacy/international relations topped the list with 252 recommendations, followed by tourism (205), international economics/ business (196), and journalism/media (196). Groups with fewer opportunities included: translation/interpretation (164), education (143), international studies/research (106), management/human resources/administration (54), and non-governmental organizations (NGOs) and non-profit organizations (NPOs) (33). The results corroborate the closed-ended item regarding diplomacy/international relations, yet contradict non-governmental and non-profit organizations with fewer actual opportunities. Meanwhile, they also indicate more actual demands for tourism, international business/economics, and journalism/media sectors (Table 30).

Table 30

Occupational Fields Suitable for GIC Graduates as Recommended by Participants

Total	**1399**

In general, with a globalized worldview, GIC graduates can expand their career opportunities in international environments such as diplomacy/international relations, international tourism/hospitality, international economics/business, and international journalism/media. Besides traditional professions like teaching and translation/interpretation, GIC graduates can assume many strategic positions within businesses, acting as a bridge for international business transactions, negotiating with foreign partners, localizing products, and operating international supply chains/platforms. To fulfil these responsibilities, besides knowledge and skills in languages, cultures, and translation/interpretation, students need to be equipped with a global cultural mindset, effective communication in multicultural environments, cultural empathy, conflict resolution, and negotiation skills. Below are some valuable suggestions regarding suitable career fields and the necessary competencies for GIC graduates.

*With a foundation in GIC, graduates are no longer limited to traditional translation and interpretation jobs but can **take on many strategic positions** in modern businesses. They can develop careers in multinational human resource management, where **cultural empathy skills** help build an inclusive and cohesive work environment. In Marketing and External Communications, sensitivity to regional psychology helps graduates become **global campaign coordinators**, ensuring brand messages do not violate sensitive cultural barriers. Furthermore, positions such as International Project Coordinator, Foreign Investment Consultant, or working for non-governmental organizations (NGOs) are also lucrative opportunities, as these jobs require **negotiation skills and conflict resolution** between parties with **differing values**. (Participant 53)*

*Graduates trained in globalization and intercultural communication can work in a wide range of fields thanks to their **language skills, cultural understanding, and global mindset**. Career opportunities span from international media, editing and content creation, PR, marketing, and international business to education, study abroad consulting, and socio-cultural research. Additionally, graduates can join non-governmental organizations, diplomatic agencies, and take on roles in project coordination or international relations. Fields such as tourism and hospitality, import/export, global human resources, **localized product development,** and **international platform operation** in the technology industry are also well-suited. Overall, careers for this group of graduates require **effective communication***

skills, an understanding of the international context, and the ability to work in a multicultural environment*. (Participant 961)*

What are recommended for the GIC curriculum development?

The thematic analysis of approximately 500 suggestions for GIC curriculum development from the final open-ended question yields three main themes: (a) core knowledge/ attributes, (b) specialized skills/competencies, and (c) curriculum implementation.

Core knowledge/attributes. The program should equip students with a rich worldview encompassing culture, international economics, international trade, politics, and global issues. The curriculum needs to be sensitive to and update the changing national, regional, and global landscapes, thereby corroborating and anticipating global trends. Moreover, in-depth specialized knowledge becomes more significant than ever as the international market demands competitive, high-quality human resources with standardized expertise and professionalism. Some suggested specializations include political science, global communication, international crisis management, negotiation in multinational environments, business, marketing, accounting, recruitment, human resources, and artificial intelligence applications. Moreover, learners need to pursue lifelong learning, constantly cultivating core attributes such as autonomy, self-management, dynamism, flexibility, quick adaptation, competitiveness, and global thinking.

Table 31.

Core Knowledge, Attributes to be Developed

General comments	Subthemes	Quantity
Knowledge	• General knowledge of worldview	7
	• Adapting to global development trends	5
	• Specialization requiring further training	8
Attributes	• Lifelong learning	7
	• Autonomy, self-management	2
	• Dynamism, flexibility, quick adaptation, competitiveness	4
	• Global thinking, global citizenship	4

Skills/competencies. While theory is undeniably important in developing abstract thinking at the university level, the vast majority of opinions emphasize PRACTICALITY: reality, practice, application, and competitiveness. This means that the GIC program must be closely linked to real-world experience, train practical skills that are highly applicable in real life, enhance enterprise practice, and improve competitive edge in the ever-changing international context. Four groups of skills/competences are summarized in

Table 32Error! Reference source not found.: intercultural language/communication competences, soft skills/critical thinking skills, digital competences, and professional skills.

The most fundamental core competency for GIC graduates is language proficiency and intercultural communication, with a total of 41 comments. Specifically, students need to be able to use English effectively and acquire internationally recognized certificates. Furthermore, multilingual proficiency (English, Russian, Chinese, Japanese, Korean, Arabic) provides a significant competitive advantage in a multinational environment. Language skills should not be limited to basic communication but should be applied in specialized fields such as logistics, finance, tourism, construction, and information technology. To nurture more demanding intercultural communication skills, students need to develop natural listening and speaking reflexes in international environments or in foreign joint ventures, where they may adopt new languages and (corporate) cultures.

Soft skills/critical thinking skills rank as the second most frequently mentioned skill group, with 23 comments. Soft skills can be interpreted as effective communication in the workplace, teamwork, adaptability and integration into a multinational community, the ability to continuously learn and develop oneself, and occupational soft skills. Furthermore, in a dynamic, high-pressure work environment, students need to cultivate critical thinking and problem-solving skills to improve productivity and work efficiency.

The third group is digital competence, with 18 contributions. In the era of digital transformation, when the world's businesses are operated by high-speed internet, high-tech platforms, and artificial intelligence, pioneering and adopting information technology in training and work is a vital requirement for development. Students desire more exposure to effective online communication platforms, virtual reality in experiential learning, and practice with specialized software applications in language, translation, and project management to enhance their digital competency to address workplace requirements.

The final group is professional skills. Although mentioned in only nine comments, this seems to be the most important skill set in career development because of its high applicability and relevance to businesses' needs, ensuring that graduates can quickly adapt to job positions after recruitment. Specialized skills in tourism, communication, marketing, journalism, business, import/export, technology, multinational teamwork, and intercultural communication should be trained more professionally in partnership with enterprises and foreign organizations.

Therefore, the GIC program needs to be designed with a focus on enhancing employability skills, encompassing four core skill/competence groups: standardized language proficiency with in-depth expertise and intercultural communication in a multinational environment; soft skills and thinking skills (critical thinking, problem-solving, adaptability); digital and artificial intelligence competences; and professional skills relevant to the training specialization.

Table 32

Employability Skills/Competences

Employability skills/Competences	Subthemes	Quantity
Skills	• Theory and practice	2
	• Reality/Practice	12
	• Applicability	9
	• Practical competition	2
Intercultural communication skills	• Standardized language proficiency	12
	• Multilingual proficiency	10
	• Highly specialized knowledge	4
	• Intercultural communication skills	15
Employability skills	• Soft skills/Critical thinking skills	23
	• Digital competences	18
	• Professional skills	9

Curriculum. The theme curriculum is arranged into three subthemes: orientation, scale, and quality of training (52 comments); program content and teaching-learning methods (28 comments); and training methods (63 comments).

Regarding training orientation, scale, and quality, GIC curriculum development is necessary to diversify training programs and address the human resource needs. The new program should shift from a language-focused mindset to training employability skills for a global environment, where students need to be equipped with in-depth knowledge of the culture, economy, politics, and society of other countries, specialized competences relevant to their profession, and the ability to network globally. Some experts and employers believe that today's recruitment trends require both foreign languages and professional skills, suggesting a dual-degree model with majors and minors, foreign languages and a second pathway, such as business, marketing, technology, law, or commerce, to enhance graduates' competitiveness in the labor market. Accordingly, participants agreed that the scale of GIC training needs to be expanded by increasing quotas, opening multidisciplinary classes, professional courses, and potentially integrating with existing training programs at other educational institutions from high school to university levels, including international schools. The intake and outcome quality are also crucial to generating a skilled and intellectual workforce for national development. This requires investment in human and material resources to develop the teaching staff and take care of students' well-being.

The program content and teaching methodology subtheme proposes innovating the curriculum to increase its applicability and practicality, developing soft skills and digital competencies, diversifying training content, and investing in digital technology to improve teaching quality. Furthermore, the curriculum needs to be refined and updated, with thematic talks on globalization, intercultural communication, business administration, and geopolitics; experiential learning at international enterprises; and participation in projects and activities with foreign partners. The training methodology should emphasize professionalism, systematic approaches, and transparent, effective quality assurance processes. Teaching methods should also be more engaging, creative, and diverse, incorporating simulated scenarios, real-world projects, business case studies, and internships at multinational companies and international organizations.

The training methodology highlights interdisciplinary/multidisciplinary, corporate, and intercultural communication skills training. Interdisciplinary and multidisciplinary training are becoming an urgent societal need as employers require language skills combined with professional expertise. Therefore, language training should be supported by employability skill development to generate a "multi-skilled" workforce with high adaptability to dynamic work environments. Corporate training is also highly recommended as it offers authentic work experience and helps students avoid “job shocks” upon commencement. The curriculum planners need to work in parallel with potential businesses with recruitment needs or a physical presence in Vietnam to fulfil their needs and cooperate with FDI companies to create more internships and job opportunities for graduates. This corporate training should be a mandatory assessment component and conducted rigorously to facilitate students' accumulation of work experience and their confident integration into international environments. At a higher level of cooperation, businesses and employers should be invited to participate in providing feedback and evaluating the curriculum. Eventually, the training of intercultural communication skills, an undeniable strength of VNU-ULIS in the era of integration and development, needs to be further developed by enhancing intercultural communication skills, moving beyond theoretical understanding to application and creativity through realistic simulations to strengthen international academic exchange and connect students with international friends, tourists, and expats working in Vietnam. "Cultural empathy" is perhaps the most important attribute, opening up opportunities for collaboration and development on many levels.

Table 33

GIC Training Program

	• Teaching methods	16
Training methods	• Interdisciplinary/Multidisciplinary training	23

	• Corporate training/labor market/ corporate internships/training partnerships with businesses	23
	• Enhancing international communication skills	17

Below is a summary of typical experts/researchers and employers' contributions regarding the vision and GIC development strategies. The most prominent training strategy is a shift in focus from "language proficiency" to "context mastery," with languages becoming the foundation for developing cultural intelligence, global thinking skills, management, digital competences, and communication skills. GIC graduates will be able to analyze global capital flows, effectively connect links in international supply chains, and engage in lifelong learning to adapt to the fluctuating labor market. Intercultural communication competences are increasingly important, as they enable students to understand "cultural symbols," thereby effectively explaining and bridging differences. Furthermore, communication needs to go hand in hand with employability skills and adaptability. Thus, students need a multifaceted, insightful perspective of the target occupations and should not be afraid to engage with real-world situations to improve themselves. Accordingly, interdisciplinary/multidisciplinary curricula should be developed to provide practical skills, real-world experience, soft skills, global competencies, and digital technologies.

In the context of artificial intelligence (AI) gradually replacing basic language tasks, the focus of foreign language training needs to shift from ***"verbal fluency"*** *to* ***"context mastery."*** *Current curricula should be designed as* ***an integrated model****, where foreign languages play a foundational role, combined with essential supporting skills such as* ***managerial thinking, digital skills****, and especially* ***cultural intelligence (CQ)****. Society needs not only fluent foreign language speakers but also personnel capable of* ***analyzing the movement of global capital flows and effectively connecting links in international supply chains****. Therefore, universities need to enhance practical application through internships* ***at FDI enterprises****, while equipping students with a lifelong learning mindset to* ***adapt to the rapidly changing labor market****. (Participant 51)*

In the context of deep integration, the demand for human resources extends beyond mere foreign language proficiency; it also requires individuals ***with intercultural communication skills, global thinking, and an understanding of international social and political contexts****. Foreign language undergraduate programs should broaden their scope to include skills such as* ***multicultural context analysis, international negotiation, multilingual organizational management****, and* ***digital skills in multimedia communication****. This enables students to not only translate languages but also interpret* ***"cultural symbols,"*** *meaning* ***they can effectively understand, interpret, and connect with differences.*** *Training also needs to be more* ***flexible*** *with practical modules, connections to businesses and international organizations, and exchange programs. At the same time, the program should integrate interdisciplinary knowledge, such as international business, project management, communication, and information technology, to meet the diverse career requirements of the modern job market. (Participant 539)*

In summary, the proposals for developing the GIC program affirm its urgency at VNU-ULIS, creating possibly more lucrative job opportunities and aligning with the nation's more intensive international integration. The program illuminates a shift in training orientation from "language fluency" to "context mastery" with a competence-based curriculum covering four core skill/competency groups: intercultural language/communication competence, soft skills, digital/ artificial intelligence competence, and professional skills. Thus, more investment is required to improve quality and expand scale. While the GIC curriculum can be implemented at the school level, this orientation should be integrated into existing training programs inside and outside VNU-ULIS. The training content needs to be comprehensive, up-to-date, and flexible to meet the needs of society and employers. Educational methods should be engaging, creative, and highly applicable through simulation exercises, case studies, collaborative projects with businesses, and international exchanges. Training modes should aim towards interdisciplinary/multidisciplinary, corporate-based training, and intercultural communication skills development.

4. Discussions and conclusion

The feasibility study on launching a new GIC program at VNU-ULIS was conducted with the research team's strong commitment. The documentary analysis of the state and government's policies and the existing curricula, together with the large-scale needs assessment with both quantitative and qualitative data, has encapsulated the dynamic interplay among the quintuple helices of the multi-layered ecosystem. After approximately six months of data collection through the Cognito survey questionnaire, the research obtained 1562 valid responses and more than 500 suggestions for GIC curriculum development. Based on the conceptual framework of a multi-tiered ecosystem (Bronfenbrenner, 1979) and the tri-dimensional needs analysis of PSA, TSA, and CNA, the research results were arranged and presented scientifically in the four levels of the ecosystem.

5. Summary of research results

RQ1. At the macro layer, the State and Government's policies and strategies promote globalization and comprehensive international integration in education to enhance Vietnam's role and its position in the international arena.

RQ2. At the meso layer, VNU-ULIS has a high capacity to meet the requirements for launching the GIC program in terms of curriculum (92/162 highly compatible subjects), human resources (45 lecturers and other functional departments), and facilities (over 170 multimedia classrooms, digital platforms, and a dynamic, modern ULIS ecosystem).

RQ3. At the exo and micro levels, a large-scale needs survey ($N = 1562$) with 5 relevant target groups - high school students, university students, workers, employers, and experts/researchers - showed that 57% were interested/very interested in the training program and career opportunities could expand in tourism/hospitality, diplomacy/international relations, economics/international business, and journalism/communication, instead of being limited to the traditional fields of education and translation/interpretation.

RQ4. The thematic analysis of multiple stakeholders' recommendations has yielded a competence-based framework for GIC curriculum development consisting of linguistic and intercultural competence, digital competence, soft skills, and professional skill

Implications for developing the GIC program

GIC orientation. As the research results indicate, the GIC orientation is consistently aligned among all four levels in the human resource development ecosystem. International

integration is perceived as the driving force for the next stage of national development and modernization. This orientation has emerged in VNU-ULIS's existing curricula, with highly compatible subjects accounting for 56.8% of the examined. Research found that GIC compatibility is most discernible in language and culture knowledge (94.6%), general knowledge (60.1%), and less so in the specialized knowledge block (38.1%). Therefore, the university needs to refine the existing compatible subjects to align the teaching content with a GIC orientation and develop more GIC-specialized subjects, such as international economics, trade negotiation, and international event analysis, to increase the professional knowledge content of the university's overall orientation.

The GIC orientation cannot only be integrated into existing VNU-ULIS curricula, but also transferred to other VNU members, or developed into an independent curriculum in an attempt to internationalize universities (Rizvi, 2007), as internationalization of higher education has recently been regarded as a game changer not only in developed but also in emerging and developing societies (de Wit, 2020). In other words, the GIC orientation resembles "integrating an international/intercultural dimension into the teaching, research, and service functions of the institution" (Knight, 1994, as cited in OECD, 1999, p.16) to shape a global perspective (van Kampen et al., 2021). If intercultural communication, specialized English, and negotiation skills courses are embedded in high-quality curricula of VNU member universities, such as the University of Economics and Business, University of Engineering and Technology, University of Law, University of Education, University of Medicine and Pharmacy, the Interdisciplinary Training Faculty, and the International School, it can generate a more competitive workforce for national development. Therefore, global connectivity should be incorporated into the curricula of other universities, academies, and even high schools. In parallel with the policy of making English the second language in Vietnam, educational institutions need to adopt policies for recruiting global citizens who can proficiently use at least one foreign language for international communication in tourism, business, trade, educational and cultural exchanges in their home country, abroad, or in the internet environment.

Developing a GIC curriculum. The development of a GIC program needs to be grounded in intensive research about the market economy and its operation under the influence of scientific, technological, socioeconomic, and geopolitical factors. The research results sketch a competence-based framework for curriculum development, encompassing language and intercultural communication competence, soft/critical thinking skills, digital/artificial intelligence competence, and professional skills. The objectives and program learning outcomes need to adhere to this framework and reflect the national demand for economic and sociocultural development. Furthermore, the curriculum needs to ensure practicality and applicability, not only equipping students with appropriate knowledge, skills, and attitudes, but also developing the competencies and attributes of future global citizens who can quickly adapt to a changing world. This orientation is aligned with "contemporary appreciation of the fluid nature of cultural and workplace identities" (Dai, 2024, p. 452) and inspires the implementation of the intercultural dimension in language teaching (Huang & Fang, 2023).

A new GIC curriculum will converge all the best fits into a single training program and reinforce it with newly designed courses to facilitate international integration and cooperation. The courses in the GIC program can be inherited from 92 highly compatible existing subjects, with adaptations and updates in objectives and content. The GIC program should also provide comprehensive interdisciplinary/multidisciplinary training in law, business, intercultural communication, political event analysis, and essential 21st-century competencies, such as digital skills, critical thinking skills, adaptability, and professional skills. Additionally, the

university needs to research and develop more practical, applicable specialized courses, such as *Negotiation Art, International Economics, International Law, and International Event Analysis,* to enhance learners' competence in international integration.

Specialized and corporate training in collaboration with enterprises and FDI corporations will minimize workplace retraining and improve GIC graduates' competitiveness with their counterparts from other leading institutions, such as the University of Foreign Trade, the Diplomatic Academy, National Economics University, and Vietnam-Japan University, which offer similar majors. The training methods for the GIC program also need to be innovative and engaging. This could include enhancing practical experience, teaching through simulated scenarios, inviting experts and recruiters to share their real-world experiences, and placing greater emphasis on developing language skills, multilingualism, and intercultural communication. Furthermore, the university could consider expanding its collaboration with member universities of Vietnam National University, Hanoi, international counterparts, and FDI enterprises to offer high-quality, internationally standardized programs to accredit the international work skills of GIC graduates.

Limitations and research recommendations

The research was conducted urgently and received enthusiastic support from many stakeholders. While snowball sampling yielded a large amount of both quantitative and qualitative data, it is a non-probability sampling method, requiring caution in generalizing the research results. Besides the voluntary participation of a large number of high school students, undergraduates, and working professionals, the research team encountered difficulties in approaching experts/researchers and employers in this relatively new field, relying merely on personal connections. Further research, with support from the VNU-ULIS network in sending formal invitations to interviewees or organizing conferences and seminars, could gather more constructive feedback from experts, researchers, and employers. Studies on the internationalization of current training programs at VNU-ULIS and the integration of intercultural communication skills into elite training programs of VNU member universities could be potential research topics for experts interested in this field.

Conflict of interest

The authors declare that there was no conflict of interest.

Sponsorship

This research was funded by VNU University of Languages and International Studies (VNU-ULIS) in project No. N.25.21.

AI declaration

Copilot and Gemini were adopted to brainstorm ideas and synthesize the State and Government's policies. The research team conducted the data collection, analysis, and writing up. The final scientific research report was translated into English by Google Translate. The transformation and refinement of the report into an article were completed by the research team, with language polish supported by Grammarly.

#151 THE USE OF ARTIFICIAL INTELLIGENCE IN ACADEMIC WRITING AND ITS RELATIONSHIP WITH SELF-REGULATED LEARNING: A SYSTEMATIC REVIEW

Thach Huong Giang[1], Cao Thanh Cong[2], Trinh Hong Linh[3]

Abstract

The increasing use of artificial intelligence (AI), particularly generative AI tools, has reshaped how students approach academic writing in English as a foreign language (EFL) contexts. While AI can enhance writing performance by providing immediate and personalized feedback, its relationship with self-regulated learning (SRL) remains unclear. This systematic review synthesizes recent empirical studies to examine how AI use is associated with learners' SRL in academic writing. The findings suggest that AI can support writing quality, motivation, and efficiency when used strategically. However, excessive or uncritical use may limit learners' engagement in higher-order cognitive processes, including critical thinking and self-monitoring. The review also highlights the importance of learners' interaction with AI-generated feedback in shaping learning outcomes, proposes concrete pedagogical strategies for classroom integration, and identifies a lack of empirical evidence in specific contexts, particularly in Vietnam. The study underscores the need for pedagogically guided AI integration to promote both effective writing development and sustainable self-regulated learning.

***Keywords*:** artificial intelligence, AI, academic writing, self-regulated learning, SRL, EFL

1. Introduction

Academic writing in English is a complex, essential, and highly integrated skill for university students because it serves not only as a means of demonstrating knowledge but also as a medium through which learners develop critical thinking, reasoning, and the ability to express ideas logically (Gao et al., 2025). Recent advances in artificial intelligence (AI), particularly Generative AI, have significantly transformed the ways students approach and practice academic writing in English (Huang & Mizumoto, 2024). GenAI tools can provide immediate feedback on grammar, vocabulary, coherence, and text structure, while also assisting learners in optimizing the writing process, improving content quality, and enhancing overall learning efficiency (Chan & Lee, 2025; Kim et al., 2025). Alongside these technological changes, self-regulated learning (SRL) - the ability of learners to plan, monitor, and evaluate their own learning (Zimmerman, 1986) - continues to play a key role in successful academic writing.

Despite these benefits, the growing use of AI in academic writing has raised concerns among educators and researchers. One of the most frequently discussed issues is students' potential overreliance on AI tools (Marzuki et al., 2023). Existing studies indicate that although AI can improve the coherence and quality of writing work, it may simultaneously reduce students' independent thinking and creativity (Marzuki et al., 2023; Shi et al., 2025). Some learners have reported that frequent use of AI makes them less willing to write independently and more inclined to depend on AI-generated responses. Such concerns suggest that excessive

[3] *University of Languages and International Studies, Vietnam National University; Email: thlinh@vnu.edu.vn*

reliance on AI may weaken learners' self-directed learning capacity, which is considered a fundamental element of sustainable academic development (Marzuki et al., 2023; Shi et al., 2025). As a result, understanding how AI influences students' self-regulated learning has become an important issue.

Despite growing interest in AI-assisted writing, the relationship between AI and self-regulated learning is still not well understood. Although the use of AI in academic writing has attracted increasing attention, existing studies have focused on describing the benefits of AI tools or learners' attitudes toward their use rather than examining their influence on self-regulated learning (Kim et al., 2025; Ozdere, 2025). Studies that discussed SRL often examined only one aspect, such as motivation, critical thinking, or self-assessment (Dazzeo, 2024; Gao et al., 2025; Huang & Mizumoto, 2024), rather than considering SRL as a complete learning process. Consequently, the current evidence remains fragmented, making it difficult to understand the overall impact of AI on students' self-regulation.

Another area that has received limited attention is how students interact with AI-generated feedback. Feedback is one of the main ways through which AI supports learning, yet relatively little is known about how students use the suggestions provided by AI. Some students critically evaluate AI feedback before revising their writing, whereas others accept AI suggestions with little reflection (Chan & Lee, 2025; Shibani et al., 2024). These different patterns of interaction may influence whether AI strengthens or weakens SRL. However, existing studies have not been systematically reviewed to explain these differences.

In addition, most research on AI-assisted academic writing has been conducted in Western countries and a small number of Asian contexts (Hornberger et al., 2025; Wang et al., 2024). Evidence from Vietnam remains very limited, even though generative AI is becoming increasingly popular in Vietnamese higher education. Because educational practices, English proficiency, and technology use vary across countries, findings from other contexts may not fully reflect the experiences of Vietnamese students. A systematic review is therefore needed to bring together existing evidence, identify common findings, and highlight areas where further research is required.

This systematic review aims to synthesize empirical studies on the use of AI in English academic writing, with a particular focus on its relationship with students' SRL and their interaction with AI-generated feedback. Specifically, the review has three objectives: (1) to examine how AI influences different aspects of self-regulated learning in academic writing, (2) to explore how students interact with AI-generated feedback, and (3) to identify gaps in the current literature, especially those related to the Vietnamese EFL context. The review addresses the following research questions:

RQ1. How does the use of AI influence students' self-regulated learning in academic writing?

RQ2. How do students interact with AI-generated feedback?

This review includes empirical studies published between 2023 and 2025, the period during which AI became widely adopted in education. Only English-language studies indexed in Scopus, Web of Science, ERIC, and Google Scholar were included. Qualitative, quantitative, and mixed-methods studies were eligible, whereas conceptual papers, technical reports, and studies unrelated to academic writing or learning were excluded. The review adopts Zimmerman's (1986) broad concept of SRL and synthesizes findings across different academic disciplines.

2. Methodology

2.1 Research design

This study employed a thematic literature review to synthesize empirical evidence on the influence of AI on students' SRL in academic writing and their interaction with AI-generated feedback. A thematic approach was considered appropriate because the review aimed to identify common themes, patterns, and gaps across existing studies rather than combine statistical results. Given the methodological diversity of the included studies, which comprised qualitative, quantitative, and mixed-methods research, the review focused on integrating findings conceptually to provide a comprehensive understanding of the topic and address the research questions.

2.2 Search strategy

Relevant studies were identified through searches in major academic databases, including Scopus, Web of Science, ERIC, and Google Scholar. The search process focused on studies published between 2023 and 2025, reflecting the period during which AI tools became widely adopted in educational settings.

A combination of keywords and Boolean operators was used, including “AI”, “generative AI”, “GenAI” OR “AI chatbot”, “self-regulated learning”, “academic writing” OR “EFL writing”, “AI feedback” OR “automated feedback”, and “feedback uptake” OR “student interaction”. These keywords were combined using AND and OR operators to retrieve studies relevant to the two research questions.

2.3 Inclusion and exclusion criteria

Studies were selected according to predefined inclusion and exclusion criteria to ensure the relevance and quality of the review. To be included, studies had to be published between 2023 and 2025, written in English, and focus on GenAI or AI-assisted writing tools within educational contexts. Eligible studies were required to examine topics related to self-regulated learning, academic writing, AI-generated feedback, or students’ interactions with AI feedback. In addition, only empirical studies employing qualitative, quantitative, or mixed-methods approaches were considered. To ensure academic rigor, the review included studies published in peer-reviewed journals, conference proceedings, or scholarly book chapters.

Studies were excluded if they focused solely on the technical development of AI systems without addressing educational applications, or if they addressed contexts unrelated to English-language learning or writing. Conceptual or theoretical papers that did not present empirical findings were also excluded. Duplicate records and publications with inaccessible full texts were removed during the screening process.

2.4 Study selection

The database search yielded 57 potentially relevant records. Among these, 47 investigated the relationship between AI and SRL, while 10 explored the concept of AI reliance or dependency. All records were assessed using the inclusion and exclusion criteria. As the screening and full-text eligibility assessment were conducted in a single stage, these processes are reported together, which is acknowledged as a limitation of the review methodology. Following the eligibility assessment, 37 records were excluded because they did not examine SRL or AI-generated feedback as a primary focus, or were not situated in an English-language

learning or academic writing context. Consequently, 20 empirical studies satisfied all inclusion criteria and were included in the thematic synthesis.

2.5 Data analysis

A thematic synthesis approach was adopted to analyze the selected studies. Information extracted from each article included publication details, research context, participants, methodology, AI tools used, and major findings.

The extracted findings were coded and grouped according to the research questions. For RQ1, themes focused on the influence of generative AI on dimensions of self-regulated learning, including motivation, self-monitoring, self-assessment, reflection, and autonomy. For RQ2, themes focused on learners' interaction with AI-generated feedback, including trust, evaluative judgment, feedback uptake, feedback rejection, and reflective engagement.

The synthesis process aimed to identify common patterns, areas of agreement, and emerging concerns across the reviewed literature, thereby providing a comprehensive understanding of the educational implications of generative AI in academic writing.

Table 1

Summary of studies included in the thematic synthesis.

Study	AI Tool / Focus	Design	Participants	Key Finding
Apriani et al. (2024)	AI chatbot	Mixed-methods	EFL students	writing performance, confidence, self-reported SRL
Wang et al. (2024)	ChatGPT	Mixed-methods	Postsecondary learners	92% positive perception; self-management/monitoring imbalance
Chang et al. (2023)	AI chatbot (design principles)	Conceptual/design-oriented	Not specified	AI supports SRL via goal setting, feedback, personalization
Wei (2023)	AI-supported platform	Mixed-methods	Not specified	motivation & SRL vs. traditional instruction
Dazzeo (2024)	AI self-assessment tool	Not specified	Students (writing course)	reflective thinking, purposeful revision
Wong & Viberg (2024)	ChatGPT	Two empirical studies	Not specified	Supports SRL in writing/reading; feedback lacks depth
Hapsari et al. (2023)	AI-mediated self-assessment	Not specified	University students	Trust & proficiency shape engagement
Yang et al. (2024)	Pigai (AWE system)	Exploratory	EFL writers	Feedback favors grammar; evolves toward self-regulated revision
Zhan & Yan (2025)	ChatGPT feedback	Not specified	Students	Domain-specific trust; superficial copying behavior
Thompson (2025)	AI personalized feedback	Not specified	Undergraduates	self-efficacy & performance; risk of reduced autonomy
Marzuki et al. (2023)	AI writing tools	Qualitative (teacher perspective)	EFL teachers	AI aids coherence but may reduce independent thinking

Shi et al. (2025)	ChatGPT vs. AWE	Comparative	L2 learners	Differing effects on ideal L2 writing self
Gao et al. (2025)	AI chatbot-integrated tasks	Exploratory	Not specified	Effects on self-efficacy & critical thinking
Kim et al. (2025)	GenAI writing tools	Not specified	Students	Perspectives on GenAI-assisted writing
Huang & Mizumoto (2024)	GenAI	Not specified	Students	motivation & writing self-efficacy
Chan & Lee (2025)	GenAI	Case study	Secondary school students	Balancing AI use and authenticity
Ozdere (2025)	ChatGPT, You.com	Not specified	EFL students	Effectiveness & grading consistency assessed
Shibani et al. (2024)	AI feedback (general)	Not specified	Students	Critical interaction with AI in assessment
Hornberger et al. (2025)	AI literacy (general)	Multinational survey	University students (DE, UK, US)	AI literacy patterns across contexts

Note. Fields marked "Not specified" reflect information not reported in the original studies as cited in this review.

3. Results

3.1. Influence of AI on students' self-regulated learning in academic writing (RQ1)

Evidence from the included studies suggests that AI can support students' self-regulated learning (SRL), although its benefits are not automatic (Apriani et al., 2024; Wang et al., 2024). Rather than serving only as a writing tool, AI is presented as a learning partner that can support several aspects of SRL, including goal setting, self-monitoring, self-evaluation, motivation, and reflective learning (Chang et al., 2023; Wei, 2023; Dazzeo, 2024; Wong & Viberg, 2024; Wang et al., 2024).

Chang et al. (2023) argue that AI chatbots are most beneficial when they encourage learners to set goals, evaluate their own work, and receive personalized support, rather than simply generating text or correcting errors. Their findings suggest that AI promotes self-regulation when it encourages students to reflect on their learning and adjust their writing strategies. In contrast, using AI only to produce answers or make corrections may encourage a more passive approach to learning.

The positive influence of AI on motivation and confidence is another consistent finding across the reviewed studies. Wei (2023) found that students using an AI-supported platform reported higher levels of motivation and self-regulation than those receiving traditional instruction. This improvement was associated with a learning environment that reduced writing anxiety and encouraged a growth mindset. Similarly, Apriani et al. (2024) reported improvements in students' writing performance, confidence, self-reported SRL, and ability to monitor their own progress after using an AI chatbot. These findings suggest that AI may strengthen self-regulated learning not only by supporting writing tasks but also by helping students feel more confident and engaged throughout the writing process.

Reflection and self-assessment also emerged as important aspects of AI-supported learning. Dazzeo (2024) found that AI-assisted self-assessment encouraged students to reflect

more critically on their writing, revise their work more purposefully, and evaluate their performance more effectively. Wong and Viberg (2024) reported similar results, showing that ChatGPT supported SRL in both reading and writing by providing timely assistance and increasing learner confidence. However, they also observed that AI-generated feedback often lacked the analytical depth of teacher feedback. Their findings suggest that the value of AI feedback depends largely on whether students evaluate and use it critically rather than accepting it without reflection.

Evidence from Wang et al. (2024) reinforces this point. Most students used ChatGPT for brainstorming, developing ideas, and revising their writing, and more than 92% viewed their experience positively. However, while students generally managed the writing process effectively, they were less consistent in evaluating the quality of AI-generated responses. Some learners questioned, verified, and revised AI suggestions before using them, whereas others accepted them with little evaluation. This indicates that managing the writing process does not necessarily mean that students also monitor AI-generated information critically.

These findings are consistent with concerns raised by Apriani et al. (2024), who cautioned that excessive or uncritical reliance on AI may weaken independent thinking, creativity, and reflective learning. Taken together, the reviewed studies suggest that AI is most effective in supporting SRL when learners actively evaluate and regulate their use of AI, rather than relying on it without reflection.

Overall, the available evidence shows that AI can strengthen self-regulated learning by supporting motivation, confidence, self-monitoring, self-assessment, and reflection. However, these benefits depend not only on the capabilities of AI but also on learners' active engagement in regulating their own learning throughout the writing process.

3.2. Students' interaction with AI-generated feedback (RQ2)

A second theme emerging from the reviewed studies concerns how students engage with AI-generated feedback. Rather than accepting AI feedback passively, students were found to evaluate, interpret, question, and sometimes reject the suggestions they received (Hapsari et al., 2023; Yang et al., 2024; Zhan & Yan, 2025). Their responses were influenced by several factors, including trust in AI, language proficiency, and perceptions of feedback quality (Hapsari et al., 2023; Yang et al., 2024; Thompson, 2025).

Trust was identified as an important factor shaping students' use of AI feedback. Hapsari et al. (2023) found that students' engagement with AI-supported self-assessment depended on both motivation and trust, although this relationship differed according to writing proficiency. Higher-proficiency students tended to compare AI feedback with their instructors' comments before making revisions, whereas lower-proficiency students were more likely to rely directly on AI-generated scores. These findings suggest that students with different levels of writing proficiency engage with AI feedback in different ways.

The reviewed studies also show that students responded differently depending on the type of feedback they received. Yang et al. (2024), in their study of the Pigai automated writing evaluation system, found that most AI feedback focused on grammar, vocabulary, punctuation, and other language-related issues, while relatively little attention was given to ideas or argument development. Students generally accepted direct error corrections but were more cautious when responding to linguistic suggestions. Their engagement also changed across multiple rounds of revision, moving from simple error correction to more self-regulated revision. Because some feedback was inconsistent, students often had to decide whether to accept, modify, or reject the AI's suggestions.

A similar pattern was reported by Zhan and Yan (2025). Students generally trusted AI feedback on grammar and vocabulary but were less confident in feedback related to content and argumentation. At the same time, many students copied ChatGPT's suggestions directly instead of rewriting them in their own words. Based on these findings, the authors highlighted three competencies that support effective use of AI feedback: evaluative judgment to identify inaccurate suggestions, questioning skills to improve AI-generated responses, and reflective calibration to maintain an appropriate balance between trust and skepticism.

The reviewed studies also suggest that students' trust in AI may be influenced by more than one factor. Hapsari et al. (2023) emphasized differences in learners' writing proficiency, whereas Zhan and Yan (2025) showed that students' trust also varied according to the type of feedback they received. Together, these findings indicate that students' engagement with AI feedback is shaped by both learner characteristics and feedback characteristics.

The nature of the feedback itself was also found to influence students' responses. Thompson (2025) reported that personalized AI feedback was associated with greater writing confidence and better writing performance than generic feedback or no feedback because students perceived it as more specific and easier to apply. However, the study also found that highly detailed feedback could reduce learner autonomy when students lacked the ability to evaluate it critically. Based on these findings, Thompson (2025) suggested that AI could provide language-level and technical feedback, while instructors focus on higher-order aspects of writing, such as tone and rhetorical organization.

Overall, the reviewed evidence suggests that students engage with AI-generated feedback in different ways rather than responding to it uniformly. Some learners critically evaluate and adapt AI suggestions before incorporating them into their writing, whereas others accept or copy them with little reflection. These differences highlight the importance of students' own engagement in determining how AI feedback is used during the writing process.

4. Discussion

Taken together, the reviewed studies suggest that the relationship between AI and students' learning in academic writing is more complex than simply being beneficial or harmful. Across both research questions, AI was found to support self-regulated learning in some situations while creating challenges in others, depending on how students used and responded to it (Apriani et al., 2024; Wang et al., 2024). These findings highlight the importance of examining students' interaction with AI, rather than focusing only on the technology itself.

For RQ1, the findings support Chang et al.'s (2023) view that AI can serve as a learning partner by providing personalized guidance that encourages students to regulate their own learning. The improvements in motivation, confidence, and self-regulation reported by Wei (2023) and Apriani et al. (2024) further suggest that AI contributes not only to writing performance but also to learning processes such as goal setting, monitoring, and reflection. At the same time, the reviewed studies consistently show that AI does not replace learners' role in regulating their own learning. Improvements in SRL were observed when students actively evaluated and used AI-generated support rather than relying on it without reflection. This is consistent with Apriani et al.'s (2024) finding that excessive reliance on AI may reduce independent thinking and creativity.

The findings for RQ2 provide further insight into how students engage with AI-generated feedback. Across the studies by Hapsari et al. (2023), Yang et al. (2024), and Zhan and Yan (2025), students were not simply passive recipients of AI feedback. Instead, they

evaluated, interpreted, questioned, and sometimes rejected the suggestions they received. Yang et al. (2024) also found that students accepted direct error corrections more readily than feedback that required interpretation, such as suggestions related to language use or rhetorical organization. This suggests that different types of AI feedback may encourage different levels of learner engagement during the revision process.

Another consistent finding concerns the role of trust in shaping students' responses to AI feedback. Hapsari et al. (2023) found that higher-proficiency students were more likely to compare AI feedback with their own judgment or their instructors' comments, whereas lower-proficiency students relied more directly on AI-generated suggestions. Zhan and Yan (2025) further showed that students' trust varied according to the type of feedback they received. They generally trusted AI feedback on grammar and vocabulary but were more cautious about feedback related to content and argumentation. Together, these findings suggest that students' engagement with AI feedback is influenced by both learner characteristics and the nature of the feedback itself.

4.1 Pedagogical implications

The findings of this review suggest several implications for integrating AI into academic writing instruction.

First, AI should be used to complement, rather than replace, teachers' feedback. Thompson (2025) suggested that AI is well suited to providing language-level feedback, such as grammar, vocabulary, and mechanics, while instructors continue to guide students on higher-order aspects of writing, including content development, argumentation, and rhetorical organization. This recommendation aligns with the findings of Zhan and Yan (2025), who reported that students generally trusted AI feedback on language-related issues but were more cautious about feedback on content and argumentation.

Second, writing instruction should place greater emphasis on helping students develop feedback literacy. Zhan and Yan (2025) identified three competencies that support effective use of AI feedback: evaluative judgment, questioning skills, and the ability to balance trust with critical reflection. Rather than assuming these skills develop naturally through repeated AI use, instructors can create learning activities that encourage students to evaluate, question, and justify their use of AI-generated feedback during the writing process.

Third, students should be encouraged to verify AI-generated feedback before incorporating it into their writing. Wang et al. (2024) found that although students generally managed the writing process effectively, they were less consistent in evaluating the quality of AI-generated suggestions. Providing opportunities for students to explain or justify how they use AI feedback may therefore help strengthen self-monitoring and reflective learning.

Finally, AI should be integrated into writing instruction in ways that encourage students to remain actively involved throughout the writing process. As highlighted by Apriani et al. (2024), Marzuki et al. (2023), and Shi et al. (2025), excessive reliance on AI may weaken independent thinking and creativity. AI should therefore be used as a tool to support learners' thinking and revision rather than replace their own decision-making and problem-solving.

Overall, the findings indicate that the educational value of AI depends not only on the technology itself but also on how it is incorporated into teaching and how students engage with it. Effective classroom practices should therefore focus on promoting active learner involvement, critical evaluation, and responsible use of AI throughout the writing process.

4.2 Theoretical contribution

Beyond its practical implications, this review contributes to the growing literature on SRL in AI-supported learning environments. The findings suggest that, in line with Zimmerman's (1986) conceptualization of SRL, learners continue to play an active role in planning, monitoring, and evaluating their learning even when AI is involved. Rather than replacing these self-regulatory processes, AI changes the context in which they are carried out by introducing AI-generated suggestions that learners need to evaluate, interpret, and decide whether to use (Chang et al., 2023; Wang et al., 2024; Zhan & Yan, 2025).

The review also highlights the importance of distinguishing AI dependency from general technology use. Across the reviewed studies, AI supported learning when students used it critically and remained actively involved in the writing process, but its benefits became more limited when learners relied on AI without sufficient evaluation or reflection (Apriani et al., 2024; Wang et al., 2024). These findings suggest that AI dependency may be a useful concept for understanding how AI influences SRL and deserves further theoretical and empirical investigation.

4.3 Gaps in the existing literature

The review identified several gaps that provide directions for future research. First, although many studies have reported the positive effects of AI on writing performance, motivation, and self-regulated learning, relatively few have examined AI dependency as a distinct focus of investigation. In addition, existing studies rarely explore how AI dependency may influence different components of SRL, such as goal setting, self-monitoring, and self-evaluation.

Second, the current evidence is drawn mainly from countries and regions where AI has been widely adopted in education, including China, Hong Kong, Malaysia, and several Western contexts (Wei, 2023; Wang et al., 2024; Wong & Viberg, 2024; Yang et al., 2024; Zhan & Yan, 2025; Ozdere, 2025; Chan & Lee, 2025; Thompson, 2025). No empirical study included in this review was conducted in Vietnam, despite the growing use of AI in Vietnamese higher education. Differences in educational context, English language proficiency, and technology use suggest that findings from existing studies may not be directly transferable to Vietnamese learners.

Third, most of the reviewed studies examined AI as a learning tool or a source of feedback rather than exploring how AI may influence the processes of self-regulated learning. Although several studies showed that AI can both support and hinder SRL depending on how learners use it (Chang et al., 2023; Apriani et al., 2024; Wang et al., 2024), there is still limited understanding of how AI dependency relates to different aspects of self-regulation. Developing clearer conceptual frameworks to explain this relationship would help strengthen future research in this area.

4.4 Limitations

This review has several limitations that should be considered when interpreting the findings. Although the numbers of identified and included studies are reported, the screening and full-text eligibility assessment were conducted in a single stage rather than documented as separate steps. As a result, the review provides less procedural detail than a fully protocol-driven systematic review. In addition, no standardized quality appraisal tool was applied to assess the methodological quality of the included studies. The search was also limited to English-language publications published between 2023 and 2025, meaning that relevant studies published in other languages, including Vietnamese, or before this period may not have been captured.

Another limitation relates to the evidence base itself. Most of the reviewed studies were qualitative, small in scale, or based on short-term interventions. As a result, there is still limited evidence on the long-term relationship between AI use, AI dependency, and the development of self-regulated learning. The review also found that existing studies have not yet provided a clear conceptual distinction between different forms of AI dependency, highlighting the need for further theoretical and empirical research in this area.

In summary, the findings suggest that the educational value of AI extends beyond improving writing performance or increasing efficiency. Across the reviewed studies, AI was most beneficial when learners remained actively involved in planning, monitoring, evaluating, and reflecting on their own learning. Future research should therefore move beyond examining whether AI improves writing outcomes and investigate how AI influences students' self-regulated learning, feedback literacy, and learner autonomy over time.

5. Conclusion

This thematic literature review examined recent empirical studies on the relationship between AI, SRL, and students' interaction with AI-generated feedback in academic writing. Overall, the evidence indicates that AI can make a positive contribution to the writing process by supporting learners' motivation, confidence, self-monitoring, self-assessment, and reflective learning (Chang et al., 2023; Wei, 2023; Apriani et al., 2024; Dazzeo, 2024; Wang et al., 2024). Rather than serving only as a writing assistant, AI can also support key aspects of SRL when learners use it thoughtfully and remain actively involved in their own learning.

The review further shows that students do not simply accept AI-generated feedback without question. Instead, they evaluate, interpret, verify, and sometimes reject AI suggestions depending on their writing proficiency, trust in AI, and perceptions of feedback quality (Hapsari et al., 2023; Yang et al., 2024; Zhan & Yan, 2025). These findings highlight that feedback literacy, critical evaluation, and reflective engagement remain essential, even when AI is available to support the writing process.

At the same time, the reviewed studies consistently caution against excessive reliance on AI. Although AI can support learning in many ways, relying on it uncritically may reduce opportunities for independent thinking, reflection, and learner autonomy (Apriani et al., 2024). In other words, the educational value of AI depends not only on what the technology can do but also on how learners use it. Students who actively evaluate and regulate their use of AI are more likely to benefit from it than those who depend on it without reflection.

This review also points to several directions for future research. More studies are needed to better understand how AI dependency relates to different dimensions of SRL, how this relationship develops over time, and how it varies across educational contexts. In particular, evidence from Vietnamese higher education remains limited despite the growing use of AI, highlighting the need for research that reflects the experiences of Vietnamese EFL learners.

In conclusion, AI has considerable potential to support academic writing and SRL, but it should be viewed as a tool that complements rather than replaces learners' own thinking and decision-making. The greatest educational benefits are likely to be achieved when AI is used

to encourage reflection, informed judgment, and active engagement throughout the writing process.

#155 FROM REPRODUCTION TO INTERACTION: EXTENDING ESP LISTENING PRACTICES TOWARD COMMUNICATIVE LISTENING IN AN ESP COURSE AT THE DIPLOMATIC ACADEMY OF VIETNAM (DAV)

Giang Hoang Thi Linh[1]

Abstract

Vietnam's ongoing shift toward English as an additional language for international communication has placed new demands on university English courses, particularly in English for Specific Purposes (ESP) programmes where listening instruction has traditionally emphasised comprehension and reproduction rather than communicative interaction. This pattern is especially evident at the Diplomatic Academy of Vietnam (DAV), where students engage with authentic news content on international relations, diplomacy, and economics but are rarely required to respond to it spontaneously.

This study investigated whether a brief, interaction-oriented post-listening activity could strengthen students' listening-to-respond performance, defined as the capacity to process spoken input and produce a relevant oral response. A four-week classroom-based action research project was conducted with 30 third-year undergraduate students in one ESP II listening class at DAV. The existing reproduction-based lesson sequence was left unchanged; a short peer-questioning stage was added immediately afterward.

Pre-test and post-test recordings were scored on a four-category rubric assessing comprehension, response relevance, fluency, and response development. Because pre-post difference scores departed from normality, Wilcoxon signed-rank tests served as the primary inferential analysis, supported by paired-samples *t*-tests as a robustness check. Both tests indicated statistically significant gains across all categories and the total score (all $p < .01$), with effect sizes ranging from medium-to-large ($d = 0.66$) to very large ($d = 2.10$), the strongest gain occurring in response development. Qualitative analysis across multiple news genres corroborated this pattern, showing a consistent shift from factual recall toward explanation and elaboration. The findings suggest that minimal, curriculum-compatible interaction extensions can meaningfully advance communicative listening within reproduction-oriented ESP instruction.

***Keywords*:** ESP listening, listening-to-respond, interaction, Vietnam, communicative competence, action research

1. Introduction

Vietnam's deepening international integration has raised expectations for communicative English competence across higher education, requiring university English programmes to prepare students not merely to know the language but to use it in real academic and professional exchange. Following Canale and Swain (1980), communicative competence denotes the ability to use language appropriately and effectively, grammatically, sociolinguistically, discursively, and strategically, across authentic contexts, a standard

[1] *Lecturer, English Faculty, Diplomatic Academy of Vietnam, Hanoi, Vietnam.*

increasingly written into Vietnamese higher-education policy even where classroom practice has been slower to follow.

English for Specific Purposes (ESP) courses sit at the centre of this shift because they exist specifically to prepare learners for discipline-specific communication. At DAV, ESP listening courses draw on authentic, news-based material tied to international relations, diplomacy, economics, and international law, content that mirrors real diplomatic and legal communication. Students are streamed by proficiency at entry; those without an IELTS score of 6.0 or above sit an institutional placement test aligned with the Vietnamese six-level foreign-language framework, itself broadly mapped to the CEFR. Students in ESP II, the level examined here, correspond approximately to B1.

In practice, instruction at this level centres on comprehension and reproduction: students listen to authentic news and reproduce its content, in writing or speech, as accurately as possible. This builds comprehension, vocabulary, and information-processing skill, but leaves little room for learners to respond to what they hear, to interpret it, react to it, or use it communicatively. Contemporary TESOL scholarship increasingly foregrounds listening-to-respond, the capacity to process spoken input and produce a meaningful spoken reaction to it, yet bringing this into heavily structured ESP settings is not straightforward given curriculum load, assessment expectations, and learners' proficiency ceilings.

The problem motivating this study arose from the researcher's own classroom observation in ESP listening courses at DAV. Students could generally identify key information in authentic news reports, but many struggled to respond to it spontaneously: responses were often short, memorised, or lifted almost verbatim from the listening text, and students hesitated when asked to elaborate or explain cause and effect. This reflects a structural feature of the curriculum rather than an individual shortcoming, since comprehension and reproduction are heavily practised and assessed while spontaneous, meaning-based response is neither taught nor tested. A full communicative redesign was not a realistic option within the existing course structure, so the problem this study addresses is narrower: whether a small extension to existing reproduction tasks can move students toward more communicative listening behaviour without disturbing the curriculum they are already required to deliver.

Accordingly, the study pursues three aims: to describe a brief, interaction-oriented post-listening activity compatible with an existing ESP reproduction-based sequence; to examine changes in listening-to-respond performance, comprehension, response relevance, fluency, and response development, across a four-week implementation; and to interpret these changes, together with classroom observation and recorded excerpts, in relation to theory and research on interaction, output, and ESP pedagogy. The study addresses the following research question:

To what extent can brief interaction-oriented post-listening activities enhance students' listening-to-respond performance in an ESP listening course?

This question is framed as a matter of extent rather than a directional prediction because the study is a single-cycle, single-group action research project conducted by the class teacher within one intact class over four weeks. Under these conditions, no control group, no random assignment, teacher and researcher combined in one role, a research question is a more defensible instrument than a formal hypothesis, which would imply a confirmatory logic the design was not built to support (Burns, 2010; Mills, 2011).

2. Literature Review

2.1. ESP Listening in Higher Education

Listening sits at the centre of ESP instruction because learners must process discipline-specific input in academic and professional settings. Dudley-Evans and St John (1998) argue that ESP instruction should be built around learners' communicative needs within a specific domain, typically lectures, interviews, presentations, and authentic media. Authentic listening material builds familiarity with real-world language use and professional communication patterns (Gilmore, 2007), though the same authenticity raises the cognitive load learners must manage. Several scholars have pushed ESP listening instruction to move past comprehension testing toward communicative application: Flowerdew and Miller (2005) observe that listening instruction still prioritises information recall over interaction, and Field (2008) describes listening classrooms that position learners as passive receivers. In Vietnam and across Asian EFL contexts more broadly, listening instruction has historically emphasised test preparation and factual comprehension (Nguyen & Boers, 2019), a pattern sharpened in ESP settings where anxiety about specialised content can push students toward memorisation over communicative risk-taking.

2.2. Listening-to-Respond and Communicative Listening

Older listening pedagogy treated listening largely as decoding followed by comprehension checks; communicative approaches instead treat listening as interpretive and interactive. Richards (2008) argues listening cannot be cleanly separated from speaking, since real communication requires listeners to act on what they hear, and Nation and Newton (2009) make a parallel case for teaching listening and speaking together through communicative tasks. Vandergrift and Goh (2012) push this further, arguing that effective listening instruction should cultivate active meaning processing and metacognitive reflection rather than comprehension testing alone; Vandergrift (2007) frames listening research in similar terms, as increasingly concerned with active meaning construction. Rost (2011) notes that response-oriented tasks push learners to process input more deeply, since they must prepare a reaction rather than select a correct answer, and Newton and Nation (2020) report that post-listening interaction can support both fluency and communicative confidence. This matters especially in ESP, where professional listening is rarely passive: diplomatic and international settings routinely require people to react, question, and explain, so listening-to-respond arguably reflects the target communicative demand more directly than comprehension testing does.

2.3. Interaction-Oriented Post-Listening Activities

Post-listening stages give learners room to consolidate comprehension and extend what they have heard into productive language use (Underwood, 1989). Two strands of theory motivate why peer interaction specifically should help. Long's (1996) Interaction Hypothesis holds that interaction supports acquisition because learners negotiate meaning and receive opportunities for modified output; Swain (2005) argues, complementarily, that producing language pushes learners to notice gaps in what they can already say, building communicative control. Peer interaction may also lower speaking anxiety, since learners are often more comfortable experimenting and reformulating with classmates than performing directly for the teacher. None of this is straightforward where courses remain assessment-driven: classroom time is limited and students carry real anxiety about spontaneous speaking, which is precisely why a minimal, low-preparation adaptation, rather than a larger communicative overhaul, is worth testing in a setting like this one.

2.4. Theoretical Framework

The theoretical framework guiding this study follows a single explanatory chain rather than a list of separate theories. Communicative Competence (Canale & Swain, 1980) supplies the target construct: the goal of instruction is appropriate, effective language use across grammatical, sociolinguistic, discourse, and strategic dimensions, not comprehension accuracy alone. Long's (1996) Interaction Hypothesis supplies the mechanism for why peer questioning should help learners move toward that target, since negotiating meaning with a partner creates opportunities for modified input and output that a solitary reproduction task does not. Swain's (2005) Output Hypothesis supplies the complementary production-side mechanism: producing a spoken response, rather than merely comprehending, pushes learners to notice gaps between what they want to say and what they can currently say. Listening-to-respond operationalises this chain for classroom measurement, sitting at the intersection of Long's interactional mechanism and Swain's output mechanism, and ESP pedagogy (Dudley-Evans & St John, 1998) supplies the professional-relevance rationale that justifies building the intervention around DAV's own news-based content.

2.5. Research Gap and Contribution of the Present Study

ESP listening research documents that reproduction-oriented instruction dominates ESP classrooms, including in Vietnam, and explains why this persists institutionally (Dudley-Evans & St John, 1998; Gilmore, 2007; Flowerdew & Miller, 2005; Field, 2008; Nguyen & Boers, 2019). Listening-to-respond and interaction research establishes, largely in general EFL/ESL contexts, why moving listening instruction toward interaction should support learners (Richards, 2008; Nation & Newton, 2009; Vandergrift, 2007; Vandergrift & Goh, 2012; Rost, 2011; Newton & Nation, 2020; Long, 1996; Swain, 2005). What remains unexplored is the middle ground: whether a minimal, curriculum-embedded interaction stage that leaves existing reproduction tasks untouched can produce measurable movement toward listening-to-respond inside an ESP course structured around reproduction, in a context where wholesale communicative redesign is not realistic. The present study's contribution is this bridging step, tested statistically rather than described only in general terms.

3. Methodology

3.1. Research Design

The study used a classroom-based action research design, structured as a one-group pre-test/post-test comparison over a four-week intervention period. Action research was appropriate because the aim was to improve classroom practice within a real instructional context, testing whether a communicative extension could be added to an existing ESP curriculum under authentic institutional constraints, rather than to establish a causal effect under controlled experimental conditions (Burns, 2010; Mills, 2011). The single ESP II class involved was selected through convenience sampling: it was the class the researcher was already teaching that semester, which made a genuine classroom-embedded trial possible. Other ESP classes taught by the same researcher continued with regular instruction but did not function as a formal control group, since students were not randomly assigned and no parallel data were collected from them, a design limitation discussed further below.

3.2. Participants

Participants were 30 third-year undergraduate students in one ESP II listening class at DAV, placed at approximately B1 level under DAV's institutional procedures. Students without an internationally recognised certificate sat an institutional placement examination

covering listening, grammar, vocabulary, reading, and short written responses, aligned with the Vietnamese six-level framework. Most participants had studied English through secondary school before entering university, and several had attended specialised or high-performing secondary schools, consistent with DAV's competitive admissions profile. The course met once weekly for 135-minute sessions; before the intervention, instruction had been predominantly comprehension-oriented, with limited communicative follow-up.

The researcher was also the classroom teacher, a dual role that carries an inherent risk of bias, since the same person designed the intervention, taught it, and scored the outcome measure. Before data collection, students were informed of the study's purpose and gave verbal consent for anonymised use of their recordings; participation did not affect course grades. Ethical approval was granted by the faculty research committee of the English Division at DAV.

3.3. Instructional Context

The course covered listening material on international relations, economics, diplomacy, international law, and global affairs, using authentic sources such as BBC World News, CNN International, Al Jazeera English, and VOA Learning English. Standard practice involved listening comprehension exercises, vocabulary development, note-taking, and news reproduction, with the emphasis on comprehension and recall rather than spoken production. During the intervention, listening texts covered international trade, climate policy, regional conflict, and diplomatic relations, chosen because they matched the curriculum's existing thematic focus. Each 2.5-hour lesson followed the textbook's usual sequence, pre-listening preparation, listening comprehension, vocabulary consolidation, note-taking, and news reproduction, and the intervention was built to sit inside this structure rather than compress or replace any part of it.

3.4. Intervention

The intervention added a brief, interaction-oriented post-listening stage immediately after the standard reproduction task, without replacing any existing activity. A typical lesson followed this sequence: warm-up and vocabulary preparation; authentic news listening and comprehension tasks; vocabulary consolidation and note-taking; oral or written news reproduction; pair questioning and listening-to-respond activity; and teacher summary. After reproduction, students worked in pairs, one answering follow-up questions while the partner asked, using teacher-provided prompts; roles rotated so both students practised questioning and responding. Prompts moved from factual clarification in the first two weeks to more elaborated, causal-reasoning prompts in the final two weeks (e.g., What happened? Why is it important? How are people reacting? What may happen next?), matched to text structure. The teacher circulated, took brief observation notes, and intervened only occasionally, keeping corrective feedback deliberately light so as not to suppress spontaneous response. The interaction stage lasted roughly three to seven minutes per lesson.

Table 1

Sample Lesson Structure During the Intervention

Stage	Activity	Approximate Time
Warm-up	Topic discussion and activation of background knowledge	15 minutes
Pre-listening	Vocabulary preview and prediction activities	25 minutes

Listening	Authentic news listening and comprehension tasks	40 minutes
Reproduction	Oral or written news reproduction	25 minutes
Interaction extension	Pair questioning and listening-to-respond activity	3–7 minutes
Wrap-up	Teacher summary and clarification	10 minutes

3.5. Data Collection

Pre-test and post-test listening-to-respond tasks were administered before and after the four-week intervention. Students listened to a short news report, took brief notes, and recorded oral responses to two follow-up questions, without preparing full scripts in advance; each response lasted roughly 45–60 seconds. Recordings were scored by the researcher using the rubric described below. A second independent rater was not involved, so inter-rater reliability could not be established, a limitation addressed in the Discussion. The researcher also kept brief observation notes on participation patterns, hesitation, and interactional difficulties during the pair activities, used to support interpretation of the qualitative findings.

3.6. Assessment Rubric

Recordings were scored on a four-category analytic rubric, Comprehension, Response Relevance, Fluency, and Response Development, each rated on a five-point scale (Table 2).

Table 2

Summary of Analytic Rubric Descriptors

Category	Score 1	Score 3	Score 5
Comprehension	Limited understanding of main ideas	Understands main ideas with some missing details	Accurate understanding of main ideas and supporting details
Response Relevance	Responses minimally connected to questions	Responses generally relevant but occasionally unclear	Responses consistently relevant and appropriate
Fluency	Frequent pauses and fragmented speech	Some hesitation but generally understandable	Smooth and sustained speech with minimal hesitation
Response Development	Very short or repetitive responses	Some explanation or elaboration provided	Responses extended with clear explanation and supporting ideas

The rubric was developed by the researcher directly from the constructs central to the study's theoretical framework, since no published instrument targeted listening-to-respond specifically for an ESP setting. Comprehension descriptors reflect established listening-assessment criteria describing accuracy of understanding of main ideas and supporting detail (Field, 2008; Flowerdew & Miller, 2005). Response Relevance and Response Development descriptors were written to capture the interactional and output dimensions emphasised by Long (1996) and Swain (2005): whether a response addressed the question asked, and whether it was extended with explanation rather than left at bare recall. Fluency descriptors reflect the broader communicative competence construct (Canale & Swain, 1980), specifically its emphasis on effective, connected spoken performance rather than accuracy alone. Score-point

descriptors were written in plain, behaviourally anchored language so that a single classroom rater could apply them consistently across recordings.

Conceptual grounding of this kind, rather than statistical validation, is the basis on which the rubric's appropriateness for this study rests. No formal expert panel review, pilot validation, or psychometric analysis, such as a reliability coefficient or factor analysis, was conducted, and a single rater scored all recordings, so no inter-rater reliability statistic exists. For a small-scale classroom action research project designed to trial a pedagogical adjustment rather than to produce a standardised instrument, this level of instrument development is consistent with the exploratory purpose of the study.

3.7. Delimitations of the Study

The scope of this study was deliberately bounded, and these boundaries should be read as intentional design decisions rather than as unplanned gaps, which are discussed separately under Limitations. The study examined one intact ESP II class at one institution because the design required a genuine classroom-embedded trial, led by the students' own teacher, rather than an artificial or borrowed setting; investigating multiple classes was beyond the scope of a single-cycle action research project of this kind. The study examined listening-to-respond performance specifically, rather than general oral proficiency or listening comprehension in isolation, because this construct most directly reflects the interactional demand the intervention was designed to strengthen. Only authentic news-based listening lessons already used in the ESP II syllabus were included, so that the intervention could be evaluated under the exact instructional conditions the course normally provides, rather than under specially constructed materials that might not transfer to regular practice. Finally, the intervention was limited to a brief interaction-oriented post-listening questioning stage rather than a broader communicative task, such as role play or extended discussion, because the guiding concern was whether a minimal, low-preparation adaptation could be absorbed into an existing reproduction-based lesson without displacing it; broader tasks would have required curriculum time this study was not designed to test.

3.8. Data Analysis

Scores for each rubric category were entered into Microsoft Excel for both the pre-test and post-test, and descriptive statistics, means, standard deviations, and mean differences, were computed for each category and the total score. Prior to inferential testing, the assumption of normality was checked by applying the Shapiro-Wilk test to the pre-post difference scores for each category and the total score, since paired-samples *t*-tests assume that these difference scores are approximately normally distributed. In every case, the Shapiro-Wilk test indicated a significant departure from normality, W ranging from 0.58 to 0.84, $p < .001$, consistent with the bounded, discrete nature of a five-point rubric applied to a sample of this size.

Because this assumption was not satisfied, the non-parametric Wilcoxon signed-rank test served as the primary inferential analysis comparing pre-test and post-test scores for each category and the total score. Paired-samples *t*-tests were also computed and are reported alongside the Wilcoxon results as a supplementary robustness check; because both tests converged on the same conclusion for every comparison, this convergence increases confidence that the pattern of significant gains is not an artefact of the specific test chosen. Cohen's d for paired samples (the mean difference divided by the standard deviation of the difference scores) was computed for each comparison as a standardised, scale-independent measure of the size of the change, interpreted using Cohen's (1988) conventional benchmarks (0.2 = small, 0.5 = medium, 0.8 = large). All statistics were computed using JASP.

Qualitative analysis involved examining representative excerpts from student recordings and classroom observation notes, organised by recurring news-text types and question types used throughout the intervention, to identify patterns in explanation, causal reasoning, elaboration, and response relevance.

4. Results

4.1. Descriptive Statistics

All 30 students completed both the pre-test and post-test tasks. Table 3 presents the mean scores, standard deviations, and mean differences for each rubric category and the total score.

Table 3

Descriptive Statistics for Pre-Test and Post-Test Scores (N = 30)

Category	Pre-test M (SD)	Post-test M (SD)	Mean Difference
Comprehension	3.37 (0.61)	3.70 (0.60)	0.33
Response Relevance	3.03 (0.67)	3.47 (0.63)	0.43
Fluency	2.87 (0.68)	3.23 (0.68)	0.37
Response Development	2.53 (0.68)	3.23 (0.63)	0.70
Total Score (/20)	11.80 (2.38)	13.63 (2.25)	1.83

Scores improved across all four categories, with the largest raw gain in Response Development (0.70), followed by Response Relevance (0.43), Fluency (0.37), and Comprehension (0.33), consistent with an intervention targeting interaction and explanation specifically, layered onto a curriculum that had already trained comprehension and reproduction intensively.

4.2. Inferential Statistics

Shapiro-Wilk tests on the pre-post difference scores indicated a significant departure from normality for every category and the total score (Comprehension: $W = 0.60$, $p < .001$; Response Relevance: $W = 0.63$, $p < .001$; Fluency: $W = 0.72$, $p < .001$; Response Development: $W = 0.58$, $p < .001$; Total: $W = 0.84$, $p < .001$). Consistent with this violation, Wilcoxon signed-rank tests served as the primary inferential analysis (Table 4).

Table 4

Wilcoxon Signed-Rank Test Results and Effect Sizes (N = 30)

Category	z	p	r	Cohen's d
Comprehension	-2.80	.002	.89	0.70
Response Relevance	-3.18	<.001	.88	0.86
Fluency	-2.69	.003	.75	0.66
Response Development	-4.02	<.001	.88	1.50
Total Score	-4.54	<.001	.87	2.10

All five comparisons were statistically significant, indicating that the improvement from pre-test to post-test was unlikely to reflect chance variation. Effect sizes ranged from

medium-to-large for Fluency (d = 0.66) and Comprehension (d = 0.70) to large for Response Relevance (d = 0.86) and very large for Response Development (d = 1.50) and the total score (d = 2.10); the corresponding rank-biserial correlations (r = .75-.89) point to the same conclusion.

Paired-samples t-tests, reported in Table 5 as a supplementary robustness check, converged with the Wilcoxon results for every comparison, and the 95% confidence intervals for the mean difference excluded zero in every case.

Table 5

Paired-Samples t-Test Results (Supplementary Robustness Check, N = 30)

Category	t(29)	p	95% CI for MD
Comprehension	3.81	<.001	[0.15, 0.51]
Response Relevance	4.71	<.001	[0.25, 0.62]
Fluency	3.61	.001	[0.16, 0.57]
Response Development	8.23	<.001	[0.53, 0.87]
Total Score	11.49	<.001	[1.51, 2.16]

Convergence across parametric and non-parametric tests strengthens confidence that the observed gains reflect a genuine pattern in the data rather than an artefact of a particular statistical procedure. The two categories showing the largest effect sizes, Response Development (d = 1.50) and the total score (d = 2.10), indicate that the intervention's clearest influence was on students' capacity to elaborate on and explain what they had heard, rather than on comprehension accuracy alone, a distinction developed further in the Discussion.

4.3. Qualitative Findings

Three cross-cutting patterns emerged when recordings and observation notes were analysed thematically across the recurring news genres used throughout the intervention, rather than lesson by lesson. Responses moved from recall toward explanation, became more closely anchored to the partner's question than to the source text, and this shift recurred across genres with different communicative demands rather than being confined to one or two familiar topics. Each pattern is illustrated below with excerpts drawn from more than one lesson of the relevant type.

The most consistent pattern was a shift from bare recall toward causal explanation, visible in both breaking-news and policy-related lessons, such as coverage of the Ever Given's grounding in the Suez Canal and of the Regional Comprehensive Economic Partnership (RCEP). Prompts for this kind of content, including What happened?, Why is this important?, and What could happen next?, were designed to move students from reporting an event to interpreting its significance. Before the intervention, responses of this type were typically limited to bare fact: one pre-test response to the Suez Canal report stated only that “the ship blocked the canal. Trade stopped,” and a comparable pre-test response to RCEP reduced the agreement to a label, “RCEP is a trade agreement.” Post-test responses to similar content added an explanatory clause in both cases: “The ship blocked the canal, so many ships could not pass. This affected transportation and world trade,” and “RCEP is a trade agreement and it can help countries recover their economies after the pandemic.” Because this shift recurred across two unrelated genres rather than in a single lesson, it illustrates the Response Development gain

reported in Table 4 and points to a general change in how students used spoken input rather than a response tied to one topic.

A second pattern was closer alignment between responses and the partner's specific question rather than the original listening text, evident in both economic-news and organisational-decision lessons, such as coverage of sanctions affecting Russian seafood exports and of a Volkswagen labour dispute. Prompts of this kind, including How did this affect different people or countries?, Who benefited or was disadvantaged?, and Do you agree with the decision? Why?, asked students to reason about consequence or to take a position rather than restate content. Early responses to both genres tended to restate the reported fact without engaging the interactional question, reflecting adequate Comprehension but weaker Response Relevance. By the later weeks, students more often addressed the partner's follow-up directly, for instance distinguishing which countries' exporters were affected in the sanctions lessons, and linking a company's decision to its effect on workers before offering a judgement in the labour-dispute lessons. This convergence across an explanatory and an evaluative genre is broadly consistent with the negotiation-of-meaning mechanism proposed by Long (1996), in which the partner's question, rather than the source text, increasingly shapes what a learner says next.

A third pattern, cutting across the first two, was that neither shift appeared confined to a single genre or question type. Explanatory gains were observed in both factual (breaking news) and policy-oriented (international agreements) content, and relevance gains were observed in both economic and evaluative (organisational-decision) content. Taken together, this suggests a change in listening-to-respond behaviour that extended across the kinds of authentic material the course already used, rather than an improvement specific to one or two familiar lessons.

Considered together, this pattern is broadly consistent with the quantitative gains reported above: the largest effect sizes were observed for Response Development and Response Relevance, the two categories most directly reflected in the qualitative shifts described here. Given the study's design, this convergence does not by itself establish that the intervention caused the change, but it does support a fuller reading of the results than either the statistical or the qualitative evidence would offer alone, since the shift toward explanation and relevance appears to have been distributed across genres rather than isolated to particular lessons.

5. Discussion

5.1. Differential Gains Across Rubric Categories

One consistent finding across the quantitative and qualitative evidence is that the intervention shifted the character of students' listening-to-respond performance from factual reporting toward explanation, and did so across genres rather than within a single familiar lesson. This pattern is broadly consistent with Swain's (2005) Output Hypothesis: requiring a spoken response, rather than comprehension alone, is the condition under which learners are thought to notice gaps between what they understand and what they can currently articulate, and Response Development, the category most directly tied to that mechanism, produced the largest effect size observed (d = 1.50). Response Relevance improved almost as strongly (d = 0.86), a result perhaps better explained by Long's (1996) Interaction Hypothesis than by output alone, since negotiating meaning with a peer gives students real-time signals about whether a response addresses the question, a mechanism visible in the qualitative shift from restating the listening text toward answering a partner's specific follow-up.

By comparison, Comprehension showed the smallest, though still significant, effect (d = 0.70). This is not a surprising result: the existing curriculum had already trained comprehension and reproduction intensively, consistent with Nguyen and Boers's (2019) account of Vietnamese and broader Asian EFL contexts, where listening instruction has long emphasised test preparation and factual comprehension, precisely the skill this cohort had already practised. Fluency showed a similar pattern (d = 0.66), plausibly because the intervention targeted relevance and elaboration rather than fluency directly, and because four weeks is a short period in which to expect observable change in spontaneous speech at approximately B1 level. Read together, these differential effects, largest where the intervention's mechanism was most direct, offer a more precise account of what changed than the total score alone.

5.2. Extending ESP Listening Research through Minimal Interaction

One finding that deserves particular attention is that the largest improvements occurred in Response Development and Response Relevance rather than in Comprehension. In other words, students did not simply become better at understanding the listening texts; they became more willing to explain, interpret, and respond to what they had heard. This distinction helps position the study within existing ESP listening research. While previous studies have shown that reproduction activities support comprehension and information organisation (Dudley-Evans & St John, 1998; Flowerdew & Miller, 2005; Field, 2008; Long, 1996; Swain, 2005; Vandergrift & Goh, 2012), relatively few have examined whether a brief interaction stage can build on those strengths without changing the overall lesson structure.

The present findings offer preliminary support that it can: reproduction and interaction need not be framed as competing approaches to listening instruction. Reproduction continues to do what Field (2008) and Flowerdew and Miller (2005) describe it as already doing well, supporting comprehension and information organisation, while a short interaction stage appears to do complementary work, encouraging communicative use of that information, in line with Richards's (2008) argument that listening and speaking are not easily separated in instruction.

Such a complementary relationship may matter most where a full communicative redesign is hardest to justify. In assessment-driven ESP programmes, where curriculum time and assessment weightings are fixed, a three-to-seven-minute addition seems more likely to be adopted and sustained than a larger structural change would be. For ESP teachers in similar positions, the practical question this study speaks to is less whether to replace reproduction with communicative tasks than what minimal addition might create room for response, a question addressed here with one tested, low-cost example rather than a general prescription.

5.3. Relevance to Vietnam's Shift toward Communicative English

Beyond the immediate classroom, these findings speak to a broader transition underway in Vietnamese higher education, in which English instruction is gradually repositioning English less as a subject mastered for examinations and more as an additional language for academic and professional use. Vandergrift and Goh (2012) argue that this kind of transition requires listening instruction to build active meaning processing and metacognitive engagement gradually rather than in short bursts, and the present study offers one classroom-tested mechanism for incremental progress toward that goal without waiting for curriculum-wide reform. Because DAV's ESP listening courses are built on internationally oriented content, diplomacy, law, and economics, where responding to spoken input is arguably a professional requirement rather than a general communicative skill, the case for narrowing the gap with

communicative competence (Canale & Swain, 1980) may be stronger here than in general English contexts.

5.4. Limitations

Several limitations bound these findings. The study drew on a single class at a single institution, so results cannot be generalised without further testing. The absence of a control group means the gains reported are consistent with the intervention rather than proof of it. The researcher's dual role as teacher and rater introduces a structural source of bias, and reliance on a single rater means no inter-rater reliability statistic could be established. The four-week window is sufficient to detect an initial shift but not to establish durability, since no delayed post-test was administered. These limitations should be considered when interpreting the findings. At the same time, the consistency between the quantitative results and the classroom evidence provides reasonable confidence that the observed changes reflected meaningful developments in students' listening-to-respond performance.

6. Conclusion

The present study asked whether a brief, interaction-oriented post-listening activity could strengthen students' listening-to-respond performance in an ESP listening course at the Diplomatic Academy of Vietnam. Wilcoxon signed-rank tests, corroborated by paired-samples *t*-tests, showed statistically significant gains across comprehension, response relevance, fluency, and response development, with effect sizes ranging from medium-to-large to very large, and qualitative evidence across multiple news genres, breaking news, economic reporting, international agreements, and organisational decisions, pointed to the same underlying shift: from factual recall toward explanation, causal reasoning, and reasoned opinion.

Read against Canale and Swain's (1980) communicative competence framework and the interactional and output mechanisms proposed by Long (1996) and Swain (2005), this pattern suggests that reproduction-based ESP listening instruction does not need to be abandoned in order to move toward communicative goals; it can instead be extended. A brief interaction-oriented stage, added after an unchanged reproduction task, appears sufficient to convert a comprehension exercise into a modest bridge toward communicative listening. For ESP teachers working within fixed curricula and assessment structures, of the kind common across Vietnamese higher education, this offers one practical, evidence-based option that does not require institutional redesign to implement.

The broader implication is a modest one: even within reproduction-bound ESP classrooms, a few minutes of structured interaction may be enough to turn listening into a starting point for communication rather than an endpoint in itself.

Declaration of AI Use

During the preparation of this manuscript, the author used Claude and ChatGPT to improve the stylistic clarity, readability, and grammatical accuracy of the text. The underlying conceptual framework, classroom intervention design, data collection, statistical analyses, and qualitative interpretations were executed entirely by the author, who maintains full accountability for the integrity of the final content.

#156 EXPLORING THE IMPACTS OF OVER-RELIANCE ON GENERATIVE AI TOOLS IN ESSAY WRITING: A CASE STUDY OF HUFLIT SOPHOMORES

Pham Kim Quoc[1], Le Hoang Yen Vy[2], Tran Nguyen Thu Ha[3], Bui Hoang Gia Han[4], Tran Thi Truc Duyen[5]

Abstract

Artificial intelligence tools, especially Generative AI (GenAI), are increasingly used in higher education, particularly in academic writing skills. Among these tools, ChatGPT has become popular among university students because it can generate ideas, correct grammar, and help to organize essays. However, excessive reliance on ChatGPT may negatively influence students' independent thinking and writing development. Since essay writing is an essential skill for English-major students, understanding the risks of overusing AI tools has become increasingly important. Therefore, this study was conducted to investigate the impacts of utilizing GenAI tools, especially ChatGPT, in essay writing among sophomores at the University of Foreign Languages and Information Technology (HUFLIT). The study involved the participation of 127 HUFLIT sophomores who had experience using ChatGPT in essay writing. The questionnaire of a 5-point Likert for 121 participants and the semi-structured interviews for six were administered to the students, examining four aspects: dependence on AI-generated content, reduction in independent idea generation, impact on critical thinking and the overall development of writing autonomy. The results revealed that students perceived the impact of overusing ChatGPT at a moderate level. The study focuses on evaluating the potential negative impacts and the level of student dependency on writing skills; in addition, several pedagogical implications were suggested to promote responsible AI use and support students' independent writing development.

Keywords: ChatGPT, AI-assisted writing, essay writing skills, English-major sophomores

1. Introduction

1.1. Overview of the Background Information

Artificial intelligence (AI) is rapidly transforming higher education, particularly through the integration of generative AI tools into teaching and learning practices. Recent research highlights that generative AI technologies, such as ChatGPT, are increasingly embedded in academic contexts to support writing instruction, provide automated feedback, and facilitate personalized learning experiences (Ding et al., 2026; Crosthwaite & Sun, 2025).

In today's globalized world, the field of English Language Studies (ELS) has gained greater significance, as English is widely used for international communication, education, and

[3] *Tran Nguyen Thu Ha, English Language Teaching senior, Faculty of Foreign Languages, Huflit*
[4] *Bui Hoang Gia Han, English Language Teaching senior, Faculty of Foreign Languages, Huflit*
[5] *Tran Thi Truc Duyen, English lecturer, Faculty of Foreign Languages, Huflit*

professional purposes. English-majored students are expected to develop proficiency in four main language skills: listening, speaking, reading, and writing. Writing is an essential skill in academic learning because it helps students organize ideas, develop arguments, and communicate their thoughts clearly (Flower & Hayes, 1981; Hyland, 2003; Wingate, 2012). Beyond educational contexts, writing is also important for professional and personal communication (Weigle, 2002). To write effectively, students majoring in English need not only grammatical knowledge and vocabulary but also the ability to generate ideas, organize content logically, think critically, and develop arguments coherently (Kellogg, 2008; Setyowati et al., 2020; Wingate, 2012).

Because of these writing requirements, generative AI tools have become more relevant to English academic writing. ChatGPT is commonly used by students as a form of writing support because it can help them brainstorm ideas, plan essay structures, revise grammar, improve vocabulary, and receive immediate feedback on their drafts. Recent studies have shown that generative AI technologies are being integrated into higher education to support writing instruction, provide automated feedback, and facilitate personalized learning experiences (Crosthwaite & Sun, 2025; Ding et al., 2026). In EFL contexts, AI-assisted writing tools have also been reported to improve students' writing performance and confidence (Jmaiel et al., 2025). However, the growing use of ChatGPT in essay writing also raises concerns about students' dependence on AI-generated content and their ability to write independently.

1.2. Problem Statement

The use of ChatGPT has become common among HUFLIT sophomores in essay writing courses as it can assist them in key stages of the writing process such as generating ideas, planning essay outlines, organizing arguments, and improving word choices. When used appropriately, ChatGPT can function as a useful learning tool that supports students during the writing process; however, problems arise when students rely on ChatGPT too frequently and let it complete major parts of their essays for them. Instead of brainstorming and coming up with their own ideas and writing strategies, some students may depend on ChatGPT to provide ready-made content.

This over-reliance may reduce students' opportunities to practice essential writing processes on their own. This lack of practice overtime may make them gradually become less capable of generating original ideas, organizing arguments logically, and evaluating the quality of their own writing. As a result, their independent writing competence may decline, which may then reduce their confidence when they are required to write essays without ChatGPT support. Furthermore, by allowing ChatGPT to organize arguments and generate content automatically, students may bypass important cognitive processes involved in developing their original reasoning. Recent studies have also warned that excessive dependence on ChatGPT can negatively affect students' creativity, critical thinking ability, and long-term writing development (Zhang et al., 2024). Therefore, further investigation is needed to examine how the overuse of ChatGPT may affect HUFLIT sophomores' ability to generate ideas, develop arguments, evaluate their own writing, and complete essay-writing tasks independently.

1.3. Objectives

This study aims to investigate the potential risks associated with the overuse of generative AI tools in essay writing, with a specific focus on ChatGPT among HUFLIT sophomores. As ChatGPT is one of the most widely used generative AI tools for academic writing support, the study examines the extent to which students depend on ChatGPT-generated content during the writing process. It also explores how this dependence may influence their

ability to generate ideas, develop arguments, and write more independently. Since academic essay writing requires active thinking, continuous practice, and independent decision making, the study seeks to determine whether the overuse of ChatGPT may limit students' engagement in these essential writing processes. To achieve these objectives, the study is guided by the following research questions:

1. To what extent does overuse of ChatGPT lead to students' dependence on AI-generated content in essay writing?

2. How does the excessive use of ChatGPT influence HUFLIT sophomores' ability to think independently when developing arguments in essays?

1.4. Scope of the Study

This study is limited to English Language Studies sophomores at HUFLIT who have used ChatGPT to support their English essay writing. The study focuses on students' overuse of ChatGPT in essay-writing tasks because these tasks require a combination of cognitive and linguistic processes, including idea generation, argument development, content organization, language use, and revision. More specifically, it investigates students' dependence on ChatGPT-generated content and how this dependence may affect their ability to think independently, develop arguments, self-edit, and complete essays without excessive support from ChatGPT.

Drawing on Cognitive Load Theory, this study views academic essay writing as a cognitively demanding task in which students need to manage several processes simultaneously, such as understanding the topic, generating ideas, organizing arguments, selecting appropriate language, and revising their work. As these processes may create a high cognitive load, particularly for students who are still developing their academic writing ability, the overuse of ChatGPT may become problematic when they rely on the tool to handle demanding stages of essay writing rather than actively practicing the thinking and writing processes needed for independent writing.

2. Literature review

2.1. Definition

2.1.1 Generative AI

The term Generative Artificial Intelligence (GenAI) refers to a branch of artificial intelligence that can produce new content based on patterns learned from large datasets. Unlike traditional AI systems that mainly classify, analyze, or predict existing information, GenAI is characterized by its ability to generate new outputs in different formats, including text, images, audio, video, and computer code, in response to user input (Wang et al., 2024; Xhaferi, 2024). Firstly, GenAI is characterized by its capacity to produce novel content by identifying and drawing on patterns learned from large-scale training datasets (Banh & Strobel, 2023; He et al., 2025). Secondly, as a prompt-based system, GenAI allows users to interact with it through instructions, questions, or requests, from which it generates relevant responses according to the given input (Banh & Strobel, 2023; Chen et al., 2025). Thirdly, text-based GenAI tools are often built on large language models, enabling them to process written language and produce coherent, human-like textual responses (Raza et al., 2025). Finally, because GenAI can create, revise, and transform information, it can support different forms of content production across various contexts (Banh & Strobel, 2023; Storey et al., 2025).

2.1.2. Over-reliance on Generative AI

Over-reliance on Generative Artificial Intelligence (GenAI) refers to an excessive pattern of dependence in which users rely on GenAI tools to a degree that goes beyond normal support or assistance (Passi et al., 2024; Zhai et al., 2024). This form of reliance occurs when users frequently depend on AI-generated outputs to perform tasks, make decisions, or solve problems with limited personal judgment, critical evaluation, or independent effort (Parasuraman & Manzey, 2010; Zhai et al., 2024). It is characterized by the repeated use of GenAI as a primary source of answers or solutions rather than as a supplementary tool, which may lead users to accept generated outputs without sufficient verification or reflection (Passi et al., 2024). Over time, such dependence may reduce users' cognitive engagement, as they become less involved in evaluating information, applying their own knowledge, and making independent decisions (Lee et al., 2025; Zhai et al., 2024). In this sense, over-reliance on GenAI can be defined as a problematic pattern of use in which excessive dependence on AI-generated support may weaken users' independent thinking, judgment, and skill application.

2.1.3. Essay Writing

Essay writing refers to a form of academic writing in which writers develop a central idea, organize supporting points, and present ideas in a clear, coherent, and structured written form (Bailey, 2025; Hamp-Lyons & Heasley, 2006; Hyland, 2019). Unlike informal writing, essay writing follows a structured format that usually includes an introduction, body paragraphs, and a conclusion. It requires writers to state a central idea, develop supporting points, connect ideas coherently, and use appropriate academic language to communicate meaning effectively (Alkamel & Alwagieh, 2024). In second language learning, essay writing is commonly understood as a complex writing task because learners need to combine language proficiency with composing skills during the writing process (Hyland, 2019; Weigle, 2002). This process involves several cognitive activities, including planning, generating ideas, organizing content, translating thoughts into written language, and reviewing or revising written work (Flower & Hayes, 1981; Kellogg, 2008). Therefore, essay writing is not simply the act of producing a written text; rather, it is a recursive process in which learners construct meaning, arrange ideas, and present their thoughts in a coherent academic form (Flower & Hayes, 1981; Hyland, 2019).

2.2. Theorical Framework

2.2.1. Cognitive Load Theory

John Sweller introduced Cognitive Load Theory (CLT) to explain how learners process information during learning. According to Sweller (1988), learners have limited working memory capacity, which means that they can only process a certain amount of information at one time. When a learning task requires too much mental effort, learning may become less effective. Cognitive Load Theory includes three types of cognitive load: intrinsic load, extraneous load, and germane load. Intrinsic load refers to the inherent difficulty of a task, extraneous load results from unnecessary or poorly presented information, and germane load refers to the mental effort devoted to processing, organizing, and constructing knowledge (Sweller, 1988; Sweller et al., 2011).

Essay writing can be viewed as a cognitively demanding task because students need to manage several cognitive and linguistic processes within limited working memory. When writing an essay, they must generate ideas, organize arguments, use appropriate grammar and vocabulary, and maintain coherence across the text (Flower & Hayes, 1981; Jiang & Kalyuga, 2022). These demands may be particularly challenging for EFL students who are still developing both language proficiency and academic writing skills (Nawal, 2018; Jiang &

Kalyuga, 2022). In this context, ChatGPT may reduce part of the immediate cognitive burden by providing language and content support (Patac & Patac, 2025). However, excessive reliance on ChatGPT may become problematic when students depend on the tool to complete demanding stages of essay writing, as this may reduce their engagement in the mental effort needed for idea development, argument construction, and self-revision (Lee et al., 2025; Zhai et al., 2024).

In relation to the present study, Cognitive Load Theory provides a useful framework for explaining why the overuse of ChatGPT may affect students' essay writing development. If students frequently rely on ChatGPT to handle cognitively demanding writing processes, they may reduce the learning-related mental effort needed to develop independent writing skills. Therefore, CLT helps clarify the connection between students' dependence on ChatGPT, their cognitive engagement, and their ability to write essays independently.

2.2.2. Second Language Acquisition in Writing Essay

Second Language Acquisition (SLA) refers to the process through which learners develop the ability to understand and use a language other than their first language. In the context of English essay writing, SLA is closely connected to how learners develop their linguistic knowledge, writing strategies, and ability to express ideas in a second or foreign language. Essay writing is not only a written product but also a learning process in which students apply grammar, vocabulary, sentence structures, and discourse knowledge to communicate meaning in an academic form. Through this process, learners have opportunities to notice language gaps, test their language use, and improve their control of written English (Krashen, 1982; Swain, 1985; Hyland, 2019).

In second language essay writing, students are expected to apply their language knowledge while engaging in key writing processes such as generating ideas, organizing content, developing arguments, and revising their work. To produce an academic essay, they need to use grammar, vocabulary, and sentence structures accurately while also presenting ideas in a coherent and logical way. These activities support second language acquisition because learners actively use the target language to construct meaning rather than only receive language input. From this perspective, essay writing plays an important role in SLA as it allows learners to transform their language knowledge into written communication and gradually improve the accuracy, fluency, and complexity of their English.

SLA in essay writing provides a basis for understanding why students' active involvement in the writing process is important. When students depend too heavily on ChatGPT to generate ideas, organize arguments, or produce written content, they may reduce their opportunities to practice using English independently. This may affect the language-learning value of essay writing, as students become less engaged in applying grammar, vocabulary, argumentation, and revision strategies by themselves. Therefore, this section helps explain why the overuse of ChatGPT in essay writing may influence not only students' writing performance but also their development as second language learners.

2.3. Previous Research

A study conducted by Mahapatra (2024) investigated the impact of ChatGPT on ESL students' academic writing skills through a mixed-methods approach. The findings revealed that ChatGPT helped students improve grammar, vocabulary, and essay organization. In addition, students reported that the tool made idea generation and revision easier during the writing process. However, the study also found that some learners became overly dependent on AI-generated suggestions, which reduced their independent critical thinking and writing

practice. Mahapatra emphasized that although AI tools can support language learning, excessive reliance on them may negatively affect students' ability to develop writing skills independently.

Bašić et al. (2023) explored the use of ChatGPT-3.5 as a writing assistant in students' essay writing tasks. The researchers discovered that ChatGPT could quickly generate coherent and grammatically accurate essays, helping students complete writing tasks more efficiently. Despite these benefits, the study raised concerns about academic integrity, originality, and students' ownership of ideas. The researchers argued that students who relied too heavily on AI-generated content might become less engaged in the writing process and less capable of producing authentic writing independently.

Research by Boudouaia et al. (2024) focused on the effectiveness of ChatGPT-4 in improving EFL students' writing performance. The findings indicated that students viewed ChatGPT-4 as a useful tool for brainstorming ideas, correcting grammar mistakes, and organizing essay structures. Furthermore, the use of AI assistance reduced students' cognitive burden during complex writing tasks. However, the researchers also observed that students who depended excessively on AI support demonstrated lower levels of creativity and active participation in writing activities. The study suggested that AI should be used as a supportive learning tool rather than a substitute for students' own thinking and writing processes.

Yuan and Dao (2026) examined ESL tertiary learners' engagement in ChatGPT-assisted second language writing. According to the findings, ChatGPT improved students' grammar, coherence, and vocabulary use while also reducing anxiety during writing tasks. Nevertheless, the study revealed that some students became passive during the revision process because they relied heavily on AI-generated feedback instead of revising their essays independently. The researchers concluded that self-regulated learning skills play an important role in preventing excessive dependence on AI tools.

In a Vietnamese educational context, Lai and Trinh (2025) investigated the effects of ChatGPT on the academic writing proficiency of English-major undergraduates. The results showed that ChatGPT positively influenced students' grammar accuracy, vocabulary use, and motivation to write in English. Many participants believed that AI tools made writing tasks easier and more convenient. However, the researchers warned that excessive use of AI-generated assistance could weaken students' independent writing abilities and critical thinking skills over time. They emphasized the importance of balancing AI support with independent learning practices.

2.4. Research Gap

Previous studies have shown that generative AI tools such as ChatGPT can positively support students' academic writing by improving grammar, vocabulary, organization, and writing efficiency (Mahapatra, 2024; Lai & Trinh, 2025). In addition, several researchers have found that AI-assisted writing can reduce students' anxiety and cognitive burden during writing tasks (Boudouaia et al., 2024; Yuan & Dao, 2026).

Although many previous studies have discussed the benefits and challenges of using ChatGPT in writing, there are still several gaps in the existing literature. First, most studies mainly focused on the effectiveness of AI tools in improving writing performance rather than specifically examining the issue of over-reliance on generative AI tools. As a result, there is still limited understanding of how excessive dependence on AI may influence students' independent writing abilities, cognitive engagement, and critical thinking skills over time.

Second, many previous studies were conducted in general ESL or EFL contexts outside Vietnam. Only a small number of studies, such as Lai and Trinh (2025), focused on Vietnamese students. However, there is still limited research investigating the impacts of over-reliance on generative AI tools among Vietnamese university students, particularly sophomores majoring in English. Therefore, more research is needed to better understand how students in the Vietnamese educational context use AI tools in essay writing and how this dependence may affect their learning process.

Finally, previous studies often emphasized either the positive or negative effects of ChatGPT separately, while few studies explored both aspects together within the context of academic essay writing. In addition, limited attention has been given to students' personal experiences, perceptions, and behaviors related to AI dependence in writing tasks. Therefore, the current study aims to fill these gaps by exploring the impacts of over-reliance on generative AI tools in essay writing among HUFLIT sophomores, with a focus on students' perceptions, writing experiences, and independent learning abilities.

3. Methodology

3.1. Research design

To collect data from participants in real time without the need for long-term observation, the study was designed as a cross-sectional survey with semi-structured interviews. This non-experimental design's primary advantage is its capacity to record the widespread application of ChatGPT as they naturally arise in the HUFLIT academic setting (Creswell & Creswell, 2018). The researchers were able to observe sophomores' self-reported habits, experiences, and perceptions in their typical learning context by opting not to alter or control the learning conditions (Bryman, 2016).

For the quantitative phase, a structured questionnaire served as the primary instrument for data collection. All items were presented through Likert-scale statements, allowing for a nuanced measurement of students' attitudes toward AI reliance. The questionnaire focused on variables such as dependence on AI-generated content, reduction in independent idea generation, impact on critical thinking and argument development, and academic confidence and writing autonomy. In addition to the questionnaire, qualitative data was collected through semi-structured interview questions. This approach allowed participants to elaborate on their experiences, writing habits, perceived benefits, and worries about using ChatGPT in academic writing, resulting in rich and nuanced insights that quantitative measurements alone could not capture (Creswell and Poth, 2018). The semi-structured method guaranteed uniformity between interviews while also allowing participants to express their thoughts in greater depth and researchers to investigate emerging themes through follow-up questions (Kallio et al., 2016).

The quantitative data was analyzed using SPSS to summarize participants' reactions to ChatGPT reliance in essay writing. Descriptive statistics, such as frequency, percentage, mean, and standard deviation, were employed to depict the general distribution of responses across questionnaire items. Furthermore, Cronbach's Alpha was used to assess the questionnaire scale's internal consistency (Field, 2018). Meanwhile, the qualitative interview data were evaluated thematically to discover common themes and perspectives connected to AI-assisted writing. The study's goal was to provide a clearer and more thorough assessment of the perceived influence of ChatGPT reliance on students' writing progress, critical thinking, and cognitive engagement (Creswell & Plano Clark, 2018).

3.2. Research context

This study was conducted at the University of Foreign Languages - Information Technology (HUFLIT), a higher education institution in Vietnam where academic writing in English plays a central role in the curriculum. Established in 1994, HUFLIT has over three decades of experience in higher education and professional training, providing academic instruction and career-oriented development for numerous generations of students. The university is guided by the educational philosophy of "pursuing happiness and freedom based on morality and wisdom" and aims to develop globally competent citizens equipped with foreign language proficiency, technological literacy, and lifelong learning capabilities. Currently, HUFLIT consists of multiple faculties and offers a wide range of undergraduate and postgraduate programs across various disciplines.

Within this institutional context, the Faculty of Foreign Languages has become one of the university's most prominent academic departments, with more than thirty years of development in language education and training. The faculty offers several language-related programs, including English Language Studies and Chinese Language Studies. The English Language major has attracted many students due to its diverse career opportunities in education, translation and interpretation, communication, business, and international working environments.

In the context of the English Language Studies (ELS) program, academic writing is an important component of the curriculum. Essay writing courses help students develop academic communication, critical thinking, argument development, and professional language use. In addition, many specialized courses require students to complete written assignments that involve independent idea generation, information evaluation, and logical argument construction. Therefore, this context is relevant for investigating how dependence on ChatGPT may influence students' writing development and cognitive engagement.

3.3. Participants

Table 34

Demographic Information of Survey Participants

Variables		Number of participants	Frequency
Major	Interpreting - Translating	18	14,9%
	Business English	31	25,6%
	English Language Teaching	40	33,1%
	Office Administration	11	9,1%
	English for Logistic	10	8,3%
	English - Chinese Bilingualism	11	9,1%
Total		121	100%

The participants in this study consisted of 127 sophomores majoring in English Language Studies in the Faculty of Foreign Languages at Ho Chi Minh City University of Foreign Languages - Information Technology (HUFLIT). This total includes 121 questionnaire respondents and six additional interviewees who were recruited separately for the qualitative data. The researcher group selected the participants through convenience sampling from the population of English Language majors. The sample included sophomores from six specializations within the English Language program: (1) Interpreting and Translation, (2) Business English, (3) English Language Teaching, (4) Office Administration, (5) English for Logistics, and (6) English - Chinese Bilingualism.

Table 35

Demographic Information of Interview Participants

Variables	Number of interviewees		Frequency
Major	English Language Teaching	3	50%
	Business English	2	33,3%
	English - Chinese Bilingualism	1	16,7%
TOTAL		6	100%
Interview Mode	Face-to-face	4	66,7%
	Online	2	33,3%
TOTAL		6	100%

The research group selected sophomores because they had recently completed essay writing courses, which constitute an important component of the English Language curriculum. At the time of the study, all participants had experience producing different types of academic essays and written assignments required in both writing and specialized subjects. In addition, all participants had prior experience using ChatGPT to support essay writing. During their coursework, they frequently used ChatGPT to generate ideas, create outlines, organize content, improve grammar, and check vocabulary when completing essay assignments assigned by their lecturers. Consequently, all participants are familiar with using ChatGPT as a writing support tool and are considered suitable for providing relevant information about their experiences with ChatGPT-assisted essay writing.

3.4. Research Instrument

Two research tools were used in the study: semi-structured interview questions and a structured questionnaire. These instruments enabled the collection of both quantitative and qualitative data from HUFLIT sophomores. The research group developed instruments based on previous studies on AI-assisted learning, academic writing, critical thinking, and learner autonomy.

The questionnaire consisted of two parts. The first part collected participants' demographic information, including their specialization within the English Language program. The second part contained twelve closed-ended statements that measured students' perceptions of the potential threats of ChatGPT overuse in essay writing. These statements were organized into four areas: dependence on AI-generated content, reduction in independent idea generation, impact on critical thinking and argument development, and academic confidence and writing autonomy. Participants responded to each statement using a five-point Likert scale ranging from "Strongly Disagree" to "Strongly Agree". In addition to the questionnaire, our research group used semi-structured interview questions to obtain more detailed information about participants' experiences and perceptions of using ChatGPT in essay writing. The interview questions focused on sophomores' writing practices, their purposes for using ChatGPT, and their views on the influence of AI-assisted writing on their learning and writing development. The semi-structured format ensured consistency across interviews while allowing participants to elaborate on their experiences and perspectives.

3.5. Data Collection Procedures

For the quantitative phase, the researchers distributed the questionnaire to 128 sophomores majoring in English Language Studies at HUFLIT. Data collection was conducted

over a period of three weeks. At the end of the collection period, 121 valid responses were returned and included in the analysis. Before completing the questionnaire, participants were informed about the purpose of the study and assured that their responses would remain anonymous and confidential. Participation was entirely voluntary.

In the qualitative data collection process, our research group conducted semi-structured interviews with six additional participants who were not part of the questionnaire sample. These participants are also sophomores majoring in English Language Studies at HUFLIT and had prior experience using ChatGPT for essay writing. Among them, three participants specialized in English Language Teaching, two specialized in Business English, and one specialized in English - Chinese Bilingualism. Four interviews were conducted face-to-face, while the remaining two were conducted online via Google Meet.

3.6. Data Analysis Procedures

For the quantitative data, the research group analyzed the questionnaire responses using SPSS. First the data was coded and entered the software. The five-point Likert scale responses were coded from 1 to 5, with 1 representing "Strongly Disagree" and 5 representing "Strongly Agree." The researchers then used descriptive statistics, including frequency, percentage, mean, and standard deviation, to summarize participants' responses regarding the perceived threats of ChatGPT overuse in essay writing. Before further analysis, the reliability of the questionnaire was examined using Cronbach's Alpha. This test was conducted to determine the internal consistency of the questionnaire items.

For the qualitative data, the researchers analyzed the interview responses using thematic analysis. The recorded interviews were first transcribed. The researchers then read the transcripts several times to become familiar with the data. After that, meaningful responses were coded and grouped into recurring themes related to students' experiences, habits, benefits, and concerns when using ChatGPT for essay writing. These themes were used to support and explain the quantitative findings.

Finally, the researchers integrated the quantitative and qualitative results to provide a more comprehensive understanding of the perceived threats of ChatGPT overuse among HUFLIT sophomores. The quantitative findings showed the general tendencies in participants' responses, while the qualitative findings provided deeper explanations of students' personal experiences with AI-assisted essay writing.

4. Findings and Discussion

This part presents and discusses the findings on HUFLIT sophomores' over-reliance on ChatGPT in English essay writing. The four components of the analysis are Reliance on AI-Generated Content, Reduction in Independent Idea Generation, Impact on Critical Thinking and Argument Development and Academic Confidence and Writing Autonomy. Reliability coefficients, mean scores, standard deviations, and frequency distributions are all used in the discussion to find the key patterns in the responses from the sophomores.

Table 36

Reliability Coefficients of the Four Aspects

Aspects	Number of Items	Cronbach's Alpha
Reliance on AI-Generated Content	3	0,52
Reduction in Independent Idea Generation	3	0,57

Impact on Critical Thinking and Argument Development	3	0,46
Academic Confidence and Writing Autonomy	3	0,50

4.1. Reliance on AI-Generated Content

Table 37

Reliance on AI-Generated Content

Statements	Frequency (%)					Mean	Stand Dev
	SD	D	N	A	SA		
1. I often rely on ChatGPT to generate ideas when writing English essays.	5,8	15,7	16,5	24,0	38,0	3,73	1,28
2. I feel it is difficult to write an essay without using ChatGPT.	5,0	13,2	33,9	35,5	12,4	3,37	1,03
3. I tend to use ChatGPT to help plan the structure of my English essays	2,5	7,4	33,1	37,2	19,8	3,64	0,97
Reliance on AI-Generated Content						3,58	

The first aspect examined sophomores' dependence on ChatGPT for generating and organizing essay content. This dimension recorded Cronbach's Alpha value of $\alpha = 0,52$ and an overall mean score of M = 3,58, the highest among the four dimensions. Table 4 shows that students relied on ChatGPT mostly for idea generation, as the statement "I often rely on ChatGPT to generate ideas when writing English essays" received the highest mean score (M = 3,73) and with 62% of respondents choosing "Agree" or "Strongly Agree". Another notable result is that 57% of sophomores agreed or strongly agreed that they used ChatGPT to plan the structures of their essays. These numbers indicate that ChatGPT was mainly used to support the early stages of essay writing, especially idea generation and organization.

The interview data clarify how this dependence appeared in students' actual writing practices. Several participants described ChatGPT as part of the early production stage of essay writing. One student explained that they used ChatGPT "especially when I do not know how to start" because it helped them feel "less stuck" and gave them "a clearer direction." Another participant gave a similar account, stating that "the first thing I do is paste it into ChatGPT to get ideas because starting from a blank page is the hardest part for me." These responses suggest that students did not use ChatGPT only for grammar correction or final editing; rather, it became involved in the generation and organization of essay content from the beginning. This indicates that students' dependence was strongest at the stage where they needed to form initial ideas and structure their essays.

From the perspective of Cognitive Load Theory (Sweller, 1988), students appeared to use ChatGPT primarily to reduce the cognitive demands associated with brainstorming and organizing ideas. While this strategy may lower the mental effort required during the initial stage of writing, frequent dependence on AI-generated ideas may also reduce opportunities for learners to actively construct their own ideas. This finding is generally consistent with previous studies, suggesting that ChatGPT is most beneficial when used as a support tool rather than as the primary source of content generation.

4.2. Reduction in Independent Idea Generation

Table 38

Reduction in Independent Idea Generation

Statements	Frequency (%)					Mean	tand ev
	SD	D	N	A	SA		
4.I feel that frequent use of ChatGPT affects how I generate ideas independently.	5,0	11,7	30,6	28,1	24,0	3,55	,13
5.I usually turn to ChatGPT when I need ideas for an essay	5,8	11,7	34,2	32,5	15,8	3,41	,08
6. I tend to accept ChatGPT's ideas instead of developing my own viewpoints.	6,7	10,0	28,3	30,0	25,0	3,57	,17
Reduction in Independent Idea Generation						3,51	

The reduction in independent idea generation was the subject of the second dimension. This recorded Cronbach's Alpha value of $\alpha = 0,57$ and an overall mean score of M = 3,51, suggesting a moderate tendency toward reduced independent idea development. Table shows that 55% of the respondents agreed or strongly agreed that they tended to accept ChatGPT's ideas instead of developing their own viewpoints (M = 3,57). Similarly, more than half of the sophomores agreed that frequent use of ChatGPT affected how they generated ideas independently (52,1%, M = 3,55). Although the item about turning to ChatGPT when needing essay ideas had a slightly lower mean score (M = 3,41), nearly half of the respondents still agreed or strongly agreed.

The qualitative responses provide a clearer picture of this shift in idea development. Interviewees repeatedly described a movement from self-generated ideas to AI-assisted idea selection. One participant reflected, "Before using ChatGPT, I had to think more carefully about the topic and try to come up with ideas by myself. But now, when I receive an essay topic, I usually ask ChatGPT first.". Another student expressed this more directly "I have been completely outsourcing the brainstorming process.". These comments indicate that ChatGPT may change the starting point of essay writing. Instead of beginning with independent brainstorming, some students first receive AI-generated options and then choose, modify, or assemble them. This helps explain why the survey results show a moderate reduction in independent idea generation because the problem is not that students never revise AI output, but that their initial thinking may increasingly depend on AI suggestions.

Rather than indicating a complete loss of independent thinking, these findings suggest that students increasingly begin the writing process by consulting AI before generating their own ideas. This behavioral pattern may gradually reshape learners' cognitive engagement because AI becomes the starting point of idea generation rather than a supplementary resource. Consequently, the issue appears to concern the sequence of cognitive processing rather than the complete replacement of students' own ideas.

4.3. Impact on Critical Thinking and Argument Development

Table 39

Impact on Critical Thinking and Argument Development

Statements	Frequency (%)					Mean	tand ev
	SD	D	N	A	SA		
7. Overusing ChatGPT weakens my ability to analyze essay topics critically.	3,3	12,4	30,6	28,1	25,6	3,60	,10
8. I find it harder to develop strong arguments without ChatGPT's support.	4,1	13,2	32,2	38,8	11,6	3,40	,00
9. My essays rely more on ChatGPT's reasoning than my own critical thinking.	7,4	8,3	31,4	35,5	17,4	3,47	,10
Impact on Critical Thinking and Argument Development						3,49	

The third dimension explored how students perceived the influence of ChatGPT on their critical thinking and argument development. With Cronbach's Alpha value of $\alpha = 0,46$ and an overall mean score of M = 3,49, the results suggest a moderate level of perceived impact. Among the items in this dimension, the strongest response was found in the statement that overusing ChatGPT weakened students' ability to analyze essay topics critically (M = 3,60) with 53,7% of respondents selecting agree or strongly agree. A similar pattern appeared in the item concerning reliance on ChatGPT's reasoning, where 52,9% of students agreed or strongly agreed that their essays depended more on ChatGPT's logic than on their own critical thinking (M = 3,47).The mean score for the statement about finding it harder to develop strong arguments without ChatGPT also remained above the neutral point (M = 3,40). These results indicate that students recognized ChatGPT's influence not only on essay content but also on the reasoning process behind their writing.

The interview responses provide further insight into how this influence appeared in students' writing practices. Some participants described a decline in their own analytical engagement when ChatGPT was used too heavily. One student admitted, "I feel like it kind of bypasses my critical thinking" explaining that instead of evaluating perspectives independently, they asked ChatGPT to generate "pros and cons" or "counterarguments." Another student similarly stated that their critical thinking was limited to judging "whether the AI's summary is suitable for the essay.". These comments suggest that, for some students, ChatGPT shifted their role from actively constructing arguments to selecting and adjusting AI-generated reasoning. At the same time, the interviews also showed that ChatGPT did not affect all students in the same way. While some used it passively, others used it more critically. One participant explained: "It helps me see the counterarguments so I can make my actual essay way stronger.". This contrast suggests that ChatGPT's impact on critical thinking depends largely on how students engage with the tool. When students rely on it to produce ready-made reasoning, it may reduce independent analysis. However, when they use it to test, question, or refine their arguments, it can become a useful tool for strengthening critical thinking and argument development.

The interview findings also reveal that the impact of ChatGPT is not uniform across learners. Students who actively questioned, evaluated, and modified AI-generated responses

appeared to maintain higher levels of critical engagement than those who accepted the suggestions with minimal reflection. This difference suggests that the educational impact of ChatGPT depends largely on how students regulate their interaction with the technology rather than on the technology itself. From the perspective of Cognitive Load Theory, reducing cognitive effort is beneficial only when learners continue to invest sufficient germane cognitive resources in constructing their own understanding.

4.4. Academic Confidence and Writing Autonomy

Table 40

Academic Confidence and Writing Autonomy

Statements	Frequency (%)					Mean	Stand Dev
	SD	D	N	A	SA		
10. Excessive use of ChatGPT decreases my confidence in my own writing ability.	5,0	9,2	37,8	30,3	17,6	3,46	1 ,05
11. I feel less independent as a writer when I rely too much on ChatGPT.	4,2	15,0	30,0	41,7	9,2	3,37	0 ,99
12. I worry that overusing ChatGPT may negatively affect my long-term writing skills.	5,8	12,4	28,1	32,2	21,5	3.51	1 ,13
Academic Confidence and Writing Autonomy						3,44	

The fourth aspect considered how ChatGPT use relates to students' academic confidence and sense of writing autonomy. This aspect shows Cronbach's Alpha value of α = 0,50 and had the lowest overall mean score among the four criteria (M = 3,44). Although this suggests that the influence of ChatGPT on confidence and autonomy was not as strong as its influence on idea generation or argument development, the results still point to a noticeable concern. More than half of the sophomores (53.7%) agreed or strongly agreed that overusing ChatGPT might negatively affect their long-term writing skills (M = 3,51). In addition, 47,9% of students reported that excessive use of ChatGPT decreased their confidence in their own writing ability (M = 3,46), while 50,9% felt less independent as writers when relying too much on the tool (M = 3,37). These figures suggest that students were aware of the possible impact of ChatGPT on their development as independent academic writers.

The interview data provides a more detailed explanation of this pattern. For many students, ChatGPT was attractive because it made essay writing more efficient and manageable. One participant explained, "I use ChatGPT to maximize my efficiency. With multiple assignments due in the same week, I don't have the luxury to spend days on one paper.". Another student described the writing process with ChatGPT as "much less stressful, much faster.". These responses show why students continue to depend on the tool, because it helped them reduce academic pressure, complete assignments more quickly, and feel more secure about the quality of their work. However, the same convenience also appeared to create a weaker sense of ownership and independence for some students. One participant referred to ChatGPT as a "safety net" suggesting that the tool had become something they depended on for reassurance. A stronger expression of dependence appeared in another response: "Without AI, I have no confidence.". Similarly, one student admitted, "I don't feel like I own the essay.".

These comments reveal that the problem is not only whether ChatGPT helps students produce better essays, but whether students still feel capable of writing without its support. Therefore, while ChatGPT offers clear academic convenience, repeated reliance on it may gradually reduce students' confidence, independence, and sense of authorship in their own writing.

Although ChatGPT helped students complete assignments more efficiently, the qualitative findings indicate that prolonged dependence may gradually weaken learners' confidence in their own writing ability. The issue therefore extends beyond writing performance to students' perceptions of themselves as independent academic writers. This observation is consistent with previous research highlighting that excessive reliance on AI may reduce learners' sense of ownership and autonomy despite improving short-term writing efficiency.

5. Conclusion

5.1. Implications

The aim of the current study is to investigate the perceived threats of overusing ChatGPT in essay writing among HUFLIT sophomores majoring in English Language Studies. Based on the survey and interview results, some implications for teaching and learning are drawn as follows.

Firstly, the strong tendency to rely on ChatGPT in the early stages of essay writing emphasizes the need for students to use the tool as a form of support rather than a replacement for independent thinking. Thus, students should be encouraged to take responsibility for the content, logic, coherence, and personal voice of their essays, even when ChatGPT is used for brainstorming, outlining, grammar checking, or idea refinement. In addition, the habit of critically evaluating and revising AI-generated suggestions may help students avoid accepting ready-made ideas too passively. As a result, students can benefit from AI assistance while still maintaining their independence as academic writers.

In addition, the findings suggest that lecturers play an important role in guiding students toward responsible AI use. Since many students have already included ChatGPT in their writing process, writing instruction should not only focus on the final essay but also on how students generate ideas, evaluate arguments, revise content, and make independent writing decisions. Thus, lecturers need to help students distinguish between using ChatGPT as useful support and depending on it excessively.

5.2. Limitations

Some limitations of the current study should also be acknowledged. First, the study was conducted only with HUFLIT sophomores majoring in English Language Studies, so the findings may not fully represent students from other academic years, majors, or institutions. Second, the questionnaire relied on students' self-reported responses, which means that the results reflected their perceptions rather than direct evidence of their actual writing behavior. Third, the number of interview participants was limited, so the qualitative findings could not cover the full range of students' experiences with ChatGPT in essay writing. In addition, the reliability coefficients of some questionnaire aspects were relatively modest, which suggests that the results should be interpreted as exploratory rather than conclusive.

5.3. Recommendations

Keeping ChatGPT as an enabler rather than a substitute for real-life learning, universities must move from passive uses of it to structured educational frameworks. Firstly,

educators need practical rules to ensure ChatGPT is treated as a basic learning tool, not a shortcut for outsourcing thought. Rather than just grading a completed paper, faculty can structure assignments to require clear evidence of active problem-solving. When students are required to submit independent brainstorming notes, rough drafts, and self-reflection logs, they are forced to stay cognitively engaged. This prevents them from using AI to skip vital critical thinking steps. Furthermore, future studies should look past the cross-sectional framework applied here and transition toward longitudinal methods. Tracking English majors across consecutive semesters would offer far deeper insights into the long-term learning consequences that AI overuse has on writing independence. Following English language students over multiple semesters will offer far deeper insights into the long-term learning consequences that AI dependency has on writing independence and structural language growth.

Bionote

Pham Kim Quoc is a junior majoring in English Language Studies, with a specialization in English Language Teaching, at Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT). His academic interests include English grammar, linguistic analysis, teaching methodology, and academic writing. He is particularly interested in language teaching and the application of generative AI tools in English learning and writing development.

Le Hoang Yen Vy is a junior majoring in English Language Studies, with a specialization in English Language Teaching, at Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT). Her academic interests include education, linguistic research, academic writing, and technology-assisted language learning. She is particularly interested in how generative AI tools influence students' writing practices and independent learning in higher education.

Tran Nguyen Thu Ha is a junior majoring in English Language Studies, with a specialization in English Language Teaching, at Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT). Her academic interests include English language teaching, second language learning, lesson planning, and teaching methodology. She is particularly interested in developing effective teaching practices and creating engaging learning activities for English learners.

Bui Hoang Gia Han is a junior majoring in English Language Studies, with a specialization in English Language Teaching, at Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT). Her academic interests include English language teaching, learner-centered instruction, lesson planning, and classroom interaction. She is particularly interested in designing communicative learning activities that support student participation and language development.

Ms. Tran Thi Truc Duyen holds an MA in Education (TESOL) and is a lecturer in the Faculty of Foreign Languages at Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT), Vietnam. She has more than 15 years of teaching experience in English language education and specializes in English language teaching methodology and Applied Linguistics. Her research interests include English language education, pre-service teacher education, teacher cognition, educational innovation, and lifelong learning within Vietnamese educational contexts.

Appendix A

Questionnaire

Dear Sophomores,

We are currently students of the Faculty of English Language at Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT).

At present, we are taking the Research 2 course and have a strong interest in the use of artificial intelligence in education, particularly in the field of essay writing. Therefore, our research team has decided to conduct a study entitled "The Threats of Overusing ChatGPT on HUFLIT Sophomores in Essay Writing."

We would greatly appreciate it if you could spare a few minutes of your valuable time to participate in our research by answering the questions in the survey below.

Your participation in this questionnaire is highly valuable to us. All responses will remain confidential and will only be used for academic purposes We look forward to your valuable cooperation and contributions!

Thank you very much!

Appendix B

Semi-structured Interview Questions

1. How do you usually use Generative AI tools such as ChatGPT when writing essays?

Possible follow-up questions:

- At which stage of essay writing do you usually use ChatGPT? (brainstorming, outlining, writing, editing)

- Do you usually modify ChatGPT's answers or use them directly? Why?

2. Do you think relying too much on ChatGPT affects your ability to develop your own ideas and write independently? Why or why not?

Possible follow-up questions:

- Do you feel less confident writing essays without ChatGPT? Why?

- How has your writing process changed since you started using ChatGPT?

3. How does using ChatGPT influence your critical thinking during the essay-writing process?

Possible follow-up questions:

- Do you usually check whether ChatGPT's information is correct? How?

- Do you compare ChatGPT's answers with other sources such as textbooks or teacher feedback?

4. Do you think using ChatGPT has changed your essay-writing skills? Why or why not?

Possible follow-up questions:

- How different is your writing process now compared to before using ChatGPT?

- Do you still practice writing essays by yourself without AI support? Why or why not?

#159 ENGLISH LISTENING AND NOTE-TAKING: CHALLENGES AND STRATEGIES FOR HUFLIT ENGLISH MAJORS

Bùi Thị Thu Ngân[1]

Abstract

Proficiency in English listening and note-taking skills is fundamental to the English Language Studies curriculum; however, many university students struggle to master this integrated skill. This study investigates the challenges faced by English majors at HUFLIT, examining students' reported coping strategies and the relationship between note-taking difficulties and strategy use. Utilizing a sample of 78 students, the research explores the sequential relationship among listening comprehension barriers, note-taking difficulties, and coping strategies. A 22-item reflective scale comprising these three constructs was developed and validated using SmartPLS. The structural equation model (PLS-SEM) tested two primary hypotheses: the impact of listening challenges on note-taking difficulties (H1) and the influence of those difficulties on strategy adoption (H2). Findings indicate that listening barriers—such as unfamiliar vocabulary, delivery speed, and lack of background knowledge—significantly predict note-taking struggles; however, these struggles do not have a significant impact on the implementation of coping mechanisms. While students report using various strategies, including pre-class preparation, symbols, abbreviations, and the integration of AI tools, the adoption of these strategies is not directly driven by note-taking difficulty. Practical recommendations are provided for students, instructors, and curriculum developers to overcome challenges in English Listening and Note-Taking classes.

***Keywords*:** Listening challenges, note-taking, English majors, coping strategies

1. Introduction

Listening and note-taking are essential academic skills that enable students to understand, record, and review information from lectures. For English majors, these skills are particularly important because they support learning in content-based courses and later professional subjects, especially English for Specific Purposes (ESP) and Interpretation courses.

At Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT), Listening and Note-Taking is a compulsory course for English-majored freshmen. Before taking this course, students complete a Listening and Speaking course to develop their basic language skills. The Listening and Note-Taking course then provides explicit training in listening comprehension and note-taking techniques through a blended learning approach that combines face-to-face and online instruction.

Despite recognizing the importance of these skills, many freshmen continue to experience difficulties when listening to lectures and taking notes in English. Common challenges include understanding specialized vocabulary, following fast speech, maintaining concentration, identifying key information, and recording notes efficiently. These difficulties

[1] *HUFLIT - HCMC University of Foreign Languages and Information Technology*
Email: nganbtt@huflit.edu.vn
Phone number: 0903509160

may negatively affect students' academic performance and their readiness for more demanding courses in later years.

Previous studies have highlighted the importance of listening comprehension and note-taking in academic success. However, most studies have examined listening difficulties, note-taking techniques, or learning strategies separately. Limited research has investigated how listening challenges lead to note-taking difficulties and how students cope with these problems within a single framework. In addition, evidence from Vietnamese English-majored freshmen remains scarce particularly in the context of Listening and Note-Taking courses.

To address these gaps, the present study adds value by moving beyond a purely descriptive analysis to examine whether listening barriers directly lead to note-taking problems, and subsequently, whether these problems actually trigger coping strategies among English-majored freshmen at HUFLIT. By testing this sequential relationship in one comprehensive model, this study establishes a rationale for understanding students' learning barriers. Ultimately, these findings are expected to provide actionable insights for students, instructors, and curriculum developers to improve integrated listening and note-taking instruction.

2. Literature review

Cognitive pressure from listening input and lecture complexity

Listening skill is one of the most vital but demanding language skills for English Linguistic Studies (ELS) learners because it requires rapid perception, interpretation, and integration of spoken input in real time. Learners must process vocabulary, pronunciation, syntax, discourse markers, and speaker intention simultaneously, which places a heavy cognitive burden on them. Prior research shows that common listening problems include fast speech rate, unfamiliar accents, difficult vocabulary, long utterances, implied meanings, and unfamiliar topics. In the Vietnamese context, these problems are often intensified by limited exposure to authentic spoken English and reduced opportunities for interactive listening practice (Tran & Duong, 2020).

This cognitive load is further worsened by lecture complexity. Lectures that contain dense information, abstract concepts, technical terminology, or an unclear structure dramatically increase cognitive pressure. Students may understand individual words but still fail to grasp the overall message when the lecture is too demanding. For English-majored students, this issue is especially pronounced because classroom lectures often contain both language learning and subject-specific knowledge (Phuong, Lam & Le, 2023). Consequently, the primary challenge is not solely decoding the language, but managing the overwhelming cognitive pressure generated by the listening input.

Effect of cognitive pressure on note-taking performance

The cognitive pressure generated by complex listening input directly impacts a student's ability to execute secondary academic tasks, most notably note-taking. Note-taking is an indispensable academic skill and a cognitive tool that supports comprehension, memory, post-listening review, and interpretation processes. Effective note-taking requires students to identify main ideas, organize key points, and use abbreviations or symbols efficiently. Research on note-taking techniques among English majors in Viet Nam indicates that content organization, visual aids, symbols, language use, abbreviations, and note-taking speed are all components of successful performance, with content organization having a particularly strong influence on listening comprehension (Vo, 2026).

However, in Listening and Note-Taking classes, the demand of processing spoken input and generating written output becomes highly problematic. English-majored students must listen carefully while simultaneously selecting, organizing, and recording information. When the cognitive pressure from lecture speed or unfamiliar vocabulary exceeds the student's processing capacity, they lose track of the speaker's message and subsequently fail to take useful notes. Likewise, when lecture content is dense or unclear, students struggle to identify what to write down. Therefore, listening barriers and note-taking problems are not isolated phenomena; rather, listening difficulties act as a primary barrier that sequentially triggers note-taking failure (Vo, 2026).

Self-regulated coping strategies as a behavioral response

Faced with these listening and note-taking difficulties, students must respond behaviorally to manage their learning. To mitigate these dual challenges, students often adopt - or fail to adopt - a variety of self-regulated coping strategies. These strategies operate as a direct response to the cognitive overload they experience in class. Preventative and active strategies include previewing lesson materials before class, using a shorthand system (e.g., abbreviations and symbols) during lectures, focusing on keywords instead of full sentences, reviewing notes after class, and comparing notes with classmates (Suritsky, 1993).

Furthermore, learners may employ memory-based strategies such as repetition, chunking, mnemonics, and spaced review to strengthen recall of lecture content. These behaviors reflect self-regulated learning, as students actively plan, monitor, and adjust their learning process to overcome note-taking breakdowns. Collaborative and structured interventions also facilitate this response; for instance, studies on Dictogloss - a grammar dictation technique developed by Wajnryb (1990, as cited in Tran, n.d.) where students listen, take notes, and collaborate to reconstruct the text - demonstrate that structured practice can help students develop these vital coping mechanisms to improve both listening and note-taking performance (Nguyen & Nguyen, 2023).

In sum, the literature indicates that listening challenges, lecture complexity, note-taking difficulties, and coping strategies are deeply interconnected. Rather than operating independently, the literature suggests a sequential framework: listening input creates intense cognitive pressure, this pressure subsequently disrupts note-taking performance, and the resulting difficulties ultimately determine whether students adopt self-regulated coping strategies.

Research gaps

Although previous studies have demonstrated the importance of listening comprehension and note-taking skills in academic learning, most have examined these factors separately. Existing research has largely focused on either listening difficulties or effective note-taking techniques, with limited attention to how listening challenges contribute to note-taking difficulties and how students respond through coping strategies. As a result, the relationships among these variables remain insufficiently understood.

Furthermore, previous studies have mainly emphasized effective note-taking practices and their impact on listening performance. Less attention has been paid to the specific listening barriers that hinder note-taking, such as fast lecture speed, unfamiliar vocabulary, lack of background knowledge, concentration loss, and listening fatigue. Similarly, note-taking difficulties, including slow writing speed, difficulty identifying main ideas, information overload, and mental translation, have received relatively limited investigation.

Another important gap concerns students' coping strategies. While some studies have explored traditional learning strategies, little research has examined how students cope with listening and note-taking difficulties in English-medium learning environments. In particular, the role of emerging technology-based strategies, such as AI-assisted note organization, remains under-explored.

In the Vietnamese context, empirical evidence is still limited, especially among freshman English majors who are transitioning from secondary school learning to university-level academic listening. Few studies have investigated how listening challenges, note-taking difficulties, and coping strategies interact within a single framework. Moreover, most previous studies have relied on descriptive or regression-based analyses, whereas research using Structural Equation Modeling (SEM) to examine the relationships among these constructs remains scarce.

To address these gaps, the present study investigates the relationships among Listening Challenges, Note-Taking Challenges, and Coping Strategies among freshman English majors in Viet Nam using a PLS-SEM approach. By integrating these variables into a single model, the study aims to provide a more comprehensive understanding of students' difficulties and adaptive behaviors in Listening and Note-Taking courses.

Conceptual framework

This study proposes that English-majored university students' listening challenges affect their note-taking difficulties, and these note-taking difficulties, in turn, influence the coping strategies they use during and after Listening and Note-Taking classes. In an academic Listening and Note-Taking class, students are required to process long lectures on a variety of topics in English, identify key information, and simultaneously record it efficiently in an outline format. This dual processing makes note-taking an essential but highly demanding skill. When listening input becomes difficult due to speed, accent, advanced vocabulary, unfamiliar topics, or high lecture complexity, students naturally struggle to keep up with the input and produce effective notes (Borkovska & Irgin, 2026).

The model assumes that students do not remain passive when facing these cascading challenges. Instead, they attempt to adopt strategies - such as previewing materials, using abbreviations, reviewing notes, and employing memorization techniques - to cope with the class demands. However, while the model proposes a sequential structure (Listening Challenges $\rightarrow$ Note-Taking Difficulties $\rightarrow$ Coping Strategies), the framework acknowledges that the adoption of coping strategies is not strictly linear. Drawing on self-regulated learning theory, a student's behavioral response to academic pressure does not depend solely on the severity of their note-taking difficulties. The actual deployment of coping strategies is multifaceted and influenced by external and internal resources. Factors such as intrinsic motivation, digital literacy, previous strategy training, and the level of explicit teacher guidance play a critical role in determining whether a student successfully adopts a strategy when faced with a challenge (Permana & Cunandar, 2025).

Hypotheses development

Listening challenges and note-taking difficulties

Listening comprehension is a prerequisite for effective note-taking; students must first decode and understand spoken input before they can accurately record it. If learners cannot catch important words, phrases, or ideas due to fast speech, unfamiliar accents, or limited vocabulary, their note-taking quality is highly likely to decline. Previous research indicates that

listening problems and note-taking problems are closely intertwined in lecture-based learning, particularly in contexts where learners have limited exposure to authentic spoken English. Based on this reasoning, the first hypothesis is proposed:

H1: Listening challenges have a positive effect on note-taking difficulties.

Note-taking difficulties and coping strategies

When students encounter friction in note-taking, they generally attempt to respond by adopting strategies that help manage or reduce these academic burdens. These may include using symbols, abbreviations, structured formats, post-class review, peer comparison, or memorization techniques. Research on meta-cognitive listening strategies indicates that strategy use logically becomes more necessary when learners face dense or demanding lecture content. However, because strategy adoption is also highly dependent on a student's self-regulated learning capacity, motivation, and prior training, the transition from experiencing a difficulty to successfully executing a strategy is complex. Despite the presence of these external mitigating factors, the baseline theoretical expectation is that increased academic pressure acts as the primary trigger for a strategic response. Therefore, the second hypothesis is:

H2: Note-taking difficulties have a positive effect on coping strategies.

In summary, the proposed framework suggests that listening challenges create difficulties in note-taking, which in turn act as the catalyst for coping strategies. The model is highly suitable for PLS-SEM because it allows for the simultaneous examination of multiple relationships among latent constructs, testing both direct and indirect effects. This structure reflects the academic reality of English-majored freshmen in Viet Nam, who must manage spoken input and complex content while navigating their own varying levels of self-regulation and learning autonomy.

3. Methodology

This study employed a quantitative, cross-sectional research design to examine the relationships among listening challenges, note-taking difficulties, and coping strategies among English-majored university students at HUFLIT, Viet Nam. A quantitative approach was selected because it enables the measurement of latent constructs and the statistical testing of structural hypotheses. Data were collected at a single point in time from students who had recently completed a compulsory Listening and Note-Taking course (Chris, 2021).

Research design

The study utilized an explanatory and predictive design, mapping the sequential impact of academic challenges on student behavior. The conceptual model was analyzed using PLS-SEM. PLS-SEM was chosen over simple multiple regression because regression cannot simultaneously handle latent variables with multiple indicators or account for measurement error. Furthermore, PLS-SEM evaluates both the measurement model (the reliability and validity of the indicators) and the structural model (the relationships between constructs) concurrently. This variance-based approach is particularly well-suited for exploratory, prediction-oriented research and remains statistically robust even with small-to-moderate sample sizes and non-normally distributed data (Hair et al., 2011; Jansen, 2025).

Participants and sampling

The target population consisted of English majors at HUFLIT. Before taking the course, these students complete a prerequisite Listening and Speaking class designed to build foundational skills at the B1-B2 proficiency level. The Listening and Note-Taking course then

provides explicit training in essential academic skills necessary for advanced, content-heavy English for Specific Purposes (ESP) and Interpretation courses. The course utilizes a blended learning approach, combining on-campus formal instruction with online practice.

A convenience sampling method was used, drawing from two class groups. The survey achieved a 100% response rate, yielding 78 valid responses. The sample was predominantly female (55 female, 23 male). Most participants were freshmen (92.3%), alongside a small percentage of juniors (3.8%) and seniors (3.8%) fulfilling the requirement. All 78 participants had completed the exact same Listening and Note-Taking course.

While convenience sampling is highly practical for accessing a specific cohort, it presents a limitation in representativeness; findings from this specific HUFLIT cohort may not generalize to all English majors across Viet Nam. Regarding sample size, while N = 78 is relatively small, it satisfies the minimum threshold for PLS-SEM estimation for a simple model. According to the "5-times rule," the minimum sample size should be 5 times the items of the scale. With only two main paths and a maximum of one predictor pointing to any endogenous construct, 78 responses provide sufficient statistical power for this preliminary exploratory analysis.

Research instrument

Data were collected using a structured, bilingual (English-Vietnamese) questionnaire to ensure clarity and minimize misinterpretation. The initial instrument consisted of a 22-item reflective scale adapted primarily from Crawford's (2015) research on note-taking skills in EFL contexts, supplemented by established theoretical frameworks to ground each construct:

- Listening Challenges: Items were developed based on cognitive load theory and established listening comprehension barriers (e.g., fast speech rate, unfamiliar vocabulary, and accent variations).

- Note-Taking Challenges: Items were drawn from academic listening research, focusing on the dual-task friction of processing input while organizing output (e.g., writing speed limitations, missing key ideas, and the burden of mental translation).

- Coping Strategies: Items were initially rooted in self-regulated learning and metacognitive strategy theory, encompassing both traditional methods (abbreviations, symbols) and active review behaviors.

Responses were recorded using a 5-point Likert scale ranging from 1 (Never) to 5 (Always), which is optimal for measuring the frequency of challenges encountered and strategies utilized.

Data analysis and instrument refinement

The collected data were analyzed using SmartPLS 3. The analysis followed the standard two-stage PLS-SEM procedure.

First, the measurement model was assessed for reliability and validity. Construct reliability was evaluated using Cronbach’s alpha and Composite Reliability (CR). Convergent validity was assessed via the Average Variance Extracted (AVE) and outer item loadings, while discriminant validity was confirmed using the Heterotrait-Monotrait (HTMT) ratio. Variance Inflation Factors (VIF) were checked to rule out collinearity issues.

Construct Refinement: During the measurement model assessment, several initial items measuring broad coping strategies demonstrated poor outer loadings and had to be removed to

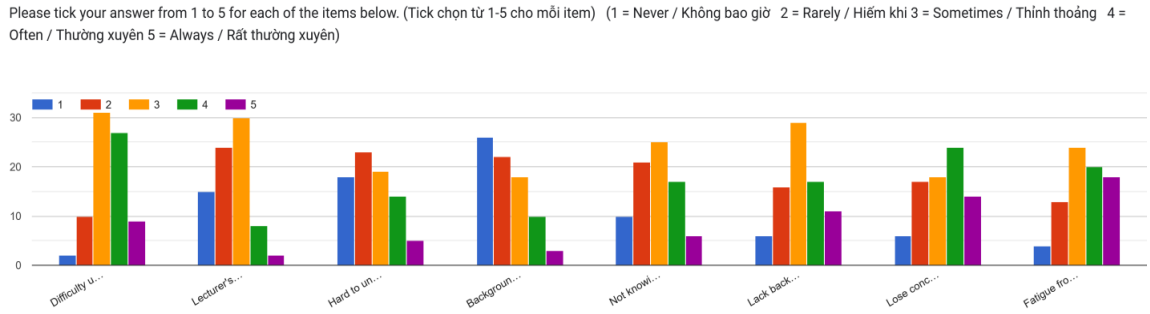
achieve acceptable construct validity (AVE > 0.5). Consequently, the finalized Coping Strategies construct relies predominantly on items related to digital and post-listening review - specifically, the use of AI-assisted note organization and comparing notes with transcriptions. While this refinement narrows the construct from the broader range of traditional strategies discussed in the wider literature, it accurately captures the specific, technology-assisted, self-regulated learning behaviors most actively utilized by this modern cohort to mitigate cognitive overload.

In the second stage, the structural model was evaluated to test the hypothesized relationships. Bootstrapping was applied to determine the statistical significance (p-values and t-statistics) of the path coefficients.

Ethical considerations

Ethical principles were strictly maintained throughout the data collection process. Prior to the survey, participants were fully informed regarding the study's academic purpose, the voluntary nature of their involvement, and their right to withdraw at any time without penalty. To encourage honest reporting and mitigate social desirability bias, the survey was completely anonymous; no personally identifiable information (such as names, student IDs, or email addresses) was recorded. All data were aggregated to ensure participant privacy.

Findings

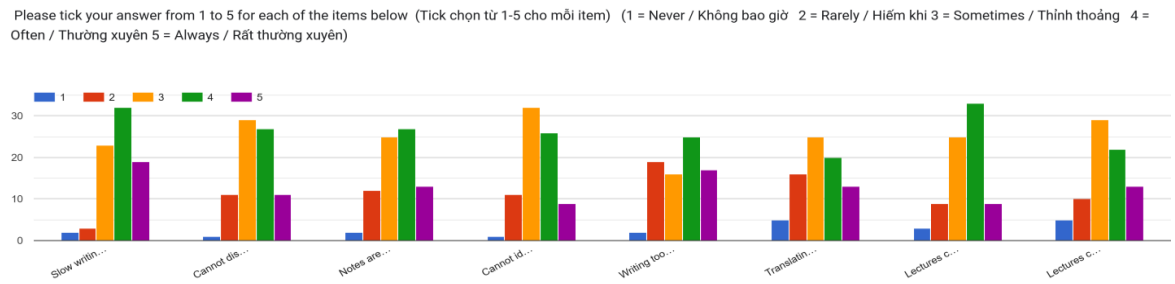


This study examined the relationships among Listening Challenges (LC), Note-Taking Challenges (NTC), and Coping Strategies (CS) among students learning through English-medium lectures.

4. Descriptive Results

The frequency distributions from the survey responses reveal clear patterns regarding the academic hurdles students face during English-medium lectures.

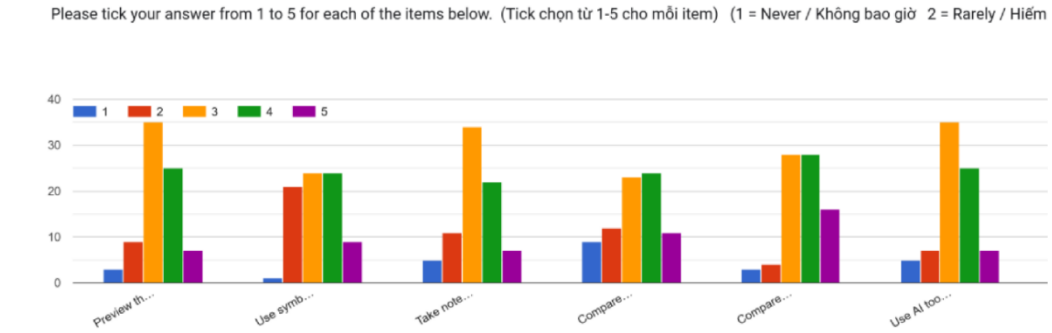
Figure 1



Frequency of experiencing listening challenges among freshman English majors

Listening Challenges: Students frequently experienced barriers related to cognitive overload and linguistic complexity. The highest reported frequencies (clustering heavily in the "Sometimes" and "Often" categories) were attributed to the lecturer's fast speed, specialized vocabulary, lack of background knowledge, concentration loss, and listening fatigue. Conversely, environmental factors such as background noise were reported as less serious problems, with many students indicating they "Never" or "Rarely" struggled with it.

Figure 2



Frequency of experiencing note-taking challenges among freshman English majors

Note-Taking Challenges: The dual-task nature of lectures heavily impacted students. A majority of respondents indicated they "Often" or "Sometimes" struggled with slow writing speed, identifying main ideas, and information overload. Additionally, the cognitive burden of mental translation and general note disorganization were highly prevalent issues.

Figure 3

Frequency of applying coping strategies among freshman English majors

Coping Strategies: While students reported using various strategies, visual data indicates high frequencies for specific technology-assisted methods, particularly the use of AI tools for note organization. However, as detailed in the measurement model results below, the nature of these reported strategies required conceptual refinement.

Measurement Model Results

Construct Reliability and Validity

	Cronbach's Alpha	rho_A	Composite Reliability	Average Variance Extracted (AVE)
CS		1.000		
LC	0.866	0.884	0.894	0.518
NTC	0.923	0.927	0.937	0.652

Discriminant Validity

Fornell-Larcker Criterion

	CS	LC	NTC
CS			
LC	0.206	0.720	
NTC	0.225	0.790	0.808

Heterotrait-Monotrait Ratio (HTMT)

	LC	NTC
LC		
NTC	0.854	

Collinearity Statistics (VIF)

Outer VIF Values

	VIF
CS5	1.093
CS6	1.093
LC1	1.680
LC2	2.270
LC3	2.228
LC4	1.539
LC5	1.827
LC6	2.447
LC7	2.428
LC8	2.683
NTC1	2.864
NTC2	2.657
NTC3	2.461
NTC4	3.441
NTC5	3.103
NTC6	2.106
NTC7	2.979
NTC8	2.541

The measurement model was assessed to ensure the reliability and validity of the constructs. The reliability and validity results demonstrated that the LC and NTC constructs met and exceeded acceptable standards. The LC construct achieved a Composite Reliability (CR) of 0.894 and an Average Variance Extracted (AVE) of 0.518. Similarly, the NTC construct demonstrated excellent internal consistency and convergent validity with a CR of 0.937 and an AVE of 0.652. Discriminant validity was established, as the Heterotrait-Monotrait (HTMT) ratio between LC and NTC was 0.854, remaining below the conservative 0.90 threshold. All Variance Inflation Factor (VIF) values were below 5, indicating no serious multicollinearity within the model.

Conceptual Refinement of the Coping Strategies (CS) Construct:

During the measurement model assessment, four traditional strategy indicators (CS1, CS2, CS3, and CS4) failed to meet the required outer loading thresholds and were subsequently removed to achieve construct validity. Only two indicators were retained:

CS5: Comparing notes with transcriptions to identify missing points

CS6: Using AI tools to organize notes

Of these, using AI tools was the dominant indicator (loading = 0.935, $p < 0.001$), whereas comparing notes with transcriptions was weaker and non-significant (loading = 0.612, $p = 0.093$). Crucially, the removal of the four traditional items alters the theoretical meaning of this construct. Rather than representing "general coping strategies" as originally hypothesized, the finalized CS construct specifically reflects technology-supported and transcription-based strategies.

Structural Model Results

Path Coefficients

Mean, STDEV, T-Values, P-Values

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
LC -> NTC	0.790	0.796	0.039	20.239	0.000

f Square

	CS	LC	NTC
CS			
LC			1.657
NTC	0.053		

The structural model was evaluated to test the two primary hypotheses.

Hypothesis 1: The Impact of Listening Challenges on Note-Taking

The structural analysis provided robust support for Hypothesis 1. Listening Challenges exhibited a strong, positive, and highly significant effect on Note-Taking Challenges ($\beta = 0.790$, $t = 20.239$, $p < 0.001$). The R-square value for NTC was 0.624, indicating that listening barriers alone account for 62.4% of the variance in a student's note-taking difficulties, representing substantial explanatory power. The effect size was correspondingly very large (f-square = 1.657), confirming that listening comprehension is a critical predictor of note-taking failure.

Hypothesis 2: The Impact of Difficulties on Strategy Adoption

Conversely, Hypothesis 2 was not supported. The relationship between Note-Taking Challenges and technology-supported Coping Strategies was statistically non-significant ($\beta = 0.225$, $t = 1.683$, $p = 0.093$). Furthermore, NTC explained only 5.1% of the variance in CS (R-square = 0.051).

Rather than viewing this solely as a rejected hypothesis, this tension represents a vital finding: the severity of a student's note-taking difficulty does not explain or predict their use of technology-supported coping strategies. Simply experiencing academic hardship is insufficient to trigger strategic adaptation. This suggests that the adoption of AI and transcription tools is likely driven by external factors not captured in this model - such as a student's digital literacy, intrinsic motivation, learning habits, or prior technological training - rather than acting as a direct, reactive response to academic pressure.

5. Discussion

Listening Challenges

The descriptive results showed that students faced several listening difficulties during English-medium lectures. The most frequently reported challenges were fast lecture speed, specialized vocabulary, lack of background knowledge, concentration loss, and listening fatigue. These findings suggest that many students struggled to process spoken information efficiently while maintaining attention throughout the lecture. Among these challenges, fast speech and unfamiliar vocabulary may place a heavy burden on students' working memory. Instead of focusing on the overall message, students may spend too much time decoding

individual words and phrases. Similarly, limited background knowledge makes it more difficult for students to connect new information with what they already know, reducing comprehension. Difficulties with different English accents further increase the complexity of lecture processing. In contrast, background noise appeared to have a relatively minor influence, indicating that linguistic and cognitive factors were more problematic than environmental factors.

These descriptive insights align tightly with the structural equation modeling (SEM) findings, which demonstrate that Listening Challenges strongly and significantly predict Note-Taking Challenges ($\beta = 0.790$, $p < .001$). Because the present study utilizes a cross-sectional design with self-reported data, this relationship suggests a highly probable pathway rather than absolute causality: when students cannot fully decode spoken lecture content, they are subsequently less able to identify key information and record it accurately.

Note-Taking Challenges

The results revealed that students experienced substantial note-taking difficulties. Slow writing speed was one of the most common problems, suggesting a strong association between the pace of the lecture and the physical or cognitive inability to keep up. Students also reported difficulty identifying main ideas and distinguishing them from supporting details, which likely leads to incomplete or ineffective notes. Another important issue was poor note organization. Many students did not use structured note-taking methods such as outlines, Cornell notes, or mind maps. As a result, their notes may have lacked clarity, making later review more difficult. In addition, many participants reported translating English into Vietnamese while listening. This additional mental process is associated with reduced listening comprehension and note-taking. Ultimately, the high explanatory power of the structural model (R-square = 0.624) confirms that listening barriers are the primary statistical driver of note-taking problems.

Coping Strategies

During the analysis, the construct was reduced to only two items - comparing notes with transcriptions and using AI tools to organize notes - with the transcription item yielding a non-significant loading. Consequently, the findings discussed here do not reflect a broad spectrum of traditional coping strategies, but rather a narrow reliance on specific, technology-supported interventions, primarily AI-assisted note organization. This reflects the growing, yet specific, role of educational technology in supporting academic learning. Crucially, the SEM findings indicate that Note-Taking Challenges do not statistically predict the use of these technology-supported Coping Strategies ($\beta = 0.225$, $p = .093$). This indicates that the adoption of coping behaviors is largely independent of the difficulty level experienced by the student. Simply encountering academic obstacles does not automatically trigger strategic adaptation. Instead, strategy use likely depends on independent external or internal factors, such as self-regulation, motivation, digital literacy, previous strategic training, or awareness of available AI tools.

Overall, the findings demonstrate that listening challenges are the main driver influencing note-taking performance among English-majored students. Difficulties such as fast lecture speed and unfamiliar vocabulary create cognitive pressure that is strongly associated with subsequent note-taking difficulties. Simultaneously, the structural results indicate that note-taking challenges alone do not push students to adopt coping strategies. Because strategy adoption - particularly regarding digital and AI-supported tools - appears disconnected from the severity of the student's academic struggle, educators cannot assume students will develop these strategies independently. This highlights a critical need for explicit training. From a

practical perspective, interventions should serve a dual purpose: first, reducing initial listening barriers (e.g., providing pre-lecture vocabulary support and activating background knowledge) before they develop into note-taking problems; and second, explicitly teaching students how and when to apply effective, technology-supported learning strategies to manage English-medium lectures.

Recommendations

The structural and descriptive findings of this study offer clear pathways for pedagogical intervention. Because listening challenges are the primary statistical driver of note-taking difficulties, and because students do not automatically adopt coping strategies simply out of academic need, a multifaceted approach is required.

For Freshman English Majors

a. ***Shift from transcription to keyword systems:*** The descriptive data highlighted slow writing speed and the cognitive burden of mental translation as primary hurdles. To reduce working memory overload, students must abandon full-sentence transcription. Instead, they should adopt a personalized system of abbreviations, symbols, and keywords, which allows them to capture main ideas without falling behind the lecturer's pace.

b. ***Build academic listening stamina:*** To counter the highly reported issues of concentration loss and listening fatigue, students should build their cognitive endurance progressively. Rather than consuming lengthy lectures immediately, students should practice with authentic materials (e.g., TED Talks, university lectures) in short, 10-to-15-minute intervals. This progressive exposure to diverse accents and authentic speeds will better prepare them for the demands of future ESP courses.

c. ***Engage in strategic, verified AI use:*** While AI-assisted note organization was the most prominent coping strategy, passive reliance on these tools undermines long-term retention. Students must use AI ethically and critically. They should treat AI-generated summaries not as final products, but as comparative tools—cross-referencing AI outputs against their own handwritten notes and available transcripts to actively identify knowledge gaps and rectify misunderstandings.

For Instructors

Anticipate cognitive overload: The strongest finding of this study (H1) confirms that listening barriers directly cause note-taking failure. Instructors cannot expect high-quality notes if the foundational listening input is too dense. Lecturers should proactively reduce cognitive pressure by pre-teaching specialized vocabulary, activating background knowledge, and explicitly highlighting signposting language before the lecture begins.

Scaffold the demand: Because students reported severe information overload, instructors should avoid continuous, unbroken presentations. Chunking lectures into 20-minute segments interspersed with brief comprehension checks, discussions, or pauses will give students the necessary time to process information and reorganize their notes without missing new input. Providing partially completed outlines before class can also scaffold this dual-task demand.

Provide explicit strategy and technology training: The non-significant finding for H2 indicates that students do not naturally adopt coping strategies just because they are struggling. Therefore, instructors must explicitly model structured note-taking methods (e.g., Cornell notes, mind mapping) in class. Furthermore, instructors should actively demonstrate how to

use AI tools for post-lecture review, teaching students the difference between using tech for academic support versus academic short-cutting.

For Curriculum Developers

Establish academic support: Because freshmen are navigating a difficult transition to English-medium lectures and do not automatically develop self-regulated learning strategies, institutions should provide more support for them. Implementing peer tutoring, listening workshops, or note-taking clinics can provide the explicit, step-by-step guidance students need outside of regular class hours.

Formalize digital and AI literacy: The findings show that students are already heavily relying on AI to cope with academic demands. Rather than ignoring or simply banning these tools, curriculum developers must formally integrate AI and digital literacy into foundational courses. Teaching students to evaluate, verify, and ethically utilize educational technology ensures that these tools enhance, rather than replace, essential cognitive skills.

Limitations

This study has several limitations that should be considered when interpreting the findings.

Sampling limitations: The study relied on a relatively small sample size (N = 78) drawn from a single institution (HUFLIT) in Viet Nam. While this sample size meets the minimum threshold for preliminary PLS-SEM analysis, it limits the overall statistical robustness of the model and restricts the generalizability of the findings to English majors at other universities or across different proficiency levels.

Measurement limitations: The Coping Strategies construct underwent significant refinement during the measurement model assessment. Because several items were removed to achieve validity, the finalized construct relies heavily on a narrow set of technology-supported and transcription-based indicators. Consequently, the model may not fully capture the complete, broader range of traditional coping strategies that students utilize in practice.

Design and data collection constraints: The cross-sectional design captures data at only a single point in time, which precludes the establishment of absolute causal relationships. Furthermore, the reliance on self-reported questionnaire data introduces the potential for response bias, as students' perceived difficulties may differ from their actual cognitive processing and academic execution.

Omitted variables: The conceptual model did not account for other potentially relevant independent variables, such as student motivation, language anxiety, prior strategy training, or baseline digital literacy. These external factors likely play a significant role in influencing both academic performance and the adoption of coping strategies.

Recommendations for future studies: To address these methodological and conceptual limitations, future research should aim to replicate this structural model using a larger and more geographically diverse sample. Researchers should also move beyond self-reported surveys by incorporating objective listening and note-taking performance tasks to measure actual academic competency. Finally, experimental or longitudinal studies should be conducted to test whether explicit strategy instruction objectively improves students’ long-term listening and note-taking performance.

Implications

Theoretical implications

This study contributes to the literature by demonstrating that academic listening and note-taking must be understood as an integrated cognitive process. Specifically, the findings establish a strong sequential link between listening challenges and note-taking difficulties. However, by revealing that the path from note-taking difficulties to coping strategies is not statistically significant, the study challenges the assumption that these adaptive behaviors are an automatic, sequential response to academic hardship. Instead, it refines current theoretical models by highlighting that while listening input barriers directly disrupt note-taking output, a student's decision to deploy coping strategies operates independently of the academic pressure they experience.

Practical implications

Practically, these findings indicate that course designs cannot rely on students naturally developing adaptive behaviors simply because they are struggling with the material. Therefore, effective pedagogy in English-medium environments requires a dual approach. First, instructors must provide proactive listening support (e.g., pre-teaching vocabulary, activating background knowledge) to reduce the initial cognitive load before it grows into note-taking failure. Second, institutions must implement explicit strategy training - particularly regarding the critical and effective use of digital and AI tools - ensuring students are actively taught how to manage complex classroom input rather than assuming they will adapt independently.

Appendix

Effective Listening and Note-Taking Checklist for Freshmen

Process	***Techniques***
Before the lecture: *Preparation*	- Preview the lecture topic before class. - Learn important vocabulary related to the lesson. - Read lecture slides or materials if available. - Bring notebooks, pens, laptop, or tablet. - Prepare a simple note-taking format (outline, Cornell notes, mind map). - Sit in a place where you can hear the lecturer clearly. - Get enough rest to improve concentration.
During the lecture: *Listening skills*	- Focus on understanding the main ideas, not every word. - Listen for signal words such as: "First…", "The main point is…", "For example…", "In conclusion…" - Pay attention to repeated ideas and emphasized words. - Ignore small unknown words if the general meaning is clear. - Stay focused and avoid distractions from phones or classmates. - Ask questions if important points are unclear.
Note-taking skills	- Write keywords instead of full sentences. - Use abbreviations and symbols - Record only important ideas and examples. - Separate main ideas from supporting details. - Leave space to add information later. - Use bullet points or numbering to organize notes. - Mark unclear points with "?" for later review. - Do not try to write everything the lecturer says.
After the lecture: *Review and Improvement*	- Review notes - Add missing information while the lecture is still fresh. - Highlight key concepts and important vocabulary. - Rewrite messy notes into a clearer format. - Compare notes with classmates if necessary. - Compare AI-organized notes with their own notes. - Create short summaries of the lecture in your own words. - Practice listening again to difficult parts after class.
Self-reflection checklist	After each lecture, ask yourself: - Did I understand the main ideas? - Did I lose concentration during the lecture? - Which listening problems did I face most? - Did my note-taking method help me?

	- What should I improve for the next lecture?
Golden rules for freshmen	*a. Listen for meaning, not every word.* *b. Write less, understand more.* *c. Review notes quickly after the lecture.* *d. Practice listening every day.* *e. Use technology as support, not dependence.*

#161 BRIDGING THE RHETORICAL GAP: THE CONDITIONAL ROLE OF PERCEIVED DISCURSIVE PROXIMITY IN LEARNING AUTHORIAL VOICE FROM MODEL TEXTS

Tran Huu Thien[1], Pham Huu Duc[2]

Abstract

This study examines how L2 learners perceive metadiscourse as a usable resource for academic writing after exposure to model texts. Although previous research has shown that exposure can help learners notice discourse features, less is known about whether learners see these features as understandable, relevant, and reusable in their own writing. A controlled post-exposure between-subject design was conducted with 190 Vietnamese university students who read one of three model texts differing in metadiscourse visibility. Data included Likert-scale measures of elaborative processing (ELAB), perceived discursive proximity (PDP), perceived metadiscourse uptake (PMU), and open-ended responses. Quantitative findings showed that text condition and PDP positively predicted PMU, whereas ELAB negatively predicted PMU. Qualitative findings suggested that learners evaluated texts through academic authority, accessibility, complexity, and reader guidance. The familiar metadiscourse condition was perceived as the most accessible and reusable. The study reconceptualizes metadiscourse learning as an issue of perceived usability rather than simple exposure and highlights discourse accessibility as an important factor in L2 academic writing.

Keywords: discursive proximity, elaborative processing, L2 academic writing, metadiscourse, model texts, perceived usability

1. Introduction

Academic writing requires writers not only to present information but also to organize arguments, express stance, and guide readers through the development of ideas. These functions are commonly realized through metadiscourse, a set of linguistic resources that enables writers to manage writer-reader interaction and position themselves within disciplinary communities (Hyland, 2005, 2009, 2017). In second language (L2) writing contexts, metadiscourse plays a particularly important role because learners must acquire not only linguistic forms but also the rhetorical conventions through which academic knowledge is communicated and evaluated. To support this process, writing instruction frequently employs model texts. Within genre-based approaches, model texts are used to make rhetorical practices visible by illustrating how writers employ transitions, hedges, self-mentions, engagement markers, and other discourse resources to achieve communicative purposes (Swales, 1990; Tardy, 2006; Yasuda, 2011). Exposure to such texts is often assumed to facilitate learning through observation and imitation. However, the pedagogical value of model texts may depend on more than the visibility of discourse features. Learners may notice metadiscourse forms

[1] *Tran Huu Thien, International Uninversity. VNU – HCMC, email: Email: ENENIU22111@student.hcmiu.edu.vn*

[2] *Pham Huu Duc, International Uninversity. VNU – HCMC, email: phduc@hcmiu.edu.vn*

without fully understanding their rhetorical functions or perceiving them as relevant to their own writing.

This issue reflects a broader shift in metadiscourse research. Earlier frameworks distinguished textual and interpersonal functions of metadiscourse (Crismore & Vande Kopple, 1988), whereas more recent interactional approaches emphasize how metadiscourse functions as a resource for negotiating relationships between writers and readers (Hyland, 2005, 2017). From this perspective, learning metadiscourse involves more than recognizing linguistic markers. It also requires understanding when, why, and under what circumstances those resources can be effectively used. Consequently, the challenge facing L2 learners may not simply be one of exposure but one of perceived usability.

Genre research further highlights this concern. Although model texts can increase awareness of rhetorical resources, learners often experience difficulty transferring those resources into their own writing (Tardy, 2006; Tardy et al., 2020). This difficulty has been linked to conditional knowledge, namely, understanding when and how discourse resources should be applied in new rhetorical situations. As a result, the transition from noticing to meaningful uptake remains insufficiently understood.

The present study addresses this gap by examining learners' perceptions of metadiscourse after exposure to model texts that vary in metadiscourse visibility. Rather than focusing on writing performance, the study investigates how learners evaluate the accessibility, relevance, and potential usability of metadiscourse as a resource for future writing. Three constructs are central to this investigation: Elaborative Processing (ELAB), which captures learners' perceived engagement with model-text discourse; Perceived Discursive Proximity (PDP), which reflects the extent to which academic discourse appears understandable and accessible; and Perceived Metadiscourse Uptake (PMU), which represents learners' perceived readiness to understand and reuse metadiscourse resources.

By examining the relationships among model-text condition, ELAB, PDP, Need for Cognition (NCS), and PMU, this study reconceptualizes metadiscourse learning as an issue of perceived usability rather than simple exposure. In doing so, it contributes to ongoing discussions in L2 writing, genre learning, and metadiscourse research by highlighting the role of discourse accessibility in shaping learners' perceptions of academic writing resources.

2. Literature review

2.1 Metadiscourse in L2 Academic Writing

Academic writing is increasingly viewed as an interactional activity in which writers organize knowledge, express stance, and guide readers toward preferred interpretations. Within this perspective, metadiscourse has become a central concept because it enables writers to manage writer-reader interaction and construct an academic identity (Hyland, 2005, 2009, 2017). Rather than functioning as mere textual markers, metadiscourse resources help writers establish credibility, negotiate commitment, and signal awareness of readers' interpretive needs.

Early frameworks distinguished between textual and interpersonal dimensions of metadiscourse (Crismore & Vande Kopple, 1988). While these classifications provided useful analytical categories, later research emphasized the rhetorical and interactional functions of metadiscourse. Hyland (2005, 2017), for example, argues that features such as transitions, hedges, boosters, self-mentions, and engagement markers should be understood as resources

through which writers position themselves and manage relationships with readers. Consequently, metadiscourse is not simply a matter of textual organization but a means of participating in disciplinary discourse communities.

This interactional perspective is particularly relevant in L2 writing contexts. Learners may recognize metadiscourse forms but still struggle to understand their rhetorical significance or use them appropriately in academic writing. Moreover, metadiscourse conventions vary across disciplines and communicative contexts, making effective use dependent on more than grammatical knowledge alone (Cao & Hu, 2014). The challenge for learners therefore involves not only recognizing discourse resources but also understanding their communicative value.

2.2 Model Texts and Genre-Based Writing Instruction

Model texts occupy a central role in genre-based writing instruction because they make rhetorical practices visible to learners. Swales (1990) argues that genres provide recurring solutions to communicative problems, while model texts illustrate how these solutions are realized through language. Similarly, Yasuda (2011) demonstrates that genre-based instruction helps learners connect linguistic choices with rhetorical purposes, encouraging deeper engagement with academic discourse.

However, genre learning involves more than exposure to exemplary texts. Tardy (2006) proposes that genre acquisition develops through multiple pathways, including instruction, feedback, participation, and textual exposure. Learners may successfully identify rhetorical features in model texts yet encounter difficulties when attempting to transfer those features into their own writing. This challenge reflects the complexity of genre knowledge, which includes not only formal knowledge of textual features but also rhetorical and contextual knowledge (Tardy et al., 2020).

A particularly important component of genre knowledge is conditional knowledge, or knowledge of when and how discourse resources should be applied in new situations. Learners may understand what a hedge or transition does within a model text while remaining uncertain about its appropriate use in their own writing. Consequently, visibility does not automatically translate into usability. Model texts may make discourse resources observable, but learners must still perceive those resources as meaningful and available for future use.

2.3 Elaborative Processing and Its Limits in L2 Writing

The Elaboration Likelihood Model (ELM) offers a useful framework for understanding how learners process model texts. According to Petty and Cacioppo (1986), elaboration refers to careful consideration of message content and argument quality. Higher levels of elaboration are generally associated with deeper cognitive engagement and more stable judgments.

Applied to L2 writing, elaborative processing may indicate attention to rhetorical meaning, argument structure, and discourse organization. Learners who actively analyze how writers construct claims or guide readers may be more likely to notice metadiscourse resources. However, elaboration may also reflect cognitive effort and processing difficulty rather than successful understanding. Self-reported engagement can therefore capture both productive attention and increased processing burden (Petty et al., 2009).

Research on writing motivation and self-regulation further suggests that effort and learning outcomes are not always positively related (Hayes, 2018). Learners may invest substantial cognitive effort because a text is difficult rather than because it is accessible. Consequently, elaborative processing should be interpreted cautiously when examining perceptions of metadiscourse learning.

2.4 Perceived Discursive Proximity as a Usability Construct

To explain why some discourse resources appear more usable than others, this study introduces the construct of Perceived Discursive Proximity (PDP). PDP refers to learners' perceptions that academic discourse is understandable, relevant, and potentially usable for their own writing. The construct focuses on perceived accessibility rather than actual proficiency and seeks to explain how learners evaluate discourse resources after exposure to model texts.

The theoretical foundations of PDP draw on academic literacies, sociocultural theory, and motivational research. Within the academic literacies tradition, literacy is viewed as a socially situated practice involving identity, power, and participation rather than merely the acquisition of skills (Street, 1984; Lea & Street, 1998). Students may possess linguistic knowledge yet still experience difficulty because academic discourse appears distant from their own communicative practices. PDP builds on this insight by focusing on learners' perceptions of access to discourse practices.

Sociocultural theory provides a complementary perspective. Vygotsky (1978) argues that learning occurs through participation in socially mediated activities, while Lantolf and Thorne (2006) emphasize the importance of mediation in language development. From this perspective, model texts function as mediational resources that can either reduce or reinforce perceived distance between learners and academic discourse. PDP therefore reflects learners' judgments regarding the extent to which discourse resources fall within their perceived range of participation.

Motivational theories further suggest that learners are more likely to internalize resources they perceive as personally meaningful and relevant (Ryan & Deci, 2000). Even highly valued discourse practices may fail to support learning if they appear inaccessible or disconnected from learners' identities. PDP captures this evaluative dimension by examining whether academic discourse feels close enough to be appropriated.

Importantly, PDP differs from several related constructs. Unlike self-efficacy, PDP concerns perceived alignment with discourse rather than confidence in performance. A learner may believe they can complete a writing task while simultaneously perceiving the discourse of a model text as distant and difficult to emulate. PDP also differs from perceived difficulty, which focuses primarily on task complexity, and from task value, which concerns usefulness or importance. Instead, PDP specifically addresses learners' perceptions of discourse accessibility and potential usability.

2.5 Previous Studies

Research on L2 writing has increasingly emphasized the roles of identity, motivation, and discourse participation. Casanave (2019) highlights how learners negotiate academic identities, while Lehman (2018) demonstrates the importance of belonging and participation in academic communities. Studies by Dewaele and Dewaele (2018) and Han and Hiver (2018), further illustrate how engagement and learning are shaped by contextual and affective factors.

Despite these developments, relatively little research has examined learners' perceptions of metadiscourse as a usable resource immediately following exposure to model texts. Existing studies have largely focused on noticing, awareness, or textual analysis rather than learners' evaluations of accessibility and potential reuse. Consequently, the relationship between discourse visibility and perceived usability remains insufficiently understood.

2.6 Conceptual Framework

The present study integrates insights from metadiscourse research, genre theory, cognitive processing, and sociocultural perspectives to explain perceived metadiscourse uptake. Model-text condition represents variation in metadiscourse visibility, ranging from minimal to familiar and advanced forms of discourse support. Elaborative Processing (ELAB) reflects learners' perceived engagement with rhetorical meaning, while Perceived Discursive Proximity (PDP) captures discourse accessibility. Need for Cognition (NCS) is included as a dispositional cognitive factor. Perceived Metadiscourse Uptake (PMU) serves as the outcome variable representing learners' perceived readiness to understand and reuse metadiscourse resources.

To examine these relationships, the study employs a conditional process framework. Model-text condition is treated as the independent variable, ELAB as a mediator, PMU as the dependent variable, PDP as the first moderator, and NCS as the second moderator. This framework allows the study to investigate not only whether model texts influence uptake but also how discourse accessibility and cognitive tendencies shape that relationship. Through this perspective, metadiscourse learning is conceptualized as a process of perceived usability rather than simple exposure.

3. Methodology

3.1 Research Design

This study employed a controlled post-exposure mixed-methods design to examine learners' perceptions of metadiscourse after exposure to model texts with different levels of metadiscourse visibility. The design combined quantitative survey data with qualitative open-ended responses, allowing the study to capture both measurable patterns and learners' interpretations of academic discourse (Creswell & Creswell, 2018; Johnson et al., 2007). Rather than examining actual writing performance, the study focused on learners' immediate perceptions following exposure to model texts. Consequently, Perceived Metadiscourse Uptake (PMU) was conceptualized as a perception-based indicator of readiness to use metadiscourse rather than evidence of successful transfer into writing.

3.2 Participants

Participants were 190 Vietnamese undergraduate students enrolled in English-medium courses at a university in Vietnam. All participants had previously completed introductory academic writing instruction and therefore shared comparable levels of familiarity with argumentative writing conventions. Students were randomly assigned to one of three model-text conditions. Random assignment was employed to reduce selection bias and enhance comparability across groups (Mackey & Gass, 2022).

3.3 Materials

Three argumentative model texts were developed specifically for the study. The texts addressed the same topic and followed an equivalent argumentative structure but differed in the visibility of metadiscourse resources. Text 1 contained minimal explicit metadiscourse, reducing overt stance and engagement markers. Text 2 incorporated familiar and highly visible features such as transitions, self-reference, and reader-oriented guidance. Text 3 employed more advanced and implicit forms of metadiscourse, including hedging and indirect positioning strategies.

The design of the materials was informed by genre-based writing research, which emphasizes the pedagogical value of model texts in making rhetorical practices visible (Swales, 1990; Tardy, 2006; Yasuda, 2011). By manipulating metadiscourse visibility while holding

topic and structure constant, the study sought to isolate the influence of discourse accessibility on learners' perceptions.

3.4 Instruments

Four perception-based constructs were measured through Likert-scale questionnaires. Elaborative Processing (ELAB) was assessed using six items adapted from the Elaboration Likelihood Model and measured learners' perceived engagement with rhetorical meaning and textual organization (Petty & Cacioppo, 1986; Petty et al., 2009). Perceived Discursive Proximity (PDP) was measured through seven items developed for this study to assess learners' perceptions of discourse accessibility, interpretability, and potential usability. The construct was theoretically informed by academic literacies, sociocultural theory, and self-determination theory (Lea & Street, 1998; Ryan & Deci, 2000; Vygotsky, 1978).

Perceived Metadiscourse Uptake (PMU) assessed learners' beliefs regarding their ability to understand and potentially reuse metadiscourse resources in future writing. Finally, Need for Cognition (NCS) measured participants' dispositional tendency to engage in effortful cognitive activity and was included as an individual-difference variable (Petty et al., 2009). In addition, participants completed several open-ended questions concerning memorable textual features, perceived academic quality, reader guidance, and the usability of discourse resources. These responses provided qualitative insights into learners' interpretations of the model texts.

3.5 Data Analysis

Data analysis proceeded in several stages. First, reliability and construct validity were assessed through Cronbach's alpha, McDonald's omega, and Confirmatory Factor Analysis (CFA). CFA was conducted to evaluate the measurement properties of ELAB, PDP, PMU, and NCS before proceeding to subsequent analyses (Brown, 2015; Kline, 2023).

Second, multiple regression analyses were performed to examine relationships among the study variables. Model-text condition, ELAB, PDP, and NCS were entered as predictors, while PMU served as the outcome variable. This analysis allowed the study to evaluate the relative contribution of discourse accessibility, cognitive engagement, and learner characteristics to perceived metadiscourse uptake (Hayes, 2014).

Third, a moderated mediation analysis was conducted using PROCESS Model 63 (Hayes, 2014). In this model, model-text condition was specified as the independent variable, ELAB as the mediator, and PMU as the dependent variable. PDP functioned as the first moderator and NCS as the second moderator. This framework enabled the study to investigate whether the indirect effect of model-text condition on perceived uptake through elaborative processing varied according to learners' perceptions of discourse accessibility and their tendency toward cognitive engagement.

Finally, qualitative responses were analyzed using thematic coding procedures (Braun & Clarke, 2006, 2022). Coding focused on recurring themes related to academic authority, accessibility, complexity, reader guidance, and discourse usability. To enhance trustworthiness, coding decisions were documented through an audit trail and supported by representative participant excerpts.

4. Results

4.1 Quantitative Results

A Confirmatory Factor Analysis (CFA) was conducted to evaluate the measurement properties of the four constructs. Although several fit indices suggested acceptable

approximation (χ^2/df = 2.129; RMSEA = .077), the overall measurement model demonstrated only moderate fit (CFI = .820; TLI = .798; SRMR = .087). Consequently, subsequent analyses were conducted using observed composite scores rather than latent variables.

Table 1 presents the results of the multiple regression and conditional process analyses. Model-text condition significantly predicted Perceived Metadiscourse Uptake (PMU) (b = .473, p < .001), indicating that learners exposed to different model texts reported different levels of perceived uptake. Perceived Discursive Proximity (PDP) also emerged as a strong positive predictor of PMU (b = .486, p < .001), suggesting that learners who perceived academic discourse as more understandable and accessible were more likely to report readiness to reuse metadiscourse resources.

In contrast, Elaborative Processing (ELAB) negatively predicted PMU (b = −.451, p < .001). Rather than indicating successful engagement, higher levels of self-reported elaboration may reflect increased processing effort or difficulty when interpreting model-text discourse. Need for Cognition (NCS) showed a smaller but significant positive effect on PMU (b = .154, p = .019). The interaction between model-text condition and PDP was also significant (b = −.252, p < .001), suggesting that the influence of discourse accessibility varied across different text conditions. However, interactions involving ELAB and NCS did not reach statistical significance.

Table 1

Measurement and Regression Results

Analysis / Predictor	**b / Value**	**SE**	**t**	**p**	**95% CI**
Measurement model					
χ^2(df)	523.750(246)	—	—	< 0.001	—
χ^2/df	2.129	—	—	—	—

ELAB × PDP	−0.010	0.043	−0.229	0.818	—

4.2 Qualitative Results

Analysis of the open-ended responses identified three recurring dimensions shaping learners' evaluations of the model texts: academic authority, argumentative manageability, and reader guidance. Participants frequently associated academic quality with evidence-based reasoning, formal language, and logical organization.

Distinct perceptual profiles emerged across the three text conditions. Text 1 was commonly described as formal and objective but relatively distant. Text 2 was viewed as the most accessible, with participants highlighting explicit transitions, reader-oriented guidance, and clear argumentative structure. Text 3 was perceived as academically sophisticated but also more demanding due to its implicit rhetorical features and greater discourse complexity (Table 2).

Table 2

Qualitative Profiles Across Conditions

Dimension	**Text 1**	**Text 2**	**Text 3**
Academic authority	Formal, objective, impersonal	Formal but accessible	Formal, sophisticated, abstract
Accessibility	Moderate to low	Highest accessibility	Lower accessibility due to complexity
Complexity	Academic distance and density	Lowest complexity profile	Highest complexity profile
Reader guidance	Mainly indirect structure	Explicit structure and visible stance	Structural guidance without direct address
Engagement	Limited direct engagement	Most directly engaging	Impersonal but rhetorically guided
Overall profile	Academic distance	Accessible instructional bridge	Advanced academic sophistication

4.3 Integrated Results

The quantitative and qualitative findings converged around the concept of discourse usability. Quantitative analyses demonstrated that perceived accessibility strongly predicted

perceived uptake, while qualitative responses revealed that learners consistently evaluated texts in terms of their usability rather than simply their academic quality.

Text 2 emerged as the most positively evaluated condition because it balanced academic credibility with accessibility. Across both data sources, learners appeared more willing to adopt discourse resources when those resources were visible, understandable, and manageable (Table 3).

Table 3

Integrated Findings

Data source	**Main finding**	**Interpretation for perceived uptake**
Measurement model	Marginal fit: $\chi^2/df = 2.129$, RMSEA = 0.077, CFI = 0.820, SRMR = 0.087	Constructs were interpreted as observed composites.
Quantitative model	Text positively predicted PMU, b = 0.473, $p < 0.001$	Model-text condition was associated with perceived uptake.
Quantitative model	PDP positively predicted PMU, b = 0.486, $p < 0.001$	Discourse access was central to perceived uptake.
Quantitative model	ELAB negatively predicted PMU, b = −0.451, $p < 0.001$	Reported elaboration indexed processing effort as well as engagement.
Quantitative model	Text × PDP was significant, b = −0.252, $p < 0.001$	Text condition mattered less when PDP was high.
Open-ended responses	Text 1 was formal, neutral, and distant	Academic authority was paired with lower perceived closeness.
Open-ended responses	Text 2 was accessible, structured, and reader-facing	Familiar metadiscourse supported perceived usability.

Open-ended responses	Text 3 was sophisticated, abstract, and demanding	Advanced discourse signalled quality but increased perceived distance for some learners.
Integrated pattern	Learners evaluated texts through authority, manageability, and guidance	Perceived uptake depended on how discourse was experienced as usable.

5. Discussion

5.1 Metadiscourse as Usable Discourse

The findings suggest that metadiscourse learning should be understood not only as a matter of exposure but also as a matter of perceived usability. Although model texts have long been used to make rhetorical practices visible in writing instruction (Swales, 1990; Yasuda, 2011), visibility alone does not guarantee uptake. Learners may recognize discourse features without perceiving them as relevant or available for their own writing.

The positive effect of model-text condition on Perceived Metadiscourse Uptake (PMU) supports this argument. Participants exposed to different model texts reported different levels of perceived uptake, indicating that metadiscourse visibility influences how learners evaluate discourse resources. In particular, the familiar metadiscourse condition generated the most favorable responses across both quantitative and qualitative measures. Learners repeatedly described this condition as clear, organized, and reader-friendly, suggesting that discourse resources became more usable when rhetorical functions were made explicit.

This finding extends interactional approaches to metadiscourse (Hyland, 2005, 2017) by shifting attention from discourse production to discourse accessibility. Previous studies have primarily examined how expert writers employ metadiscourse to construct stance and engage readers. The present study instead focuses on how learners evaluate those resources before attempting to use them. From this perspective, metadiscourse learning involves an intermediate stage in which discourse resources become perceived as understandable, relevant, and potentially reusable.

The results also align with genre-based perspectives on writing development. Tardy (2006) and Tardy et al. (2020) argue that genre learning requires more than awareness of textual features. Learners must develop conditional knowledge regarding when and how rhetorical resources can be applied. The present findings suggest that perceived usability may represent an important precursor to this process. Before learners can appropriate discourse resources, they must first perceive those resources as accessible.

5.2 Reinterpreting Elaborative Processing

One of the most unexpected findings was the negative relationship between Elaborative Processing (ELAB) and PMU. Within the Elaboration Likelihood Model, elaboration is typically associated with deeper engagement and more stable judgments (Petty & Cacioppo, 1986). A straightforward prediction would therefore suggest a positive relationship between elaboration and perceived uptake. However, the present findings indicate the opposite pattern.

A possible explanation is that self-reported elaboration captures not only engagement but also processing burden. In L2 academic writing contexts, learners frequently encounter unfamiliar discourse practices, disciplinary expectations, and rhetorical conventions. Greater elaboration may therefore reflect increased effort required to understand a text rather than successful integration of its discourse resources.

This interpretation is consistent with research on writing self-regulation and cognitive processing (Hayes, 2018). Cognitive effort does not always indicate effective learning. Learners may invest substantial mental resources because discourse appears difficult, distant, or unfamiliar. Under such circumstances, high elaboration may signal struggle rather than mastery.

The qualitative findings provide further support for this interpretation. Participants frequently described Text 3 as sophisticated and academically advanced, yet they also viewed it as difficult to understand and emulate. In contrast, Text 2 received lower descriptions of difficulty while simultaneously producing higher levels of perceived uptake. These patterns suggest that accessibility may be more important than processing intensity when learners evaluate discourse usability.

Consequently, elaborative processing should not automatically be interpreted as evidence of successful rhetorical engagement. Instead, it may function as an ambiguous indicator reflecting both cognitive involvement and processing difficulty. Future research should therefore distinguish between productive elaboration and effort associated with discourse complexity.

5.3 Perceived Discursive Proximity as a Condition for Uptake

Among all predictors examined in the study, Perceived Discursive Proximity emerged as one of the strongest predictors of perceived metadiscourse uptake. This finding supports the central theoretical claim of the study: learners are more likely to adopt discourse resources when those resources appear close enough to their existing communicative repertoire.

The concept of PDP builds upon academic literacies research, which emphasizes access to discourse practices rather than simple acquisition of textual skills (Lea & Street, 1998; Street, 1984). From this perspective, learners' difficulties often stem not from a lack of linguistic knowledge but from uncertainty regarding participation in academic discourse communities. PDP operationalizes this issue by focusing on learners' perceptions of discourse accessibility.

The findings also resonate with sociocultural perspectives on learning. According to Vygotsky (1978), learning occurs through participation in socially mediated activities. Model texts can therefore function as mediational resources that either reduce or reinforce perceived distance between learners and academic discourse. When discourse resources appear understandable and manageable, learners may perceive them as available for future use. When discourse appears distant, uptake becomes less likely.

Furthermore, PDP complements motivational perspectives on internalization (Ryan & Deci, 2000). Learners are more likely to adopt resources they perceive as personally meaningful and attainable. The strong relationship between PDP and PMU suggests that discourse accessibility may play a critical role in transforming visible discourse resources into potentially usable ones.

Taken together, the quantitative and qualitative findings indicate that perceived accessibility is not a peripheral factor but a central condition for metadiscourse uptake. This

contribution extends existing metadiscourse and genre-learning research by highlighting the importance of learners' perceptions of discourse availability.

5.4 Pedagogical Implications

The findings have several implications for academic writing instruction. First, model texts should be selected not only for authenticity but also for their ability to make rhetorical functions visible and accessible. Texts that balance academic sophistication with reader-oriented guidance may be particularly beneficial for novice writers.

Second, instruction should move beyond identifying metadiscourse features toward explaining their rhetorical purposes. Helping learners understand why writers use particular discourse resources may increase perceived accessibility and support future transfer.

Finally, writing pedagogy should recognize that learners' perceptions of discourse accessibility can influence uptake. Creating opportunities for guided discussion, reflection, and adaptation of model-text discourse may help learners perceive academic writing as something they can realistically use rather than simply admire from a distance.

6. Conclusion

This study examined how Vietnamese university students perceived metadiscourse after exposure to model texts with varying levels of metadiscourse visibility. By integrating quantitative and qualitative evidence, the findings demonstrated that model-text condition and Perceived Discursive Proximity (PDP) positively predicted Perceived Metadiscourse Uptake (PMU), whereas Elaborative Processing (ELAB) showed a negative relationship with uptake. Qualitative analyses further revealed that learners evaluated model texts in terms of academic authority, accessibility, complexity, and reader guidance, with the familiar metadiscourse condition emerging as the most accessible and reusable.

The study contributes to L2 writing research by reconceptualizing metadiscourse learning as a matter of perceived usability rather than simple exposure. While previous research has focused primarily on noticing discourse features, the present findings suggest that learners are more likely to adopt rhetorical resources when those resources are perceived as understandable, relevant, and accessible. In this regard, PDP offers a useful framework for understanding how learners evaluate their access to academic discourse and how such evaluations shape perceived uptake.

Pedagogically, the findings highlight the importance of selecting model texts that balance academic sophistication with discourse accessibility. Writing instruction should therefore emphasize not only the identification of metadiscourse features but also their rhetorical functions and practical applicability. Future research should examine whether perceived usability predicts actual transfer into writing through longitudinal designs and analyses of learners' written production.

#164 INTEGRATING AI LITERACY AND DELIVERY INSTRUCTION IN PUBLIC SPEAKING CLASSES FOR VIETNAMESE UNDERGRADUATE STUDENTS

Mai Thị Mỹ Hạnh[1]

Abstract

The rapid integration of generative AI tools into the academic learning process has fundamentally transformed traditional public speaking instructions. When undergraduate students can easily produce speech scripts and slides with AI assistance, the instructors face two pressing questions: how do teachers encourage authentic oral communication, and how does delivery training impact student performance when presenting AI-assisted content? To address these issues, this study employs a reflective teaching approach to evaluate instructional practices that balance AI literacy with intensive oral delivery instruction. This dual-framework instructional model was implemented across two Public Speaking courses with 80 Vietnamese undergraduate English majors over one academic semester. In the first phase, students were taught prompt engineering to critically evaluate, refine, and personalize AI-generated outlines; and then came the delivery instruction phase, where structured training in vocal variety, pausing, and intonation control were provided. Data were collected from classroom observations, teacher reflections, and student feedback and performance results. Findings show that systematic delivery training produced observable improvements in students' oral presentation performance, while AI literacy activities enhanced personal ownership of the language. The paper provides practical recommendations for TESOL practitioners teaching oral communication in AI-integrated language teaching contexts.

***Keywords*:** AI literacy, public speaking, oral delivery, EFL/ESL, TESOL

1. Introduction

We are at the time when the integration of GenAi tools has completely transformed and reshaped English Language Teaching (ELT), particularly with the subject of Public Speaking. The AI-driven tools can now help undergraduate students create logical and grammatically correct speech scripts in a matter of minutes. Although this has raised concerns regarding academic integrity and a potential threat to erosion of critical thinking, it also provides Public Speaking instructors an opportunity to re-evaluate what is important in teaching this subject. In public speaking, a good script is not equal to a good presentation; it depends on other features, such as vocal variety, pausing, and intonation, facial expressions and body language. When students passively copy AI-generated text, their speeches often result in flat, unengaging, and poor performances, since the language used in the text tends to exceed students' linguistic competence. To address this challenge, this study proposes an instructional framework implemented in an undergraduate public speaking course for English majors at a university in Vietnam. Previous AI studies have mainly focused on writing, academic integrity, or language accuracy, this study addresses how AI-generated content can be transformed into personally owned oral performance through delivery training. Rather than banning the use of AI tools, this study investigates an alternative instructional method. Specifically, it examines how

[1]*MA., Faculty of Foreign Languages, HCM City University of Foreign Languages & Information Technology (HUFLIT), Email: hanhmtm@huflit.eud.vn*

embedding AI literacy and prompt engineering into the brainstorming and outline phrases of speech preparation, combined with intensive delivering training, supports students' public speaking development. The public speaking classroom, through this dual instructional framework model, demands that students inhabit the language, use it as their own to say something that really matters to them in a confident manner. Specifically, the study aims to assess the effectiveness of targeted training in prosodic delivery features, specifically vocal variety, strategic pausing, and intonation control, in improving students' presentation performance; and analyze the influence of the integration of prompt engineering and AI literacy activities into a public speaking course on students' sense of language ownership and authentic engagement with AI-generated content.

2. Literature Review

Artificial intelligence (AI) in language learning and teaching

Studies have increasingly reported positive influences of the pedagogical potential of integrating AI in language learning on learners' oral performance, speaking confidence, and interactional competence. AI tools can generate different argument structures and language styles, providing students with examples they can emulate, thereby boosting confidence and broadening their linguistic repertoire (Steiss et al., 2024). A great amount of scholarly response focused on writing contexts - examining how AI tools affect the writing process, what they mean for academic integrity, and how writing pedagogy might adapt to a landscape in which fluent, coherent text can be generated with minimal human effort (DuBose et al.,2023). This is understandable given that text generation is the most visible and disruptive capability of AI tools, but it has left a considerable gap in the literature: the implications of AI for oral communication instruction, particularly in public speaking skills, remain relatively underexplored. With the aid of AI-driven tools, students can generate the content of their speeches or their presentations before delivering them to a human audience; and this raises questions about authenticity and the purpose of oral communication instruction. The challenges this practice creates are what several scholars have described as a *competence-performance gap* related to AI-assisted language production (Gilea et al., 2025). When AI generates sophisticated language that exceeds learners' proficiency levels, a visible mismatch emerges between the fluency of the text and the speaker's ability to elaborate on or defend it in real-time communication. This mismatch is particularly notable in public speaking contexts. Addressing this gap is one of the central motivations for the dual-framework model described in this paper.

Authenticity and Speaker's voice in Public Speaking

Research on authenticity in EFL public speaking has established that audiences, including instructors and peers, are sensitive to markers of speaker ownership that go beyond linguistic fluency. Joughin (2010), in a study of oral assessment in higher education, stated that evaluators intuitively recognize students who appeared to *know* their material and those who appeared to be *reproducing* it, and that this distinction shaped evaluative judgments even when assessment criteria did not name it. More recently, studies of presentation skills in EFL university contexts have noted that the highly rated student presenters tend to be those who integrate personal experience and locally relevant examples into their talks - precisely the behavior observed and encouraged in the present study (Chen, 2019). These findings prove that rhetorical ownership is not a desirable quality but an observable and assessor-recognizable feature of effective oral performance.

Delivery Instruction and Oral Performance in Public Speaking

Public speaking competence emphasizes oral delivery, together with content preparation and organization. Delivery competence is the ability to present within a specific context, including the capacity to evoke emotions and regulate one's behavior (Zhang et al., 2019). A speaker with delivery competence knows how to communicate non-verbally, using eye contact, gestures, and voice to convey their message to the audience (Lucas & Stob, 2020). Delivery features such as vocal variety, eye contact, fluency, and body language have been identified as significant predictors of audience perception of speaker credibility, engagement, and overall effectiveness. Studies have shown that ESL/EFL speakers often struggle with prosodic features, specifically intonation, pausing, and stress, in ways that can impede communicative clarity regardless of content quality (Derwing & Munro, 2005; Gilbert, 2008). This shows that it is imperative to treat delivery not as a concern but as a core instructional target in public speaking courses for ESL/EFL learners.

Intonation control is perhaps the most complex instructional challenge of the three delivery features targeted in this study, both because of its linguistic complexity and because of the specific transfer challenges it has for Vietnamese-speaking learners. Vietnamese, as a tonal language, uses pitch variation at the syllable level to mark lexical meaning, a fundamentally different function that draws on some of the same phonological resources but deploys them in ways that can interfere with the acquisition of English intonation patterns. Research on Vietnamese learners' English prosody has documented consistent patterns of L1 transfer in intonation production, including a tendency toward flatter overall contours, reduced use of the high-rising terminal, and syllable-timed rhythm that can obscure the stress-timed information structure of English (Tran, 2006). Targeted intonation instruction, especially when coupled with activities and models of native or proficient speaker norms, has demonstrated positive effects on both production accuracy and learner confidence (Nguyen, 2004).

Empirical studies that have incorporated explicit delivery instruction into public speaking or oral presentation courses report consistently positive findings. King (2002) stated that iterative practice combined with instructor modeling of delivery behaviors produced benefits not only in technical delivery but also in student confidence and willingness to communicate. In TESOL contexts specifically, delivery-focused instruction has been linked to improvements in comprehensibility ratings by both teacher assessors and peer listeners (Derwing et al., 2004). Together, these three strands establish the conceptual foundation for the dual-framework model and situate the study's research questions.

Although significant improvements have been made in AI-supported language education, research gaps remain, specifically concerning AI's impact on public speaking instruction for EFL/ESL learners in Vietnamese contexts. There is limited theoretical and empirical research exploring how AI tools affect presentation performance. This highlights an area in urgent need of further research.

The dual-framework Instructional Model

In the era when AI can assist students to produce polished speech scripts within seconds, the public speaking classrooms then become a performance in which students simply read aloud what AI has written for them, the public speaking class therefore may lose its main purpose, which is producing confident speakers who can connect with an audience in their own voice. The dual-framework instructional design was developed in response to this challenge.

Instead of banning AI use, which proves impractical in the contemporary classrooms, the model integrates it into the course design through two parallel instructional tracks. *Phase 1* - AI Literacy - addresses the content of the speeches by guiding students to analyze,

personalize, and engage with AI-generated drafts. *Phase 2* - Delivery Instruction - provides skill-focused training in the main features of public speaking that distinguish an interesting speaker from a script reader, regarding vocal variety, pausing, and intonation control. The model was implemented across two Public Speaking courses enrolling a total of 80 Vietnamese undergraduate English majors over one semester. Both courses followed the same instructional sequence, allowing the instructor to observe patterns across class groups and refine activities in response to student needs.

Phase 1 - AI Literacy Instruction

The AI Literacy phase was designed around a single guiding principle: students should be the authors of their speeches, even when AI assists in the first draft. Instead of using AI-generated text as a finished product to be memorized and delivered, this phase treated it as raw materials, the first draft that required the student's own knowledge, experience, and communicative intention to make it become their own speech.

Key Activity: Revision and personalization of AI-generated drafts

The primary instructional activity in this phase involved a revision process applied to AI-generated speech drafts. Students were first taught the sample prompts and were invited to use an AI tool of their choice (ChatGPT or Gemini) to generate a draft/outline on their assigned or chosen speech topic(s). This draft served as a starting point rather than a final text. Students were then guided through a process in which they were asked to identify the text / passages that did not reflect their own knowledge or experience, replace generic AI examples with personal stories or locally relevant examples/illustrations, adjust the formality and tone to match their own natural speaking style, and insert their own linking phrases and signposting rather than using the AI's structural scaffolding. This revision process was not presented as a corrective measure against AI use, but as a standard part of the speech writing process - the same critical stage that a skilled writer would apply to any draft. The instructional message emphasized that AI could help you structure your ideas, but only *you* can make this speech worth listening to. More importantly, this activity served as preparation for the oral performance itself.

Assessment of AI Literacy outcomes

AI literacy was assessed through the content section of the course's rubric. Content scores were based on students' personal engagement with and investment in their material during the presentation - specifically, their ability to analyze and criticize the AI-script, respond to audience or instructor prompts, and integrate personal examples or locally based evidence.

Phase 2 - Delivery Instruction

While the AI Literacy phase addressed what students said, the Delivery Instruction phase focused on how they said it. A polished script read in a flat monotone communicates far less than a modest script delivered with confidence and rhythm. For EFL learners particularly, whose L1 prosodic patterns (Vietnamese) may transfer in ways that affect intelligibility and audience engagement in English, repeated delivery training is not supplementary, but it is crucial. The delivery instruction sequence focused on three main features: vocal variety (modulating pitch, pace, and volume to catch audience attention and emphasize key ideas), strategic pausing (using silence to signal transitions, allow audience time to think, and project speaker confidence), and intonation (managing rising and falling patterns to convey meaning and attitude in English).

Activity 1: Drilling Exercises

Drilling activities formed a cornerstone of the delivery instruction and was integrated into in-class sessions throughout the semester. Drilling tasks targeted each of the three delivery features in focused practice contexts before students were asked to apply them in full presentations. For vocal variety, students practiced reading short passages aloud with instructor-guided cues. As for pausing, students worked with marked-up scripts in which pause points were indicated, practicing the deliberate act of stopping, and holding the silence before continuing next points. Many students initially found this uncomfortable, as silence in performance contexts often considered as error or not fluent in their prior learning experience. Repeated drilling helped normalize the pause as a tool rather than a failure. For intonation and stress, students practiced contrastive stress patterns, fall-rise sequences for hedging and suggestion, and the high-rising that signals incompleteness in English, the features that differ from Vietnamese tonal patterns and require attention.

Activity 2: Feedback on Recorded and Live Presentations

Feedback sessions were structured around the same delivery rubric used for formal assessment, training students to observe and articulate delivery features in each other's performances. By using the same rubric for both peer feedback and formal assessment, students developed metalinguistic awareness of delivery features while simultaneously learning to evaluate their peers' performances. Students were grouped to listen to short-recorded practice presentations or a live speech and provide written feedback using a guided observation form that prompted specific comments on vocal variety, pausing, and intonation. This activity served as a dual function. As feedback providers, students developed an awareness of delivery features that sharpened their own self-monitoring during practice. As feedback recipients, students received peer observations that often carried different power than instructor feedback - hearing from a classmate that "*your voice went flat in the middle section*" proved, in many cases, more helpful and impactful than the same note from a teacher. Live peer feedback sessions were also conducted in class, with small groups observing a presenter and offering real-time observations immediately following each practice round.

3. Methodology

This study adopted a reflective classroom research design to examine the effectiveness of integrating AI literacy and oral delivery instruction into the Public Speaking course for second-year students majoring in English. This study investigates a pedagogical intervention implemented by the course instructor in a real classroom context; therefore, the design was chosen to allow for pedagogical adjustments during implementation while evaluating the impact on student performance and language ownership. This reflective classroom research can be more appropriate than experimental or quasi-experimental design for this stage of inquiry. The study can be framed as exploratory practitioner research aiming to generate pedagogical insights in public speaking courses. The course instructor acted as a practitioner-researcher, collecting and interpreting evidence from direct classroom experience, self-reflection, and student interactions throughout one academic semester.

Participants were 80 second-year English-major students in two Public Speaking classes, which shared similar learning conditions, at the Faculty of Foreign Languages, HUFLIT. All students, at intermediate to upper-intermediate English proficiency (B1–B2 CEFR level), had prior experience with basic presentation tasks but limited systematic training in delivery skills or AI-assisted content creation.

Data were collected from three sources. Accordingly, *Classroom observations* were conducted throughout the semester. The instructor maintained notes about instructional

practices, use of AI-generated versus personalized content, student engagement patterns, and difficulties (if any) in both the AI literacy and presentation skills training activities. *Teacher reflections* were recorded systematically across the semester in the form of a reflective journal and teaching logs, maintained by the course instructor. These entries captured pedagogical decisions, student responses, and adjustments made to instruction. In addition, *Student feedback and performance results* were collected at specific assessment points in the semester. There were 3 in-class mini speeches (3-5 minutes) and 1 video-recorded speech. All presentations were scored using a validated analytic rubric (adapted from Lucas, 2015, and institution-specific criteria) assessing both content ownership and delivery effectiveness. The rubric included subscales for vocal delivery (25%), non-verbal delivery (20%), content adaptation/personalization (25%), organization (15%), and audience engagement (15%). Student feedback was also collected via informal written reflections on their experience of integrating AI tools into the speech preparation process. Classroom observation notes and teacher reflections were analyzed thematically, following an inductive coding procedure to identify recurring patterns related to student engagement, challenges, and instructional effectiveness. Student performance data were examined to assess change in delivery-related scores across the semester, while written feedback was analyzed for themes pertaining to students' perceived agency, language ownership, and attitudes toward AI-assisted speech preparation. Triangulating these data sources allowed the study to develop a multi-angled understanding of classroom dynamics and to propose evidence-based adjustments for desired learning outcomes.

The course instructor acted as a practitioner-researcher, collecting and interpreting evidence of student learning outcomes and engagement throughout one academic semester of 12 weeks. Since potential biases might arise from this dual role, different measures were implemented to ensure objectivity in data collection, including student feedback and informal discussions with students during break time for each teaching session.

This methodology enabled a comprehensive examination of how AI literacy and delivery instruction can be effectively combined to promote oral communication skills in an AI-rich educational environment.

4. Results

The findings are organized around three interrelated themes that emerged across the three data sources, including classroom observations, teacher reflections, and student feedback and performance results. The first theme addresses the impact of structured delivery training on students' oral presentation performance. The second examines how students engaged with and took ownership of their AI-assisted content. The third explores the productive interplay between the two instructional tracks, showing how gains in one dimension frequently amplified and made visible gains in the other.

Impact of Delivery training on Oral performance

The most significant and measurable finding across the semester was that public speaking delivery training produced considerable improvements in students' presentation performance across all three features: vocal variety, strategic pausing, and intonation control. Improvements were evenly distributed, proving that the drilling and feedback activities benefited students across the range of prosodic features addressed in the course.

Vocal variety: At the beginning of the semester, classroom observations showed that students delivered their speeches in a flat pitch range, with pace and volume remaining flat from the opening to the end of the speech. Teacher reflections from the first 3 weeks noted that

this flatness was not only because of anxiety and nervousness, it persisted even in students who appeared well-prepared. It reflected an absence of vocal training rather than an anxiety response. By mid-semester, following repeated drilling sessions and peer feedback, observations recorded a noticeable change by approximately 70%. Students started using their tone and speed more intentionally - slowing down at key points and using volume shifts to signal emphasis. Feedback from several students reported that the drilling exercises, which they had initially found artificial and uncomfortable, began to feel more natural when they understood the communicative function. Delivery scores on the vocal variety feature of the speech showed improvement from the first mini presentation to the final one across both class groups.

Pausing*:* Strategic pausing proved to be the feature that was the most visible in-class transformation. Early in the semester, students consistently treated silence as a problem to be avoided. Instructor reflections noted that when students forgot script or reached a transition point, the response was to fill the gap with 'um,' or repeated what they had just said. The drilling activities targeting pausing, in which students were asked to stop, hold silence for a full count of approximately 2-5 seconds. Teacher reflections from this period noted that normalizing silence and pausing required persistent reframing, both in explicit instruction and in the way the instructor modeled pausing during her own classroom lectures. By the latter half of the semester, however, pausing had become one of the most commented-upon improvements in peer feedback sessions. Students observing their classmates noted when a well-placed pause before a key point or transition gave them time to absorb what had just been said. Rubric scores on the pausing dimension reflected notable improvement, and student feedback at the end of the semester identified pausing as the delivery skill they felt most confident applying in their future speeches.

Intonation control: Intonation control showed equally meaningful improvement, though its development followed a somewhat different trajectory. Unlike vocal variety and pausing, in which students could see the relatively immediate results after practicing, intonation was a challenge for Vietnamese learners. Vietnamese is a tonal language in which pitch variation at the syllable level contains lexical meaning, and the relationship between pitch and meaning created interference patterns in students' English intonation production. My classroom observations from the drilling sessions on intonation revealed that students responded well to intonation practice, hearing and producing the same sentence with different intonation patterns and discussing the change in communicative meaning. Student feedback highlighted this approach as very useful, with several students noting that they had never considered intonation as a meaning-making resource in English, having focused on vocabulary and grammar accuracy. Teacher observations recorded an increase in the use of rising intonation to engage the audience, as well as more confident use of falling intonation to signal emphasis. Rubric scores showed improvement in intonation and stress across both class groups, a finding that points toward the need for continued attention to this feature in the public speaking course.

Student Engagement with AI-assisted contents

While delivery instruction was the most measurable outcome of the semester, the AI literacy phase produced a qualitatively important finding: across the two class groups, students tended to insert personal stories and specific examples from their experience into their speeches, adding them into their AI-generated scripts. This pattern was not seen from the beginning of the semester. In Mini presentation 1, approximately 70% of students maintained note-focused delivery with minimal eye contact. By the mid-term presentation, classroom observations recorded a significant increase in the frequency of personal stories / anecdotes

and locally specific examples in student speeches, with references to their own experiences and locally relevant contexts. These insertions showed that the students could reproduce the AI drafts and made them into their own versions. Teacher reflections from this period noted that this personal insertion was among the most communicatively effective. When a student paused to share a personal story or her own experience with the topic she was presenting, his/her audience would immediately engage, and the presenters could catch audience attention in the room easily. Student feedback at the end of the semester reinforced this observation. Students demonstrated greater resilience during Q&A sessions when they had personalized their material. They expressed confidence in their ability to add their insights to and take ownership of AI-generated materials, which represents a pedagogically productive relationship with these tools. The most compelling finding of the semester was the way in which the benefits of the two phases amplified each other in practice. The ownership of content seemed to motivate better delivery practice. The clearest illustration of this came in presentations where students had both revised and personalized their scripts and then applied their delivery training into their speeches. Teacher reflections noted that this pattern happened repeatedly in both class groups. Students who had improved delivery skills through drilling practices and feedback appeared to use those skills better with personalized contents. This interplay suggests that the dual-framework approach functions not merely as two separate instructional phases running in parallel, but as an integrated system in which each phase creates conditions for the other to operate more effectively.

5. Discussion & Recommendations

Discussion

Public speaking in EFL/ESL context, defined by Lucas (2009) is a strategic communication act, in which not only English proficiency but also critical thinking, creativity, and a logical structure for the speech are required. Public speaking demands that speakers present ideas clearly, systematically, and persuasively. Therefore, it is an effective approach to help EFL/ESL students develop communication awareness, build confidence, use English comprehensively, and, importantly, enhance their critical thinking skills (Zhang, 2009). The findings suggest productive directions for public speaking instruction in AI-integrated contexts. When AI tools can produce grammatically correct and coherent speech scripts, the focus on helping students build well-organized spoken texts remain important, but teachers need to give greater attention to personalization, delivery, and audience engagement. However, what AI cannot produce is an eloquent speaker, one who delivers personalized content with confidence and prosodic control. The dual-framework model implemented and proposed in this study and the findings suggest that it is a productive and practically viable foundation for rethinking oral communication pedagogy in EFL contexts.

The consistent improvement observed across all three delivery features - vocal variety, strategic pausing, and intonation control - supports a central argument of this paper that in the AI era, delivery instruction is a priority. When the script-production burden is done by AI assistance, class time and instructional energy can be redirected. The voice, the pause, and the body language are exactly what distinguishes a compelling speaker from a well-written script read aloud. The revision and personalization activities in Phase 1 did not ask students to stop using or refuse AI assistance but asked them to do something more demanding: to critically read the AI-generated draft, find out where it did not show their own knowledge and experience, and take steps to make it theirs. The result, as observed in classroom presentations and shown in student feedback, was what students invested in and took control of the content they are presenting, regardless of how that content was AI-drafted in the first place.

Recommendations

The findings and discussion above point toward a set of recommendations for TESOL practitioners teaching oral communication in AI-integrated EFL/ESL contexts. For public speaking courses, it is necessary for teachers to integrate AI literacy throughout speech preparation, make personalization a compulsory revision step, use peer feedback with clear observation form, and assess both content ownership and delivery quality. It is also useful if teachers clearly communicate to students from the first session that this course is about becoming an eloquent speaker, and that AI tools are welcome as a draft assistant.

The suggested activity sequence for a fifteen-week public speaking course is as follows. In the first 4 weeks of the course, it is recommended that the instructors introduce each delivery feature through focused drilling, with in-class practice presentations being used as drilling rather than assessed performances. From weeks 5 - 8, teachers can move to feedback sessions in which students observe and give feedback to each other's use of specific delivery features in practice presentations, using an observation form. From weeks 9-12, students need to identify one delivery strength and one priority for improvement in each presentation. From week 13-15, instead of commenting on individual features in isolation, students respond to the overall communicative effect of a presentation regarding the content and delivery.

Teachers need training and skills to integrate AI effectively into their practice. As AI becomes increasingly indispensable in education, understanding how to balance AI literacy with authentic oral communication is crucial. This will allow teachers to take advantage of AI's power and balance AI literacy with authentic oral communication.

6. Limitations

This study is restricted by its dependence on classroom observations, instructor's teaching reflections, and feedback from students; therefore, these data sources limit the generalizability of the findings beyond this specific institutional context and instructor. In addition, the findings are context-specific because the study involved two classes at one university and one instructor. The study adopted a teacher-researcher design, which may introduce subjectivity into both the instructional delivery and the observational data. The lack of detailed score reporting, limited reliability evidence for rubric scoring, limited information about the student feedback instrument, and the absence of a control group also mean that observed improvements in delivery and content ownership cannot be attributed merely to the dual-framework intervention, other factors, including students' self-practice and students' own development outside class may have contributed. Future studies should include a comparison group, multiple raters, pre- and post-performance scores, student in-depth interviews, and a clearer measure of AI literacy development and content ownership to strengthen the evidence for the model's effectiveness.

7. Conclusion

Vietnamese educational policy has signaled an ambitious shift in the role of English - from a foreign language taught as a subject to a medium of instruction, professional communication, and social participation embedded across the curriculum and the workplace (Ministry of Education and Training, 2017). This transition aims to produce a kind of speaker who can think in English, respond in English, use English to communicate naturally instead of rehearsed accuracy. The public speaking classroom, through the dual-framework model, is a foundation to build this kind of speaker - not because it only teaches English, but because it requires students to inhabit the language and use it to say something that matters to them in front of an engaged audience. The public speaking class, in the AI era, is for making good

speakers, not script producers or AI editors. Speakers who can stand confidently in front of an audience and deliver what they really want to say with the prosodic tools that make an audience engage in, stay with them, and believe that what is being said is worth hearing. The dual-framework model reported in this study provides one step toward that goal. This is not only a response to the use of AI in the classroom, it is also a response to the arrival of a new vision of what Vietnamese English education is for.

#172 HUFLIT STUDENTS' PREPARATION FOR GRADUATION CERTIFICATES: PERCEIVED EFFECTIVENESS OF AI-GENERATED LEARNING SUPPORT

Quốc Bảo Mai[1,2], Thị Cẩm Vân Nguyễn[1,2], Đình Bảo Hân Nguyễn[1], & Nguyễn Nhựt Tuyết Hồ[1]

Abstract

Generative Artificial Intelligence is rapidly changing higher education. However, little is known about how students in Vietnamese private universities use these tools to prepare for important graduation certificates - such as TOEIC, VSTEP, and MOS - under strong academic pressure. This study addresses this gap by examining how Performance Expectancy, Effort Expectancy, and Academic Pressure influence students' AI Usage Behavior and their Perceived Effectiveness of learning. Using an explanatory sequential mixed-methods design, the study surveyed 260 English-majored juniors at Ho Chi Minh City University of Foreign Languages – Information Technology (HUFLIT) and interviewed six selected participants. Based on an extended Unified Theory of Acceptance and Use of Technology (UTAUT) framework, the quantitative results showed that Effort Expectancy (β = .470), Academic Pressure (β = .431), and Performance Expectancy (β = .307) all had positive and significant effects on AI Usage Behavior. AI Usage Behavior was also strongly associated with students' perceived learning effectiveness (β = .603). The interviews revealed a more nuanced picture. While students used GenAI as a learning support tool, pressure-driven reliance could produce a false sense of competence: students completed tasks with AI support but did not always build deep, independent understanding. Students also raised concerns about inaccurate AI-generated content and growing dependency. Overall, this study suggests that universities should move beyond outright bans and develop an AI-Integrated Academic Integrity Framework that promotes AI literacy and a human-in-the-loop approach, helping students use technology responsibly while still owning their learning.

1. Introduction

Higher education is changing as the Fourth Industrial Revolution automates routine cognitive tasks and raises demand for non-routine skills such as problem-solving and adaptability (Phan & Doan, 2019). This shift is closely tied to the emergence of Generative Artificial Intelligence (GenAI), particularly Large Language Models (LLMs) such as ChatGPT, which can produce human-like text responses (Bearman & Ajjawi, 2023; Kasneci et al., 2023). In Vietnam, this technological trend coincides with strict graduation requirements. Circular 12/2017/TT-BGDĐT requires higher education institutions to enforce foreign language proficiency (e.g., TOEIC, VSTEP) and computer skills (e.g., MOS) certifications as mandatory conditions for graduation (Ministry of Education and Training, 2017). Undergraduates at Ho Chi Minh City University of Foreign Languages – Information Technology (HUFLIT) therefore face a practical tension between using new AI tools and managing the pressure of these mandatory exit requirements.

GenAI is often described as a useful tool for self-regulated learning because it can provide quick and personalized feedback (Nguyen, N. T., 2025). However, a gap exists between what AI can support and how students actually use it. When students need to meet strict graduation requirements, they may use AI to reduce their cognitive effort rather than to deepen learning. This is particularly consequential in English Language Teaching (ELT), where language development typically requires sustained practice and active engagement. The result may be a competence gap: students produce answers that meet certificate requirements but do not fully understand or retain the underlying knowledge. Vo (2025) described this risk as a "false sense of competence" - students feel more capable than they actually are. Whether this type of AI use genuinely prepares students for work and further study, or only creates surface-level performance, remains unclear.

Problem Statement

The specific problem this study addresses is that, at HUFLIT, GenAI use and mandatory certificate requirements have grown together without clear evidence of how they interact. Because Circular 12/2017/TT-BGDĐT ties graduation directly to certificate scores, students have a strong incentive to use AI in whatever way gets them a passing result fastest. However, current UTAUT-based adoption research does not reveal whether that incentive pushes students toward AI as a genuine learning aid or as a shortcut around learning. This gap matters practically: if students pass TOEIC, VSTEP, or MOS examinations with heavy AI assistance but do not retain the underlying language or digital skills, the university risks certifying competencies that graduates do not actually hold, with consequences for their later academic and workplace performance.

A related issue is that existing technology-acceptance models such as UTAUT were not designed for high-stakes, deadline-driven certification settings, so they may understate how much Academic Pressure itself - separate from usefulness or ease of use - drives students toward AI-assisted shortcuts (Kasneci et al., 2023; Rudolph et al., 2023). Without empirical evidence on how Performance Expectancy, Effort Expectancy, and Academic Pressure jointly shape AI Usage Behavior, and on whether that usage produces genuine or only perceived learning gains, HUFLIT and similar institutions lack an evidence base for deciding between banning AI, ignoring it, or actively teaching students to use it well.

Research Objectives

To address this gap, this study examines how Performance Expectancy, Effort Expectancy, and Academic Pressure influence AI Usage Behavior and how AI Usage Behavior affects students' Perceived Effectiveness of learning at HUFLIT. Using an explanatory

sequential mixed-methods design, the study first tests the structural relationships among the main variables through a survey. It then uses interview data to explain students' AI use in greater depth, including their learning strategies, perceived test readiness, concerns about AI dependency, and ethical awareness.

Significance of the Study

This study contributes in several ways. Theoretically, it extends the UTAUT framework by adding Academic Pressure as a context-specific factor relevant to high-stakes education. Practically, it provides evidence for HUFLIT teachers and administrators about how students actually use AI for certification preparation. The study suggests that universities should move from outright AI bans toward an AI-Integrated Academic Integrity Framework. It also supports a shift to process-oriented assessment and encourages students to adopt a human-in-the-loop approach, in which AI serves as support while students retain responsibility for checking, evaluating, and developing their own understanding.

Scope and Delimitations

This study is scoped to junior undergraduate students in the Department of English Language at HUFLIT who are preparing for institutionally mandated graduation certificates (TOEIC, VSTEP, MOS, and second foreign language qualifications). Data were collected through a single cross-sectional survey (N = 260) and follow-up interviews (n = 6) within one semester, so the study captures students' perceptions and self-reported behavior at one point in time rather than change over time.

Several delimitations were set deliberately. First, the sample was limited to English-majored juniors because this cohort faces the most immediate exposure to certification deadlines; other majors, academic years, and institutions were excluded, which limits how far the findings can be generalized beyond similar Vietnamese private-university contexts. Second, Perceived Effectiveness is defined as students' self-reported sense of learning support and test readiness, not as independently verified test scores or objective learning gains. Third, the extended UTAUT model includes three antecedents - Performance Expectancy, Effort Expectancy, and Academic Pressure - chosen for their relevance to high-stakes certification contexts; other UTAUT constructs (e.g., Social Influence, Facilitating Conditions) and individual differences (e.g., prior AI literacy, baseline English proficiency) fall outside the scope of this study. Finally, the qualitative phase was limited to six purposively selected interviewees, which supports interpretive depth but not statistical generalization of the qualitative themes.

2. Literature Review

Overview of Generative Artificial Intelligence in Education

Generative Artificial Intelligence refers to AI systems that create new content-text, images, code - by learning patterns from large datasets (Bearman & Ajjawi, 2023). Within higher education, LLMs such as ChatGPT and Gemini have moved quickly from novelty to widely used tools, offering benefits such as personalized feedback and support for self-regulated learning while simultaneously raising concerns about academic integrity and independent thinking (Kasneci et al., 2023; Chan & Tsi, 2023). For English as a Second Language (ESL) learners, GenAI can act as a responsive tutor that provides immediate corrective feedback and explains grammar or vocabulary. This accessible, individualized support is especially useful for non-native speakers preparing for standardized proficiency assessments (Nguyen, N. T., 2025; Almogren et al., 2024).

Theoretical Frameworks

The Evolutionary Trajectory: From TAM to UTAUT

Technology adoption research is grounded in the Technology Acceptance Model (TAM), proposed by Davis (1989), which explained behavioral intentions through Perceived Usefulness and Perceived Ease of Use. As digital environments grew more complex, Venkatesh et al. (2003) synthesized eight earlier models to create the Unified Theory of Acceptance and Use of Technology (UTAUT), which improved predictive power by identifying Performance Expectancy (PE) and Effort Expectancy (EE) as key determinants of technology use. Recent studies in the GenAI domain confirm these relationships: Parveen et al. (2024) used Structural Equation Modeling to show that PE drives ChatGPT adoption, and Strzelecki (2024) found Performance Expectancy to be the strongest predictor of students' behavioral intention to use ChatGPT across a large sample of university students.

Academic Pressure in High-Stakes Certification Contexts

Academic Pressure refers to the stress students experience when they must meet academic deadlines, pass important exams, and satisfy graduation requirements. In this study, Academic Pressure is specifically tied to certificate requirements such as TOEIC, VSTEP, MOS, and second foreign language qualifications. This pressure differs from general academic stress because it is linked to graduation conditions, fixed timelines, exam fees, retake costs, and the risk of delayed graduation. When facing these high-stakes requirements, students may use GenAI not only because it is useful or easy to use, but because it helps them save time, reduce stress, and prepare more quickly. Nguyen, A. H. (2025) showed that academic pressure is associated with students' AI use and concerns about academic integrity. Similarly, Beyersdorf et al. (2025) found that students often consider using GenAI when they face time pressure and difficult academic tasks. Academic Pressure is therefore included in this study as a context-specific factor that may strongly influence AI Usage Behavior among HUFLIT students.

Synthesis: The Extended Research Model

Although UTAUT provides a useful structure for explaining technology acceptance, its generic application may not fully capture the contextual pressures of Vietnamese higher education. Drawing on Nguyen, A. H. (2025), this study extends the UTAUT framework by incorporating Academic Pressure as a context-specific antecedent. The proposed model posits that AI adoption in this setting is shaped not only by students' perceived usefulness and ease of use, but also by institutional pressure surrounding high-stakes graduation requirements. Accordingly, Performance Expectancy, Effort Expectancy, and Academic Pressure are examined in relation to AI Usage Behavior, which is then linked to Perceived Effectiveness. Direct paths from these antecedents to Perceived Effectiveness are also estimated to assess whether AI Usage Behavior functions as a partial mediator.

Review of Related Studies

The following subsections review empirical studies that support the logic of the research model. Research on GenAI capabilities in examinations establishes the tool context. Studies on effectiveness versus dependency explain why Perceived Effectiveness must be interpreted carefully. Research on hallucination and academic integrity frames the qualitative themes.

AI Capabilities in High-Stakes Examinations

The strong performance of GenAI on examination tasks has moved from theoretical concern to empirical reality, raising questions about the reliability of traditional assessments. Wu et al. (2025) found that GPT-4o performed significantly better than human candidates on Taiwanese medical licensing exams. Ali et al. (2023) showed that AI tools achieved high proficiency on neurosurgery oral board questions. In the Vietnamese context, Pham (2024) found that Google Bard outperformed the average human score on the National High School Geography exam. These studies suggest that GenAI can support task completion and test practice in ways that may not reflect students' independent understanding - a concern directly relevant to institutional exit qualifications such as TOEIC and VSTEP.

Effectiveness versus Dependency in Language Learning

The use of LLMs in language learning creates both opportunities for perceived learning effectiveness and risks of cognitive dependency. While Nguyen, N. T. (2025) reported that AI can support vocabulary learning and structural comprehension, students may also over-rely on AI for tasks requiring independent thinking. Using latent profile analysis, Stojanov et al. (2024) identified a subgroup of students whose heavy reliance on ChatGPT was associated with weaker independent study habits, lending empirical support to the dependency concern. Bearman and Ajjawi (2023) similarly argued that students need to learn how to work critically with AI rather than use it as a replacement for their own judgment. In this study, Perceived Effectiveness is therefore defined as students' self-reported sense of learning support and test readiness, not as direct evidence of objective learning achievement.

Challenges and Academic Integrity

GenAI also raises ethical and information-reliability concerns. Anh-Hoang et al. (2025) identified "algorithmic hallucinations"-the phenomenon where AI confidently generates plausible but factually incorrect content-as a key challenge requiring users to verify AI-generated information carefully. Perkins (2023) argued that institutions cannot rely on plagiarism-detection tools alone and need updated academic integrity policies that explicitly address AI-assisted work. For this study's theoretical structure, Nguyen, A. H. (2025) established a correlation between Academic Pressure and the propensity for academic integrity transgressions among undergraduates. This suggests a survival-oriented pattern of AI use, where students facing graduation deadlines may prioritize certification outcomes over the learning process.

Hypothesis Development

Synthesizing the literature with the extended UTAUT framework, this study advances the following hypotheses.

Performance Expectancy (PE) and AI Usage Behavior (H1)

Performance Expectancy reflects the extent to which students believe that using a system will improve their academic performance. Originating from the Perceived Usefulness construct in Davis's (1989) TAM, PE was identified by Venkatesh et al. (2003) as the strongest predictor of behavioral intention in UTAUT. In the context of GenAI for certification preparation, students are motivated by practical benefits. Parveen et al. (2024) demonstrated through SEM that PE drives ChatGPT adoption, with students viewing the tool as a productivity enhancer. Nguyen, N. T. (2025) found a strong positive relationship between AI content generation capabilities and perceived learning effectiveness among HUFLIT students. Dang et al. (2024) reported that ChatGPT has become a common learning and research support

tool among students in Ho Chi Minh City. Strzelecki (2024) confirmed PE as the strongest predictor of students' intention to use ChatGPT in university settings. If HUFLIT students perceive AI as a tool that can simulate TOEIC mock exams or clarify grammar concepts more effectively than traditional resources, this expectation should directly increase their usage.

H1: Performance Expectancy has a positive and significant influence on AI Usage Behavior.

Effort Expectancy (EE) and AI Usage Behavior (H2)

Effort Expectancy refers to the perceived ease of use associated with a technology. Rooted in Davis's (1989) Perceived Ease of Use, this construct suggests that intuitive systems encourage frequent use, whereas complex technologies encounter user resistance (Venkatesh et al., 2003). GenAI tools are distinctive because their natural language interfaces substantially lower technical barriers, especially for non-IT majors. Parveen et al. (2024) noted that ChatGPT's conversational design significantly reduces students' cognitive load. Nguyen, N. T. (2025) found that effortless content generation encourages sustained engagement. Bearman and Ajjawi (2023) characterized AI as a user-friendly "black box" where simple prompts yield complex outputs, thereby increasing students' willingness to integrate it into their study routines. If HUFLIT students find interacting with AI to be straightforward and effortless, their usage frequency should increase.

H2: Effort Expectancy has a positive and significant influence on AI Usage Behavior.

Academic Pressure (AP) and AI Usage Behavior (H3)

Moving beyond traditional models that focus primarily on technological features, this study incorporates Academic Pressure as a critical determinant. Defined as the psychological strain from strict deadlines, elevated expectations, and the fear of academic failure, this construct draws on Agnew's (1992) General Strain Theory, which holds that individuals adopt specific coping strategies under stress. In Vietnamese higher education, such pressure can act as a catalyst for AI adoption. Nguyen, A. H. (2025) identified a direct correlation between academic pressure and AI usage, suggesting that students confronted with impending VSTEP deadlines often prioritize efficiency over independent study. Beyersdorf et al. (2025) noted that undergraduates frequently justify GenAI use when subjected to time constraints and high-stakes evaluations. Under these conditions, the threat of delayed graduation may transform AI from a learning aid into a coping mechanism.

H3: Academic Pressure has a positive and significant influence on AI Usage Behavior.

AI Usage Behavior (UB) and Perceived Effectiveness (PEA) (H4)

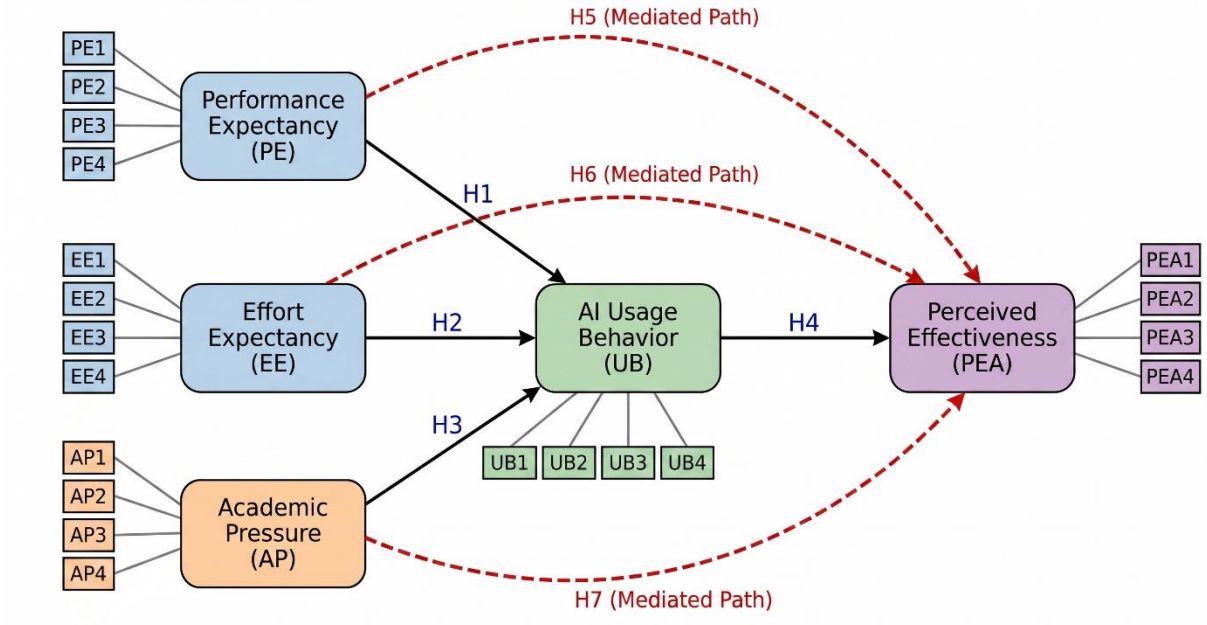
Perceived Effectiveness relates to students' self-assessment of learning support, perceived skill improvement, and confidence regarding test readiness. Usage Behavior functions as the critical bridge: as Reich (2020) emphasized, access to technology alone does not guarantee learning without active engagement. Empirical evidence connects active AI integration with higher perceived competence. In high-pressure academic environments, sustained interaction with AI tools shapes how students evaluate their own proficiency (Nguyen, A. H., 2025; Beyersdorf et al., 2025). As students use GenAI to navigate academic demands (Klitgaard, 2025), their sustained engagement is associated with their subjective perception of academic success.

H4: AI Usage Behavior has a positive and significant influence on Perceived Effectiveness.

In addition to the hypothesized paths, direct paths from Performance Expectancy, Effort Expectancy, and Academic Pressure to Perceived Effectiveness were estimated. These paths were included to determine whether AI Usage Behavior served as a full or partial mediator in the structural model.

The Mediating Role of AI Usage Behavior (H5, H6, H7)

Central to this research framework is the mediating role of AI Usage Behavior. Drawing on mediation analysis principles (Baron & Kenny, 1986), an independent variable may influence a dependent variable through an intervening mechanism. In this study, AI Usage Behavior acts as a behavioral pathway through which students' beliefs about usefulness, perceived ease of use, and academic pressure are translated into perceived learning outcomes. Because the structural model also estimates direct paths from the three antecedents to Perceived Effectiveness, the analysis can determine whether the mediation is full or partial. In a high-stakes certification context, pressure may directly shape students' confidence and perceived readiness, while also encouraging more frequent AI-assisted study.



H5: AI Usage Behavior mediates the relationship between Performance Expectancy and Perceived Effectiveness.

H6: AI Usage Behavior mediates the relationship between Effort Expectancy and Perceived Effectiveness.

H7: AI Usage Behavior mediates the relationship between Academic Pressure and Perceived Effectiveness.

Figure 6

Proposed Extended UTAUT Research Model

3. Methodology

Research Design

This research employs an explanatory sequential mixed-methods research design (Creswell, 2014). The quantitative phase tests the hypothesized structural relationships within the extended UTAUT model. The qualitative phase then follows to explore participants' lived

experiences, particularly their sense of competence, ethical concerns, and possible dependency on AI. This two-phase approach allows the interview findings to explain, contextualize, and nuance the survey results.

Participants and Research Context

The target population consists of junior undergraduate students enrolled in the Department of English Language at HUFLIT, Vietnam. Using purposive sampling, 260 participants were recruited for the quantitative phase. This cohort was selected because juniors face the most immediate exposure to graduation certification deadlines (e.g., TOEIC, VSTEP, MOS) and the associated academic pressure. The sample size of 260 exceeds the minimum requirement calculated using the "10-times rule" commonly applied in PLS-SEM (Hair et al., 2019).

For the qualitative phase, six participants were purposively selected from the survey respondents. Selection criteria focused on maximizing variation in self-reported GenAI use patterns (from highly dependent users to strategic users) and willingness to discuss their learning experiences in depth. All participants provided informed consent, participation was voluntary, and data anonymity was guaranteed throughout the study.

Instrumentation and Data Collection

The quantitative data were collected using a closed-ended questionnaire based on a five-point Likert scale (1 = Strongly Disagree; 5 = Strongly Agree). Core constructs were measured by adapting pre-validated scales to the context of LLM integration. Items for Performance Expectancy and Effort Expectancy were adapted from Venkatesh et al. (2003). Items for Academic Pressure, AI Usage Behavior, and Perceived Effectiveness were synthesized based on Nguyen, A. H. (2025). Before formal deployment, the instrument was pilot-tested with 30 undergraduates to evaluate semantic clarity and internal consistency.

Formal data collection took place over a four-week period using an online survey distributed via Google Forms. Responses with incomplete data or straight-lining patterns were excluded to ensure data quality. Qualitative data were collected through semi-structured interviews lasting approximately 30–45 minutes each, conducted in Vietnamese to allow participants to express their thoughts accurately. All interviews were audio-recorded with explicit permission. The interview protocol was designed to elicit narratives about AI use for specific tasks, self-reflection on technological dependency, and views on the role of lecturers.

Analytical Procedures

Quantitative data underwent screening before analysis using IBM SPSS Statistics and SmartPLS 4.0. Descriptive statistics were generated to outline the demographic profile and baseline AI usage patterns. Partial Least Squares Structural Equation Modeling (PLS-SEM) was then conducted using SmartPLS 4.0. PLS-SEM was selected over Covariance-Based SEM (CB-SEM) for three reasons: its robustness with complex predictive models, its suitability for exploratory frameworks (such as extending UTAUT with Academic Pressure), and its relaxed distributional assumptions (Hair et al., 2019). Common Method Bias (CMB) was assessed using full collinearity Variance Inflation Factors (VIF).

The analysis proceeded in two stages: first, evaluating the measurement model's convergent and discriminant validity; second, testing the structural model's direct and indirect paths. A non-parametric bootstrapping procedure with 5,000 subsamples (two-tailed, 95% bias-corrected confidence intervals) was used to evaluate significance. Direct paths from the three antecedents to Perceived Effectiveness were included to assess mediation type.

For the qualitative phase, Vietnamese interview recordings were transcribed verbatim and translated into English. Transcripts were analyzed using MAXQDA professional software following an inductive thematic analysis approach. Two independent researchers coded the data; initial codes were generated independently, compared, and refined through discussion until inter-coder consensus was reached. Qualitative themes were then integrated with the quantitative results to provide a comprehensive explanation of students' AI adoption behaviors.

4. Results

Demographic Profile of the Respondents

Table 1 outlines the demographic and academic profile of the 260 participants. Females constituted 57.7% of the sample; males accounted for 42.3%. The majority of participants were preparing for multiple certifications simultaneously, with TOEIC (90.8%) and Second Foreign Languages (78.5%) showing the highest prevalence, followed by VSTEP (73.5%). Regarding baseline proficiency, the distribution suggests a sample with moderate to good foundational competence.

Table 41

Demographic and Academic Profile of Respondents

Demographic Variable	Category	Frequency (n)	Percentage (%)
Gender	Male	110	42.3%
	Female	150	57.7%
Target Certification *(Multiple selection permitted)*	English: TOEIC (2 or 4 skills)	236	90.8%
	English: IELTS	164	63.1%
	English: VSTEP	191	73.5%
	Informatics: MOS (Excel/Word/PPT)	125	48.1%
	Second Foreign Language	204	78.5%
Current Proficiency	Very Low	19	7.3%
	Low	20	7.7%
	Average	61	23.5%
	Good	95	36.5%
	Excellent	65	25.0%

Note: Multiple selections were permitted for target certifications.

Usage Habits and Metrics (UHM)

To examine how students use GenAI in their independent study, usage habits and engagement patterns were tabulated. GenAI tools are widely and frequently used among this cohort. ChatGPT is the most popular platform (87.3%), followed closely by Grammarly/Quillbot (86.5%) and Gemini (81.2%). A large share of students reported spending considerable time on AI-assisted academic tasks daily.

Table 42

Primary AI Tools Utilized by Respondents

Tool	Frequency (n)	Percentage (%)
ChatGPT (OpenAI)	227	87.3%
Grammarly / Quillbot	225	86.5%
Gemini (Google)	211	81.2%
Copilot (Microsoft)	162	62.3%
Elsa / Duolingo	162	62.3%

*Multiple selections were permitted.

Descriptive Statistics of the Measurement Items

Descriptive data were examined for central tendency and dispersion. Mean scores ranged from 3.231 to 3.773, indicating moderately to highly positive attitudes toward AI use. All skewness and kurtosis values fell within ±1.0, confirming acceptable univariate normality for PLS-SEM analysis. Full item-level statistics are available upon request.

Table 43

Descriptive Statistics of Measurement Items

Construct	Item	Mean	Std. Deviation	Skewness	Excess Kurtosis
PE	PE1 - PE4	3.438 - 3.473	0.775 - 0.837	-0.204 to 0.210	-0.501 to -0.055
EE	EE1 - EE4	3.658 - 3.704	0.800 - 0.818	-0.288 to -0.072	-0.251 to 0.055
AP	AP1 - AP4	3.488 - 3.546	0.776 - 0.860	-0.283 to -0.206	-0.314 to 0.009
UB	UB1 - UB4	3.723 - 3.773	0.718 - 0.734	-0.279 to -0.126	-0.223 to 0.252
PEA	PEA1 - PEA4	3.231 - 3.269	0.723 - 0.772	-0.088 to 0.148	-0.368 to 0.066

Measurement Model: Reliability and Validity

The measurement model was evaluated for indicator reliability, internal consistency, convergent validity, and discriminant validity. As shown in Table 4, all constructs demonstrated strong reliability, with Composite Reliability (CR) values exceeding the 0.70 threshold. Convergent validity was confirmed through Average Variance Extracted (AVE) values above the 0.50 benchmark.

Table 44

Measurement Model: Indicator Reliability, Internal Consistency, and Convergent Validity

Construct	Items	Outer Loadings	Cronbach's Alpha	Composite Reliability (CR)	Average Variance Extracted (AVE)
Academic Pressure (AP)	AP1	0.872	0.894	0.926	0.759
	AP2	0.873			
	AP3	0.882			
	AP4	0.858			
Effort Expectancy (EE)	EE1	0.883	0.905	0.934	0.779
	EE2	0.864			
	EE3	0.891			
	EE4	0.892			
Performance Expectancy (PE)	PE1	0.883	0.904	0.933	0.776
	PE2	0.886			
	PE3	0.886			
	PE4	0.869			
Perceived Effectiveness (PEA)	PEA1	0.839	0.869	0.911	0.718
	PEA2	0.849			
	PEA3	0.852			
	PEA4	0.850			
Use Behavior (UB)	UB1	0.824	0.868	0.910	0.717
	UB2	0.874			
	UB3	0.865			
	UB4	0.823			

Discriminant validity was assessed using the Heterotrait-Monotrait (HTMT) ratio of correlations (Henseler et al., 2015). As shown in Table 5, all HTMT values were below the 0.90 threshold (maximum value: 0.871 between UB and PEA), confirming that each construct captures a distinct phenomenon.

Table 45

Discriminant Validity (HTMT Ratio)

Construct	AP	EE	PE	PEA	UB
AP					
EE	0.179				
PE	0.029	0.057			
PEA	0.499	0.528	0.345		
UB	0.576	0.627	0.371	0.871	

Structural Model and Hypotheses Testing

A non-parametric bootstrapping approach with 5,000 subsamples was executed in SmartPLS 4.0. As shown in Table 6, Performance Expectancy (β = .307, p < .001), Effort Expectancy (β = .470, p < .001), and Academic Pressure (β = .431, p < .001) all had significant positive effects on AI Usage Behavior, supporting Hypotheses 1, 2, and 3. The path from Usage Behavior to Perceived Effectiveness was also strong and significant (β = .603, p < .001), supporting Hypothesis 4.

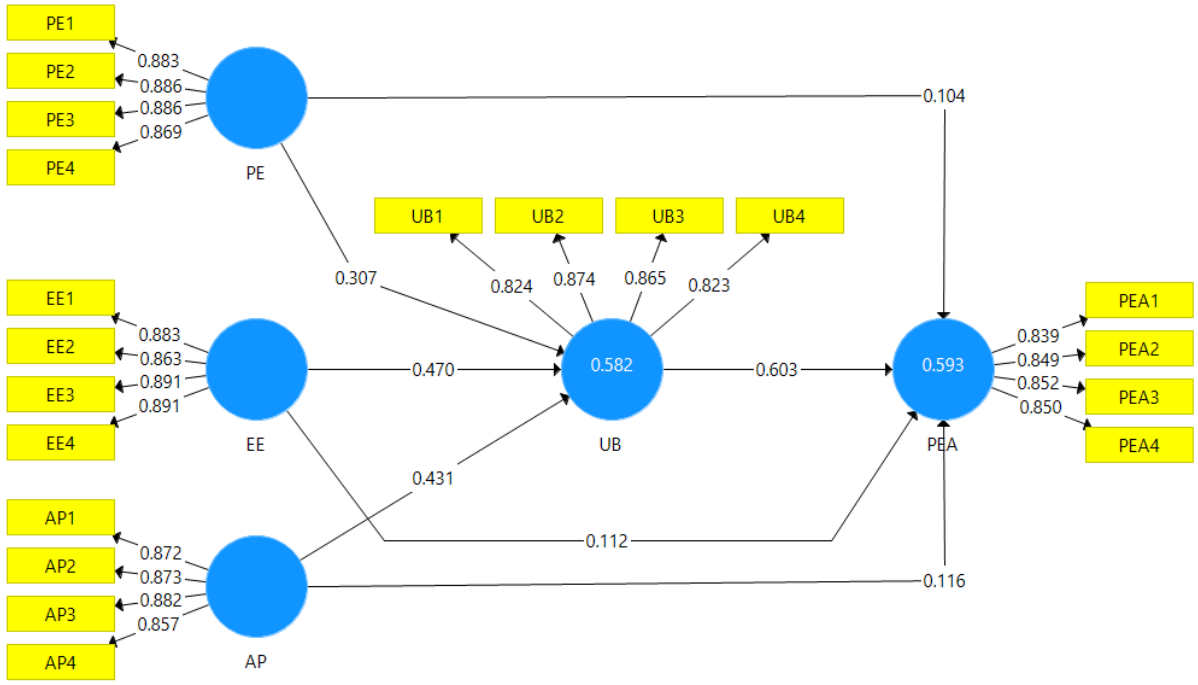


Table 46

Structural Model Assessment (Direct Effects)

Hypothesis	Structural Path	*β*	*t*-Statistic	*p*-Value	95% CI (BC)	Decision
H1	PE -> UB	.307	7.822	< .001	[.225, .381]	Supported
H2	EE -> UB	.470	13.265	< .001	[.397, .536]	Supported
H3	AP -> UB	.431	11.148	< .001	[.350, .504]	Supported
H4	UB -> PEA	.603	9.754	< .001	[.480, .722]	Supported
-	PE -> PEA	.104	2.284	< 0.05	[.012, .191]	Supported
-	EE -> PEA	.112	2.191	< 0.05	[.009, .211]	Supported
-	AP -> PEA	.116	2.256	< 0.05	[.014, .215]	Supported

Figure 7

PLS-SEM Structural Model and Hypotheses Testing

The specific indirect effects were then examined to clarify the mediating role of AI Usage Behavior (Table 7). AI Usage Behavior significantly mediated the relationship between Performance Expectancy and Perceived Effectiveness (H5: $\beta = .185$, $t = 6.267$, $p < .001$). The mediating pathways for Effort Expectancy (H6: $\beta = .283$, $t = 7.419$, $p < .001$) and Academic Pressure (H7: $\beta = .260$, $t = 7.516$, $p < .001$) were also significant. Because the corresponding direct paths to Perceived Effectiveness were also significant, the results indicate partial rather than full mediation.

Table 47

Structural Model Assessment (Direct Effects and Confidence Partial mediation)

Hypothesis	Mediating Pathway	β	*t*-Statistic	*p*-Value	95% CI (BC)	Decision
H5	PE -> UB -> PEA	.185	6.267	< .001	[.131, .248]	Patrial
H6	EE -> UB -> PEA	.284	7.419	< .001	[.211, .362]	Patrial
H7	AP -> UB -> PEA	.260	7.516	< .001	[.197, .334]	Patrial

Explanatory Power (R^2) and Effect Size (f^2)

The R^2 values for the two endogenous constructs-AI Usage Behavior and Perceived Effectiveness - were .582 and .593, respectively. The exogenous variables explain 58.2% of the variance in Usage Behavior and 59.3% of the variance in Perceived Effectiveness. Both values exceed the 0.50 threshold, indicating moderate to strong explanatory power (Hair et al., 2019).

Effect size (f^2) analysis revealed that Effort Expectancy ($f^2 = .514$) and Academic Pressure ($f^2 = .433$) exert large effects on AI Usage Behavior. Performance Expectancy demonstrated a moderate effect ($f^2 = .225$). AI Usage Behavior exhibited a large effect on Perceived Effectiveness ($f^2 = .373$). Together, these findings confirm that AI Usage Behavior serves as a significant mediating mechanism through which PE, EE, and AP are translated into Perceived Effectiveness.

Model Fit

The overall goodness-of-fit was evaluated using the Standardized Root Mean Square Residual (SRMR). The estimated SRMR value is 0.046, which is below the conservative threshold of 0.08 (Hu & Bentler, 1999), confirming an excellent fit between the theoretical model and the empirical data.

Out-of-Sample Predictive Power (PLSpredict)

The PLSpredict procedure with 10 folds and 10 repetitions was used to assess out-of-sample predictive capability (Shmueli et al., 2019). All Q^2 values for the endogenous constructs were strictly greater than zero (ranging from 0.267 to 0.421), confirming that the PLS path model outperforms the naïve benchmark. Furthermore, the Root Mean Square Error (RMSE) values from the PLS-SEM model were consistently lower than those from the naïve linear regression model (LM) across all indicators. This confirms that the proposed structural model has high predictive power.

Qualitative Research Findings: In-depth Interview Analysis

Semi-structured interviews with six HUFLIT students were conducted to provide interpretive depth to the quantitative findings. The thematic analysis aimed to clarify the psychological motivations, usage strategies, perceived learning outcomes, and ethical concerns associated with GenAI use for certification preparation. Five major themes emerged: (1) academic pressure as a coercive driver, (2) the distinction between learning scaffolding and cognitive offloading, (3) a possible false sense of competence, (4) information control and ethical boundaries, and (5) the continuing importance of faculty guidance.

Theme 1: Academic Pressure as a Coercive Driver

The interview findings reinforced the quantitative result for Hypothesis 3. Participants consistently described graduation requirements as a source of urgency that pushed them toward AI-supported study. Certifications such as TOEIC, VSTEP, and MOS were perceived not merely as academic milestones but as institutional barriers affecting graduation timelines. Interviewee 1 stated that because graduation was approaching, they would naturally use any AI tool that could help them graduate on time. This response suggests that AI adoption is often motivated by the perceived need to cope with unavoidable academic demands rather than by curiosity alone.

At the same time, students did not necessarily view AI as a complete replacement for learning. Interviewee 4 explained that AI helped reduce pressure to some extent but emphasized that it should remain a support tool. However, under severe time constraints, AI use shifted from learning scaffold to task-completion shortcut. Interviewee 1's admission of copy-pasting AI outputs for class assignments illustrates how systemic pressure may encourage efficiency-oriented behaviors that do not contribute to sustainable learning. The qualitative evidence thus suggests that academic pressure operates as a coercive force, transforming AI from an optional study aid into a survival mechanism.

Theme 2: Learning Scaffolding vs. Cognitive Offloading

The interviews revealed a clear behavioral distinction between students who used AI actively as a learning scaffold and those who relied on it passively for cognitive offloading. In the first pattern, AI served as a tool for organizing, practicing, and deepening learning. Interviewee 2 used AI to generate customized practice exercises (multiple-choice and Yes/No questions) for independent study outside the classroom. Interviewee 4 used AI to request conceptual outlines rather than complete essays. These practices show that when students control the learning process and use AI selectively, technology can support autonomy and structured preparation.

However, some participants expressed concern that excessive reliance on AI could weaken independent reasoning. Interviewee 5 stated that using AI too much could lead to dependency and negatively affect critical thinking. This concern reflects cognitive offloading-transferring mental tasks such as idea generation, grammar correction, and translation to AI systems. Although AI may increase speed and convenience, it can also reduce opportunities for deep engagement with learning material. The educational value of AI therefore depends less on whether students use it and more on how they use it.

Theme 3: A Possible False Sense of Competence

One of the most significant qualitative findings was a possible false sense of competence. Participants frequently described a gap between feeling capable with AI support and feeling uncertain when required to perform independently. This theme helps explain the

quantitative finding that AI Usage Behavior strongly predicted Perceived Effectiveness. While students may perceive AI-supported learning as effective, the interviews suggest that this effectiveness can be temporary and technologically mediated rather than evidence of independent mastery.

Interviewee 3 warned that AI may create the feeling that one's ability is higher than it actually is. When students allow AI to solve problems or generate answers, they may not internalize the knowledge needed for real exam conditions without AI. Interviewee 2 acknowledged that forgetting answers after AI-supported practice is natural, because AI only responds to the user's input. This highlights the temporary nature of AI-mediated performance: students may complete tasks successfully with AI assistance yet struggle to retain or reproduce the knowledge independently.

Theme 4: Information Control and Ethical Boundaries

Despite frequent AI use, participants did not demonstrate blind trust in AI-generated responses. Many showed algorithmic skepticism, particularly regarding inaccurate or fabricated information. Interviewee 6 emphasized that AI-generated information could not always be considered reliable and needed to be verified through textbooks or Google searches.

Students also articulated their own ethical boundaries. Interviewee 4 distinguished between asking AI to suggest ideas (acceptable) and having AI write an entire essay (unacceptable). Interviewee 3 raised concerns about inequality, noting a possible skill gap between students who use AI effectively and those who do not. This observation suggests that AI literacy is becoming an important academic resource, and unequal access to effective usage strategies may create new disparities. Overall, students were concerned not only with convenience but also with reliability, fairness, and appropriate academic conduct.

Theme 5: The Enduring Role of Faculty

Although students acknowledged AI's usefulness, they placed stronger trust in human teachers. Interviewee 5 stated that students trust faculty the most because teachers have practical experience. Interviewee 1 similarly prioritized lecturers' pedagogical expertise over algorithmically generated explanations. These responses suggest that AI has not displaced the authority of human instruction; students view AI as a supplementary tool whose value must be guided and evaluated by educators.

Participants also expressed a need for institutional support and formal AI literacy training. Interviewee 2 suggested that HUFLIT should organize targeted training sessions to help students use AI more appropriately. Such training could help students move from passive consumption of AI-generated answers toward more critical and reflective usage. This finding carries important pedagogical implications: rather than prohibiting AI outright, universities should provide structured guidance on ethical, effective, and learning-oriented AI practices. Faculty remain central not only as sources of academic knowledge but as mediators who help students develop the evaluative judgment needed to use AI responsibly.

5. Discussion

The findings of this study provide a contextualized understanding of how HUFLIT undergraduates adopt GenAI when preparing for graduation-related certifications. Overall, the results validate the extended UTAUT model: students' AI usage is driven by both traditional technological factors - Effort Expectancy and Performance Expectancy - and by Academic Pressure as a contextual factor. While Effort Expectancy ($\beta = .470$) exerted the strongest influence, followed by Academic Pressure ($\beta = .431$) and Performance Expectancy ($\beta = .307$),

the emergence of Academic Pressure as a key antecedent is particularly meaningful. HUFLIT students must obtain certifications such as TOEIC, VSTEP, MOS, and second foreign language qualifications before graduation. In such a context, AI is perceived not merely as an optional innovation but as a practical response to institutional pressure, time constraints, and the fear of delayed graduation.

The support for Hypotheses 1 and 2 confirms that Performance Expectancy and Effort Expectancy significantly influence AI Usage Behavior, consistent with the original UTAUT framework (Venkatesh et al., 2003). The strong effect of Effort Expectancy highlights that the conversational, frictionless interfaces of GenAI tools are a major adoption motivator. This aligns with Parveen et al. (2024), who reported PE as a key driver of ChatGPT adoption, and with Strzelecki (2024), who identified PE and EE as the strongest predictors of ChatGPT use among university students.

The significant effect of Academic Pressure on AI Usage Behavior (Hypothesis 3) confirms the value of extending UTAUT with a context-specific antecedent. While the original UTAUT emphasizes technological acceptance, this study shows that in high-stakes academic settings, technology adoption is also reinforced by coercive educational conditions. This aligns with Agnew's (1992) General Strain Theory, which suggests that individuals under pressure adopt coping strategies to manage stress. In the HUFLIT context, graduation certificates function as institutional gatekeeping mechanisms, and students may turn to AI not only for learning efficiency but also to reduce anxiety and avoid delayed graduation. This finding is consistent with Nguyen, A. H. (2025), who identified academic pressure as a factor associated with AI use and academic integrity concerns. The qualitative evidence further explains this relationship: students' AI usage is embedded in a survival-oriented academic logic, where the immediate goal is often to pass requirements rather than to develop stable, long-term competence.

AI Usage Behavior had a strong positive effect on Perceived Effectiveness (Hypothesis 4). Students who used AI more frequently reported higher confidence and stronger perceptions of learning effectiveness. At first glance, this supports the perceived value of AI-assisted learning. However, when integrated with the interview data, a more complex picture emerges. The qualitative evidence suggests that perceived effectiveness may sometimes reflect a false sense of competence: participants reported that AI made them feel capable during practice, but they also recognized that this confidence might not hold in real exam conditions without AI. This aligns with Bearman and Ajjawi (2023), who warned that excessive reliance on AI might foster superficial fluency without deep cognitive assimilation.

Interestingly, AI Usage Behavior showed higher mean scores than Perceived Effectiveness. This suggests that frequent AI use does not automatically translate into strong perceived learning gains. This pattern is consistent with the interview findings, where some students used AI for speed and task completion while remaining uncertain about their independent mastery.

The supported mediation effects (Hypotheses 5, 6, and 7) further clarify these mechanisms. AI Usage Behavior significantly mediated the relationships between all three antecedents and Perceived Effectiveness. For Academic Pressure specifically, this means that pressure may shape students' Perceived Effectiveness both directly and indirectly. Indirectly, it encourages more frequent AI use, which then strengthens students' perceived effectiveness. This finding is central to the study's theoretical contribution: in high-pressure educational contexts, perceived learning effectiveness may be constructed through repeated AI-assisted performance rather than through independently verified mastery. The relationship between AI

use and learning effectiveness should therefore be interpreted with caution, particularly when effectiveness is measured through subjective self-perception.

The qualitative themes also reveal a clear distinction between productive and problematic forms of AI use. Some students used AI as a learning scaffold-generating mock tests, requesting outlines, clarifying grammar points, or practicing independently. These practices are consistent with the view that GenAI can support autonomous learning and personalized feedback (Nguyen, N. T., 2025; Almogren et al., 2024). However, other students expressed concern that excessive AI use could weaken critical thinking and create dependency. This distinction echoes Bearman and Ajjawi's (2023) argument that higher education should teach students how to work critically with AI systems rather than simply prohibiting the tools. It also aligns with Stojanov et al.'s (2024) finding that heavy ChatGPT reliance is associated with weaker independent study habits.

Ethical awareness emerged as another important finding. Students were not uncritical of AI outputs; several reported verifying AI-generated information through textbooks, Google searches, or repeated prompting. They also drew ethical boundaries between acceptable and unacceptable AI use. This suggests that HUFLIT students possess an emerging sense of AI-related academic ethics, though this awareness remains informal. Without institutional guidance, students may develop inconsistent standards of appropriate use. Perkins (2023) similarly argued that institutions need explicit policies addressing AI-assisted work.

Finally, the findings highlight the enduring role of faculty. Despite frequent AI use, students placed greater trust in lecturers' practical experience, pedagogical judgment, and ability to contextualize knowledge. This challenges the assumption that AI will replace human instruction and suggests that faculty roles should be redefined rather than diminished. Lecturers are needed to help students evaluate AI outputs, design process-oriented assessments, and distinguish between perceived learning gains and AI-supported task completion.

In summary, GenAI adoption among HUFLIT students is best understood as pressure-driven, context-sensitive, and pedagogically ambivalent. The extended UTAUT model accurately explains AI use in this setting: while technology features (Effort Expectancy and Performance Expectancy) strongly drive usage, institutional and psychological pressures surrounding graduation certification are equally important. While AI use is associated with students' confidence and perceived readiness, the subjective nature of Perceived Effectiveness demands caution due to the risks of dependency, ethical ambiguity, and a false sense of competence.

7. Conclusion

This study examined how GenAI adoption works among undergraduates preparing for mandatory graduation certificates at HUFLIT. By extending the UTAUT framework with Academic Pressure, the study developed a more context-sensitive model for explaining AI Usage Behavior in a high-stakes educational environment. The integration of quantitative and qualitative findings demonstrates that students' AI adoption is driven by perceived ease of use and usefulness, and is also strongly shaped by systemic academic pressure-particularly the urgency to complete requirements such as TOEIC, VSTEP, MOS, and second foreign language certifications. Effort Expectancy was the strongest direct predictor of AI Usage Behavior, followed by Academic Pressure and Performance Expectancy.

The findings reveal a pedagogical paradox. On the one hand, students perceive AI as effective because it saves time, generates practice materials, clarifies difficult content, and increases confidence. On the other hand, the qualitative interviews indicate that this perceived

effectiveness may sometimes reflect a false sense of competence: students feel capable while using AI but may struggle to internalize the knowledge required for independent performance. AI-assisted learning can therefore function both as a productive scaffold and as a mechanism of cognitive dependency, depending on how students use it. The study contributes theoretically by validating Academic Pressure as a meaningful extension of UTAUT and practically by highlighting the need for universities to guide students toward responsible, reflective AI use.

Practical Implications

A purely prohibitive stance toward GenAI is unlikely to be effective, especially when students already rely on these tools daily. Instead, universities should develop a contextualized "AI-Integrated Academic Integrity Framework." The following strategies are recommended:

1. **Guide AI-assisted Revision:** Provide clear directives on using AI for exam preparation (e.g., generating mock questions, explaining grammar) without substituting independent critical thinking.

2. **Implement Process Documentation:** Require students to maintain and submit prompt logs or process journals when AI is utilized for major assignments, shifting the focus from the final product to the learning journey.

3. **Formalize AI Literacy:** Integrate specific AI literacy modules into foundational academic skills courses to build critical evaluation skills early on.

4. **Redesign Assessment Methods**: Gradually transition toward process-oriented, reflective, and dialogic forms of evaluation, such as oral defenses, in-class tasks, and reflective writing, which require students to explain their thinking process and show understanding without relying only on AI-generated outputs.

5. **Conduct Faculty Training:** Provide targeted professional development for educators focused on AI verification, hallucination detection, ethical citation practices, and strategies for designing AI-resilient curricula.

Limitations and Directions for Further Studies

This study has several limitations. First, it was conducted within a single institution (HUFLIT), and findings may not generalize to other universities, disciplines, or educational systems. Future studies should expand the sample to include students from different Vietnamese institutions-public and private-and from non-language majors to compare how academic pressure and AI usage vary across contexts.

Second, the cross-sectional design captures perceptions and behaviors at one point in time. It cannot determine the long-term effects of AI usage on learning retention, cognitive development, or actual exam performance. Future research should adopt longitudinal designs to examine how frequent AI use relates to students' independent competence over time.

Third, Perceived Effectiveness relied on self-reported perceptions, which may be influenced by social desirability, overconfidence, or the false sense of competence identified in the qualitative findings. Future studies should incorporate objective performance-based measures-pre-tests and post-tests, official certification scores, writing assessments, speaking tasks, or delayed retention tests-to compare perceived effectiveness with actual learning outcomes.

Fourth, the qualitative phase included only six interviewees. Future research should conduct larger-scale qualitative investigations or focus group discussions to explore more

diverse student experiences. Comparing different AI user profiles-highly dependent users, strategic users, skeptical users, and low-frequency users-would help clarify how different engagement patterns affect learning quality.

Finally, future research should investigate the role of lecturers and institutional policy more directly. Studies could examine lecturers' perceptions of AI-assisted certification preparation, their readiness to teach AI literacy, and their strategies for designing AI-resilient assessments. Experimental studies could test the effectiveness of structured AI literacy interventions, comparing students who receive formal training with those who use AI without guidance.

Acknowledgments

We express our sincere gratitude to the Board of Presidents and the Faculty of Foreign Languages at HUFLIT for their support. We are especially thankful to our supervisor, Dr. Tran Quang Bao Phuc, for his valuable guidance, feedback, and encouragement throughout this study. We also deeply appreciate the HUFLIT English Language students who participated in the survey and interviews. Their time and honest responses made this research possible.

Bionote

Quốc Bảo Mai is an undergraduate student in the Department of English Language, Faculty of Foreign Languages at Ho Chi Minh City University of Foreign Languages - Information Technology (HUFLIT), Vietnam. His research interests encompass educational technology, second language acquisition, and the integration of Generative AI in higher education.

Thị Cẩm Vân Nguyễn is an undergraduate student majoring in English Language at HUFLIT. Her academic pursuits focus on applied linguistics, digital pedagogy, and the psychological impacts of technology-enhanced learning environments on ESL students.

Đình Bảo Hân Nguyễn is an undergraduate student at the Faculty of Foreign Languages, HUFLIT. Her research endeavors primarily revolve around modern pedagogical strategies, technology-enhanced language learning, and the ethical implications of artificial intelligence in academic assessments.

Nguyễn Nhựt Tuyết Hồ is an undergraduate student pursuing a degree in English Language at HUFLIT. She is deeply interested in the intersection of artificial intelligence and language education, specifically exploring behavioral adoption and autonomous learning methodologies among university cohorts.

#176 EQUITY, INCLUSION, AND ACCESS IN HIGHER EDUCATION: CHALLENGES FACED BY STUDENTS FROM DIVERSE SOCIOECONOMIC BACKGROUNDS

Trang Nguyen [1], Vy Nguyen[2]

Abstract

Equity, inclusion and access are fundamental pillars in education, particularly within tertiary education settings, hosting students from diverse socioeconomic backgrounds. his study examines the systemic and classroom-level challenges related to these principles at two public universities in Vietnam: the University of Social Sciences and Humanities (USSH) and Ho Chi Minh City University of Technology (HCMUT). Employing a convergent mixed-methods design, the study utilized an online survey with 100 undergraduate students (50 from USSH and 50 from HCMUT) and semi-structured focus group interviews with 10 participants to investigate students' access to academic resources, perceptions of equity in learning opportunities, and experiences of classroom inclusion. Key findings reveal significant disparities: students from lower-income backgrounds reported financial pressure from hidden financial costs (textbooks, devices, internet, software), digital access barriers, reduced study time due to part-time work, feelings of classroom alienation, and perceptions of insufficient institutional support. These challenges shaped students' everyday learning experiences post-enrollment. The paper proposes evidence-based pedagogical strategies and institutional policy recommendations to promote more equitable and inclusive classrooms. The study also acknowledges its limitations regarding sample representativeness and offers suggestions for future research.

***Keywords*:** equity, inclusion, access, socioeconomic background, higher education

1. Introduction

Higher education is a critical pathway for academic and professional development. However, students do not always experience university life under the same conditions. While pedagogical research often focuses on teaching methods and learning outcomes, less attention has been paid to how socioeconomic backgrounds influence students' ability to participate fully in educational opportunities after enrollment. For many students, the costs associated with learning extend beyond tuition fees and include textbooks, technological devices, internet access, and extracurricular activities. Particularly in Vietnam, where university students come from diverse socioeconomic backgrounds, access to equitable learning experiences sometimes depends on circumstances beyond their control. This difference, however minor, may lead to classroom exclusion rather than opportunity, where a student's academic success may be determined as much by their financial situation as by their individual efforts to acquire knowledge. Hence, the concepts of equity, inclusion, and access are essential in modern

[1]*Nguyen Thi Thao Trang, Foreign Language Center – HCMC University of Technology, VNU-HCM, Ho Chi Minh City, Vietnam Vietnam. Email:trangnguyen@hcmut.edu.vn*

[2]*Nguyen Thi Tuong Vy, English Language Teaching, English Linguistics and Literature, University of Social Sciences and Humanities, VNU-HCM, Ho Chi Minh City, Vietnam*

tertiary education. Although these concepts are widely recognized in educational theory, their practical application is often complicated by the socioeconomic realities of different student groups. For this reason, understanding how socioeconomic backgrounds shape students' access to resources, their sense of inclusion, and their experience of equity within the learning environment has become a crucial concern in Vietnam's higher education system.

This study contributes to the body of existing research by redirecting the focus from the general academic outcomes or the comprehensive access to higher education to the daily lived experiences of socioeconomic inequality that students encounter after enrolling. It investigates not just whether students join university, but how they experience equity, access, and inclusion during their university education. The research was conducted to address the following question:

In which way do Ho Chi Minh City University of Technology (HCMUT) and University of Social Sciences and Humanities (USSH) students perceive the challenges regarding equity, access and inclusion based on their diverse socioeconomic backgrounds?

2. Literature Review

2.1. Equity, Inclusion, and Access in education

Modern education has to be fundamentally restructured in light of the rapidly changing student demographics brought about by social, political, and cultural shifts. In 21st-century education, to avoid classroom alienation and systemic inequality, the core values of equity, access, and inclusion are no longer optional or theoretical ideas; they are essential for constructing equitable, sustainable, and forward-thinking learning environments (Panigrahi, 2025). To provide a theoretical foundation for the survey instruments used in this study, this section reviews literature surrounding three main constructs: equity, access, and classroom inclusion in education.

According to the Strength through Diversity Project (OECD, 2023), equity in education systems means that all students can achieve their educational potential, regardless of their gender, ethnic origin, Indigenous background, immigrant status, sexual orientation and gender identity, special education needs, or giftedness (Cerna et al., 2021; OECD, 2017). To understand this concept, it is essential to distinguish between equality and equity. Panigrahi (2025) and Iheduru-Anderson et al. (2025) clarified that equity is different from equality in that, whereas equality just means the same treatment for all individuals, equity acknowledges the existence of systemic imbalances and demands interventions to address them. Yasinzai and Ahad (2025) further noted that achieving fairness in education necessitated acknowledging and resolving historical and systemic disadvantages.

Iheduru-Anderson et al. (2025) defined access as the elimination of structural, economical, physical, technical, systemic, curricular, language, and cultural barriers to full participation in educational and professional settings via appropriate accommodations. Although worldwide higher education enrollment has increased, access remains significantly uneven across different regions and social and economic classes (Yasinzai & Ahad, 2025). With a growing dependency on online education platforms, Panigrahi (2025) pointed out that it is critical to ensure educational materials and resources are accessible to students with learning disabilities and those living in distant areas. To him, accessibility also applies to language, pedagogy, and evaluations, ensuring that students may participate meaningfully regardless of where they begin or their personal background.

UNESCO (2009) characterized inclusive education as "an on-going process aimed at offering quality education for all while respecting diversity and the different needs and abilities, characteristics and learning expectations of the students and communities, eliminating all forms of discrimination". The goal for it is to address all students' needs, which extends beyond school attendance and achievement, while simultaneously improving their well-being and participation (Cerna et al., 2021), so that diverse individuals can feel valued, welcomed, respected, and able to contribute fully within an environment (Panigrahi, 2025).

Table 1

Defining Equity, Access, and Inclusion

Terms	Definition
Equity	Fairness in treatment, access, and outcomes by addressing structural and systemic barriers.
Access	Removing structural, cultural, institutional, and systemic barriers that limit full participation or advancement.
Inclusion	Creating environments where all individuals feel welcomed, valued, respected, and able to participate and contribute fully.

**Note.* Adapted from Iheduru-Anderson et al.(2025)

2.2. Socioeconomic backgrounds and inequality in higher education

These theoretical distinctions regarding the three concepts are crucial, as socioeconomic backgrounds play an essential role in determining learning opportunities within higher education. As stated by Tomaszewski et al. (2022), people from socioeconomically deprived backgrounds frequently have lower academic performance than those from more socio-economically advantaged backgrounds; this disparity can be linked to their fundamental differences in learning experiences.

The claim was also further supported by previous studies from Sabic-El-Rayess (2012, 2014 & 2020); Sabic-El-Rayess & Mansur (2016), Sabic-El-Rayess & Seeman (2017), Sabic-El-Rayess & Otgonlkhagva (2012), Sabic-El-Rayess, Mansur, Batkhuyag & Otgonlkhagva (2019), Moratti and Sabic-El-Rayess (2009), who demonstrated that elite mechanisms and interests often prevail over the needs of the disadvantaged across social, economic, and educational hierarchies globally. Unfortunately, universities and colleges only help reinforce this existing socioeconomic strata further (Sabic-El-Rayess & Mansur, 2016), unless there is a strong political determination to disrupt the status quo and increase opportunities for the poor (Fadhil & Sabic-El-Rayess, 2021). As a result, students from disadvantaged backgrounds, such as those with disabilities, those living in poverty, ethnic and linguistic minorities, and rural communities, continue to encounter systemic challenges that impede their ability to study, contribute, and achieve (Panigrahi, 2025).

According to Tomaszewski et al. (2022), there are seven different barriers to accessing university, such as low self-efficacy, received youth allowance, low-SES school, school life, no plan for university, parents not wanting university and low PISA (Programme for International Student Assessment) score. The findings in their research showed that individuals

from lower socioeconomic origins are far more likely than their more advantaged counterparts to encounter these numerous challenges to attending college.

Applied to our study, these findings suggest that simply providing the same course requirements to every student is insufficient. When learners lack access to standard requirements for higher education learning such as the financial means to purchase coursebooks or afford tuition fees, the "equal" treatment often masks an underlying inequality.

2.3. The Vietnamese higher education context

Many studies have been undertaken on inequities in educational access in Vietnam. Nguyen (2004) observed that while countrywide school enrollment expanded across all educational levels, particularly in higher education, the financial burden of private schooling heavily impacted low-income households. This economic strain further widened the disparity between affluent and disadvantaged students regarding both educational opportunity and quality. Another study by Thach (2020) indicated that children from low-income families' access to higher education lower than their peers. According to Vu (2012), severe inequalities in school access still exist; hence, significant gaps continue to separate rural and urban students, ethnic minorities and the majority population, and wealthy households from low-income ones.

To operationalize these concepts for the current study, the literature is synthesized around three main constructs that directly inform our survey and interview instruments:

1. Access to resources: focused on structural and material barriers (Iheduru-Anderson et al., 2025), this construct measures students' ability to afford hidden costs such as laptops, internet, textbooks and proprietary software.

2. Perception of equity: rooted in the acknowledgment of systemic imbalances (Panigrahi, 2025), this construct evaluates the perceived fairness of university support systems and rigid academic policies.

3. Perception of inclusion: based on UNESCO's (2009) framework, this construct assesses students' psychological sense of belonging and their comfort in participating without fear of socioeconomic alienation.

2.4. Research gap

While existing literature highlights the challenges low-socioeconomic status imposes on higher education students across the globe, there remains a notable lack of contemporary research specifically situated within the Vietnamese higher education context. This study seeks to address this and bridges three specific gaps. First, a contextual gap exists as most prior studies focus on enrollment or broad academic outcomes rather than the everyday classroom experiences in Vietnamese public universities. Second, a conceptual gap remains regarding the intersection of the three pillars of modern education: equity, access, and inclusion; few studies examine how they influence one another simultaneously. Third, there is an empirical gap in qualitative exploration into students' lived experiences of hidden academic costs and classroom alienation post-enrollment. This study seeks to close these gaps by exploring how these three pillars influence one another, and how they appear differently for students' daily experiences from diverse socioeconomic backgrounds at two Vietnamese public universities (USSH and HCMUT). By connecting specific barriers that hinder equitable, accessible, and inclusive learning experiences, this research proposes pedagogical strategies and institutional policy recommendations for a just and sustainable educational framework that ensures all learners can achieve their full academic potential, regardless of their socioeconomic backgrounds.

3. Methodology

3.1. Research site

The research was conducted at two member institutions of Vietnam National University Ho Chi Minh City (VNU-HCM): the University of Social Sciences and Humanities (USSH) and Ho Chi Minh City University of Technology (HCMUT). USSH is located in the VNU-HCM Urban Area, Linh Trung Ward, Thu Duc City, Ho Chi Minh City, while HCMUT's second campus is located in Dong Hoa Ward, Ho Chi Minh City. As two major public universities in southern Vietnam, these institutions attract students from diverse socioeconomic and educational backgrounds across the country. USSH and HCMUT were treated as two sites for exploring shared student experiences rather than as a comparative study; no institutional differences were systematically examined.

3.2. Participants

The participants were undergraduate students from the Faculty of English Linguistics and Literature (EF) and Engineering Faculty. A total of 100 students agreed to take part in the study, with 50 students from USSH and 50 students from HCMUT. The convenience sampling approach was implemented to select the sample. This approach was chosen due to the researchers' existing connections within the faculties, which is efficient and provides timely data collection. By targeting students based on their availability and willingness to participate, the researchers were able to gather a diverse range of student perspectives regarding academic challenges.

However, this non-probability sampling limits the full representativeness of the findings, meaning the findings cannot be generalized to all students at these universities or Vietnamese higher education broadly, as participation was voluntary and dependent on accessibility. Participant variation included multiple academic years (freshmen to seniors), gender, major, and self-reported family financial status (low income, lower-middle income, middle income, upper-middle income, high income). Detailed data on rural/urban background, scholarship status, and living arrangements (with family or renting) were also not systematically collected; future studies should include these as socioeconomic barriers may differ across conditions.

3.3. Study design

This study employed a convergent mixed-methods design (Creswell & Plano Clark, 2018). Quantitative and qualitative data were collected concurrently during the same period to provide a comprehensive understanding: the survey (quantitative data) captured broad patterns of perceptions, while follow-up focus group interviews (qualitative data) provided deeper explanations of students' lived experiences. The two strands were integrated during interpretation to complement each other.

3.4. Data collection procedures

For quantitative data, an online questionnaire was distributed via email to 100 participants. The items from the survey were directly developed based on the conceptual definitions outlined in the literature review (Table 1). It consisted of 18 Likert-scale items (1 = Strongly Disagree to 5 = Strongly Agree) and 3 open-ended questions, covering five key sections aligned with the three core constructs:

1. Access to resources: Items derived from structural/material barriers in literature included affordability of textbooks, devices, internet, software, and extracurricular costs.

2. Perception of equity: Items derived from fairness and unequal resources focused on fairness of assessments, influence of external resources, and university support.

3. Perception of classroom inclusion: Items derived from belonging and participation evaluated the sense of belonging, discomfort sharing experiences, and social alienation.

For qualitative data, semi-structured focus group interviews (10 questions) with 10 participants served as follow-up to explore hidden costs, classroom exclusion, policy flexibility, and institutional support in depth. Interviews were conducted in familiar classroom settings, audio-recorded with consent, and supplemented with observation notes.

3.5. Reliability and validity

A pilot test of the questionnaire was conducted with 15 students from similar backgrounds to assess clarity, face validity, and reliability. Internal consistency reliability was evaluated using Cronbach's alpha for each subscale: access to resources: $\alpha = 0.82$; perception of equity: $\alpha = 0.79$; perception of classroom inclusion: $\alpha = 0.85$. All coefficients exceeded the acceptable threshold of 0.70 recommended for exploratory research in social sciences (Hair et al., 2019), indicating internal consistency. Content validity was further supported through instrument alignment with established definitions and consultation from higher education faculty members.

Regarding the qualitative data, transcript coding was independently conducted and subsequently cross-checked by two researchers to resolve discrepancies and establish consensus, ensuring trustworthiness.

3.6. Data processing procedures

An online questionnaire was distributed via email. Raw data from the questionnaires were processed using the Statistical Package for the Social Sciences (SPSS). The results were extracted and then analyzed using frequency tables and bar charts. Qualitative data from the focus group interviews were transcribed verbatim and analyzed using thematic analysis following Braun and Clarke's (2006) six-phase approach. An inductive coding process was employed, while also being informed deductively by the three core constructs (access to resources, perceptions of equity, and classroom inclusion) from the literature and survey. Initial codes were generated, collated into potential themes, reviewed, defined, and named. To enhance trustworthiness, two researchers independently coded a subset of transcripts, and discrepancies were resolved through discussion until consensus was reached. Member checking was conducted with two participants to verify the accuracy of interpreted themes.

3.7. Ethical issues

Since the research involves audio recordings, semi-structured focus group interviews, and questionnaires, we ensure that informed consent is obtained from all participants prior to their involvement. For the questionnaires, we sent an invitation via email that included all the necessary details about the study, including its benefits and any possible risks. Before the participants filled out the form, they had to sign a consent statement, which confirmed they were aware of the points and allowed the research to use their data. Regarding the interview, the participants are only asked to discuss topics they are comfortable with and they will have the right to refuse to participate in the research or withdraw from it at any time. To ensure confidentiality in the results, all names were replaced with numbers (e.g., Participant 01). Hard copies of data were stored in secured drawers, and digital files were password-protected.

4. Results

After reviewing the survey responses and conducting focus group interviews, the researchers processed 100 survey questionnaire responses and 10 in-depth interview transcripts.

The quantitative analysis reveals a significant disparity in how students perceive equity, resource access and inclusion at the university. Table 2 shows that most respondents came from middle-income (40%) and lower-middle-income (25%) backgrounds. In addition, 62% of participants reported not having a part-time job, while 38% were engaged in part-time employment.

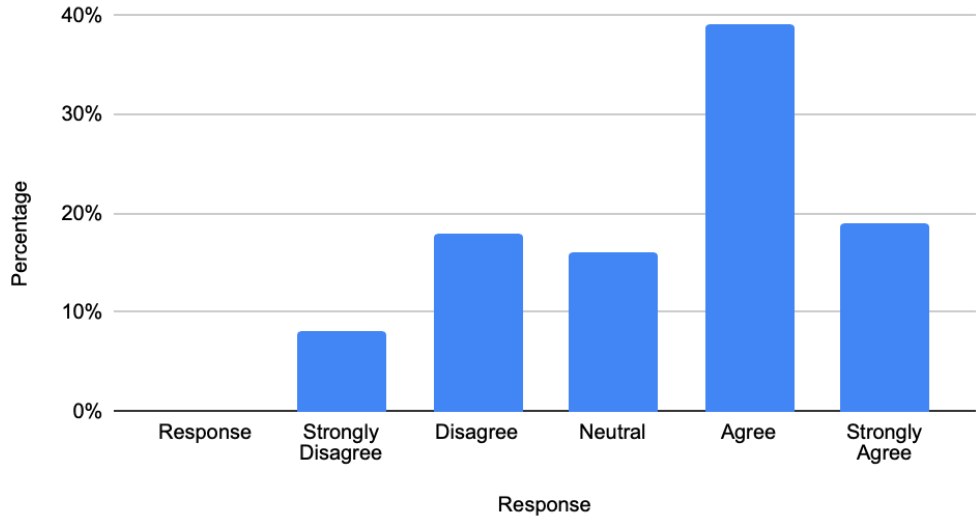
Table 2

Demographic Information of the Respondents

Variable	Category	Number of students	Percentage
Family financial status	Low income	15	15%
	Lower-middle income	25	25%
	Middle income	40	40%
	Upper-middle income	15	15%
	High income	5	5%
Part-time job	Yes	38	38%
	No	62	62%

**Note.* Data are based on student responses to survey questions regarding family financial status and part-time employment status. $N = 100$.

The qualitative investigation, conducted through focus group interviews with 10 survey respondents, provides deeper insights into the lived experiences and challenges students encounter.



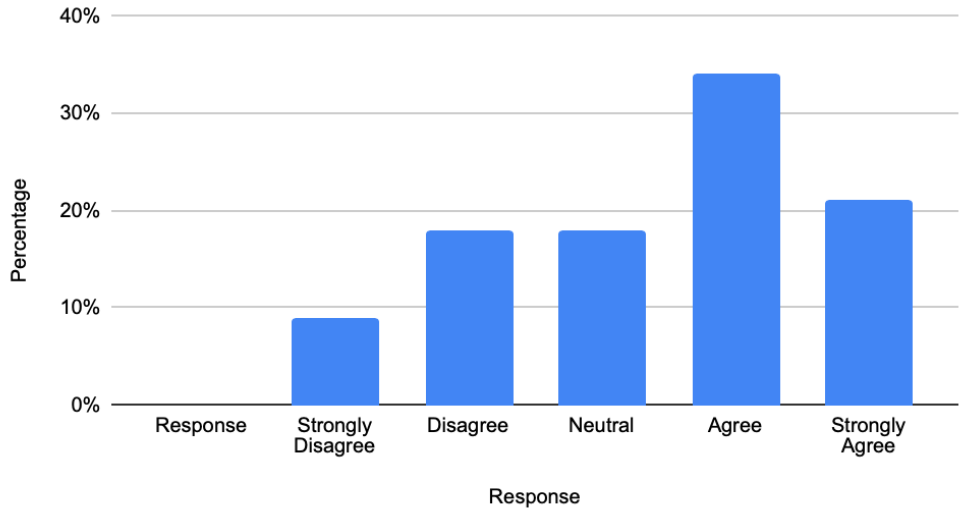
To directly address the research questions, the findings regarding students' learning experiences are organized conceptually around the three core pillars: access to resources, perceptions of equity, and classroom inclusion, integrating both quantitative trends and qualitative depths.

4.1. Access to resources

Figure 1 illustrates students' perceptions regarding their ability to afford necessary learning resources. While 39% of respondents agreed that they were able to afford the required resources, 26% of students expressed concerns regarding the burden of academic requirements (Mean = 3.21). This suggests that the costs of textbooks, internet access, software, technological devices and other learning expenses remain barriers for a notable minority of students.

Figure 1

Student Responses Regarding Financial Ability to Afford Necessary Learning Resources



Note. Data are based on student responses to the survey item: "My financial situation allows me to afford all necessary learning resources (e.g., textbooks, specialized software, learning applications, a stable internet connection) and other course-related expenses".

Figure 2 presents students' responses regarding the impact of work responsibilities on their studies. Approximately 34% of respondents agreed and 21% strongly agreed that work responsibilities reduced the time and energy they could devote to academic activities. This suggests that balancing work and study can be a challenge for many students.

Figure 2

Students' Perceptions of the Impact of Work Responsibilities on Study Time and Energy

Note. Data are based on student responses to the survey item: "My work responsibilities (eg house chores, part-time jobs) reduce the time and energy I can devote to my studies".

These statistical patterns were deeply echoed in the focus group interviews as interviewed students expressed severe frustration regarding the "hidden costs of digital and academic learning". 6 out of 10 students noted that these requirements are often treated as standard, overlooking the financial strain on low-income students.

"For our speech and presentation classes, we are constantly required to create high-quality slides and digital portfolios. My laptop is a second-hand model my family bought years ago so it runs incredibly slow and the battery dies in 20 minutes. When professors require us to buy original international textbooks instead of using photocopies due to copyright rules, it takes a massive chunk out of my monthly allowance. I ended up having to borrow a friend's book to take photos of the pages." - Participant 03.

4.2. Perception of equity

While some students acknowledge the support of the university's support services such as library and computer labs, respondents with lower-income status viewed current university support as insufficient in addressing their needs. Table 3 shows that when assessing proactive institutional support, disparities emerged across income groups. 60% of students with low income, 40% of lower-middle income and 22% of middle income perceived the university support services as inadequate. Although these percentages highlight a stark contrast based on self-reported financial status, it is important to note that inferential statistical tests (e.g., chi-square) were not conducted; thus, these figures represent observed trends within the convenience sample rather than statistically generalized differences.

Table 3

Students' Perceptions of Proactive University Support by Financial Status

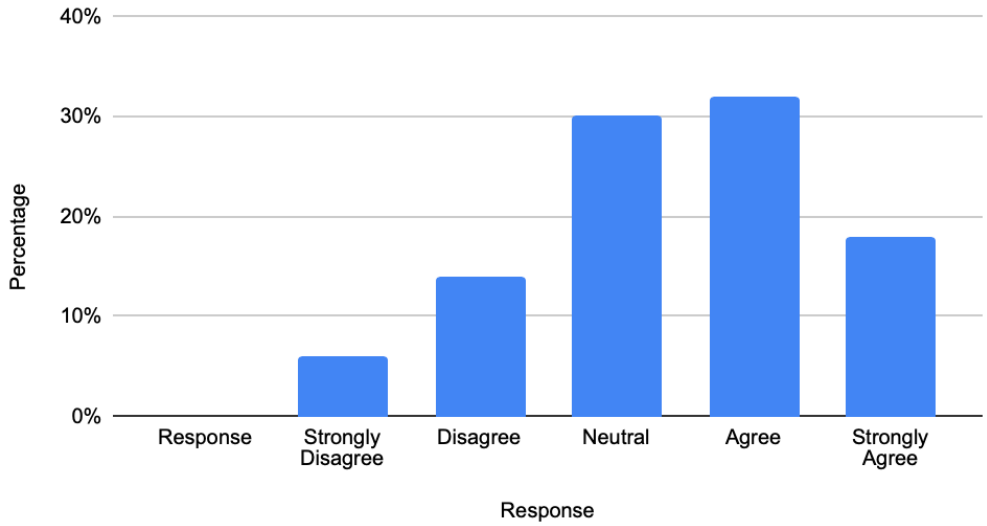
Financial status	Agree/Strongly agree	Neutral	Disagree/Strongly disagree
Low income (15)	3 (20%)	3 (20%)	9 (60%)
Lower-middle income (25)	8 (32%)	7 (28%)	10 (40%)
Middle income (40)	19 (48%)	12 (30%)	9 (22%)
Upper-middle income (15)	9 (60%)	4 (27%)	2 (13%)
High income (5)	3 (60%)	2 (40%)	0 (0%)

**Note.* Data are based on student responses to the survey item: "I feel the university takes proactive steps to support students from low-income backgrounds (e.g., providing facilities and scholarships) so that they are not left behind".

Qualitatively, in the interviews, 5 out of 10 students also emphasized the severe stress of balancing part-time employment with academic deadlines. The strict attendance and submission policies at their universities were cited as lacking the flexibility needed for working students.

"I work as a barista at a coffee shop and do evening tutoring to cover my room rent in the city. My shifts sometimes conflict with morning classes if a coworker gets sick. The university's attendance policy is incredibly rigid; if you miss more than 20% of classes, you are barred from taking the final exam. If I am late because a shift ran over, my process score suffers." - Participant 07.

Moreover, 6 out of 10 participants expressed concerns that the university does not truly understand the extent of the equity gap. 2 out of 10 participants felt that policies are designed for the students from more affluent backgrounds, ignoring those facing financial hardship. 3 out of 10 participants also noted that the university's support systems were often reactive rather than preventive. Assistance was usually available only after students had already encountered difficulties. However, 3 out of 10 participants noted that some instructors show genuine empathy regarding socioeconomic challenges. This includes providing recorded lectures or accepting late submissions due to unavoidable work shifts.



"The school's administrative system is slow and the computer labs are outdated, which doesn't help much. But some of my instructors have been amazing. When I explained that I didn't have Wi-Fi at home last month, my teacher allowed me to submit my essay a day late." - Participant 09.

4.3. Perception of inclusion

Figure 3 illustrates students' perceptions of inclusivity in the classroom. A notable proportion of respondents (32%) reported feeling uncomfortable sharing personal experiences that differed from those of wealthier peers. This finding suggests that socioeconomic differences may influence students' sense of inclusion and participation in classroom discussions.

Figure 3

Students' Feelings of Discomfort Sharing Personal Experiences due to Socioeconomic Differences

Note. Data are based on student responses to the survey item: "I feel uncomfortable sharing my personal experiences in class as they differ from the "typical" or "wealthy" student experience".

This sense of subtle exclusion was detailed in the qualitative findings. A recurring theme among interview participants was the feeling of being "out of place" within certain classroom discussions and social interactions. Most students from lower-income backgrounds reported feeling left out when topics related to travel, private tutoring, expensive hobbies, or dining experiences were discussed in class. Although these conversations were not intended to exclude anyone, 3 out of 10 participants noted that they often struggled to relate to such experiences. As a result, they became less willing to participate in discussions or share their own personal experiences, fearing that they would be judged or misunderstood by their peers.

5. Discussion

The findings suggest that socioeconomic differences not only appear to prevent students from entering universities but also continue to influence how students experience university life after enrollment. This extends prior research (e.g., Tomaszewski et al., 2022; Panigrahi, 2025;) by revealing "post-access" barriers inside higher education as challenges that persist even after enrollment and affect equity, access, and inclusion simultaneously.

Access to education therefore extends beyond admission and tuition fees. Reliable internet access, appropriate learning devices, academic materials, and the ability to participate in extracurricular activities all contribute to students' opportunities to engage fully in their studies. For many respondents with stronger financial backgrounds, these requirements are often treated as a standard expectation. For other notable numbers with lower-socioeconomic backgrounds, they represent additional obstacles that must be overcome alongside academic responsibilities.

The results also raise questions about educational equity. Students in the same classrooms are required to reach the same academic standards, but they do not have the same resources or opportunities. Lower-income students were more likely to regard university support as insufficient and to report problems due to financial pressures. At the same time, students who worked part-time frequently described challenges balancing employment and academic responsibilities. Equal expectations may therefore not always lead to equal opportunities. When students must devote significant time and energy to meeting financial needs, their ability to participate in learning activities can be reduced despite having similar academic potential.

Inclusion appears as a more subtle issue. Within this sample, most participants reported a general sense of belonging within their faculties; however, feelings of exclusion often appeared during everyday classroom interactions rather than through formal institutional practices. Discussions involving travel experiences, private tutoring, or expensive leisure activities occasionally reinforced social differences between students. Such occurrences may seem minor, yet repeated exposure can contribute to feelings of isolation among students from unprivileged backgrounds. This emphasizes the importance of creating learning environments that acknowledge and respect students' diverse socioeconomic experiences.

The results highlight the interconnected nature of the three pillars: limited access undermines equity, which in turn affects inclusion.

It is important to clarify that this study provides perception and experience-based evidence from a small convenience sample at two specific faculties. The findings suggest patterns within this specific sample rather than broad systemic facts, thereby should not be generalized broadly without qualification. USSH and HCMUT were treated as complementary sites for exploring shared experiences rather than compared directly; no institutional differences were tested.

6. Conclusion

This study provides insights into the socioeconomic barriers affecting students at USSH and HCMUT in relation to equity, access, and inclusion in higher education. The findings suggest that access, equity, and inclusion should not be viewed only as separate concepts. Access to educational resources alone does not necessarily guarantee equitable learning opportunities, while equitable opportunities do not automatically ensure that all students feel included within the learning environment. Students from lower socioeconomic backgrounds often faced additional challenges that were less visible to their peers, particularly in relation to educational expenses, work responsibilities, and participation in university life. Efforts to reduce socioeconomic barriers should therefore extend beyond financial assistance and consider how institutional policies, academic expectations, and support services affect students with different levels of economic resources.

Institutional-level recommendations: for digital and material support, universities should subsidize essential digital subscriptions and improve access to updated computer

laboratories to address the technological deficit reported by students lacking adequate devices. To ensure policy flexibility, schools should establish more flexible attendance and assessment deadline policies specifically tailored to accommodate students working part-time, alleviating the severe time pressures identified in the study. Lastly, for proactive communication, communication regarding available financial aid and scholarships should be strengthened so that support systems act preventively rather than reactively.

Teacher-level recommendations: regarding inclusive pedagogy, educators should be trained to avoid making assumptions about students' financial resources, offering low-cost alternatives (e.g., OER materials instead of standard expensive imported textbooks). Teachers must be more sensitive towards classroom inclusivity by actively guiding class discussions to ensure discussing topics (e.g., daily experiences, hobbies) do not alienate students from disadvantaged backgrounds, fostering a culturally and economically sensitive environment.

While this study sheds light on important issues surrounding equity, access, and inclusion, it has several limitations. First, the reliance on a relatively small convenience sample restricts the generalizability of the findings. Second, the data is self-reported, and socioeconomic status was self-categorized by students rather than measured through objective economic indicators (e.g., household income tax or official pell-grant equivalents). Third, utilizing focus groups for sensitive financial discussions may have introduced social desirability bias, as some students might have hesitated to openly share deep financial hardships in front of peers.

Future research should involve a broader range of participants across different institutions and employ longitudinal approaches to track how socioeconomic factors influence students throughout their academic journeys. Furthermore, conducting one-on-one individual interviews is recommended for future qualitative investigations to provide a safer space for discussing sensitive financial topics. Finally, comparative research designs such as analyzing differences between public and private universities, or urban versus rural student populations would yield a more comprehensive understanding of systemic inequities in Vietnamese education. Ultimately, addressing these barriers is essential to ensuring that higher education remains equitable, accessible, and inclusive for students regardless of their socioeconomic backgrounds.

Acknowledgments

The author would like to express sincere gratitude to all participants for their valuable contributions to this study. Special appreciation is extended to the survey respondents for their time, cooperation, and honest feedback, which were essential to ensuring the reliability of the research data. The author also thanks colleagues and mentors for their insightful comments and continuous support throughout the research process. The author gratefully acknowledges the organizing committee of the HUFLIT International Conference for providing a valuable academic platform for knowledge exchange and scholarly discussion.

Nguyen Thi Thao Trang (Ms) holds a Master's degree in TESOL through a joint program with Victoria University, Australia. She has over 16 years of experience teaching Non-English-Major learners at Ho Chi Minh City University of Technology and at Language Centers specializing in IELTS and TOEIC. Her research and teaching interests focus on technology-enhanced language learning, soft skills development, and innovation in English education. She has led student teams in award-winning community projects and participated in international professional development programs, including Train the Trainer and online instructional design workshops. She continues to explore innovative approaches to enhance language learning outcomes and foster learner autonomy in higher education contexts.

Nguyen Thi Tuong Vy (Ms.) holds a Bachelor's degree in English Linguistics and Literature from the University of Social Sciences and Humanities, Vietnam National University Ho Chi Minh City. She has four years of experience teaching English at language centers and is currently an English Teacher at RES English Center. Her professional interests include English language teaching and language learning. She can be contacted at nguyengon196@gmail.com.

Appendices

Appendix A – Survey questions

Socioeconomic barriers to equity, access and inclusion in education for students with diverse socioeconomic backgrounds

Student Information

1. Academic year: _____

2. What's your email address? _____

3. Do you work part-time?

1. Yes
2. No

If yes, what is your part-time job? _____

4. How would you describe your family's financial situation?

1. Low income
2. Lower-middle income
3. Middle income
4. Upper-middle income
5. High income

Instructions: *Please indicate your level of agreement using a 5-point Likert scale: 1 = Strongly Disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, 5 = Strongly Agree.*

1. Strongly disagree
2. Disagree
3. Neutral
4. Agree
5. Strongly agree

Questions

Part 1: Perception of socioeconomic impact on access

1. My financial situation allows me to afford all necessary learning resources (e.g., textbooks, specialized software, learning applications, a stable internet connection) and other course-related expenses.
2. The cost of participating in extra-curricular activities (e.g., workshops, certificates) is a burden for me.
3. I have reliable access to a high-performance computer/laptop to complete digital assignments.
4. My home environment (e.g., lack of quiet space, household responsibilities) limits my ability to study outside of class.
5. My work responsibilities (e.g., house chores, part-time jobs) reduce the time and energy I can devote to my studies.

Part 2: Perception of socioeconomic impact on equity

1. I feel that access to external resources (e.g., private tutors, expensive software) influences academic outcomes more than students' learning efforts.

2. Course assessments are designed in a way that is fair to students regardless of their financial background.

3. I feel that students with higher financial resources have an unfair advantage in keeping up with the course pace.

4. The university provides sufficient support (e.g., computer labs, library resources) to help students who lack equipment at home.

Part 3: Perception of socioeconomic impact on inclusivity

1. I feel uncomfortable sharing my personal experiences in class as they differ from the "typical" or "wealthy" student experience.

2. My instructors show awareness of the different socioeconomic challenges students face.

3. The language and topics used in my classes are not relatable to my life experiences and background.

4. I feel a sense of belonging in the faculty, regardless of my socioeconomic status.

Part 4: Perception of systemic challenges

1. Financial concerns negatively affect my participation in activities compared to my peers (e.g., class discussions, group work, workshops).

2. Students who experience financial difficulties can easily access information about available support services at the university (e.g., scholarships, financial aid)

3. I feel the university's policies on attendance and deadlines are flexible enough to accommodate students with part-time jobs or financial difficulties.

4. I feel the university takes proactive steps to support students from low-income backgrounds (e.g., providing facilities and scholarships) so that they are not left behind.

Part 5: Open-ended questions

1. Are there any financial challenges (e.g., learning materials, internet access, devices, transportation, extracurricular costs) that affect your learning experience? Please explain.

2. Have you ever felt "different" or "out of place" in a classroom due to your financial or social background? Describe the situation.

3. What additional support or changes should the university provide to help students from different socioeconomic backgrounds?

Appendix B – Interview questions

1. How does your current financial situation influence your ability to access the tools and resources you need to succeed in your classes?

2. Have you ever felt that your socioeconomic background made it harder for you to participate in or keep up with course requirements compared to your classmates?

3. Do you believe your instructors are aware of and sensitive to the different personal or financial challenges that students face outside of the classroom?

4. Can you describe a time when you felt either included or excluded in a classroom setting based on your social or economic background?

5. What is one practical change you think the University could make to ensure that all students, regardless of their financial status, have an equal chance in the program?

#178 AI-DRIVEN SELF-DIRECTED LANGUAGE LEARNING: STRATEGY USE AND GENDER PERSPECTIVES AMONG VIETNAMESE EFL UNDERGRADUATES

Huynh Thanh Trung [1], Chau Thi Kim Ngan [2], Vo Thi Tien [3], & Tran Quoc Thao [4]

Abstract

Artificial intelligence (AI) has recently emerged as a prominent force in language learning, opening opportunities to foster students' learning autonomy and strengthen their self-directed learning skills. AI is reshaping educational settings at a dramatic pace. Yet evidence on how students in Vietnam actually put these tools to work in their own learning remains limited. This study examined how Vietnamese EFL undergraduates at one vocational college employ AI-driven self-directed language learning strategies (AI-SDLLS), and whether gender shapes strategy use. Adopting a convergent mixed-methods design, it paired a questionnaire (N = 52) with semi-structured interviews (n = 16). The findings revealed a consistent descriptive pattern: cognitive strategies such as grammar correction, translation, and idea generation were used most frequently, metacognitive and affective strategies surfaced at moderate levels, and social strategies ranked lowest. This pattern suggests that students gravitate toward AI for immediate, task-level support but underuse it for planning, self-monitoring, or collaborative learning. As for gender, independent-samples t-tests detected no significant differences across the four subscales, though the modest sample limits statistical power. Given its single-institution scope, the study offers context-specific evidence rather than a national picture. Targeted AI-literacy and metacognitive-strategy instruction, coupled with teacher preparation for responsible integration, could support Vietnamese classrooms as they move toward English as a Second Language (ESL) practice.

***Keywords*:** artificial intelligence, EFL to ESL, gender, self-directed language learning strategies

1. Introduction

Vietnam's English-language landscape is shifting. Driven by national policy and labor-market demand, English is increasingly positioned as a language for higher education, employment, and global participation (Nguyen & Tran, 2025). This repositioning is best understood as a policy and pedagogical aspiration, an ongoing reorientation toward English as a second language (ESL), rather than a completed sociolinguistic shift, since for most Vietnamese learners English remains a foreign language encountered largely in the classroom. Realizing this aspiration depends in part on what happens beyond the classroom walls, where AI is fast becoming part of everyday study.

Since 2022, generative AI tools such as ChatGPT or Grammarly have moved from the periphery to the mainstream of undergraduate study (Annamalai et al., 2023; Lam, 2024). On-demand correction, translation, conversational practice: these tools personalize instruction at a scale classroom teachers cannot easily reach (Baskara & Mukarto, 2023; Benek, 2025).

Consider the learner pursuing self-directed learning (SDL), "an awareness and control over ways to learn" (Curry et al., 2017, p. 18). For that learner, AI looks like the ideal extension of teacher-led instruction: scaffolding available anywhere, anytime, tailored to whatever question arises.

The empirical record on AI in EFL settings grows fast, but unevenly. Three limitations recur. First, most studies fix on a single tool, usually ChatGPT, and a single skill, usually writing (Pham & Cao, 2025). Second, many report what learners think AI is good for, not the strategic moves learners actually make once AI enters the picture (Wang et al., 2025; Yang & Li, 2024). Third, despite an obvious conceptual fit, vanishingly few anchor their analysis in established frameworks of language learning strategies or self-regulated learning (Zhang & Zou, 2024). The Vietnamese picture narrows further: classroom studies dominate, and gender's role in AI-mediated SDL remains largely unexamined (Ngo et al., 2025; Vo & Nguyen, 2024).

These gaps matter for two reasons, both tied to the conference theme. First, the EFL-to-ESL transition is, for the individual learner, a shift away from compliance with classroom routines toward autonomous, lifelong engagement with English; lacking evidence on how learners self-direct with AI, teacher educators cannot prepare future teachers to scaffold that shift responsibly. Equity is the second. Should male and female students draw on AI in systematically different ways, generic guidance will quietly leave some students under-served.

Accordingly, this study addresses two research questions:

RQ1. What AI-driven self-directed language learning strategies (AI-SDLLS) do Vietnamese EFL students use?

RQ2. What are gender differences in using AI-SDLLS in self-directed language learning?

To answer these questions, we adopt a convergent mixed-methods design at a vocational college in Ho Chi Minh City, pairing a questionnaire (N = 52) with semi-structured interviews (n = 16). Vocational-college learners merit particular attention here: relative to the four-year university students who dominate the Vietnamese evidence base, they more often combine study with paid work, enter with more uneven English proficiency, and depend on more variable digital access, conditions that plausibly shape both how readily they turn to AI and which strategies they can sustain. The study offers a localized portrait of AI-mediated SDL in a Vietnamese setting rarely visible in the international literature, alongside practical guidance for teachers, teacher educators, and policy actors readying students for English as a second language.

2. Literature Review

2.1. Self-Directed Learning and Language Learning Strategies

Self-directed learning is most often traced to Knowles (1975). He cast it as a process in which adults "take the initiative…in diagnosing their learning needs, formulating goals, identifying human and material resources, choosing and implementing appropriate learning strategies, and evaluating outcomes" (p. 18). Curry et al. (2017) later recast SDL for the language classroom as self-directed language learning (SDLL), foregrounding awareness, management, and autonomy. Pemberton and Cooker (2012) sharpened the picture: SDLL surfaces when "students take the initiative in setting their own goals, developing learning strategies, or employing various learning styles" (p. 203).

Strategic action sits at the core of SDLL. Building on O'Malley and Chamot (1990) and Oxford (1990, 2016), researchers typically sort language learning strategies into four families: cognitive (manipulating the language: translating, summarizing, repetition), metacognitive (planning, monitoring, and evaluating one's own learning), affective (managing emotions, motivation, and anxiety), and social (interacting and collaborating with others). Hawkins (2018) reworked this taxonomy into cognitive, affective, sociocultural-interactive, and meta-strategies. This study keeps the four-strategy framework. It dominates Vietnamese EFL research and yields categories that hold up across studies.

2.2. AI Tools in Language Learning

AI entered the SDLL toolkit precisely as learners began reaching for support beyond the classroom. Three classes of tools matter most here. Generative AI applications such as ChatGPT and Gemini generate human-like text that learners mine for explanation, paraphrasing, and feedback (Caruccio et al., 2024; Peres et al., 2023). Intelligent personal assistants like Alexa and Siri draw on natural language processing to "tailor the pace, approaches, content, and activities of learning to match the interests and needs of individual language learners" (Chen et al., 2021, p. 205). Then come mobile-assisted language learning (MALL) applications (Duolingo, Busuu, HelloTalk) which fold practice into everyday digital routines (Lai et al., 2022).

Empirical work links these tools to gains across the four skills. Writing benefits from AI support for idea generation, organization, grammar correction, and stylistic feedback (Abdalkader, 2022; Jensen et al., 2024; Zhang et al., 2023). In speaking, chatbots and speech-recognition systems open up low-stakes rehearsal and real-time pronunciation feedback (Rukiati et al., 2023). Listening widens too: AI-mediated platforms such as Netflix and YouTube (subtitles, translation, replay) expand exposure to authentic input (Suryana et al., 2020). For reading, dictionary-style lookups, summaries, and text-to-speech tools feed vocabulary growth and comprehension (Herawati et al., 2022). Yet most reviews caution that AI's pedagogical value rests less on the tool than on how learners use it (Mohebbi, 2024; Wang et al., 2025). This is where SDLL frameworks become useful.

2.3. AI-SDLL: A Strategic View of Learner Engagement

Framing AI use through this four-strategy lens clarifies what AI-SDLLS denotes: AI does not replace the strategy categories so much as extend each one. Cognitively, learners offload translation, grammar correction, summarizing, and vocabulary practice to AI, which returns immediate, low-cost feedback. Metacognitively, AI can scaffold goal-setting, planning, self-monitoring, and reflection, prompting learners to evaluate their answers or ask how to improve, though these uses demand more deliberate initiative. Affectively, AI offers low-stakes, non-judgmental practice that can ease anxiety and sustain motivation, while also risking over-reliance. Socially, AI serves as an interactional partner or a rehearsal space for human contact, from conversational chatbots to checking one's language before speaking with others. Read this way, AI-SDLLS are not new strategy types but familiar strategies re-mediated by AI affordances, which makes Oxford's (2016) taxonomy a productive frame for analyzing them.

Recent studies converge on three findings about AI-mediated SDL. First, learners reach for AI most readily on cognitive tasks (translation, correction, vocabulary lookup), where entry costs little and feedback arrives at once (Annamalai et al., 2023; Jeon, 2022). Second, metacognitive use is harder to cultivate without explicit instruction; left to their own devices, learners deploy AI reactively rather than for planning or monitoring (Wang et al., 2024; White, 2008). Third, affective benefits (lower anxiety, higher motivation) are real, yet ambivalent,

shadowed by recurrent risks of over-reliance and shallow engagement (Cotton et al., 2023; Özkan et al., 2024). Social use lags furthest behind. Conversational practice with chatbots stays thinly developed, reflecting both technological limits and learners' preference for human partners (Rukiati et al., 2023).

2.4. Gender and AI-Mediated Language Learning

Gender has long drawn interest in language learning strategy research. Female learners are sometimes reported as heavier users of metacognitive and social strategies (Alhaysony, 2017; Montero-SaizAja, 2021), though the findings waver across contexts. In AI-mediated studies the evidence thins considerably. Selim (2024) found that female Saudi undergraduates turned to Grammarly and GPT-3 to polish their academic writing more readily than male peers, even if the confidence gains stayed uncertain. Liu and Wang (2024) detected no significant gender difference in critical-thinking gains from AI in EFL literature classes. Reporting greater listening-comprehension difficulty among female learners, Huang (2024) tentatively linked it to less efficient processing strategies. Closer to home, Ngo et al. (2025) found no significant gender differences in overall AI use, yet pressed for finer-grained analysis of strategic patterns.

2.5. AI-SDLL in Vietnamese Higher Education

Vietnamese empirical work on AI-mediated SDL has expanded rapidly since 2023, but it clusters in two areas: students' perceptions of generative AI for writing tasks (Ho et al., 2024; Vo & Nguyen, 2024) and survey-based explorations of self-efficacy (Ngo et al., 2025). Such work establishes that Vietnamese undergraduates use AI often and regard it favorably. What it rarely does is examine the four-strategy structure typical of Oxford-style research, folding strategy use instead into broad categories. They also draw predominantly on four-year university samples; vocational colleges, which enroll a substantial share of post-secondary learners in Vietnam and differ in proficiency, time pressure, and digital infrastructure, are largely absent from the published record. The strategic profile of vocational EFL learners therefore remains an evidence gap with direct implications for an ESL-oriented system, where learners must self-regulate across longer time horizons and more diverse communicative settings.

2.6. The Present Study

This review exposes three connected gaps. The first is empirical: despite rapid growth in research on AI in Vietnamese EFL, no study has mapped the full four-strategy AI-SDLLS profile (cognitive, metacognitive, affective, and social) that learners enact when they self-direct with AI, as strategy use is typically folded into broad perception categories. The second is contextual: this evidence base draws overwhelmingly on four-year university samples, leaving vocational-college learners, who differ in proficiency, time pressure, and digital access, largely undocumented, even though they form a substantial share of Vietnam's post-secondary population. The third is methodological: gender and strategy patterns have rarely been examined with converging quantitative and qualitative evidence, so survey-level patterns remain unexplained by accounts of how learners actually use AI. The present study addresses these three gaps together and locates its findings within the conference theme of moving from EFL to ESL practice.

3. Methodology

3.1. Research Design

A convergent mixed-methods design (Creswell & Plano Clark, 2018) was used to address the two research questions. In a convergent design, quantitative and qualitative data are collected concurrently, analyzed separately, and then merged so that each strand can corroborate, explain, or complicate the other. This logic suited the study's dual aim: the closed-ended questionnaire was needed to establish the group-level frequency and patterning of AI-SDLLS, whereas the semi-structured interviews were needed to show how individual students actually enacted those strategies and reasoned about gender, detail that frequencies alone cannot convey. The two strands were given equal priority and were merged at the interpretation stage, where interview accounts were read against each subscale to judge whether they confirmed the survey pattern (for example, the prominence of cognitive uses), explained it (for example, why social uses lagged), or complicated it. Because the data came from a single institution, the design was intended to yield an in-depth, context-specific account rather than findings generalizable to all Vietnamese EFL undergraduates.

3.2. Research Context

The study was conducted at a vocational institution in Ho Chi Minh City. The college offers programs in English Language, Business Interpretation, Hospitality and Tourism Management, Logistics, and Information Technology. Communicative competence anchors the English Language program; instructors routinely recommend AI tools (Grammarly, QuillBot, ChatGPT, Grok, Copilot, Monica) as out-of-class support, and the college runs occasional workshops on AI use.

3.3. Participants

Participants were recruited through convenience sampling at a single vocational college; all were enrolled EFL students who volunteered to take part. The achieved sample of 52 is modest but adequate for an exploratory, descriptive study of strategy-use patterns; as noted below, however, it affords limited statistical power for detecting small gender differences. Fifty-two undergraduate EFL students, all aged 18 or older, completed the survey. Just over half (51.9%) fell into the 18–19 band; 26.9% were 20–21, and 21.2% were 22 or older. Males made up 53.8% and females 44.2%, with 1.9% identifying as another gender. Year level skewed early: 50.0% second-years, 38.5% first-years, and 11.5% in their third year or beyond. More than a third (38.5%) had studied English for five years or longer.

All respondents owned a personal learning device. ChatGPT was the most-used AI tool (88.5%), followed by Google Translate (59.6%), Duolingo (50.0%), and Grammarly (32.7%). Newer generative AI tools (Gemini, DeepSeek, Character.AI) were used by 3.8% or fewer. Writing was the most-supported skill (50.0% of participants used AI for it "often" or "always"), followed by vocabulary (46.2%), reading (46.1%), listening (40.3%), and speaking (34.6%). For the interview phase, 16 survey respondents were purposively selected from those who volunteered, balancing gender (seven male, nine female) and representing different year levels. Because these participants were volunteers, some volunteer bias, toward students more engaged with AI or more confident in English, cannot be ruled out and is acknowledged as a limitation. These profile characteristics (year level, length of English study, near-universal device ownership, the concentration of use in a few tools, notably ChatGPT, and the skew toward writing and vocabulary support) are not merely descriptive; each plausibly conditions which AI-SDLLS students adopt and is therefore treated as interpretive context for the results rather than as a controlled variable.

3.4. Instruments

3.4.1. Questionnaire

A 43-item questionnaire was developed for this study, organized into five sections: demographics, AI tool usage, and four AI-SDLLS subscales (cognitive: 9 items; metacognitive: 7 items; affective: 6 items; social: 7 items), each rated on a 5-point Likert scale (1 = Never, 5 = Always). The subscales were constructed by taking Oxford's (2016) four strategy families and Knowles' (1975) SDL principles as the conceptual scaffold and writing items that re-expressed each strategy as a concrete AI-mediated behavior. Cognitive items captured using AI for translation, grammar checking, summarizing, and vocabulary practice; metacognitive items captured AI-supported goal-setting, planning, monitoring, and reflection; affective items captured using AI to manage motivation, enjoyment, and anxiety; and social items captured using AI to prepare for or mediate interaction with others. Items were newly written for this study, with wording informed by behaviors reported in prior AI-in-EFL research rather than adopted from a single validated scale, as no existing instrument operationalized AI-SDLLS across all four families.

Content validity was established through expert review: two EFL instructors independently judged whether each item belonged to its intended strategy family and was clearly worded, and items were revised accordingly. The instrument was then pilot-tested with three students to confirm clarity. Internal consistency was strong across all four subscales (see Table 1). Construct validity was not formally tested through factor analysis, because the sample was too small to support a stable factor solution; this is acknowledged as a limitation of instrument validation.

Table 1

Internal Consistency of the AI-SDLLS Subscales

Subscale	k	Cronbach's α
Cognitive	9	.85
Metacognitive	7	.84
Affective	6	.84
Social	7	.85

Note. k = number of items; N = 52.

3.4.2. Semi-structured Interview

A 20-question protocol covered (a) introduction, (b) AI tool usage, and (c) AI-SDLLS practice across the four strategy families. Two sources shaped the protocol: Benson's (2013) autonomy framework and recent empirical work on AI in EFL contexts (Annamalai et al., 2023). Optional follow-up prompts nudged participants toward concrete examples. Before administration, two students piloted the protocol and two further instructors reviewed it. The full interview protocol appears in Appendix A.

3.5. Data Collection and Analysis

Collection ran two weeks through Google Forms. Survey respondents completed the instrument at their own pace; interview participants, having signed a consent statement, received the form and replied asynchronously in writing. This format ruled out real-time probing but permitted thoughtful and reflective responses.

Quantitative data were analyzed in IBM SPSS Statistics 31. Descriptive statistics (M, SD) were computed per item and per subscale. Internal consistency was tested with Cronbach's α. Independent-samples t-tests compared male and female participants on the four subscale means (the one participant identifying as another gender was excluded from this comparison, leaving n = 51). Levene's test indicated equal variances for all four subscales, so equal-variance results are reported, and Cohen's d indexed effect size. Given the modest sample, these tests had limited power to detect small effects, so non-significant results are read as consistent with either genuine similarity or insufficient power, not as evidence of no difference.

Qualitative data were analyzed using Braun and Clarke's (2006) six-phase thematic analysis: familiarization, initial coding, theme generation, theme review, definition, and reporting. Codes were generated both inductively and deductively, organized around the four-strategy framework. Trustworthiness was supported through peer debriefing, an audit trail, and triangulation with the quantitative findings. Formal member checking was not undertaken; because interviews were administered in writing through Google Forms, participants' original responses were retained verbatim and consulted directly during analysis, and excerpts are reported with minimal editing to preserve participants' wording. In peer debriefing, research-team members independently reviewed a subset of coded responses and discussed discrepancies until the coding scheme and theme definitions were agreed, which sharpened several category boundaries (for example, separating metacognitive monitoring from cognitive checking). Themes were merged with the quantitative results during interpretation. Participants are identified anonymously as S1–S16.

4. Results

4.1. AI-SDLLS Use Across the Four Strategy Families

Across the sample, students reported using AI-SDLLS at moderate levels overall. Cognitive strategies (M = 3.38, SD = .80) were the most frequently used. Metacognitive (M = 3.09, SD = .85) and affective strategies (M = 3.09, SD = .89) followed at very similar levels, and social strategies (M = 3.02, SD = .89) ranked lowest. The clearest feature of these data is the gap between cognitive use and the other three families; the differences among metacognitive, affective, and social use, by contrast, are small (no greater than 0.07 on the 5-point scale). Because no inferential test was conducted across the four subscale means, this ordering is reported as a descriptive tendency rather than a statistically established hierarchy (see Table 2).

Table 2

EFL Students' Use of AI-SDLLS

No.	Components	N = 52	
		M	**SD**
1	Cognitive	3.38	.80
2	Metacognitive	3.09	.85
3	Affective	3.09	.89
4	Social	3.02	.89
	Average	**3.15**	**.86**

*Note. Scale: 1 = Never, 5 = Always.

4.2. Cognitive Strategies

Within the cognitive subscale (Table 3), translating between English and Vietnamese (Cog2: M = 3.75, SD = 1.12) and grammar checking (Cog8: M = 3.75, SD = 1.20) were the most frequent uses. Vocabulary practice (Cog1: M = 3.58, SD = 1.09) and exploring alternative expressions (Cog6: M = 3.58, SD = 1.05) were also common. Less frequent were sentence-construction practice with new words (Cog5: M = 3.00, SD = 1.25) and pronunciation practice via text-to-speech (Cog7: M = 2.83, SD = 1.32).

Table 3

EFL Students' Use of Cognitive Strategies

No.	Items	N = 52	
		M	SD
Cog1	I use AI to practice new vocabulary.	3.58	1.09
Cog2	I use AI to translate between English and Vietnamese.	3.75	1.12
Cog3	I use AI to summarize English texts to understand better.	3.39	1.16
Cog4	I use AI to make practice questions for myself.	3.19	1.14
Cog5	I use AI to make sentences with new vocabulary items.	3.00	1.25
Cog6	I use AI to know different ways to express my ideas.	3.58	1.05
Cog7	I listen to AI text-to-speech to listen to and copy correct pronunciation.	2.83	1.32
Cog8	I use AI to check my grammar when I write.	3.75	1.20
Cog9	I use AI tools to compare my writing with better examples.	3.35	1.20

Interview accounts supported the quantitative pattern. S1 explained, "To be honest, I am really bad at writing and grammar, so I often use AI tools to practice them." S3 added, "I often use AI tools to practice reading. It helps me read faster, understand new words, and check whether I did it right or wrong." These accounts illustrate why cognitive support emerged as AI's most prominent role for participants: it addressed perceived weaknesses with immediate, low-effort feedback.

4.3. Metacognitive Strategies

For metacognitive strategies (Table 4), one item alone crossed the "often" threshold: evaluating answers after exercises (MetaCog6: M = 3.46, SD = 1.15). Reviewing mistakes to learn from them followed it narrowly (MetaCog3: M = 3.44, SD = 1.13). Long-term planning fared worse. Arranging a learning schedule through AI (MetaCog2: M = 2.77, SD = 1.23) and soliciting AI suggestions for further improvement (MetaCog7: M = 2.79, SD = 1.19) drew the lowest ratings.

Table 4

EFL Students' Use of Metacognitive Strategies

No.	Items	N = 52	
		M	SD
MetaCog1	I use AI to set learning goals.	2.92	1.27

MetaCog2	I plan my study by asking AI to make a study schedule for me.	2.77	1.23
MetaCog3	I use AI tools to review my mistakes and learn from them.	3.44	1.13
MetaCog4	I use AI tools to choose exercises that match my level.	3.15	1.27
MetaCog5	I ask AI for feedback on my speaking or writing.	3.12	1.15
MetaCog6	I use AI to evaluate my answers after finishing exercises.	3.46	1.15
MetaCog7	I reflect on my study by asking AI, "How can I do better next time?"	2.79	1.19

The interviews exposed the same lopsidedness. S2 used AI mainly to diagnose weaknesses: "I'll ask for a sample test and AI will check it and explain what my problems are and what I need to improve." A minority did set goals or monitor progress with AI. S10 reported, "I set [a goal] to reach 70+ at PTE in 6 months, and like a coach every day I [log] the day I learn," and S9 explained, "When I write a paragraph, I ask ChatGPT to give me feedback and show my mistakes. It tells me what parts are weak, like grammar or vocabulary." Yet sustained planning remained the exception; as one student admitted, "I make plans for using AI, but I cannot always follow them." Diagnosis and on-the-spot evaluation came easily; disciplined, forward-looking planning did not.

4.4. Affective Strategies

Affective strategy use (Table 5) was moderate. Three uses clustered closely: AI sustained motivation through immediate feedback (Affect4: M = 3.27, SD = 1.14), made learning enjoyable via gamified applications (Affect3: M = 3.17, SD = 1.26), and offered encouragement through achievements and rewards (Affect5: M = 3.17, SD = 1.09). Reducing the fear of mistakes rated slightly higher (Affect6: M = 3.33, SD = 1.13). Rarest of all was building speaking confidence through chatbot interaction (Affect1: M = 2.67, SD = 1.28).

Table 5

EFL Students' Use of Affective Strategies

No.	Items	N = 52	
		M	SD
Affect1	I talk with AI chatbots to build confidence in speaking.	2.67	1.28
Affect2	I use AI tools to reduce stress before tests.	2.94	1.26
Affect3	I use AI games or apps to make learning fun.	3.17	1.26
Affect4	I use AI tools to stay motivated by seeing quick results.	3.27	1.14
Affect5	Learning with AI helps me stay motivated with rewards for reaching milestones.	3.17	1.09
Affect6	Learning with AI helps me feel less afraid of making mistakes.	3.33	1.13

Interview responses split along the same lines. For some, AI relieved anxiety: S13 valued that "it's just an AI, not a real human, so I'm not afraid to be judged if I have a mistake," and S12 said, "I feel relaxed and motivated because it helps me with everything, from checking mistakes to giving me new exercises." Others were cooler or warier. S10 reported feeling "nothing... [I treat] it as just a tool, nothing more, nothing less," while S2 felt, "Sometimes I feel really bored because myself depend on AI." Such ambivalence hints that AI can ease anxiety yet, overused, may dull intrinsic interest.

4.5. Social Strategies

Social strategies (Table 6) were the least frequently used. Students did use AI to generate ideas for group activities (Social4: M = 3.48, SD = 1.02), to check English before social interaction (Social5: M = 3.40, SD = 1.16), and to clarify peers' or teachers' English (Social7: M = 3.12, SD = 1.34). However, treating AI as a speaking partner (Social1: M = 2.54, SD = 1.31) and practicing virtual conversations (Social3: M = 2.60, SD = 1.23) were rare.

Table 6

EFL Students' Use of Social Strategies

No.	Items	N = 52	
		M	SD
Social1	I use AI as a speaking partner.	2.54	1.31
Social2	I share AI-generated ideas with my friends to start conversations.	2.87	1.31
Social3	I use AI tools as virtual friends to practice real-life conversation.	2.60	1.23
Social4	I use AI tools for ideas to complete group activities.	3.48	1.02
Social5	I use AI to check my English before talking with others.	3.40	1.16
Social6	I ask AI to suggest topics to discuss with other people.	3.17	1.18
Social7	I use AI to help me understand classmates' or teachers' English.	3.12	1.34

The interviews echoed the numbers. Where students used AI socially, it was mostly to prepare for human interaction: S13 explained, "I often use AI to prepare for discussing with my classmates or answering questions from teachers; I ask AI for the main points, then I widen ideas from them." A few embraced it as a conversational partner. S14 said, "When it comes to speaking, I tell ChatGPT to make a conversation for me and we talk like friends," and S8 noted, "I think we can talk to AI anytime, anywhere." Even so, most ultimately favored peers and teachers for genuine social practice; as S3 put it, "a good partner for speaking practice is a classmate, because real people will be better than AI."

4.6. Gender Differences in AI-SDLLS

Independent-samples t-tests revealed no statistically significant gender differences on any of the four subscales (Table 7). Levene's test indicated equal variances throughout, so equal-variance results are reported, t(49). Mean differences were small, no larger than about 0.15 on the 5-point scale, and effect sizes were negligible to small (d = -.18 to .13). Female participants edged ahead on cognitive (M = 3.44 vs. 3.30) and affective (M = 3.16 vs. 3.01) use, and male participants on metacognitive use (M = 3.13 vs. 3.01), while social-strategy use barely differed (M = 3.05 vs. 3.00). These null results should be read with caution: at this sample size the t-tests had limited power to detect small effects, so the absence of significant differences is consistent with either genuine similarity or insufficient power. The interviews likewise surfaced no marked gendered patterns, with male and female participants alike emphasizing cognitive uses; however, because the interviews were not designed primarily to elicit gendered accounts, this convergence is treated as broadly consistent with the survey rather than as independent confirmation of no gender difference.

Table 7

Differences in EFL Students' Use of AI-SDLLS by Gender

Subscale	Male M (SD)	Female M (SD)	*t* (df)	*p*	*d*
Cognitive	3.30 (0.85)	3.44 (0.75)	-0.63(49)	.53	-0.18
Metacognitive	3.13 (0.93)	3.01 (0.76)	0.48(49)	.64	0.13
Affective	3.01 (1.02)	3.16 (0.72)	-0.61(49)	.55	-0.17
Social	3.00 (0.98)	3.05 (0.81)	-0.20(49)	.85	-0.05

Note. N = 51 (male = 28, female = 23); the one participant identifying as another gender was excluded from this comparison. Equal variances assumed (Levene's $p > .05$ for all subscales). d = Cohen's d.

5. Discussion

This study set out to map how Vietnamese EFL undergraduates draw on AI-SDLLS, and whether gender shapes that use. Three patterns stand out, each worth reading against Vietnam's broader move toward ESL.

5.1. A Strategy Hierarchy Anchored in Cognitive Use

Cognitive strategies dominated. This replicates earlier findings that learners first exploit AI for concrete, surface-level scaffolding like grammar correction, translation, idea generation (Annamalai et al., 2023; Jensen et al., 2024). For Oxford (2016), such strategies form the most accessible entry point into strategic learning, a reading that fits our participants' A2–B1 proficiency. Yet an ESL-oriented system carries a particular risk: learners stall at this cognitive layer. AI becomes a pair of "task hands" rather than a partner in extended, autonomous learning.

5.2. Underdeveloped Metacognitive and Affective Use

Metacognitive use was uneven. Students turned to AI to evaluate and review finished work, yet rarely to plan ahead or set long-term goals. White (2008) and Lai et al. (2022) noted the same: metacognitive growth seldom happens without explicit support. Vietnam's traditional teacher-centered classroom may sharpen the problem. Where instruction prizes accuracy and teacher direction over self-regulation, students reach AI-mediated SDL with few planning habits in place (Ngo et al., 2025).

Affective use proved equally ambivalent. For some students, AI worked as a non-judgmental partner that took the edge off anxiety (Lai et al., 2022). Others described boredom and dependence, an echo of Cotton et al. (2023) and Amaro et al. (2023) on shallow engagement and over-reliance. Juggling jobs alongside coursework, with little time for deliberate practice, the vocational students here look especially prone to passive dependence on AI.

5.3. The Social Gap

Social strategies lagged furthest behind. Few students used AI as a conversational partner, and many called the chatbot exchanges "robotic," squaring with Rukiati et al. (2023) on how poorly chatbots reproduce human affective nuance. Two contextual factors likely contribute. Free-tier tools seldom offer high-quality voice interaction, leaving cost-conscious learners with text alone. Low oral proficiency, in turn, makes sustained AI dialogue hard to keep going. Where authentic spoken interaction sits at the center of an ESL-oriented system, this gap is the most pedagogically urgent.

5.4. Gender: Small and Context-Dependent

No statistically significant gender differences emerged. This contrasts with earlier strategy research (e.g., Alhaysony, 2017), though it aligns with more recent Vietnamese work (Ngo et al., 2025). Two cautions frame this null result. First, the modest sample gave the t-tests limited power to detect small effects, so the finding is best read as an absence of evidence for sizable gender differences rather than evidence of their absence. Second, the interviews were not designed primarily to elicit gendered accounts, and they too surfaced no marked pattern. Taken together, these results suggest that in a relatively homogeneous vocational sample, gender is a weaker predictor of AI-SDLLS than factors such as proficiency, digital literacy, time pressure, and access to tools, variables that plausibly shape strategy use more directly and that cut across gender. This does not render gender irrelevant, since small directional differences could matter at scale; rather, it implies that AI-strategy instruction should be designed for all students while attending to the conditions that more clearly differentiate them.

5.5. Implications for the EFL-to-ESL Transition

Read together, these patterns of AI use, heavily weighted toward task-level cognitive support and lighter on planning, self-regulation, and interaction, are consistent with, though not direct proof of, a broadly task-oriented use of AI rather than the autonomous, communicative use implied by an ESL orientation. It bears emphasizing that the study measured how students use AI strategically, not their broader stance toward English or their identity as EFL or ESL learners; the link to the EFL-to-ESL transition is therefore interpretive rather than demonstrated. With that caveat, the findings suggest that supporting an ESL-oriented shift will require deliberate scaffolding of metacognitive and social strategies, not merely access to more powerful tools.

5.6. Pedagogical Moves for Teachers and Programs

Three concrete moves emerge from the findings. The first is targeted strategy instruction. Because cognitive use of AI is already established, classroom time can be devoted to the layers that are underdeveloped: planning, monitoring, and reflective evaluation of AI feedback. Brief in-class routines (i.e. setting a weekly AI-use goal, logging the prompts that worked, comparing AI suggestions with peer feedback) convert AI from a hidden out-of-class crutch into a visible object of metacognitive learning. These routines align with the autonomy framework of Benson (2013) and with recent work on AI-supported self-regulation (Mohebbi, 2024).

The second is the deliberate design of social practice. Where chatbot conversations feel robotic to learners, teachers can scaffold hybrid activities: peer dialogues informed by AI preparation, role-plays that mix human and AI interlocutors, and small-group reviews of AI-generated transcripts. Such activities preserve the human relational dimension that learners value while extracting the linguistic affordances of AI. They are also well aligned with strand 6 of the conference theme, which positions technology and AI as supports for ESL development rather than as ends in themselves.

The third is teacher preparation. Because students already access AI for cognitive support, teacher development should target not basic access but higher-order use: designing reflective prompts, evaluating the accuracy and usefulness of AI feedback, comparing AI output with peer and teacher feedback, using AI ethically, and recognizing and countering overreliance. Pre-service and in-service teachers need experiential training that equips them to model this kind of AI literacy rather than merely police AI use; teacher-education programs can fold in brief modules on prompt design, ethical evaluation of AI outputs, and strategy-

explicit assignment design (Eldin, 2024). Skip this preparation, and the gap between policy aspirations for ESL competence and classroom realities will only widen.

These moves must be set against a backdrop of unequal access. Although every student in this sample owned a learning device, free-tier tools, premium features such as advanced voice interaction, and, critically for working vocational students, stable time to practice are not evenly distributed. Equitable AI integration therefore means more than supplying tools; it means attending to which learners can realistically reach the higher-quality, interactive features that an ESL-oriented use of AI depends on.

6. Conclusion

This mixed-methods study examined how Vietnamese EFL undergraduates at a vocational college in Ho Chi Minh City use AI-driven self-directed language learning strategies, and whether that use varies by gender. A consistent hierarchy emerged: cognitive strategies dominate, metacognitive and affective strategies see moderate use, and social strategies remain underdeveloped. Independent-samples t-tests turned up no significant gender differences across the four subscales.

Three pedagogical implications follow. First, classroom programs should treat AI literacy as an explicit learning objective, set beside language skills. Students need guided practice in moving past surface-level correction toward planning, monitoring, and critically weighing AI feedback, the very activities at the heart of self-regulated learning. Second, teachers need professional development that frames AI as a pedagogical resource rather than a competitor or threat; absent such support, principled classroom integration stays out of reach. Third, equity deserves explicit attention. Language proficiency, time pressure, and uneven access to premium tools shape who benefits most from AI, and the stakes run highest in vocational and under-resourced settings. Unless these conditions are addressed, Vietnam's move toward English as a second language risks becoming stratified by digital access rather than inclusive.

Several limitations warrant acknowledgment. Modest in size and drawn through convenience and voluntary sampling from a single vocational college, the sample constrains generalizability to other Vietnamese institutional contexts, and its size gave the gender comparison limited statistical power to detect small effects. The data were entirely self-reported, with no direct evidence from AI-interaction logs, learning diaries, or language-performance measures, and the asynchronous interview format limited real-time probing of nuanced responses. Future research could triangulate self-reports with proficiency measures, AI-interaction logs, and longitudinal designs tracking how AI-SDLLS evolve over a program. Comparative work across institutional types (secondary schools, universities, and vocational colleges) would further clarify how contextual factors shape AI-SDLLS adoption as Vietnam continues its transition from EFL to ESL practice.

Three directions for future research deserve specific attention. The first calls for intervention studies, testing whether short, targeted instruction in metacognitive and social AI strategies measurably shifts the strategy profile reported here. The second requires larger, stratified samples to see whether the small directional gender differences here hold up as statistically reliable in more powered designs. The third points to qualitative work tracking individual learners across a semester, complementing cross-sectional findings by showing how AI-SDLLS evolve in response to course demands, assessment formats, and teacher intervention.

Despite these limitations, the study contributes a localized portrait of AI-mediated SDL in a context rarely visible in the international literature. It speaks directly to the HUFLIT INTESOL 2026 theme, showing what the EFL-to-ESL transition looks like at the level of individual learners working with AI tools, and what teacher educators, curriculum designers, and policy actors can do to support it.

Bionote

Huynh Thanh Trung is an English lecturer at the Saigon Institute of Technology (SaigonTech) and an M.A. student in English Language Studies at HUTECH University. Moving from engineering to linguistics and literature, his research explores the synergy between technology and pedagogy. His academic interests include AI-driven self-directed learning, digital literacy, and literature education. He focuses on developing frameworks that help students utilize emerging technologies, fostering independence in both practical language acquisition and the study of literary works.

Chau Thi Kim Ngan is an English teacher at ASEL Language School and an MA student English Language at HUTECH University. Her primary research interests encompass English language pedagogy, AI-driven self-directed learning, and the innovative integration of AI tools in language education. Her recent work focuses on utilizing AI in teaching methods to enhance EFL learners' speaking performance and learning attitudes.

Vo Thi Tien is an M.A. student in English language studies at HUTECH University. Her research interests regarding AI advancements in language education, AI-driven self-directed learning, and TESOL methodology. She would like to develop students' digital literacy, which promotes their self-study motivation and enhances language competence.

Tran Quoc Thao is working as a lecturer of English linguistics. His research areas are English language studies, TESOL methodology, and teacher professional development. He has served as a keynote speaker and an invited reviewer.

Appendix

Semi-Structured Interview Protocol

Part 1. Background. 1. Can you tell me a little about yourself, your name and what you study at Saigon College? (Why did you choose to study English?) 2. Do you enjoy learning English? Why or why not? (What part of English learning do you like best, e.g., speaking, writing?)

Part 2. AI Tool Use. 3. Which AI tools (e.g., Duolingo, ChatGPT, Grammarly, QuillBot, ELSA) do you use for learning English? (Why these? Are there others you tried but did not like?) 4. How often do you use AI tools for English learning, and when (e.g., at home, after class)? (Can you give an example?) 5. What English skills do you practice with AI tools (e.g., listening, speaking, reading, writing)? (Which skill the most? Why?)

Part 3. Cognitive Strategies. 6. Do you use AI tools to learn new words or grammar? How? 7. Can you give an example of when AI helped you understand a text or a difficult sentence? 8. How do you use AI tools to practice writing or speaking better? 9. Have you ever used AI to make practice exercises for yourself? What kind?

Part 4. Metacognitive Strategies. 10. Do you use AI to plan your study (e.g., daily goals, schedules)? Can you describe how? 11. How do you use AI to check your progress or find out your weaknesses? 12. Do you ever ask AI for advice about how to improve your English? What answers did it give? 13. How do you use AI to look back at your mistakes and learn from them?

Part 5. Affective Strategies. 14. How do you feel when using AI tools to learn English (happy, relaxed, stressed, motivated)? 15. Do you feel more confident when you use AI to practice speaking or writing? Why or why not? 16. Do you use AI tools for fun learning (games, songs, videos)? Which ones?

Part 6. Social Strategies. 17. Have you ever used AI to practice conversations in English? What was it like? 18. Do you use AI to prepare for talking with classmates or teachers? How? 19. Have you ever used AI to help you in group work or discussions? Can you share an example? 20. Do you think AI can be a good partner for speaking practice? Why or why not?

#180 AI-SUPPORTED PROBLEM-BASED LEARNING FOR ENHANCING UNIVERSITY STUDENTS' PUBLIC SPEAKING PERFORMANCE

Thi Thao Trang Nguyen[1]

Abstract

Driven by the shift towards learner-centered education and knowledge construction through solving real-world problems, Problem-Based learning (PBL) has demonstrated its effectiveness globally over the past five decades. This study investigates the integration of AI-driven virtual simulations and automated feedback into a Learning Management System (LMS) within a Problem-Based Learning (PBL) framework to improve students' public speaking skills. Employing a quasi-experimental design, the research involved two intact classes at Ho Chi Minh City University of Technology, divided into an experimental group (AI-supported LMS instruction) and a control group (traditional instruction). Data was gathered through pre-and-post performance assessments and an online survey evaluating students' perceptions, engagement levels, and attitudes toward AI-integrated learning. The results indicate that embedding AI tools within the PBL cycle significantly improved students' public speaking performance in fluency and confidence, while fostering greater learner autonomy.

Keywords: Problem-Based Learning (PBL), artificial intelligence, LMS, innovation, public speaking.

1. Introduction

In an era where communication competence is increasingly recognized as a critical graduate attribute, the ability to speak confidently and effectively in public has become essential for university students. However, despite its importance, public speaking remains a persistent challenge for many learners, often constrained by anxiety, limited practice opportunities, and insufficient individualized feedback. Traditional instructional approaches, while structured, frequently fail to provide the dynamic and learner-centered environment necessary for meaningful skill development. Against this backdrop, Problem-Based Learning (PBL) has gained prominence as a pedagogical approach that situates learning within authentic problem-solving contexts, encouraging active engagement, critical thinking, and self-directed learning. At the same time, the rapid advancement of Artificial Intelligence (AI) is reshaping educational landscapes by enabling adaptive learning, real-time feedback, and personalized support on a scale. The convergence of these two approaches presents a compelling opportunity to reimagine how complex skills such as public speaking are taught and learned. This study explores the integration of AI-supported tools within a PBL framework throughout Learning Management System (LMS) to enhance university students' public speaking performance. Students can practice speaking skills whenever they have a free time at home. By embedding intelligent feedback mechanisms and interactive simulations into a structured problem-solving cycle, the proposed approach aims to create a responsive and supportive learning environment where students can practice, reflect, and improve iteratively. The research seeks to contribute to emerging discussions on technology-enhanced pedagogy while

addressing a critical gap in developing both competence and confidence in public speaking among higher education learners.

To achieve these objectives, the study addresses the following research question:

What is the impact of an AI-supported Learning Management System (LMS) integrated within a Problem-Based Learning (PBL) framework on university students' public speaking performance, confidence, motivation, and learner autonomy?

2. Literature Review

2.1. Theoretical Foundations of Problem-Based Learning (PBL)

Problem-Based Learning (PBL) was originally applied in medical education and officially introduced as a methodology by Howard Barrows at McMasterUniversity in Ontari o, Canada, in the1960s (Boud &Feletti,1997; Delisle, 1997; Magnussen et al., 2000). The theoretical architecture of Problem-Based Learning (PBL) is rooted in the tradition of experiential learning, which emphasizes that knowledge construction is most effective when situated within meaningful, real-world tasks (Dewey, 1938; Hmelo-Silver, 2004). As Barrows (1996) emphasizes, the value of this approach is not found in memorization, but in providing necessary and effective skills that ensure knowledge remains useful in the future.

The effectiveness of PBL is fundamentally rooted in its organized, iterative tutorial framework, which transitions the emphasis from passive content absorption to active inquiry and the resolution of genuine challenges, allowing students to learn through problem-solving while teachers assume the role of facilitators (Barrows, 2000; Hmelo-Silver, 2004). According to Hmelo-Silver (2004), as shown in Fig.1, this cycle begins with a problem scenario, which prompts students to identify relevant facts and represent the problem. A critical stage in this process is the identification of knowledge deficiencies, termed “learning issues”, which direct the student’s Self-Directed Learning (SDL). By requiring students to formulate hypotheses and subsequently apply newly acquired knowledge to evaluate them, the PBL cycle ensures that learning is grounded in performance.

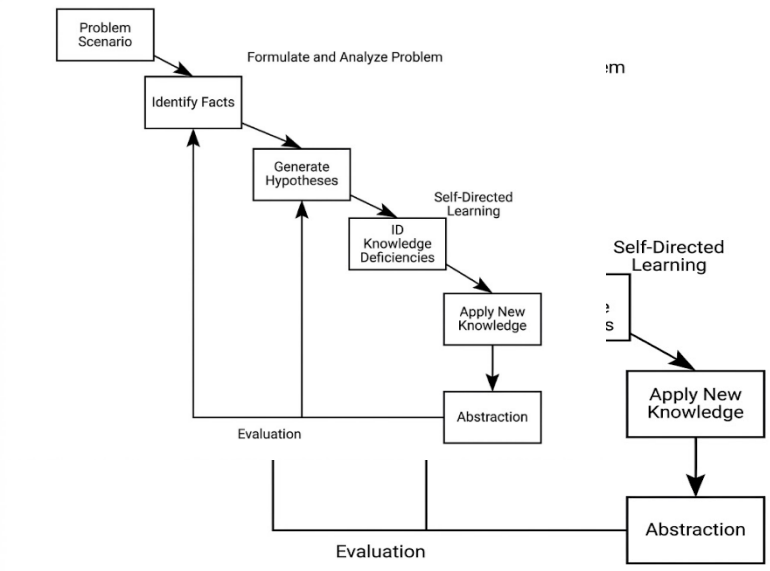

Fig 1. The problem-based learning cycle (Adapted from Hmelo-Silver, 2004)

Vietnam has been using the PBL approach since the 1980s to improve the quality of teaching and learning. Some universities have tried using PBL in certain subjects, and the

results showed that it makes students more active and interested in learning. While PBL is becoming more common in different fields, there is still a need for more research on how to use it to teach specific skills at the university level.

2.2. The Integration of PBL and AI

The combination of PBL and Artificial Intelligence (AI) creates a powerful framework for modern education. According to Novak et al. (2025), while PBL provides a student-centered approach focusing on inquiry and collaboration, AI enhances this process by offering personalized learning experiences, real-time feedback, and data-driven insights. For instance, AI can analyze a student's progress and adjust instructional materials to fit their specific needs, helping them navigate complex problems more efficiently. Similarly, Shocheb et al. (2025) stated that AI can also serve as a virtual mentor that offers guidance, support, and resources while students work through problems. Hence, AI-powered tools, such as intelligent tutors and simulation platforms, can guide learners through every stage of the PBL cycle, from defining the problem to testing hypotheses and reflecting on outcomes (Novak et al., 2025).

Integrating AI into the PBL framework also helps more students and teachers participate in digital learning. According to Omeh and Ayanwale (2025), this combination allows learners to immerse themselves in intelligent environments that offer instant feedback, chances to work together, and automatic help with solving problems. These tools make the PBL learning process more accessible and interactive for everyone involved.

2.3. Impacts on Public Speaking: Motivation, Confidence and Learning Autonomy

AI powered learning enhances accessibility, personalization, and digital inclusion, promoting equitable and quality education through tailored feedback and adaptive learning (Hariyanto et al., 2025). These contributions are particularly relevant in higher education, where AI-supported PBL models can support self-directed learning, critical thinking, and digital literacy.

Public speaking is widely recognized as a fundamental component of professional skill, allowing individuals to persuade others, inspire audiences and boost their confidence. However, for most learners, managing speech anxiety remains the primary obstacle to proficiency. Research indicates that structured instruction and consistent feedback are the most effective methods to reduce nervousness and improve delivery.

As a result, the integration of Artificial Intelligence (AI) has recently opened up new opportunities for speaking practices to address the aforementioned issues in public speaking. Since AI systems enable personalized learning experiences with interaction and feedback, students can engage in repeated practice, correct their own errors, and progressively develop confidence in their speaking abilities (Zhang, 2025). Other research has also proved that AI has had a beneficial impact on the affective outcomes of learners, including the reduction of language anxiety (Bashori et al., 2020; 2021), the enhancement of motivation (Chiu et al., 2023), and the rise in self-confidence. Similarly, a research by Phan (2024) demonstrates that applying AI greatly improves university students' speaking performance while also enhancing their motivation and confidence.

In this study, one of the primary objectives of integrating AI within a PBL framework is to cultivate intrinsic motivation in practicing public speaking, which occurs when learners engage with a task due to personal interest, perceived challenge, or a sense of mastery. Motivation is believed to be significantly amplified when students perceive that the outcome of learning is under their control. Hence, by rewarding profound understanding and

independent action rather than comparative performance, the PBL framework fosters an environment where students are intrinsically motivated (Hmelo-Silver, 2004). Therefore, on an AI-PBL platform, students are provided with a "safety net" where they can manage their own learning direction and practice schedules with real-time feedback.

Furthermore, under the PBL framework, proximate, tangible activities, such as successfully navigating a simulated speech, are more motivating than abstract goals according to Bandura (1997) and can boost the learner's self-efficacy. Junaidi et al. (2020) also claims that AI can improve not only the learners' oral fluency but also their self-confidence.

With regards to self-directed learning, the Problem Based teaching approach was introduced with the desire to integrate language and content, which can facilitate autonomous learning. Moreover, according to Lin and Muenks (2025) and Tozzo et al. (2024), learners' sense of mastery and autonomy may be increased by using AI technologies through adaptive feedback and real-time suggestions. As Hariyanto et al. (2025) noted that students are more likely to remain interested and persistent when they are exposed to information that particularly suits learning speed, personalized learning such as AI-supported systems can therefore promote learner autonomy.

2.4. Research gap

Despite the growing availability of AI tools for public speaking, empirical evidence remains limited regarding their actual impact on a learner's holistic development specifically in terms of fluency, confidence, motivation, and autonomy. In Vietnam, this research gap is even more pronounced; while Problem-Based Learning (PBL) has been studied for decades, implementation has still been largely confined to secondary schools, leaving its potential in higher education under-explored (Phan, 2024). Furthermore, the use of combined AI-supported PBL models for teaching soft skills is still a fairly unexplored area, especially in tertiary contexts. This study addresses these gaps by investigating how an AI-supported PBL framework can support the specific communication needs of university students.

3. Methodology

3.1. Research site

This study was conducted at Ho Chi Minh City University of Technology (HCMUT), Vietnamese National University Ho Chi Minh City (VNU-HCM), one of the leading technical universities in southern Vietnam. The university currently enrolls more than 30,000 students, postgraduates, and doctoral candidates across a wide range of engineering and technology disciplines. This site was selected for its large, diverse student population, which provides a representative sample and facilitates efficient data collection for the study.

3.2. Participants

The participants who took part in the study were students from the Ho Chi Minh City University of Technology (HCMUT). The targets consisted of undergraduate students enrolled in effective communication and English-speaking courses. To minimize potential teacher bias, convenience sampling was used to select two intact classes taught by the same instructor. The experimental group interacted with the AI-supported PBL digital environment, while the control group covered identical course aims using traditional teaching methods.

3.3. Study design

This study employs mixed methods, quasi-experimental research design. Due to rigid academic scheduling at Ho Chi Minh City University of Technology (HCMUT), randomly

assigning individual students to experimental and control conditions was not feasible. Instead, two intact, pre-existing classes were utilized. The independent variable is the instructional method. The experimental group engaged with a Learning Management System (LMS) integrated with Artificial Intelligence (AI) within a Problem-Based Learning (PBL) framework, while the control group received traditional classroom instruction. The dependent variables include objective public speaking performance, measured through fluency and confidence, alongside psychological factors such as learner autonomy, cognitive engagement, and attitudes toward AI technology.

3.4. Data collection procedures

Data were gathered using two primary instruments: objective performance assessments and subjective perception surveys. To measure concrete skill development, students in both groups completed a post-test presentation in the final week of the module, in which the speaking performance results of 48 students in experimental class in semester 252 (2026) were compared with data of the control class about 48 students in the same semester who had not used AI popularly yet. These recorded speeches lasted between three and five minutes. Fluency was objectively measured using automated software to track speaking rate and filler word frequency, while confidence and vocal expression were independently graded by lecturer.

Following the post-test, two sets of questionnaires were also utilized in this study, one for participants who engaged with AI-supported PBL instructions on the LMS platform and one for the other group with traditional teaching methods. Firstly, the questionnaires were sent separately via email to two groups of students with 27 students per group. Students' levels of interest were measured using a five-point Likert scale, ranging from 1 (strongly disagree) to 5 (strongly agree), with higher scores indicating greater levels of interest, and two open-ended questions in both sets of questionnaires. The survey employed a multiple-choice format, including questions related to students' interest in the two instructional methods. This survey was designed to capture students' subjective experiences regarding their learning autonomy, engagement levels, motivation and overall acceptance of the technology.

3.5. Data processing procedures

Quantitative data

The collected quantitative data were analyzed using statistical procedures appropriate for both paired and independent sample comparisons. After this data-cleaning process, a final sample of 27 valid responses per group was retained for analysis, while the remaining responses were discarded due to corrupt or insufficient data. All performance scores and survey responses were imported into SPSS (Statistical Package for the Social Sciences) software for processing. Descriptive statistics, including means, standard deviations, and standard errors of the mean, were first computed to summarize the central tendencies and distribution of scores within each dataset.

To assess students' levels of interest in the two instructional methods, a Paired Samples T-Test was conducted. The questionnaire comprised 27 items with identical content administered to the same group of 27 students under both conditions, yielding two related sets of scores: d_1 (interest in the traditional public speaking method) and d_2 (interest in the AI-supported PBL method), each ranging from a minimum of 27 to a maximum of 135 points. Because each student contributed one score to each method, the data constituted matched pairs rather than independent samples, making the paired t-test the appropriate procedure for isolating the effect of instructional method on perceived interest while controlling for between-

subject variability. The null hypothesis proposed that no difference existed in students' mean interest scores between the two methods.

To evaluate the effectiveness of AI-assisted practice on students' speaking performance, an Independent Samples T-Test was applied to compare the post-test scores of the Control Group (without substantial AI support) and the Experimental Group (with extensive AI support). As these two groups consisted of distinct, unrelated participants, the data were treated as independent samples. Prior to conducting the t-test, an F-Test on the ratio of two variances was performed to verify the assumption of homogeneity of variance between the two groups, determining whether the subsequent t-test should be conducted under the assumption of equal or unequal variances. Once variance equality was confirmed, the pooled estimator of variance was calculated, and the independent samples t-test was conducted to determine whether the difference in mean performance scores between the two groups was statistically significant or attributable to random variation.

In addition, Cronbach's Alpha will be calculated to verify the internal reliability of the psychological survey scales, ensuring that the items within each section of the questionnaire (e.g., cognitive engagement, learning autonomy, fluency and self-efficacy) consistently measure their intended underlying constructs.

Qualitative data

For the qualitative data derived from the open-ended survey questions, a thematic analysis approach will be employed. Students' written responses detailing the most helpful AI features, their specific learning challenges and their changes after applying either learning methods will be systematically reviewed, coded, and categorized into core themes. This qualitative data serves a vital explanatory purpose, providing deeper context to the quantitative statistics and revealing the mechanisms of how the AI-enhanced learning environment influenced student motivation, self-efficacy and autonomy.

Ethical issues

All participants provide formal institutional consent and are assured that their academic records and personal data will remain strictly anonymous. They will have the right to refuse to participate in the research or withdraw from the study at any stage. The information provided by the students will only be used for research purposes and will not be shared with anyone or any organization other than the researchers. The names of each participant in the report will be a random number from 1 to 48, so their identities will also be kept anonymous. Lastly, all hard copies of data related to our research will be safely stored in a locked file drawer while digital files are password protected.

4. Results

The questionnaire consisted of 27 items with identical content administered to assess students' interest in the two instructional methods. Responses were recorded on a 5-point Likert scale (1 = Strongly disagree, 2 = disagree, 3=neutral, 4 = agree, and 5 = Strongly agree) and converted into numerical scores. Let d_1 and d_2 denote the total converted scores reflecting students' interest in the traditional public speaking method and the AI-supported PBL method, respectively. Given 27 items per method, the minimum and maximum possible values of d_1 and d_2 were 27 and 135, respectively. Boxplots were generated to visualize the distribution of both samples. The boxplot 1 and the results presented in Table 1 indicate that the two datasets exhibit relatively similar distributions. The Posttest scores for the Traditional method (N = 27)

yielded a mean of M = 98.52 (SD = 26.41, SE = 5.08), while the Posttest scores for the AI-supported PBL method (N = 27) yielded a mean of M = 100.63 (SD = 26.96, SE = 5.19).

Boxplot 1

The result of students'interest through online survey

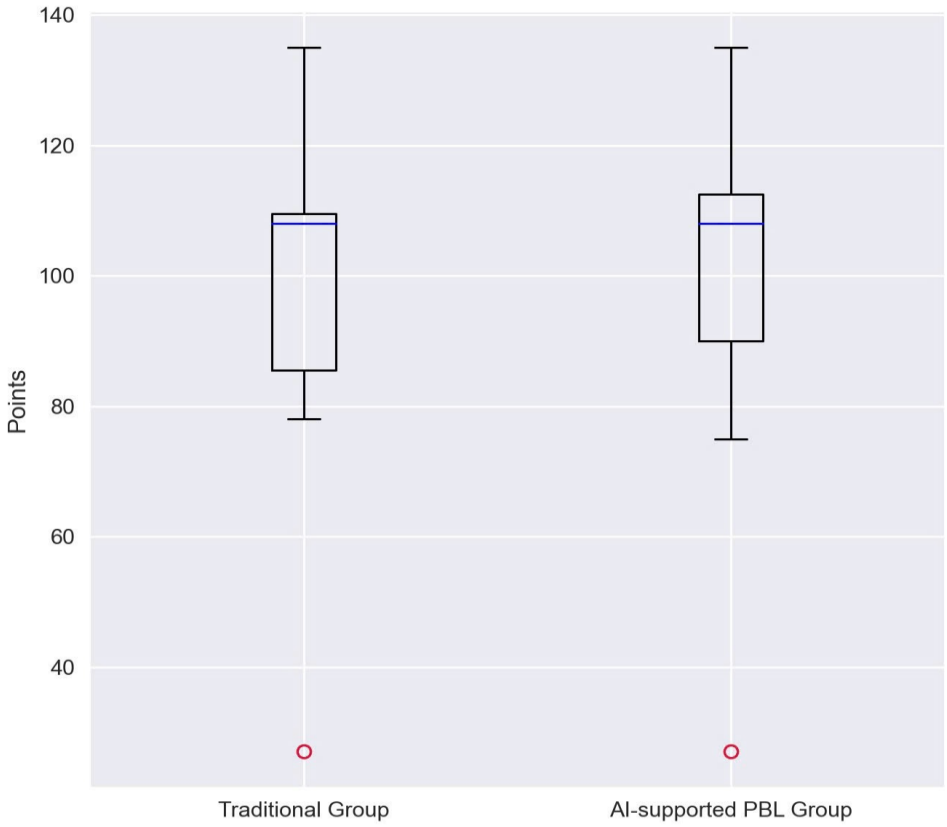

Table 1

Descriptive Statistics for Interest Scores through online Survey

	Group	***N***	***M***	***SD***	***SE***
Online Survey	Traditional	27	98.52	26.41	5.08
	AI-supported PBL	27	100.63	26.96	5.19

Although the descriptive results suggested that the AI-supported PBL sample (d_2) produced a slightly higher mean score than the traditional sample (d_1), this difference could plausibly be attributable to chance. To determine whether the observed difference was statistically meaningful, a paired-samples t-test was conducted, given that both sets of scores were obtained from the same cohort of 27 students, with each participant contributing two related data points.

Let $\Delta d = d_2 - d_1$ represent the difference in converted interest scores between the PBL method and the traditional public speaking method. Three possible outcomes were defined: $\Delta d > 0$ indicates greater interest in the PBL approach; $\Delta d = 0$ indicates equal interest in both methods; and $\Delta d < 0$ indicates greater interest in the traditional approach. The mean difference

score was $\Delta\bar{d}$ = 2.11 (SD = 4.81). The null hypothesis (H_0: $\mu\Delta d = 0$) proposed that students' interest levels did not differ between the two instructional methods. At a significance level of $\alpha = 0.05$ with 26 degrees of freedom, the critical value was t (26) = 1.71. The paired-samples t-test yielded t (26) = 2.24, p-value 0.017, which exceeded the critical threshold and fell below the significance level. The null hypothesis was therefore rejected, indicating that students demonstrated significantly greater interest in the AI-supported PBL method than in the traditional public speaking method, t (26) = 2.24, p-value 0.017.

A second analysis examined the effectiveness of speaking practice with and without substantial AI support, using students' speaking performance scores. The dataset comprised two independent samples: a Control Group, representing speaking practice without significant AI assistance, and an Experimental Group, representing speaking practice with AI support.

As shown in Table 2, descriptive statistics indicated that the Control Group (N = 48) had a mean performance score of M = 6.59 (SD = 0.58, SE = 0.08), while the Experimental Group (N = 48) had a mean performance score of M = 7.25 (SD = 0.76, SE = 0.11).

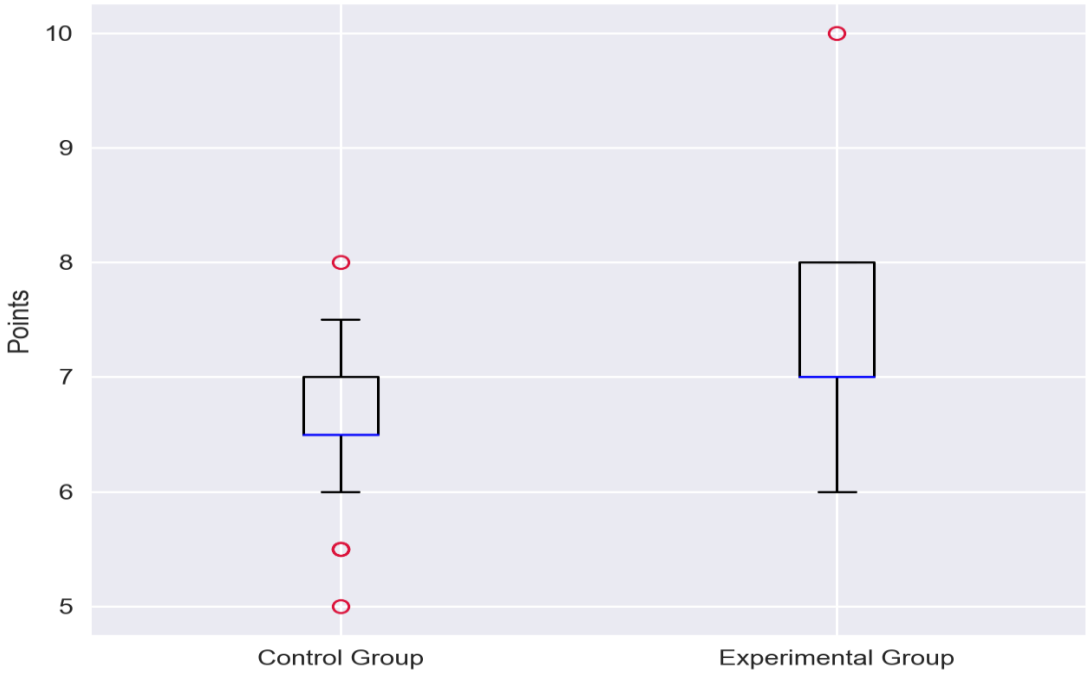

Table 2

Descriptive Statistics for Speaking Performance Scores by Groups

	Group	***N***	***M***	***SD***	***SE***
Posttest	Control	48	6.59	0.58	0.08
	Experimental	48	7.25	0.76	0.11

Boxplot 2:

The speaking performance of groups

Note: The boxplot shows points between control group and experimental group.

The boxplot 2 and descriptive results (table 2) indicated that scores in the Experimental Group were generally higher than those in the Control Group. To determine whether this difference was statistically significant, an independent samples t-test was conducted. Prior to this analysis, an F-test on the ratio of two variances was performed to examine the homogeneity of variance between the two independent populations.

The F-test, conducted at $\alpha = 0.05$, yielded $F = 0.58$, p-value 0.061, indicating no statistically significant difference between the variances of the two populations. Consequently, an independent-samples t-test assuming equal variances was applied. The null hypothesis (H_0) proposed that there was no statistically significant difference between the mean performance scores of the Control and Experimental Groups, and that any observed difference was due to random variation. The pooled estimator of variance was calculated as 0.46.

The independent-samples t-test yielded $t(94) = 4.74$, $p < 0.001$, providing strong evidence to reject the null hypothesis. This result indicated that the Experimental Group's speaking performance scores were significantly higher than those of the Control Group, suggesting that AI support meaningfully enhanced students' speaking skills.

Taken together, the findings from both datasets indicate that students demonstrated greater interest in practicing speaking skills through the AI-supported PBL model relative to the traditional public speaking method, $t(26) = 2.24$, p-value 0.017. Furthermore, students' speaking performance improved significantly when AI-assisted practice was incorporated.

5. Discussion

The findings provide empirical support for the central premise of this study: that embedding AI-driven tools within a Problem-Based Learning (PBL) framework benefits university students' public speaking development across performance, motivation, autonomy, and confidence. Students' stronger speaking performance under AI-supported practice is consistent with Phan (2024) finding that AI integration enhances university students' speaking performance alongside their motivation and confidence, and with Bandura's (1997) self-efficacy theory, which holds that repeated, tangible success in a low-stakes practice environment builds confidence more effectively than abstract instruction alone.

This gain in performance was accompanied by a parallel rise in interest, which can be explained through Hmelo-Silver's (2004) account of PBL as a framework that fosters intrinsic motivation by rewarding independent action and authentic problem-solving rather than comparative performance. Because the questionnaire items were identical across both conditions, this difference can reasonably be attributed to the AI-supported PBL approach itself rather than to extraneous content effects.

This heightened engagement, in turn, points to a plausible gain in learner autonomy: students who found the AI-supported method more interesting were likely also exercising greater control over their own practice and pacing, an arrangement Hmelo-Silver (2004) describes as a "safety net" within the PBL cycle. Taken together, the consistency between greater interest and stronger performance suggests that engagement and skill development are mutually reinforcing within the AI-supported PBL model, lending empirical weight to AI-PBL integration as a pedagogical strategy. While the use of independent samples for the performance comparison limits the strength of causal inference, the convergence of both effects offers reasonable support for the conclusion that AI-supported PBL instruction meaningfully improves students' public speaking outcomes, both in measurable performance and self-reported interest in learning.

Overall, the consistency between the two outcomes—greater interest and superior speaking performance in the AI-supported PBL group—indicates that engagement and skill development are mutually reinforcing within this model. This pattern lends empirical weight to the integration of PBL and AI as a pedagogical strategy and addresses the research gap identified by Phan (2024) regarding the limited empirical evidence on AI integrated PBL implementation in Vietnamese higher education. While the use of independent samples for the performance comparison limits the strength of causal inference, the consistency of both effects provides reasonable support for the conclusion that AI-supported PBL instruction meaningfully improves university students' public speaking outcomes, both in terms of measurable performance and self-reported interest in learning.

Limitations

Despite the promising findings, several limitations should be acknowledged. First, the sample size was relatively small and drawn from a single university context, which may limit the generalizability of the results. Future studies should include a larger and more diverse population across different institutions and cultural settings. Second, the duration of the intervention was relatively short. A longer experimental period may provide deeper insights into the long-term effects of AI-assisted learning on speaking performance and learner autonomy. Third, the study relied partially on self-reported data, which may be subject to response bias. Although efforts were made to ensure anonymity, students may have overestimated their perceived improvements. Finally, while this study focused on speaking skills, other language competencies such as listening and pronunciation accuracy were not examined in depth. Future research could adopt a more comprehensive approach to evaluating language proficiency. These limitations suggest that while the findings are encouraging, they should be interpreted with caution.

6. Conclusion

This study set out to determine the impact of an AI-supported Learning Management System integrated within a Problem-Based Learning framework on university students' public speaking performance, confidence, motivation, and learner autonomy. The findings answer this question clearly: students in the AI-supported PBL condition achieved significantly stronger speaking performance and reported significantly greater interest in their instructional method than their peers in the traditional condition. It also produces a coherent, mutually reinforcing improvement across performance, motivation, and self-directed engagement. This suggests that AI is best treated not as a supplementary tool but as a structural component of the PBL cycle itself.

In addition, the findings highlight the potential of AI technologies to transform traditional language learning environments into more interactive, personalized, and learner-centered experiences. From a pedagogical perspective, the results suggest that educators should consider incorporating AI-driven platforms into their teaching practices to provide students with more opportunities for practice and feedback. Such integration not only improves learning outcomes but also fosters greater learner independence and confidence. Future research is encouraged to explore the long-term impact of AI-assisted learning and to examine its effectiveness across different educational contexts and disciplines.

Acknowledgments

The author would like to express sincere gratitude to all participants for their valuable contributions to this study. Special appreciation is extended to the survey respondents for their time, cooperation, and honest feedback, which were essential to ensuring the reliability of the

research data. The author also thanks colleagues and mentors for their insightful comments and continuous support throughout the research process. The author gratefully acknowledges the organizing committee of the HUFLIT International Conference for providing a valuable academic platform for knowledge exchange and scholarly discussion.

Ms. Thi Thao Trang Nguyen holds a Master's degree in TESOL through a joint program with Victoria University, Australia. She has over 16 years of experience teaching Non-English-Major learners at Ho Chi Minh City University of Technology and at Language Centers specializing in IELTS and TOEIC. Her research and teaching interests focus on technology-enhanced language learning, soft skills development, and innovation in English education. She has led student teams in award-winning community projects and participated in international professional development programs, including Train the Trainer and online instructional design workshops. She continues to explore innovative approaches to enhance language learning outcomes and foster learner autonomy in higher education contexts.

Appendix A

Experimental Group

Survey on learning experience with ai and the pbl model

Student Information

Student ID: _____

Note: The student ID is used solely to match your performance improvement results. All personal information will be kept strictly confidential.

Instructions: Please indicate your level of agreement on a scale from 1 (*Strongly Disagree*) to 5 (*Strongly Agree*).

Section 1: Perceived Usefulness of Traditional Learning Methods

1. Instructor feedback in class helps me clearly identify my strengths and weaknesses.

2. Practicing speaking directly with peers/instructors provides a realistic learning environment.

3. Course materials and the instructional structure help me understand the lesson content systematically.

4. In-class practice activities help me learn how to handle real presentation situations.

5. Feedback from instructors and peers helps improve my speaking fluency.

6. I find the current speaking instruction method effective in improving my skills.

Section 2: Cognitive Engagement

7. I feel fully engaged when participating in class discussions or presentations.

8. I spend considerable time reviewing and correcting my mistakes based on instructor feedback.

9. I am willing to rehearse my presentations multiple times to prepare thoroughly for class presentations.

10. In-class activities require me to think carefully about delivering the most persuasive presentation.

11. I remain fully focused and undistracted during speaking practice activities.

12. I proactively seek additional learning materials to improve my speaking skills.

Section 3: Learning Autonomy

13. I set personal goals for each AI practice session (e.g., avoiding reading notes, controlling speaking pace).

14. I monitor my progress by comparing results across different attempts on the system.

15. AI tools enable me to practice effectively without direct teacher guidance.

16. I independently identify ways to correct errors highlighted by AI (e.g., practicing pronunciation until recognized as correct by the system).

17. I feel fully in control of managing my own learning (e.g., choosing when to practice without waiting for instructor instructions).

18. AI evaluation criteria help me assess my speaking performance objectively.

19. I feel comfortable identifying areas for improvement without external reminders.

Section 4: Fluency and Self-Efficacy

20. I feel confident in delivering a fluent presentation in front of a real audience.

21. I believe I can effectively manage presentation anxiety (e.g., nervousness, forgetting content).

22. I am confident in using body language (gestures, movements) to enhance my presentation.

23. I am able to maintain natural eye contact with the audience.

24. I believe I can organize ideas logically and clearly when presenting them.

25. My confidence has increased due to repeated practice in a safe AI-supported environment.

26. I can maintain a stable speaking pace without being too fast or too slow.

27. I am able to minimize filler words (e.g., “um,” “uh,” “you know”) when speaking in public.

Section 5: Technology Acceptance

28. The LMS interface and AI tools are user-friendly and easy to operate.

29. I rarely encounter technical issues that interrupt my practice.

30. I would like to continue using these AI simulation tools in other courses.

Section 6: Open-Ended Questions (Optional – for qualitative analysis)

31. Which feature of this AI system do you like the most? (e.g., virtual audience, detailed feedback reports, ability to repeat practice multiple times, etc.)

32. How has learning through problem-based learning (PBL) combined with AI changed the way you prepare a presentation? (Please briefly describe your changes.)

……

Appendix B

Control Group

Survey on learning experience in public speaking skills

Student Information

Student ID: _____

Note: The student ID is used solely to match your skill improvement results. All information will be kept confidential.

Instructions: Please rate your level of agreement from 1 (*Strongly Disagree*) to 5 (*Strongly Agree*) based on your learning experience during this semester.

Section 1: Perceived Usefulness of Traditional Learning Methods

1. Instructor feedback in class helps me clearly identify my strengths and weaknesses.

2. Practicing speaking directly with peers/instructors provides. a realistic learning environment.

3. Course materials and the instructional structure help me understand the lesson content systematically.

4. In-class practice activities help me learn how to handle real presentation situations.

5. Feedback from instructors and peers helps improve my speaking fluency.

6. I find the current speaking instruction method effective in improving my skills.

Section 2: Cognitive Engagement

7. I feel fully engaged when participating in class discussions or presentations.

8. I spend considerable time reviewing and correcting my mistakes based on instructor feedback.

9. I am willing to rehearse my presentations multiple times to prepare thoroughly for class presentations.

10. In-class activities require me to think carefully to deliver the most persuasive presentation.

11. I remain fully focused and undistracted during speaking practice activities.

12. I proactively seek additional learning materials to improve my speaking skills.

Section 3: Learning Autonomy

13. I set personal goals after receiving feedback from instructors or peers.

14. I monitor my progress by recording myself or practicing speaking at home.

15. I am able to practice effectively without constant supervision from the instructor.

16. I independently identify ways to correct the errors I notice during practice.

17. I feel capable of managing my own learning pace and schedule.

18. I can objectively evaluate my speaking performance based on the criteria provided by the instructor.

19. I feel comfortable identifying areas for improvement without external reminders.

Section 4: Fluency and Self-Efficacy

20. I feel confident that I can deliver a fluent presentation in front of a real audience.

21. I believe I can effectively control presentation anxiety (e.g., nervousness, forgetting content).

22. I am confident in using body language (gestures, movements) to enhance my presentation.

23. I am able to maintain natural eye contact with the audience.

24. I believe I can organize my ideas logically and clearly when presenting them.

25. My confidence has increased as a result of repeated practice during the course.

26. I am confident that I can maintain a stable speaking pace without speaking too fast or too slowly.

27. I believe I can minimize the use of filler words (e.g., “um,” “uh,” “you know”) when speaking in public.

Section 5: Feedback (Optional)

28. Which teaching method or classroom activity has helped you improve your speaking skills the most?

29. What is the biggest difficulty you face when practicing speaking skills using the current learning approach?

#182 STUDENT PERCEPTIONS OF AI-ASSISTED LEARNING AND ITS PERCEIVED ASSOCIATION WITH TEACHER–STUDENT INTERACTION IN EFL SPEAKING CLASSES: AN EXPLORATORY SELF-REPORT STUDY WITH NON-ENGLISH MAJOR UNIVERSITY STUDENTS

Thanh Thuy Nguyen[1]

Abstract

The growing integration of artificial intelligence (AI) in English language education has generated increasing interest in its perceived relationship to classroom interaction. This study presents an exploratory, self-report investigation of student perceptions of AI-assisted learning and its perceived association with teacher–student interaction in English as a Foreign Language (EFL) speaking classes among non-English major university students at HCMC University of Technology. Data were collected from 200 students through Likert-scale questionnaires and reflective journals. The results indicate that students perceived AI tools as associated with increased confidence, greater reported enjoyment of speaking tasks, and more prepared engagement with teachers in specific interactional contexts. Specifically, 64% of students reported feeling more confident after AI-assisted speaking tasks, and 61% expressed that learning through AI felt enjoyable; however, only 47% reported feeling willing to share ideas in class, illustrating a preparedness–participation gap between internal readiness and observable engagement. Notably, challenges such as over-reliance on AI (42% of students) and reduced spontaneity (38%) were also prominent findings and receive equal weight in this analysis. Although most participants expressed positive attitudes toward AI use in speaking classes, its perceived association with interactional quality appears contingent on thoughtful pedagogical integration and appropriate instructional design. All findings are strictly perceptual and associational; no causal claims regarding AI's effects on teacher–student interaction are made. The findings highlight the importance of balancing technological support with active teacher guidance to sustain meaningful classroom interaction.

Keywords: artificial intelligence (AI), AI-assisted learning, teacher–student interaction, EFL speaking, non-English major students

1. Introduction

The rapid advancement of artificial intelligence (AI) technologies has profoundly reshaped English as a Foreign Language (EFL) teaching. From intelligent grammar checkers and pronunciation coaches to conversational chatbots and adaptive learning platforms, AI tools are increasingly embedded in language learning environments worldwide. In Vietnam, where English proficiency is a national educational priority, the integration of AI into higher education classrooms has accelerated considerably, particularly following the COVID-19 pandemic, which forced widespread adoption of digital learning tools (Pham & Ho, 2020).

[1]*Corresponding author. Foreign Language Center, Ho Chi Minh City University of Technology (HCMUT), Ho Chi Minh City, Vietnam. Email: nguyenthanhthuy@hcmut.edu.vn*

Despite this proliferation, a critical question remains underexplored: to what extent do AI-assisted tools genuinely enhance teacher–student interaction in EFL speaking classes, particularly among non-English major students? Speaking is widely regarded as the most challenging language skill, requiring spontaneity, fluency, accuracy, and confidence—qualities difficult to nurture in large, exam-focused Vietnamese university classrooms (Nguyen et al., 2021). Non-English major students, who study English as a compulsory subject rather than a specialized field, often exhibit lower motivation and higher anxiety toward speaking tasks compared to English-major peers (Tran, 2020).

Teacher–student interaction is a cornerstone of effective speaking instruction. Sociocultural theory views second language development as a socially mediated process in which learners' participation in social activity and interaction contributes to their development (Lantolf & Beckett, 2009). When AI tools enter this interaction space, they create new communicative dynamics: students may practice speaking with AI before engaging with teachers; teachers may use AI-generated feedback to redirect classroom discussions; and the feedback loop between teacher, student, and language may be fundamentally altered. Understanding how students perceive these shifts, and what those perceptions suggest for pedagogical practice, is the central motivation of this study.

This paper reports findings from an exploratory study conducted at HCMC University of Technology (HCMUT), involving 200 non-English major undergraduate students enrolled in required EFL speaking courses. Using a mixed-methods design combining Likert-scale questionnaires and reflective journals, the study is guided by three research questions presented in the following subsection.

1.1 Research Questions

The study is organized around three research questions that collectively address AI's perceived influence on teacher–student interaction:

RQ1: How do non-English major university students perceive AI-assisted learning as associated with their readiness and willingness to engage in teacher–student interaction in EFL speaking classes?

RQ2: What interactional challenges do non-English major students report perceiving in AI-assisted EFL speaking activities, and how do they perceive these challenges as affecting their engagement in teacher–student interaction?

RQ3: Under what self-reported pedagogical conditions do students perceive AI-assisted learning as most supportive of their engagement in teacher–student interaction in EFL speaking classes?

1.2 Organization of the Paper

To situate this inquiry within the broader field, Section 2 reviews key theoretical and empirical work on teacher–student interaction in EFL contexts, the role of AI in language learning, and the intersection of these two areas. Section 3 describes the research methodology, followed by the results in Section 4, discussion in Section 5, and conclusions in Section 6.

2. Literature Review

2.1 Teacher-Student Interaction in EFL Contexts

Teacher–student interaction has long been recognized as a central mechanism through which language acquisition occurs. Interaction hypothesis theory (Long, 2015) proposes that

negotiation of meaning between interlocutors drives second language development by making input comprehensible and pushing learners toward more accurate output. In EFL speaking classrooms, this negotiation typically unfolds through question-and-answer exchanges, corrective feedback, recasts, and collaborative tasks (Walsh, 2011).

However, large class sizes, time constraints, and student anxiety frequently impede interaction in Vietnamese university EFL contexts. Research consistently documents teacher-dominated discourse in such settings, where students speak minimally and rely on rehearsed formulaic utterances (Nguyen et al., 2021; Tran, 2020). Interventions that redistribute interactional opportunities, which encourage students to take more turns, elaborate more fully, and respond more spontaneously, are therefore of considerable pedagogical interest.

Against this backdrop of interactional challenges in EFL classrooms, researchers and educators have increasingly turned to AI-powered tools as a potential means of expanding and enriching opportunities for language practice and feedback.

2.2 AI in Language Learning

Artificial intelligence applications in language education encompass a broad spectrum of tools, including natural language processing (NLP)-based feedback systems, speech recognition software, conversational agents, and generative AI models such as ChatGPT (Kohnke et al., 2023; Godwin-Jones, 2022). These tools share a common capacity to provide immediate, individualized feedback—a feature that distinguishes them from traditional classroom-based instruction, where teacher attention is distributed across many learners.

Studies have demonstrated that AI-mediated feedback can reduce speaking anxiety by offering a low-stakes practice environment (Huang et al., 2023). Students reluctant to speak in front of peers may find it easier to experiment with language when interacting with an AI system. Furthermore, AI tools can extend interaction beyond class hours, allowing students to practice pronunciation, vocabulary, and conversational routines independently (Godwin-Jones, 2022). Generative AI tools, particularly large language models, have introduced new possibilities in EFL instruction. ChatGPT and similar tools can generate topic-relevant speaking prompts, simulate conversational partners, provide error analysis, and scaffold content preparation—functionalities that can significantly support speaking task readiness (Kohnke et al., 2023). Nevertheless, concerns about pedagogical dependency, the authenticity of AI-generated content, and equity of access have also been raised (Ulla et al., 2023).

2.3 AI and Teacher–Student Interaction

The intersection of AI and classroom interaction remains a relatively emergent research area. Some studies suggest that AI can serve as an interactional catalyst, meaning students who have prepared with AI tools arrive in class better equipped to participate meaningfully, thereby enriching teacher–student exchanges (Huang et al., 2023). Others caution that AI use may create a paradox: while students interact more with technology, their interaction with teachers may paradoxically diminish as AI becomes the primary feedback provider (Ulla et al., 2023).

This tension underscores the importance of instructional design. When teachers explicitly frame AI tools as preparatory scaffolds rather than replacements for classroom dialogue, positive interactional outcomes are more likely. Conversely, unstructured AI use may result in surface-level language performance that masks deeper communicative deficiencies (Kohnke et al., 2023). Research in Vietnamese EFL contexts is sparse. Pham and Ho (2020) found that students valued digital feedback tools during the pandemic but noted that teacher presence remained essential for motivated participation. No study has systematically explored

student perceptions of AI's relationship to teacher–student speaking interaction among non-English major university students in Vietnam—a gap this exploratory study aims to address.

2.4 Conceptual Framework: The Preparedness–Participation Gap

Recent scholarship on AI in language education presents an emerging paradox. On one hand, AI-assisted tools enhance learner confidence, reduce anxiety, and increase readiness to engage in speaking tasks (Huang et al., 2023; Godwin-Jones, 2022). On the other hand, a growing body of research raises concerns that increased interaction with AI may reduce learners' reliance on teacher-mediated feedback and limit spontaneous classroom communication (Ulla et al., 2023; Kohnke et al., 2023).

To better understand this dynamic, the present study proposes a three-dimensional model of interactional readiness with clear operational distinctions between dimensions: (1) cognitive readiness—operationalized as learners' self-reported ability to generate ideas, organize content, and formulate linguistically appropriate responses prior to speaking tasks, as measured by items related to preparation quality and idea generation; (2) affective readiness—operationalized as learners' self-reported emotional orientation toward speaking, including confidence, perceived self-efficacy, and enjoyment, as measured by items from the anxiety and AI Attitudes subscales; and (3) interactional engagement—operationalized as learners' self-reported willingness to take communicative risks in public classroom settings, including willingness to share ideas, speak without extensive preparation, and engage responsively with teacher prompts, as measured by items from the WTC subscale. Unlike the first two dimensions, the third is inherently social and evaluative, shaped by concerns about peer perception, face-saving, and audience awareness that are not reducible to internal preparedness alone.

This framework suggests that AI may influence these dimensions unevenly: while it is likely to enhance cognitive and affective readiness, its impact on actual interactional engagement may be more limited. This potential discrepancy is conceptualized here as the preparedness–participation gap, defined as the divergence between learners' self-reported internal readiness to communicate and their self-reported willingness to engage in classroom interaction. This concept is related to, but distinct from, the broader willingness to communicate (WTC) construct (MacIntyre et al., 2001) and foreign language anxiety (Horwitz, 2010). WTC captures a learner's general disposition to initiate communication when given the opportunity; research has further linked WTC to self-regulatory and action control processes that shape whether readiness is converted into actual communicative behavior (MacIntyre & Doucette, 2010). The preparedness–participation gap focuses specifically on the mismatch that arises when AI-mediated preparation raises internal readiness without proportionally increasing the willingness to take interactional risks in public, teacher-evaluated settings. Foreign language anxiety, meanwhile, is primarily an affective variable; the gap concept foregrounds the social and contextual barriers that persist even after affective readiness has improved.

3. Research Methodology

3.1 Research Design

A mixed-methods research design was adopted, combining quantitative Likert-scale questionnaires with qualitative reflective journal entries. This triangulated approach enables convergent validation of findings while capturing both the breadth of student attitudes and the depth of individual experiences. The study was conducted during the second semester of the 2023–2024 academic year at HCMUT.

3.2 Participants

Two hundred (200) undergraduate students participated in this study. All were enrolled in required English communication courses representing non-English major disciplines including Engineering, Computer Science, Business Administration, and Natural Sciences. Ages ranged from 18 to 22 years; approximately 53% identified as male and 47% as female. In terms of English proficiency, students were placed into the course based on institutional placement results aligned to the CEFR framework: approximately 41% were assessed at A2 level, 47% at B1 level, and 12% at B2 level. Proficiency level is reported as a descriptive variable; the sample size and study design do not permit meaningful subgroup comparisons across levels, and proficiency is not included as a covariate in inferential analyses. None had previously received formal instruction on using AI tools for EFL learning, though 78% reported prior informal use of translation applications. The eight-week intervention was implemented across four intact class sections, all taught by the same instructor, who is also the author. Holding postgraduate qualifications in Applied Linguistics, the instructor completed several training courses in AI-assisted teaching prior to the intervention, ensuring standardized guidance on AI tool use, task framing, and journal prompt delivery across all four sections.

3.3 AI Tools Used

Students were introduced to two primary AI tools during the eight-week intervention period: (1) ChatGPT (OpenAI) for speaking topic preparation, idea generation, and self-review of drafted oral responses; and (2) ELSA Speak, an AI-powered pronunciation coaching application, for phoneme-level practice and fluency feedback. Teachers provided structured guidance on using these tools as pre-task preparation aids and post-task self-assessment resources, following principles of scaffolded technology integration (Godwin-Jones, 2022).

3.4 Intervention Procedure

The intervention was implemented over eight consecutive weeks during the regular English communication course. Each weekly session lasted approximately 150 minutes and incorporated AI-assisted preparation activities prior to classroom speaking tasks. Students primarily used ChatGPT to generate ideas, organize responses, and rehearse speaking content, while ELSA Speak was used for pronunciation and fluency practice. Teachers emphasized that AI tools should function as preparatory supports rather than substitutes for classroom performance. AI use did not contribute directly to students' course grades.

Table 1

Overview of the Eight-Week AI-Assisted Speaking Intervention

Week	Speaking Focus	AI-supported Preparation	Classroom Speaking Activity	Teacher Role
1	Giving suggestions for improvements	Brainstorm ideas and organize responses (ChatGPT)	Pair discussion and presentation	Introduced AI prompting strategies and provided a speaking outline
2	Talking about the inventions of the 20th century	Search for information, generate key ideas, and organize content (ChatGPT)	Individual speaking and presentation	Guided speaking requirements provided feedback
3	Describing jobs	Generate an outline, key vocabulary, and sample expressions (ChatGPT)	Pair discussion	Facilitated warm-up and follow-up activities

Week	Speaking Focus	AI-supported Preparation	Classroom Speaking Activity	Teacher Role
4	Conducting a job interview	Generate interview questions and model responses (ChatGPT)	Pair role-play	Monitored interactions and provided corrective feedback
5	Discussing health issues	Brainstorm ideas and useful vocabulary (ChatGPT)	Small-group discussion	Facilitated discussion and encouraged spontaneous responses
6	Role-playing a conversation at a doctor's	Generate sample dialogues and useful expressions (ChatGPT)	Pair role-play	Observed role-plays and provided communicative feedback
7	Narrating a folk tale	Brainstorm ideas and organize the story sequence (ChatGPT)	Pair storytelling	Facilitated pre-speaking activities and follow-up discussion
8	Describing favorite entertainment activities	Generate an outline and supporting vocabulary (ChatGPT)	Individual video-recorded presentation	Provided individualized feedback on content and language use

**ELSA Speak was used for pronunciation and fluency practice as homework and is therefore not presented in this table.*

Students spent varying amounts of time using AI tools before each classroom speaking activity. The teacher, who is also the author, followed a standardized instructional protocol developed prior to the intervention in all four classes, including identical guidance on AI use, and speaking task procedures. Students were encouraged to evaluate and personalize AI-generated responses rather than memorizing them. AI-assisted preparation served as a learning support and was not assessed separately from normal course participation.

3.5 Data Collection Instruments

3.5.1 Questionnaire

A 9-item, five-point Likert-scale questionnaire (1 = Strongly Disagree to 5 = Strongly Agree) was administered at the end of the intervention period. Items were selectively adapted from three established, validated scales to ensure psychometric soundness and theoretical coherence across the three dimensions of the study.

The first cluster, measuring speaking anxiety, fear of negative evaluation, and communication apprehension, was adapted from the Foreign Language Classroom Anxiety Scale (FLCAS; Horwitz et al., 1986). Items were reworded to reflect the AI-assisted speaking context. The second cluster, capturing willingness to communicate, participation intent, and interactional readiness, was adapted from the WTC scale (MacIntyre et al., 2001). The third cluster, addressing student attitudes toward AI tools, perceived enjoyment, and outcome expectations, was adapted from the GenAIAS (Orhan et al., 2024).

The adapted instrument was piloted with 25 non-English major students to verify item clarity and internal consistency. The final questionnaire demonstrated satisfactory reliability (overall Cronbach's $\alpha = .83$; anxiety cluster $\alpha = .79$; WTC cluster $\alpha = .81$; AI attitude cluster $\alpha = .85$), all meeting the conventional threshold of $\alpha \geq .70$ for exploratory research (Tavakol & Dennick, 2011).

In addition, AI-assisted preparation was measured as an independent construct using three items developed specifically for this study (Cronbach's $\alpha = .78$; $M = 3.72$, $SD = 0.61$), serving as the independent variable in the exploratory path analysis reported in Section 4.2.

3.5.2 Reflective Journals

Qualitative data were collected through structured guided reflective journals administered after each AI-assisted speaking task across the eight-week period, grounded in Boud, Keogh, and Walker's (1985) three-stage model of reflection—returning to experience, attending to feelings, and re-evaluating the experience—as more recently synthesized in Mali's (2025) review of reflective practice in language teaching and learning. Following this three-stage model, three structured prompts were developed: (a) "Describe how you used the AI tool to prepare for today's speaking task"; (b) "How did using the AI tool affect how you felt about speaking in class today?"; and (c) "What would you do differently in your next AI-assisted speaking task, and why?" Students were permitted to write in English or Vietnamese to minimize language barriers. Vietnamese-language entries were translated into English by a bilingual research assistant with a postgraduate qualification in Applied Linguistics prior to thematic coding. Back-translation of a randomly selected 15% subsample confirmed semantic equivalence, with no substantive discrepancies identified.

3.6 Data Analysis

Quantitative data were analyzed using descriptive statistics and inferential analyses in SPSS 26.0, including multiple regression to examine whether AI-related affective factors predict willingness to communicate, and exploratory path analysis (with bootstrapping, 5,000 resamples) to explore whether confidence mediates the association between AI-assisted preparation and participation. An exploratory factor analysis (EFA) using principal axis factoring with varimax rotation was conducted to validate the adapted questionnaire's three-factor structure. Given the cross-sectional design, the exploratory path analysis is strictly exploratory; results are presented as associational patterns only and should not be interpreted causally.

Qualitative journal entries were analyzed using Braun and Clarke's (2021) six-phase thematic analysis in NVivo 12. Two independent coders analyzed a randomly selected 20% subsample, yielding inter-rater reliability of $\kappa = .81$, indicating strong agreement (McHugh, 2012). Discrepancies were resolved through discussion.

4. Results

4.1 RQ1: Student Perceptions of AI-Assisted Learning and Perceived Readiness for Teacher–Student Interaction

The findings indicate that students perceived AI-assisted learning as associated with positive shifts in their readiness to engage in classroom interaction, particularly at the level of cognitive and affective preparation. Students reported relatively high levels of enjoyment (61% endorsing Agree or Strongly Agree) and increased confidence after completing AI-assisted speaking tasks (64%). It is important to note, however, that a substantial neutral bloc was present across items: between 31% and 48% of students selected the Neutral response option, indicating that a sizable proportion of participants neither endorsed nor rejected positive associations between AI and their interactional readiness. This neutral bloc is particularly prominent for willingness to share ideas in class (48% Neutral) and expectations about upcoming tasks (40% Neutral), and should temper overly positive readings of the aggregate

endorsement percentages. The Positive (%) column in Table 2 reflects only Agree + Strongly Agree responses; neutral and negative responses together account for the remaining proportion.

Table 2

Affective Readiness and Participation Indicators (N = 200)

Item	SD (%)	D (%)	N (%)	A (%)	SA (%)	Positive (%)
Feel enjoyable	1	3	35	44	17	61%
Have high expectations	1	5	37	42	15	57%
Feel willing to share	2	3	48	34	13	47%
Have no worry	4	10	35	34	17	51%
Feel nervous (anxiety indicator)	2	16	42	25	15	40%†
Feel confident to be seen	6	12	37	27	18	45%
Feel no shame with mistakes	3	7	39	34	17	51%
Feel more confident after tasks	2	3	31	42	22	64%
Expect upcoming tasks positively	3	7	40	33	17	50%

**SD = Strongly Disagree; D = Disagree; N = Neutral; A = Agree; SA = Strongly Agree. Positive (%) = proportion endorsing Agree or Strongly Agree. Percentages are rounded to the nearest whole number and may not sum to 100% due to rounding. † For the negatively worded item "Feel nervous when speaking," higher agreement reflects elevated anxiety rather than a positive outcome. This item is retained in its original directional form to preserve item authenticity; it is not reverse-coded in the descriptive frequency table. In all inferential analyses (regression, mediation, EFA), this item loads on the Anxiety factor as designed and is treated accordingly. The Positive (%) figure of 40% for this item therefore denotes the proportion of students reporting elevated nervousness, not a favorable outcome.*

However, self-reported indicators more directly linked to active classroom participation were comparatively lower. Only 47% of students reported feeling willing to share their ideas in class, and 45% indicated confidence in being seen speaking publicly. These figures should be read alongside the neutral bloc: 48% of students selected Neutral on the willingness-to-share item, and 37% selected Neutral on confidence in being seen speaking, indicating that many students neither endorsed nor rejected participation readiness. Together, these patterns illustrate a perceived gap between positive affective orientation toward AI-assisted preparation and self-reported readiness for live classroom engagement.

The descriptive statistics presented in Table 2 suggest that positive perceptions of AI-assisted learning were stronger for affective readiness than for indicators of public classroom participation. These descriptive patterns were further examined using inferential analyses.

A Pearson correlation analysis revealed a moderate positive association between reported enjoyment and willingness to share in class ($r = .42$, $p < .01$), suggesting that positive affect tends to accompany increased participation. Multiple regression analysis further indicated that confidence is a meaningful predictor of WTC, and exploratory path analysis provides support for confidence as a partial mediator of the association between AI-assisted preparation and WTC. Although causal inferences cannot be drawn from the cross-sectional design, these patterns are broadly consistent with the preparedness–participation gap.

Thematic analysis of the reflective journal entries yielded five overarching themes. Table 3 presents these themes together with frequency counts reflecting the number of individual students (out of 200) whose journals contained each theme across at least one entry.

Table 3

Reflective Journal Thematic Analysis: Themes and Frequencies

Theme	Number of Students (out of 200)	% of Students
Confidence-building	136	68%
Idea generation / content organization	106	53%
Anxiety reduction	94	47%
Improved teacher interaction quality	58	29%
AI dependency concerns	46	23%

[*]Frequency = number of students (out of 200) whose journal entries independently contained each theme across at least one submission round. % of Students = (Frequency / 200) × 100. Note that a single student's journals may contain multiple themes; therefore, percentages do not sum to 100%.

Confidence-building emerged as the dominant theme (68%), reflecting students' repeated accounts of feeling better prepared and less hesitant following AI-assisted preparation. Idea generation was closely related (53%), with many students describing AI as a scaffold for content organization. Anxiety reduction followed (47%), with students noting that AI practice in low-stakes environments helped mitigate fear of public speaking. Improved teacher interaction quality was reported by 29% of students, who observed that their exchanges with teachers became more substantive following AI preparation. Finally, AI dependency concerns emerged as a reflexive theme (23%), with students questioning their reliance on AI-generated content.

4.2 Inferential Analyses of AI-Related Factors and Willingness to Communicate

4.2.1 Multiple Regression Analysis (RQ1)

A multiple regression analysis assessed whether AI-related affective factors, including perceived enjoyment and confidence after AI-assisted preparation, predict students' willingness to communicate (WTC). The overall model was statistically significant, $F(2, 197) = 34.25$, $p < .001$, explaining 25.8% of the variance in WTC ($R^2 = .258$, Adjusted $R^2 = .250$). Confidence emerged as a significant positive predictor ($\beta = .41$, $p < .001$). Enjoyment also reached significance ($\beta = .12$, $p = .047$), though its effect size was considerably smaller than that of confidence.

Table 4

Multiple Regression Predicting Willingness to Communicate

Predictor	B	SE B	β	t	p
(Constant)	1.21	0.28	—	4.32	< .001
Confidence	0.47	0.07	.41	6.71	< .001

Enjoyment	0.14	0.07	.12	2.00	.047

[*]R^2 = .258, Adjusted R^2 = .250, F(2, 197) = 34.25, p < .001. Standardized regression coefficients (β) are reported alongside unstandardized coefficients (B) and their standard errors (SE B).

4.2.2 Exploratory Path Analysis (RQ1)

A exploratory path analysis tested whether confidence mediates the relationship between AI-assisted preparation and WTC. All variables were measured simultaneously in a cross-sectional design; consequently, no temporal precedence can be established among AI-assisted preparation, confidence, and WTC, and the paths described below should be interpreted as associational patterns only. AI-assisted preparation was positively associated with confidence (β = .53, SE = .05, p < .001), and confidence was positively associated with WTC (β = .41, SE = .06, p < .001). The indirect effect of AI-assisted preparation on WTC through confidence was significant based on bootstrapped 95% confidence intervals (β = .22, 95% CI [.14, .31]). The direct effect remained significant after accounting for the mediator (β = .18, SE = .05, p = .001), indicating partial mediation.

Table 5

Exploratory Path Analysis: Indirect Effect of AI-Assisted Preparation on WTC via Confidence

Path	β	SE	95% CI LL	95% CI UL	p
AI-Assisted Prep → Confidence (a)	.53	.05	.43	.63	< .001
Confidence → WTC (b)	.41	.06	.30	.52	< .001
Direct effect (c′)	.18	.05	.08	.28	.001
Indirect effect (a × b)	.22	.04	.14	.31	< .001

[*]Bootstrapped indirect effects are based on 5,000 resamples. CI = confidence interval; LL = lower limit; UL = upper limit. All results are strictly associational given the cross-sectional design.

4.2.3 Exploratory Factor Analysis (Instrument Validation)

An EFA was conducted to examine the factor structure of the adapted nine-item instrument. An important limitation should be acknowledged: with nine items distributed across three factors, the average of three items per factor falls below the four-to-five items per factor recommended in psychometric literature (Costello & Osborne, 2005); EFA results are therefore treated as preliminary. Data suitability indicators were adequate (KMO = .84; Bartlett's Test: $\chi^2(36) = 412.35$, p < .001). Using principal axis factoring with varimax rotation, a three-factor solution emerged corresponding to Anxiety, Willingness to Communicate, and AI Attitudes, explaining 62.7% of the variance. Table 6 presents the factor loadings for all nine items. All items loaded above .55 on their respective factors with minimal cross-loadings (<.30), and factor membership was consistent with the theoretical frameworks from which items were drawn.

Table 6

Exploratory Factor Analysis: Factor Loadings for All Nine Items

Item	Factor 1: Anxiety	Factor 2: WTC	Factor 3: AI Attitudes
Feel nervous when speaking (ANX1)	.74	—	—
Fear making mistakes publicly (ANX2)	.69	—	—
Feel no shame with mistakes (ANX3)	.61	—	—
Willing to share ideas in class (WTC1)	—	.76	—
Speak without extensive preparation (WTC2)	—	.71	—
Feel confident to be seen speaking (WTC3)	—	.65	—
Enjoy using AI tools for EFL (AI1)	—	—	.78
AI improves my confidence (AI2)	—	—	.73
High expectations after AI practice (AI3)	—	—	.67

**Loadings < .40 are suppressed and replaced with "—". KMO = .84. Bartlett's Test of Sphericity: $\chi^2(36) = 412.35$, $p < .001$. Total variance explained = 62.7%. ANX = Anxiety items; WTC = Willingness to Communicate items; AI = AI Attitudes items. All items from the nine-item questionnaire are retained; no items were excluded from this analysis.*

4.3 RQ2: Perceived Interactional Challenges During AI-Assisted Speaking Activities

Despite the positive trends identified above, several challenges emerged that complicate the relationship between AI use and interactional outcomes. Table 7 summarizes the four primary challenges identified through thematic analysis of reflective journal entries, including the proportion of students who reported each challenge and its link to the EFA-validated constructs.

Table 7

Perceived Challenges Affecting Engagement Quality: Student-Reported Frequencies and Implications

Challenge	Students Reporting (%)	Description	Perceived Implication for Engagement
Over-reliance on AI (linked to AI Attitudes factor)	42%	Students submitted AI-drafted responses with minimal personal input	Reduces authentic language production and critical thinking
Reduced spontaneity (linked to WTC factor)	38%	AI preparation led to scripted, less natural oral delivery	Hinders development of real-time communication skills
Digital literacy gaps (linked to AI Attitudes factor)	21%	Some students struggled with AI interface navigation and prompt formulation	Creates unequal learning opportunities in the classroom

Anxiety about AI accuracy (linked to Anxiety factor)	17%	Students uncertain whether AI feedback was pedagogically correct	May undermine trust in self-correction and teacher feedback

[*]Student reporting percentages are derived from thematic analysis of reflective journal entries (N = 200). Percentages reflect the proportion of students who referenced each challenge in at least one journal entry. Factor linkages are based on the EFA structure reported in Table 6.

The most prominent issue was over-reliance on AI-generated content (42%), with students using AI outputs with minimal modification, leading to responses that were linguistically accurate but less personalized and spontaneous. As one student stated, "Sometimes I just copy the answer from AI and try to remember it. When the teacher asks a different question, I don't know how to respond." Closely related was reduced spontaneity (38%), whereby students who relied heavily on AI-prepared scripts expressed discomfort when required to deviate from their responses during live interaction.

Digital literacy gaps affected approximately 21% of participants, who reported difficulty formulating effective AI prompts. As one noted, "I don't know how to ask good questions to ChatGPT, so sometimes the answers are not useful." Finally, 17% of students expressed uncertainty about the pedagogical accuracy of AI feedback, occasionally leading them to disengage from AI-supported preparation.

4.4 RQ3: Self-Reported Pedagogical Conditions Perceived as Supporting Teacher–Student Interaction

Overall, student attitudes toward AI-assisted learning were positive, with a majority indicating willingness to continue using AI tools for English learning. Qualitative findings indicate, however, that positive attitudes were conditional. Table 8 presents the key pedagogical conditions identified through thematic analysis as most likely to support productive teacher–student interaction in AI-assisted contexts.

Table 8

Conditions for Bridging the Preparedness–Participation Gap

Condition	Implementation Strategy	Expected Outcome
Teacher scaffolding	Teachers guide AI use with clear task parameters and explicit framing of AI as preparatory tool	Balanced AI use without over-dependence
Task authenticity	Design open-ended speaking tasks requiring personal opinions and real-time elaboration	Promotes genuine student language production
Digital literacy training	Pre-task orientation on AI tools and critical evaluation of AI output	Reduces inequity in AI access and ability
Reflective practice	Post-task learner reflections on AI use and interaction quality	Deepens metacognitive awareness and language learning

[*]Conditions and strategies are derived from convergent themes across quantitative survey data and qualitative reflective journal entries.

Three key conditions emerged. First, teacher guidance was critical: students who received clear instructions on using AI tools as supports for preparation rather than substitutes for performance reported more productive experiences. Second, task design mattered: tasks requiring personal opinions, real-time responses, or follow-up elaboration were less easily completed through AI alone and therefore encouraged more authentic participation. Third, learner autonomy was important: some students expressed resistance to compulsory or overly structured AI use, suggesting that flexibility may enhance motivation. As one student observed, "AI helps me think faster and gives me ideas I didn't have before, so I feel more confident when preparing."

5. Discussion

5.1 AI as Preparatory Support: Cognitive and Affective Gains

The present study found that non-English major university students perceived AI-assisted learning as primarily associated with the cognitive and affective dimensions of speaking preparation. Students consistently reported that AI tools, particularly ChatGPT for content preparation and ELSA Speak for pronunciation, enabled them to approach speaking tasks with clearer ideas and greater structural coherence, reducing the self-reported cognitive burden associated with spontaneous language production. These perceptual patterns align with Huang et al. (2023), who documented similar anxiety-reduction effects of AI-mediated practice environments in EFL contexts, and with Godwin-Jones (2022), who highlighted the role of AI in extending interactional opportunities beyond classroom hours. From a sociocultural perspective, the reported gains in preparedness may be understood as consistent with the concept of AI as a mediational tool that expands learners' perceived capabilities (Lantolf & Beckett, 2009); however, caution is warranted in invoking the Zone of Proximal Development as an explanatory framework here, as this concept requires the presence of a more capable other and developmental scaffolding across time—conditions not fully verifiable in a cross-sectional, self-report study. The ZPD framing is therefore offered as a tentative theoretical lens rather than a confirmed mechanism.

5.2 The Preparedness–Participation Gap

Despite reported gains in preparedness, self-reported willingness to speak publicly remained comparatively lower—a pattern this study conceptualizes as the preparedness–participation gap. While students reported higher confidence after AI-assisted preparation, indicators more directly linked to active classroom participation, such as willingness to share ideas (47%) and confidence in being seen speaking publicly (45%), were substantially lower. This distinction is consistent with Ulla et al. (2023), who cautioned that AI may be associated with reduced learner engagement with teachers even as technology-mediated practice increases; however, given the self-report nature of the present data, no causal claim can be made about AI reducing interaction. The exploratory path analysis provides associational evidence that confidence partially bridges this gap, but the significant direct effect ($\beta = .18$) confirms that additional factors, likely social, evaluative, and contextual, also shape participation decisions independently of confidence.

Traditional interactional frameworks such as the interaction hypothesis (Long, 2015) emphasize negotiation of meaning as the driver of second language development. The present findings suggest that learners' access to linguistic resources is a necessary but insufficient condition for such negotiation: the willingness to take interpersonal risks in public, evaluative contexts remains a distinct and underexplored barrier. AI tools, which operate in private, low-stakes environments, appear well-suited to the former but less effective in addressing the latter.

5.3 Challenges and the Evolving Role of the Teacher

The study identified four perceived challenges of notable prominence: over-reliance on AI content (42%), reduced spontaneity (38%), digital literacy gaps (21%), and uncertainty about AI feedback accuracy (17%). Critically, the two most frequently reported challenges, namely over-reliance and reduced spontaneity, affect a substantial proportion of participants and warrant equal analytical weight alongside the positive findings. These challenges suggest that AI-supported preparation carries inherent risks for authentic communicative competence when not counterbalanced by appropriate task design and teacher guidance. Specifically, students who submitted AI-drafted responses with minimal personal input reported difficulty adapting when teacher questions deviated from their prepared material, echoing Kohnke et al.'s (2023) observation that unstructured AI use may mask deeper communicative deficiencies. The reduced spontaneity finding (38%) further indicates that scripted preparation, while reducing anxiety, may also constrain the real-time responsiveness that is central to genuine teacher–student interaction. These patterns are associational only; the cross-sectional, single-group design precludes causal attribution of reduced spontaneity to AI use per se.

Rather than diminishing the importance of teachers, these findings suggest that AI integration reconstitutes instructional responsibilities toward the management of interactional and affective conditions. As AI tools assume a greater role in supporting content preparation, teachers become increasingly central in facilitating real-time meaning negotiation, modeling spontaneous language use, and cultivating the social conditions necessary for risk-taking in public communication. This reframing of teacher roles has direct implications for professional development: EFL instructors in AI-integrated contexts may benefit from targeted training not only in AI tool operation, but in designing post-AI interaction tasks, giving metacognitive feedback on scripted versus authentic communication, and managing the socio-affective dynamics that emerge when students arrive over-prepared but under-confident in live interaction.

5.4 Implications for Pedagogy

The central pedagogical finding of this study is that students perceived AI-assisted preparation as most beneficial when embedded within a structured instructional framework rather than used independently. Students who received clear guidance on using AI tools as preparatory scaffolds reported more substantive and confident engagement with teachers, while those who relied on AI outputs without critical evaluation tended toward scripted delivery and reduced responsiveness in real-time interaction. This pattern is consistent with Kohnke et al. (2023), who argued that pedagogical framing is the key variable determining whether AI functions as a communicative bridge or a communicative barrier, and with Ulla et al. (2023), who identified teacher role clarity as essential in AI-integrated classrooms. The explanation for this pattern likely lies in the distinction between AI as a content provider versus AI as a thinking scaffold: students who were guided to use AI for idea generation and then elaborate independently arrived in class better equipped to deviate from their prepared material. This distinction has direct implications for instructional design. Specifically, the present findings support the following evidence-informed strategies: designing speaking tasks that require personal opinions and real-time elaboration, rendering AI-generated scripts insufficient; providing structured low-stakes practice sessions to build social and evaluative confidence alongside linguistic readiness; offering explicit digital literacy training so that all students can access AI tools effectively and equitably, addressing the participation gap identified among the 21% who reported difficulty with AI interfaces; and framing AI use through reflective journal practice that builds metacognitive awareness of when AI assistance enhances versus constrains

authentic communication. These implications extend beyond classroom practice to curriculum design and teacher professional development, where preparation for AI-integrated speaking instruction should be considered a core competency.

6. Conclusion

6.1 Summary of Findings

The findings reveal that students perceived AI-assisted learning as associated with nuanced and uneven shifts in their readiness for teacher–student interaction in EFL speaking classrooms. All findings are self-reported and strictly perceptual; no causal claims about AI's effects on interaction are made. Students broadly perceived AI as associated with increased enjoyment (61%), improved preparedness, and higher post-task confidence (64%). At the same time, a sizable neutral bloc (31%–48% of students) selected the Neutral response across items, indicating that a substantial proportion of participants neither endorsed nor rejected positive associations. The central contribution of this study lies in identifying a preparedness–participation gap: students reported that AI tools were associated with their ability to generate ideas and rehearse language prior to speaking, yet this perceived preparedness did not translate consistently into self-reported willingness to engage publicly in live classroom interaction. Equally important, the study identified significant perceived challenges: 42% of students reported over-reliance on AI-generated content, and 38% reported reduced spontaneity in oral delivery—findings that qualify the overall positive picture and warrant serious consideration in pedagogical planning. Students continued to report hesitation and anxiety when engaging in live classroom interaction, suggesting that AI is perceived as exerting a more limited influence on the socio-affective dimension of public communication.

Effective teacher–student interaction in EFL contexts cannot be fully supported through technological means alone, as interaction depends not only on linguistic readiness but also on confidence, identity, and social risk-taking. As AI increasingly supports the cognitive aspects of language learning preparation, the teacher's role appears even more central in shaping the affective and interactional environment of the classroom. Effective AI integration therefore calls for a balanced instructional approach pairing AI-supported preparation with pedagogical strategies that promote real-time communication, reduce fear of public speaking, and foster authentic participation—while remaining attentive to the dependency and spontaneity challenges that AI integration may introduce.

6.2 Contributions of the Study

This research makes three contributions. First, it introduces the concept of the preparedness–participation gap as a framework for understanding the perceived differential impact of AI on internal readiness versus reported engagement in interaction. Second, it provides exploratory mixed-methods evidence from a Vietnamese university context, a setting underrepresented in research on AI in language education, documenting how non-English major students perceive AI-assisted speaking preparation. Third, it highlights the continued centrality of teacher mediation in AI-integrated classrooms, with implications for pedagogy, curriculum design, and teacher professional development.

6.3 Limitations and Future Directions

Several limitations frame the scope of interpretable findings. First, and most fundamentally, the study relied exclusively on self-reported perceptual data. All conclusions pertain to what students believed about their experiences, not to observable changes in speaking behavior or interaction quality. Future research should incorporate behavioral measures such

as discourse analysis and turn-taking counts to validate perceptual reports. Second, the absence of a control group or pre-test/post-test design means that no baseline comparison is available; observed patterns may reflect pre-existing dispositions rather than responses to the AI intervention. Third, the single institutional setting at HCMUT and the eight-week timeframe limit generalizability to other Vietnamese university contexts, other EFL systems, or higher-proficiency learners. Fourth, the nine-item questionnaire yields an average of three items per factor, falling below the four-to-five items per factor recommended by Costello and Osborne (2005); the EFA results should therefore be treated as preliminary and require replication with a larger, psychometrically developed instrument. Fifth, the cross-sectional exploratory path analysis cannot establish temporal precedence among AI-assisted preparation, confidence, and WTC; the "mediation" model is associational only. Sixth, the study did not examine proficiency as a moderating variable; it is plausible that the preparedness–participation gap manifests differently across A2, B1, and B2 learners, a question that warrants targeted future investigation. Seventh, social desirability bias may have inflated positive self-reports, given that AI integration was teacher-initiated and journal entries were submitted to the instructor. These limitations collectively frame this study as exploratory and call for methodological triangulation in future work.

Future research should incorporate direct behavioral measures of classroom interaction, including discourse analysis and turn-taking frequency counts; longitudinal designs tracking communicative development over time; experimental or quasi-experimental designs for stronger causal evidence; and investigation of teacher perspectives on AI integration. Additional research is also needed to examine how the preparedness–participation gap varies across proficiency levels, task types, and cultural contexts.

Thanh Thuy Nguyen (nguyenthanhthuy@hcmut.edu.vn) is a lecturer at the Foreign Language Center, Ho Chi Minh City University of Technology (HCMUT), Vietnam. She has accumulated over 15 years of experience in English language teaching since joining HCMUT in 2008. She holds a Bachelor's degree in English Language Teaching from Ho Chi Minh City University of Pedagogy and a Master's degree in Applied Linguistics from Curtin University, Australia. Her research interests include AI-assisted language learning, speaking instruction, and teacher–student interaction in EFL contexts. Guided by her philosophy that "teaching is a dual learning process," she believes teachers and students grow together through continuous learning and reflection.

#184 ENHANCING STUDENT ENGAGEMENT IN INTERPRETATION COURSES THROUGH AI-ASSISTED SELF-PRACTICE

Dang Thi Anh Tuyet[1]

Abstract

In interpretation courses, students are typically expected to engage in independent practice on their own to develop these complex skills. However, many students encounter difficulties in practicing interpreting autonomously. The study examined how Artificial Intelligence (AI) integration can facilitate students' self-practice in interpretation courses. This research adopted a qualitative-dominant mixed-methods design, incorporating supportive quantitative analysis to gain better insights into the research questions. The study was conducted with the participation of eighty-two third-year students from three business interpretation classes at the Faculty of Foreign Languages, HUFLIT. The participants were encouraged to utilize AI tools to support their independent practice for self-study. The findings reveal that the majority of students perceived AI-assisted self-practice as both useful and engaging while also offering several recommendations for improving its implementation. For more generalizations and pedagogical implications, it is recommended that further studies on a large-scale and on the negative aspects of the approach should be conducted to examine the effectiveness of AI as a facilitator in self-regulated practice for interpreting skills among university students.

Keywords: engagement, AI integration, interpretation courses, interpreting training, self-practice

1. Introduction

1.1. Background of The Study

With the application of Artificial Intelligence (AI) in all aspects of life, necessary transformations have taken shape in education to adapt to the new trends. AI integration in higher education is currently not only a trend but also a requirement for educators with a view to optimizing learning outcomes. Tertiary education has recently experienced vivid AI integration in many fields since AI applications have proved to benefit teaching and learning considerably, saving both time and effort. In terms of motivation, AI-powered platforms have supposedly enhanced students' engagement and autonomy that are crucial for improvement. Furthermore, with the popularity of AI applications in recent years, students' desire for the freedom of utilizing AI in academic work has risen, which has obliged educators to take it seriously as to how to integrate AI into pedagogical approach effectively.

Business Interpretation course is among the author's favorite subjects at HUFLIT Faculty of Foreign Languages (FFL). However, this module can sometimes be seen as a "nightmare" for many students of different majors, for this subject requires a comprehensive competence in many factors with oral communication skills and cognitive processing reflexes as the prerequisites. Students are supposed to carry out regular practice to hone their interpreting skills on their own. Therefore, students with low levels of proficiency usually find this subject immensely challenging. Before AI applications came into life, students mostly had to practice alone or occasionally with peers. This is indeed demanding work which requires tremendous effort and motivation; otherwise, giving up half-way through may result in failure,

[1] *Lecturer, Faculty of Foreign Languages, Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT), Ho Chi Minh City, Vietnam*

giving rise to students' intimidation in learning this subject. Under such circumstance, students supposedly need some new kind of motivation for self-study. In seeking new inspiring and engaging ways to facilitate students' self-practice, the author had a burning desire to take advantage of AI integration. Nevertheless, interpretation courses have intrinsic features that require particular integration approach as the ultimate learning outcomes of this subject is learners' capability to perform their genuine interpreting skills.

1.2. Research Problem

In interpreting training, reality has showed that "practice makes perfect" significantly necessitates students' improvement; what matters is how to engage students to practice interpreting skills frequently. In order to enhance engagement, students would be encouraged to practice with peers in addition to practicing independently. However, practicing with peers is sometimes hindered by several reasons including the matters of time-matching, high pressure from peer feedback. At the outset, the use of AI in interpreting training was mostly restricted, but it has gradually proved to be beneficial in many aspects and has become increasingly applicable. For this study, in empowering students with AI integration into their self-practice in interpretation courses, the author wondered how the approach can benefit students and enhance their engagement.

1.3. Research Objectives

In allowing AI integration into self-practice in interpretation courses, it is hoped that students' self-regulated learning is recognized, thereby helping promote their engagement and motivation. In alignment with this view, this study aims to investigate the efficacy and pedagogical impacts of AI integration on students' engagement in learning interpretation whereby pedagogical implications and recommendations can be proposed for further implementation.

1.4 Research Questions

With the research objectives in mind, my research questions were designed accordingly as follows:

1. *To what extent do students find AI assistance engaging and useful for their self-practice in interpretation courses?*
2. *What are students' perceived benefits from using AI tools to support their self-practice in interpretation courses?*
3. *What are common challenges students may encounter while using AI support for self-practice in interpreting training, and their recommendations for improvement?*

1.5 Significance of The Study

The wave of AI approaching and effecting tertiary education was welcomed as a supplementary drive for boosting students' engagement. With more and more students relying on AI for their translation and even interpretation regardless of not being permitted, I would rather openly allow them with guidelines for proper use than leave them with hidden misleading manner. Therefore, empirical findings from this study can provide insights into the efficiency of AI integration in enhancing learner engagement in interpreting training, thereby hopefully contributing to subsequent implications and pedagogical recommendations for further studies.

2. Literature Review

With the above-said core research questions, the investigation from former researcher on this practice was carried out. In light of the literature, the rapid wave of Artificial Intelligence (AI) has significantly impacted language teaching and learning, prompting novel approach for interpreter training. Interpreting competence requires more than just one element; it in fact involves an intensive cognitive process and particular skills like note-taking, memorizing, etc., of which continuous rigorous practice really matters. In this aspect, AI-assisted self-practice has emerged as a highly welcoming and promising addition for students' self-training. This literature review has drawn on recent papers on the enhancement of interpreting skills through AI supports. It examines the topic through four key themes: current trends, practical applications, pedagogical benefits, and possible challenges.

2.1 Trends in AI Integration in Interpreting Training

In recent years, Translation and Interpreting (T&I) education has undergone paradigm transformation. At the outset, AI was viewed as a disruptive threat that was not welcomed and encouraged for use in T&I pedagogy. However, AI has now been embraced as a pedagogical necessity. Cui et al. (2025), and Šveda & Poláček (2025) highlighted that modern interpreter training must take the initiatives to adapt to the "era of AI," moving from traditional methodologies to integrating technological competencies directly into the curriculum. This trend is echoed globally; for example, Tran (2026) noted the popularity of using AI translation and interpreting tools among Vietnamese students, indicating a dramatic shift where students independently and eagerly employ AI tools for linguistic support and practice. Besides that, as Gutiérrez (2025) put it, the gap between academic training and professional reality has now become mitigated. AI assistance in interpreting teaching and learning is increasingly welcomed as valuable, supportive tools for future careers instead of a threatening mechanism for job displacement. In line with the new trends, educators are prompted to align pedagogical practice with these new technological applications.

2.2 The Application of AI Tools for Enhancing Interpreting Practice

The application of AI tools in training interpreting skills has proved to be popular in various ways. Particularly, with generative AI chatbots, AI can be utilized as simulated interlocutors and automated feedback providers. For self-guided practice, AI can perform various interactive and analytical modalities to simulate real-world interpreting environments. With regard to interactivity, Yu et al. (2025) examined how generative AI chatbots have been employed to deliver targeted critique in comparison with using traditional peer-review mechanisms. Likewise, Chien, Chan, and Hou (2024) noted the efficiency of using generative AI as scaffolding for role-playing educational games. With AI simulating consecutive or simultaneous interpreting environments outside the classroom, giving instant feedback on students' performance, learning outcomes can significantly improve. Going beyond conversational interaction, AI tools can also performs tasks analytically. According to Tang, J. (2023), with AI-based needs analysis in digital environments, self-practice materials can be tailored for specific linguistic deficits or professional domains whereby student's independent study regimen in interpretation can be personalized.

2.3 The Benefits of AI-Assisted Learning in Interpreting

According to researchers, the pedagogical benefits of AI assistance in self practice primarily involve enhancing self-regulated learning, providing instant feedback, and promoting student motivation. High levels of student satisfaction is reported by Consuelo Sáiz-Manzanares et al. (2023) when self-regulated learning is facilitated by chatbots. Similarly, Ng,

Tan, and Leung (2024) claimed that students' autonomy could be empowered with popular platforms like ChatGPT during their educational journeys. Particularly in interpreter training, the availability of 24/7 instant feedback from AI tremendously benefit students in terms of refining their delivery and accuracy while independent and constant practice is essential for cognitive process reflex (Chien et al., 2024; Yu et al., 2025). Interestingly, Yu, Wei & Chen, 2025 pointed out that AI feedback strategies can also help interpreting students identify semantic errors, adjust their grammar structures, and eventually refine their overall performance at their own pace. Notably, in terms of motivation, Tran (2026) pointed out that the these tools can be integrated to positively affect learners' motivation. Specifically, students' anxiety can be reduced, and confidence be increased thanks to immediate scaffolding provided by AI in a low-pressure environment.

2.4 Challenges and Limitations

In spite of profound benefits of integrating AI into interpreting training, notable challenges and limitations also come alongside. One of the most striking limitations is the shortcoming of technology in replicating the nuanced human cognition which can be required in complex, dynamic communicative contexts. As argued by Gómez & Pinazo (2026), in in high-stakes contexts that require cultural mediation, empathy, and situational awareness, AI show incapability in replacing humans due to its inherent deficiencies. Tang, L. (2025) also pointed out "other minds" - an intuitive, empathetic understanding of human intention that AI lacks whereas this cognitive capability is vital for coherence interpreting. The most note-worthy challenge in terms of pedagogy are concerns about learner real autonomy which is a common concern among educators in integrating AI in other domains as well. According to Darvishi et al. (2024), student agency can be negatively impacted if over-reliance on AI assistance is committed. As frequently warned by other researchers, over-reliance on AI support can lead to passive learning and degraded critical thinking skills instead of active cognitive engagement.

Eventually, researchers emphasized that integrating "critical AI literacy" into interpreter training is a urgent necessity. The ultimate goal is to ensure that while using AI for self-practice to possess the skills, students can also critically assess AI outputs, avoid hallucinations, and fully be aware the ethical implications of the tools they use (Giustini & Dastyar, 2024). Despite multiple benefits of utilizing AI assistance in self-practice for interpreting training such as accessible simulations, personalized feedback, and enhanced learner motivation, learners should not consider AI applications a 'magic cure-all'. There should be a balanced pedagogical approach. Leveraging the practical applications of AI as well as actively fostering critical AI literacy should be catered in order to address ethical challenges thereby preserving student agency, and navigating the inherent drawback in machine cognition.

3. Methodology

3.1. Research Design

With an interpretative epistemological stance, this research primarily adopted qualitative methodology; in addition, to evaluate the extent of student engagement and perceived utility, quantitative measures were also incorporated. Overall, this research employed a qualitative-dominant mixed-methods design, incorporating supportive quantitative analysis to gain better insights into the research questions.

3.2. Study Setting

This study was conducted at the Faculty of Foreign Languages (FFL) at HUFLIT with regard to Business Interpretation course which serves as a significant module for students of different majors. This course is considered advanced, requiring comprehensive proficiency in various aspects, such as good speaking and listening skills, vocabulary and general knowledge on daily life and business settings. In addition to independent practice and practice with peers in a traditional manner, the students were allowed to use AI-powered platforms to enhance their engagement for self-practice. In this study, my pedagogical intent is utilizing AI as supportive tools for students' self-practice. Students were intentionally empowered with AI support for their self-practice so that engagement can be promoted. Accordingly, students were encouraged to consult with AI-powered platforms during self-practice. The extent of AI utilization is supposedly limited around mediating functions such as generating learning materials (e.g. a text or speech), transforming text-to-speech, composing a vocabulary list, doing role-playing, giving feedback for interpretation work. The restriction on AI facilitation is definitely set: interpreting skills must be performed by students themselves.

3.3. Participants

The participants in this study were 82 third-year students from three Business Interpretation classes at HUFLIT FFL, being randomly selected by volunteering with informed consent in alignment with institutional ethical guidelines.

3.4. Research Instruments

In order to ensure robust data collection, gaining insights into instructional efficacy with regard to enhancing student engagement in interpretation courses through AI integration, the following three research instruments were employed:

3.4.1. Structured Classroom Observations

Observations were conducted across the nine class sessions using a checklist to document student engagement and behavioral responses during AI-assisted self-practice.

3.4.2. Student Survey:

Informed by preliminary observational data, a structured questionnaire comprising 5-point Likert scale questions, multiple-choice questions, and open-ended question(s) was administered to explore student perceptions and experiential outcomes. The online survey questionnaire was sent to students via Google Forms.

3.4.3. Semi-structured Interviews

Semi-structured focus group interviews were conducted with a sample of nine student volunteers; the interviews lasted approximately five minutes each to examine learner attitudes, identify perceived benefits and constraints, and to gather pedagogical recommendations regarding AI mediation in interpreting self-practice.

Overall, these data collection instruments provided a comprehensive, multi-perspective data, yielding deep insights into the dynamics of the contemporary pedagogical practices.

3.5. Procedure

The study was conducted over a nine-week period during the academic term, including three phases:

3.5.1. Preparation Phase

Guidelines were provided to students, showing how to use AI support for self-practice. The ultimate goal of this approach was clarified at the outset - using AI assistance to improve students' independent interpreting performance. Students should be fully aware that AI-powered tools can only serve as facilitators for their self-practice and that AI can by no means be utilized as an interpreter in lieu of students themselves. To ensure compliance, the instructor stressed the importance of maintaining cognitive autonomy, warning of the adverse effects of AI over-reliance on critical thinking and analytical reasoning and that students' performance from this practice can be appreciated as their efforts, but not be evaluated as formal testing results in class. The awareness of this rule necessarily prevents the students from intentional cheating or over-reliance on AI in their self-practice.

3.5.2. Implementation Phase

Students were encouraged to experience the approach - AI integration in their self-practice, both in class and in self-study, following the provided guidelines. Recommended AI supportive activities basically involve creating materials (e.g. a text or speech), transforming text-to-speech, composing vocabulary list, doing role-playing, giving feedback for interpretation job.

3.5.3. Data Collection Phase

Class observations were carried out during the 9 weeks with field notes being documented while the students engaged in self-practice with AI facilitation. Prominent trends identified during the observations guided further empirical inquiry. Specifically, salient themes derived from these observations facilitated the development of a structured questionnaire including two 5-point Likert scale questions, two multiple-choice questions, and one open-ended question to elicit participant perceptions and qualitative feedback. The survey was administered electronically via Google Forms nearing the end of the course. For the last two week, semi-structured interviews incorporating open-ended questions were conducted in person. All interview sessions were recorded with prior participant consent and subsequently transcribed verbatim for analytical processing.

3.6. Data Analysis

Data analysis was conducted based on qualitative, thematic analysis approach. Accordingly, qualitative data from open-ended responses from online surveys and interviews were analyzed. Transcripts from the interviews were coded to identify recurring themes. Besides, the quantitative data of the first two Likert scale questions in the survey questionnaire were also analyzed using SPSS software platform to strengthen the reliability of the data. Meanwhile, notes from class observations were used to triangulate findings, increasing the validity of interpretations.

In particular, thematic analysis of the interview transcripts revealed several emergent categories: (a) the engagement and utility of AI applications as learning scaffolds, (b) perceived benefits, including personalized learning experience and exposure to more topics for practice, (c) common challenges including student over-reliance and misuse in employing the approach, and (d) student recommendations for optimizing AI integration in interpretation courses. Collectively, these themes offered critical insights into student dispositions, highlighting both the benefits and constraints of embedding AI technologies in interpreting training. Furthermore, quantitative and qualitative data obtained through Google Forms was analyzed to discern broader trends regarding student attitudes and perceptions. The integration of close-ended Likert scales alongside open-ended qualitative prompts provided both statistical breadth and contextual depth to the findings. Ultimately, this mixed-methods analytical framework

yielded triangulated insights into the efficacy of AI support in enhancing learner engagement for self-practice in interpretation courses.

4. Results

4.1 Addressing Research Question 1:

Students' Showing Interest and Confirming the Usefulness of Utilizing AI to Assist Their Self-practice in Interpretation Courses

Table 1

Item Statistics

	Mean	Std. Deviation	N
Q1	4.02	.785	82
Q2	4.20	.744	82

**Note: Q1: Question 1, Q2: Question 2 in the survey questionnaire*

Figure 1

Students' expressing engagement in using AI support for their self-practice in interpretation courses

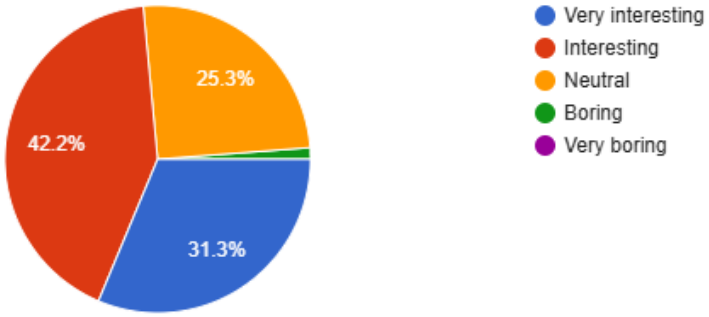

Figure 1 shows that a high proportion of participants welcome the approach, taking interest in utilizing AI to support their self-practice in interpreting training. The majority of students claimed their engagement with AI integration into their self-study as a facilitator; specifically, approximately 75% of students found the approach *interesting* and *very interesting*. This phenomenon accords with the data generated from classroom observations where most of them showed high level of interest and engagement during their self-practice, interacting with AI tools as mediators.

The data reliability can be reinforced in quantitative analysis (in Table 1): for Q1, a standard deviation of 0.785 is relatively low for a 5-point scale, showing a strong consensus among the cohort. Most responses are categorized around the *"Interesting"* and *"Very interesting"*. A mean score of 4.02 indicates that the average respondent finds using AI tools to facilitate interpreting skills to be *"Interesting"*.

Figure 2

High level of usefulness of utilizing AI-powered platforms in practicing interpreting skills

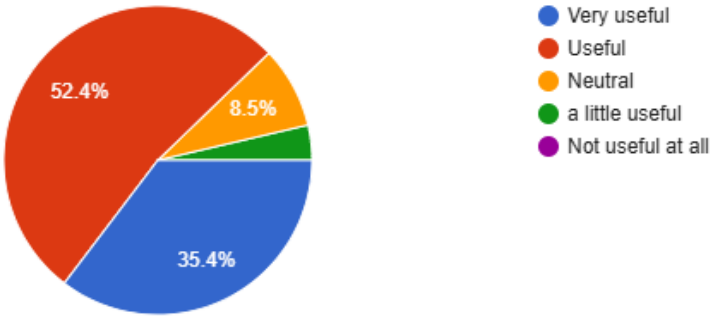

Figure 2 presents students' perceived usefulness of AI tools in interpreting training with regard to usefulness of employing AI as mediator and facilitator in practicing interpreting skills. Impressively, 100% of the participants confirmed the approach to be *useful*; the majority claimed the high level of usefulness of this approach with almost 90% rating as *useful* and *very useful* while no one found it not useful at all. These proportions align with the research findings from the literature review that AI can benefit interpreting training in many ways including enhancing self-regulated learning, providing instant feedback, and promoting student motivation. Additionally, AI mediation can also help identify semantic errors, adjust grammar structures, and eventually refine overall performance at one's own pace, enhancing autonomy.

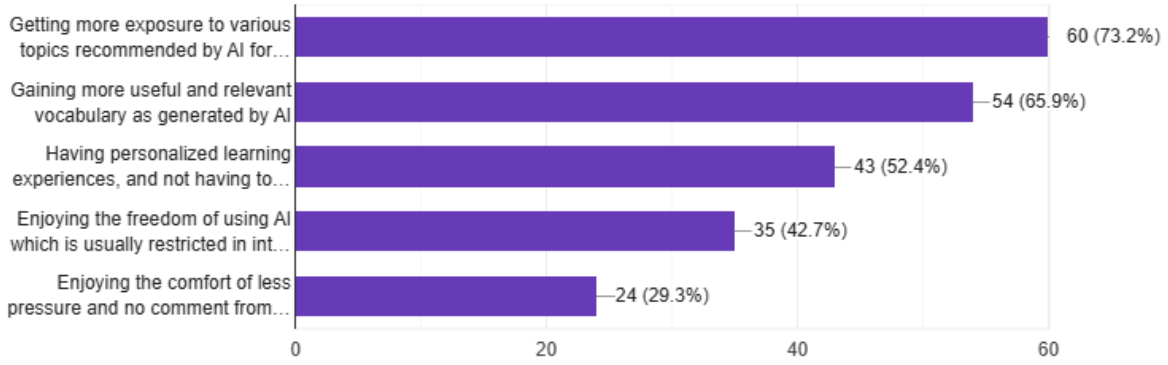


Regarding quantitative analysis, the data reliability can be reinforced (as shown in Table 1): for Q2, a standard deviation of 0.744 is relatively low for a 5-point scale, showing a strong consensus among the cohort. Most responses are around the *"Useful"* and *"Very useful"* categories. A mean score of 4.20 shows that the average respondent finds using AI tools to facilitate their interpreting training to be *"Useful"*.

4.2 Addressing Research Question 2

Student Perceived Benefits in Using AI to Support Self-Practice in Interpretation Courses

Figure 3

Common perceived benefits of utilizing AI tools in self-practice of interpreting skills

When being asked about common benefits of AI support in facilitating self-practice, many students admitted such benefits as *"gaining more useful and relevant vocabulary as generated by AI"*, accounting for almost 66%. of the students. *"Having personalized learning experiences, and not having to rely on peers for practice"* is noted by more than half of the students under survey. Many students pointed to the activity's benefits such as *"enjoying the freedom of using AI which is usually restricted in interpreting courses"* and *"enjoying the comfort of less pressure and no comment from instructor/peers"* with the proportion of

approximately 43% and 30% respectively. Notably, more than 73% agreed on *"Getting more exposure to various topics recommended by AI for practice"*. Some students put forth their comments:

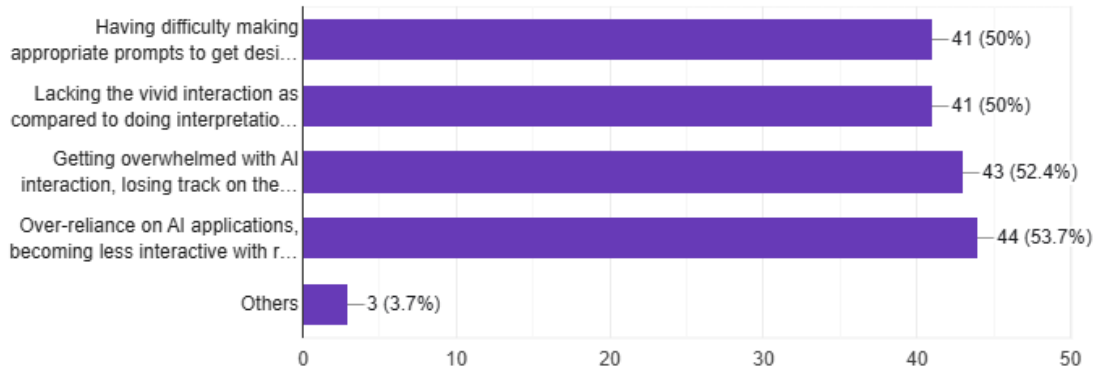
"Use AI as a real-time partner to simulate live interpreting scenarios and provide immediate feedback on linguistic nuances and delivery speed."

"AI can improve interpreting through real-time practice, instant feedback, and personalized learning."

"Using ChatGPT helps me practice interpreting more easily by generating scripts and giving quick feedback."

Similar comments on the benefits were also noted from the focus group interviews:

"AI helps me practice interpreting with instant feedback and flexible topics." (S4)



"AI tools like ChatGPT, Gemini help me practice interpreting by providing many topics and speeches. I can practice anytime, which improves my vocabulary and understanding." (S6)

4.3 Addressing Research Question 3

Common Challenges for Students in Utilizing AI Support for Interpreting Training, and Student Recommendations for Improvement

Figure 4

Common disadvantages/difficulties in employing AI tools to facilitate interpreting practice

The graph shows the challenges of using AI as a facilitator for interpreting training are recorded not critical. Regarding the difficulties/disadvantages in utilizing AI tools for interpreting training, *"having difficulty making appropriate prompts to get desired AI-generated content for practice"* represents 50%. Similarly, also 50% of the students admitted *"Lacking the vivid interaction as compared to doing interpretation with people"* as one of the disadvantages. More than half of the students agreed on *"Getting overwhelmed with AI interaction, losing track on the major task_practicing interpreting"* (52%). And the most notable challenge facing the students is *'Over-reliance on AI applications, becoming less interactive with realistic situations for interpretation",* which was confirmed by more than 54%. This figure echoes the observation-generated fact showing a phenomenon that while students were engaged in interacting with AI-mediated tools, many apparently allocated more time for other related tasks than for performing their interpreting job. Some of students' comments from the survey:

"Users should use it actively, not depend on it."

"It cannot fully simulate real-life pressure or natural speaking situations."

"AI speech is sometimes not natural…I should also review my performance to find mistakes. AI is useful, but it should be used in a smart and active way."

Likewise, group interviews echoed similar findings from the survey results. Some students voiced their concerns over common challenges, of which some notable drawbacks can be the lack of vivid interaction as compared to human interactions, and the risk of overwhelm with or over-reliance on employing AI tools.

Students' Recommendations for Improvements

It is noted that many of the students' suggestions and recommendations are insightful, showing their serious attitude in AI employment and reflection. Multiple interesting opinions from students being gained from their practice using the approach were notably recorded. Their inputs centered around proposing some strategies for utilizing AI-mediated tools for interpreting training effectively and recommending some useful AI tools as facilitators in self-practice.

Some note-worthy features in students' recommendation as below:

"I think the Natural Reader is a really useful tool for interpretation skills."

"Elevenlabs"

"Use Gemini, Chatgpt, Copilot"

"Increase difficulty gradually and practice both languages direction, focusing on specialized topics."

"Verify the information provided by the AI because it may not be accurate."

"Use AI as a real-time partner to simulate live interpreting scenarios and provide immediate feedback on linguistic nuances and delivery speed."

" To improve efficiency, I should combine AI with self-recording, practice under time pressure, and balance AI use with real interaction practice."

Similar suggestions and recommendations were echoed in comments given by participants in the focus group interviews:

"...The most efficient use of AI is to make practice more deliberate. Many learners use AI only to generate random texts or check vocabulary. That is useful, but limited. A better approach is to use AI at each stage of the interpreting cycle: input, performance, feedback, and reflection (S1)

"I recommend use Grok because this AI platform can create some ideas"(S6)

"... To improve, I should use different tools together, practice with increasing difficulty, and simulate real situations. I should also review my performance to find mistakes. AI is useful, but it should be used in a smart and active way."(S8)

"Balance between using AI for interpreting and studying."(S5)

" To improve, I should simulate real situations, review my performance, and combine AI with real-life practice."(S9)

5. Discussion

5.1 Discussion of Findings

The empirical findings provided valuable insights into one of the most significant contemporary issues in ELT: integrating Artificial Intelligence (AI) into pedagogical practice. Despite the advantages and disadvantages associated with the use of AI-powered platforms in interpreting training, AI integration has been apparently welcomed by both teachers and students as supplementary facilitators for teaching and learning interpretation. This approach aligns with the necessity of pedagogical adaption in the era of AI being highlighted by Cui et al. (2025) and Šveda & Poláček (2025).

Regarding the benefits for students in self-practice, AI-powered platforms seemingly outperform many existing technological applications in several aspects. According to students' feedback, AI has offered tremendous facilitation such as providing adaptive feedback and assistance 24/7, thereby enhancing self-regulated learning and autonomy. These findings are consistent with Consuelo Sáiz-Manzanares et al. (2023) and Ng, Tan, and Leung (2024) claiming that AI-powered platforms can help improve learners' autonomy. Data collected from group interviews also revealed another advantage: by interacting with AI-powered platforms and receiving instant feedback, students has immensely improved their cognitive process reflex, which was pointed out by Chien et al. (2024) and Yu et al. (2025). Last but not least, increased motivation was also reported by students due to the freedom of utilizing AI support and the comfort of learning in a more relaxing and low-stress practice environment. This prominent feature aligns with findings from Tran (2026) pointing out that the AI tools can be integrated to positively affect learners' motivation, together with reduced anxiety and increased confidence.

Regarding the obstacles encountered learners while using AI to facilitate their interpreting training, the research indicates several adverse implications. Students may find it difficult to generate prompts in utilizing AI platforms; to mitigate this disadvantage, it is advocated that explicit guidelines should be provided. Another drawback in practicing with AI-powered platforms is the feeling of missing human vivid interaction. Students reported the lack of the nuanced human cognition in complex, dynamic communicative contexts. This reflection aligns with the concerns from literature review by Tang, L. (2025) and Gómez & Pinazo (2026) arguing about AI's incapability in replacing human interaction. In addition, a primary challenge involves embedding AI into self-practice without compromising learners' active cognitive involvement and skill acquisition. In other words, learners' efficient autonomy can be questioned because their engagement in self-practice is predominantly self-regulated and lacks formal oversight. The matters of overwhelm or over-reliance with AI interaction is disputable with detrimental effect of degrading learners' critical thinking and analytical reasoning. This challenge echoes the findings from Darvishi et al. (2024) who also warned that student agency can be negatively impacted if over-reliance occurs. In interpreting training, over-reliance or misuse of AI tools may result in even more deteriorating consequence. In light of literature review, over-reliance on generative AI supposedly degrades the cognitive working memory reflexes required in real-time interpretation. Since interpreting skills require instant reflexes, it takes prompt and effective cognitive process that can be achieved only by consistent practice on one's own. With AI over-reliance, students tend to utilize AI not only as a facilitator but also as a substitute interpreter for them, which may deprive them of the chance to train their cognitive process reflexes, resulting in poor skills performance. Therefore, as mentioned previously, AI integration in interpreting training aims to facilitate learners with their self-practice as supportive tools only. Importantly, AI must not replace students in performing the major function - interpreting if students are to improve their skills.

It is assumed that certain challenges are inevitable in employing advanced technology. In practice, considerable attention has been given to the underlying challenges associated with AI integration into interpreting training. Overall, based on the literature review and empirical findings of this study, the benefits of AI integration in interpreting training, particularly for learners' self-practice, supposedly outweigh the limitations in various respects. Benefits should be optimized while challenges can be mitigated with consideration to students' reflections and recommendations.

Regardless of whether this practice is fully supported or debated, the integration of AI remains an contemporary trend in English Language Teaching (ELT) in general and interpreting training in particular. Moreover, this pedagogical approach is consistent with the learner-centered philosophy of education which emphasizes the promotion of learner autonomy and the maximization of learners' benefits.

5.2. Limitation of The Study

As common sense, certain limitations of this study are inevitable. Firstly, the research was conducted on a relatively small number of students at the Faculty of Foreign Languages of HUFLIT. For more empirical insights and profound pedagogical implications for AI integration in this particular context, more interpretation classes should be observed with more instructors and students involved in different academic settings. Secondly, further research should also cater to keeping track of students' progress over a given period of implementation for proven efficiency of the pedagogical approach. Lastly, these advanced digital applications have recently been integrated into pedagogical practices for several years only, it takes more time for proven efficacy, including scrutinizing and evaluating the integrity of AI feedback to students' interpreting outputs, and investigating negative aspects of the approach such as misuse and over-reliance.

5.3. Recommendations

With a view to enhancing the benefits and alleviating the drawbacks of AI integration into interpreting training, following strategies are recommended. First, students should be made fully aware of the intent of utilizing AI in their self-practice where interpreting skills acquisition fundamentally necessitates rigorous, independent practice. The actual cognitive task of interpretation remains strictly students' responsibility - a boundary that must be maintained for genuine skills improvement. Accordingly, the extent and restrictions of using AI in self-practice should be clarified to students at the outset: AI integration must comply with the provided guidelines; AI serves as a mediator/ facilitator only and will never replace students in producing interpreting outputs at any cost if students are to hone their skills. Second, students should be warned against the adverse effects of AI over-reliance on their cognitive competence. Thus, they should stay alert, using critical thinking and logical reasoning to determine the effectiveness of AI feedback, not be overly optimistic or complacent with AI comments that can be flattering occasionally. To avoid inflated expectations, continuous effort is essential. On the part of instructors, this approach advocates for transparent, explicit guidelines for proper utilization over prohibition that may lead to misuse. No ban is imposed on student use of AI-powered platforms, but ethical use should be taught. Furthermore, oral tests should be given in class on a regular basis to monitor and evaluate students' genuine performance of interpreting skills, keeping track of their continued progress. Last but not least, students' performance from self-study with AI assistance should be considered for on-going assessment, not for formal testing, which should be well informed to students in advance in order to prevent intentional cheating or misuse.

6. Conclusion

To conclude, in tertiary education, AI integration has recently transcended a mere trend to become an essential pedagogical requirement. In interpreting training where AI applications were initially restricted, AI-powered platforms have become gradually recognized as beneficial and supportive. However, the extent and methodology of AI integration in interpreting training require careful consideration by educational stakeholders. In alignment with the literature review, this study has yielded empirical findings with insightful implications regarding enhancing student engagement through AI-assisted self-practice in interpretation courses. Despite certain inevitable drawbacks, the benefits of utilizing AI as a facilitator for self-practice in interpreting training have prevailed in many respects. AI integration makes self-regulated learning process more personalized and engaging for students. Particularly, AI integration for self-practice in interpreting training may help enhance students' engagement and promote their autonomy, aligning with the learner-centered pedagogical philosophy that should be embraced.

Dang Thi Anh Tuyet is a Master of TESOL and a Bachelor of Economics with almost 20 years of teaching English in both academic and business settings. Tuyet is currently a lecturer at Faculty of Foreign Languages, HUFLIT, a dynamic working environment. She is a devoted lecturer, passionate about bringing values to learners, connecting theory with the reality.

Appendices

Appendix A. Classroom Observation Checklist

Observation Criteria	High	Moderate	Low	Notes
1. Students show interest in employing AI tools such as ChatGPT, Gemini, etc. in interpreting self-practice.	☐	☐	☐	
2. Students exhibit engagement, actively interacting with AI as a facilitator in interpreting self-practice.	☐	☐	☐	
3. During implementing, students mostly follow the guidelines, only using AI as a facilitator for self-practice.	☐	☐	☐	
4. Students have difficulty in making appropriate prompts for AI chatbots.	☐	☐	☐	
5. Students exhibit overwhelm with AI interaction, not focusing on training interpreting skills.	☐	☐	☐	

Appendix B. Survey Questionnaire

Survey on Utilizing AI support for Interpreting Practice

1. How interesting do you find using AI tools to facilitate your practice of interpreting skills?

B I U

- ○ Very interesting
- ○ Interesting
- ○ Neutral
- ○ Boring
- ○ Very boring

2. How useful do you find using AI tools to facilitate your practice of interpreting skills?

B I U

- ○ Very useful
- ○ Useful
- ○ Neutral
- ○ a little useful
- ○ Not useful at all

3. In your opinion, what are common benefits of using AI tools to facilitate your practice of interpreting skills? (more than one choice is possible)

- [ ] Getting more exposure to various topics recommended by AI for practice
- [ ] Gaining more useful and relevant vocabulary as generated by AI
- [ ] Having personalized learning experiences, and not having to rely on peers for practice
- [ ] Enjoying the freedom of using AI which is usually restricted in interpreting courses
- [ ] Enjoying the comfort of less pressure and no comment from instructors/peers

4. What are some disadvantages/difficulties you face when using AI tools to facilitate your practice of interpreting skills? (more than one choice is possible)

- [ ] Having difficulty making appropriate prompts to get desired AI-generated content for practice
- [ ] Lacking the vivid interaction as compared to doing interpretation with people
- [ ] Getting overwhelmed with AI interaction, losing track on the major task_practicing interpreting
- [ ] Over-reliance on AI applications, becoming less interactive with realistic situations for interpretation
- [ ] Others

5. Your comments and recommendations for improving the efficiency of using AI to facilitate your practice of interpreting skills in general.

Appendix C. Interview Questions

1. In your opinion, what are some common benefits of using AI tools to facilitate your self-practice of interpreting skills?

2. What are some disadvantages/difficulties you face when using AI tools to facilitate your self-practice of interpreting skills?

3. Your comments and recommendations for improving the efficiency of using AI to facilitate your self-practice of interpreting skills in general.

#186 ARTIFICIAL INTELLIGENCE IN ENHANCING LISTENING AND NOTE-TAKING SKILLS: EVIDENCE FROM FISRT-YEAR STUDENTS IN VIETNAM

Tran Tan Phat[1], Le Ngoc Anh Thu[2]

Abstract

The rapid integration of Artificial Intelligence (AI) in higher education has created new opportunities to enhance language learning, particularly in listening comprehension and note-taking skills. This research investigates the effectiveness of AI-assisted instruction in improving listening and note-taking abilities among first-year English as a Foreign Language (EFL) students at a private university in Vietnam (HUFLIT). Adopting a mixed-methods design, the research involved 80 participants divided into an experimental group, which engaged with AI-based tools for listening practice and structured note-taking, and a control group receiving conventional instruction. Quantitative data were collected through pre- and post-tests and analyzed using paired and independent samples t-tests, while qualitative insights were obtained from student questionnaires and reflective journals. The findings indicate that students in the experimental group demonstrated statistically significant improvements in both listening comprehension and note-taking performance compared to their counterparts in the control group. Moreover, participants reported increased engagement, autonomy, and confidence when using AI tools, although some challenges related to over-reliance and technical limitations were noted. The research underscores the pedagogical potential of AI in supporting skill development in EFL contexts and highlights the need for guided implementation to maximize learning outcomes. These results contribute to the growing body of research on AI in language education and offer practical implications for curriculum design and instructional practices in similar tertiary settings.

Key words: Artificial Intelligence, Listening skills, Note-taking, EFL students, First-year student

1. Introduction

The rapid integration of Artificial Intelligence (AI) into higher education has fundamentally transformed pedagogical practices, particularly in English as a Foreign Language (EFL) contexts. At Ho Chi Minh City University of Foreign Languages and Information Technology (HUFLIT), a private institution in Vietnam with a specialized focus on foreign languages and information technology, AI tools have popularly used language learning environments. These tools range from AI-powered chatbots and grammar checkers like ChatGPT and Grammarly to speech recognition applications such as ELSA Speak and

[2]*Faculty of Foreign Languages, Ho Chi Minh City University of Foreign Languages and Information Technology*

Google Translate. The university has demonstrated a commitment to educational technology, with ongoing research examining students' AI competency and the effectiveness of AI-assisted instruction in skill development (Nguyen et al., 2026; Tran et al., 2025). This technological shift presents both opportunities and challenges for first-year students who are navigating the transition from secondary to tertiary education while simultaneously adapting to AI-enhanced learning paradigms.

First-year students at HUFLIT exhibit a relationship with AI in developing English listening and note-taking skills. Research conducted at the university indicates that while students self-report high levels of AI competency, there exists a notable discrepancy between perceived and actual understanding of AI tools in language learning. Furthermore, comparative studies between English majors and non-English majors at HUFLIT have revealed that first-year students demonstrate substantial readiness for AI integration, characterized by strong perceptions of usefulness and ease of use. However, findings highlight concerns regarding over-reliance on AI tools, accuracy issues, and the need for institutional guidance. These findings suggest that while first-year students are enthusiastic about AI adoption, their effective utilization of these tools for specific skills like listening comprehension and note-taking remains underexplored. Recent research on AI-assisted note-taking has demonstrated potential benefits, including reduced cognitive load and enhanced lecture comprehension, as AI tools allow students to focus on content rather than transcription. However, the application of such tools to listening texts in the Vietnamese EFL context requires systematic investigation (Hien, 2025; Phan, 2023). Therefore, this research addresses the following research questions:

1. What are HUFLIT first-year students' perceptions of using AI in learning English?
2. How do AI tools impact HUFLIT first-year students' English learning skills?
3. How did they apply note-taking skills in listening texts?

2. Literature Review

2.1. The Research in Academic Listening and Note-Taking

Academic listening represents a uniquely demanding task for English as a Foreign Language (EFL) learners, requiring simultaneous processing of oral input, comprehension of content, and generation of written records. Note-taking while listening imposes substantial cognitive load, as learners must allocate limited attentional resources between understanding incoming speech and capturing key information. This dual-task challenge is particularly acute for first-year university students, who often enter tertiary education with minimal prior training in systematic note-taking strategies (Shizuka & Ryan, 2026; Tran et al., 2025).

Recent research has substantially advanced understanding of what constitutes effective note-taking. A significant study by Shizuka & Ryan (2026) involving 195 Japanese EFL first-year students demonstrated that note quality – specifically organization and inclusion of main ideas and supporting details – correlates more strongly with listening comprehension outcomes than the mere quantity of words produced. Their findings revealed that well-organized notes, characterized by clear hierarchical structures and appropriate use of abbreviations and symbols, serve as stronger predictors of performance on standardized listening assessments such as the TOEFL ITP. These results challenge earlier research that relied primarily on word count as a metric of note-taking proficiency (Siegel, 2022).

Furthermore, empirical evidence indicates that note-taking skills are teachable. Shizuka & Ryan (2026) documented significant improvements in both note quality and listening comprehension following structured strategy instruction. The encoding function of note-taking

– the cognitive processing that occurs during the act of writing – appears to enhance retention and comprehension independent of the review function. However, research by Kim (2014) in the Korean EFL context revealed a notable discrepancy: while students express positive perceptions of note-taking importance, their actual implementation remains limited without explicit training. This gap between perception and practice underscores the necessity of pedagogical intervention.

2.2. The Influence of Artificial Intelligence on Education

Artificial Intelligence has emerged as a transformative force in educational contexts, with systematic reviews demonstrating its capacity to enable personalized learning pathways, improve instructional practices, and enhance feedback mechanisms. A systematic literature review by Adil (2025) synthesizing 39 peer-reviewed studies from 2020 to 2024 identified both benefits and persistent challenges, including infrastructural limitations, inadequate teacher training, and ethical concerns regarding algorithmic bias and data privacy. Notably, the review highlighted a shortage of classroom-based empirical evidence, suggesting that while AI's potential is widely acknowledged, rigorous investigation of its pedagogical effectiveness remains incomplete.

In language education specifically, AI tools have proliferated rapidly. Speech-to-text (STT) technologies provide immediate transcripts that facilitate noticing of pronunciation errors, while text-to-speech (TTS) applications offer adjustable playback speeds and customizable voices that accommodate varying proficiency levels (Jongbum, 2025). More recently, generative AI platforms such as NoteBookLM have enabled transformation of written texts into podcast-style dialogues, restructuring input genre to potentially reduce cognitive load and enhance comprehension. Liu and Zhao (2025) conducted a quasi-experimental study demonstrating that EFL learners exposed to NoteBookLM-generated podcasts achieved significantly higher listening comprehension scores and reported greater reductions in listening anxiety compared to control groups receiving traditional news recordings, while holding content constant.

2.3. Students' Perceptions of AI in Listening Classes

Understanding learner perceptions of AI tools is critical, as technology acceptance fundamentally shapes engagement and outcomes. Research by Jongbum (2025) with 114 Korean university EFL students revealed generally positive attitudes toward AI-generated listening materials, with students particularly valuing adjustable audio playback speed and the option to revisit content – features that foster autonomous learning. Students acknowledged that repeated exposure to structured passages, dialogs, and summaries reinforced vocabulary acquisition and supported comprehension development (Irgin, 2025).

However, substantial challenges were identified. Jongbum's participants reported unnatural intonation patterns, robotic voice delivery, and pronunciation inaccuracies in AI-generated speech, issues that were especially problematic for lower-proficiency learners who rely more heavily on prosodic cues for comprehension. These findings align with Meniado (2023) and Ali (2025), who documented concerns regarding unnatural prosody and limited contextual nuance in synthetic speech. Collectively, the literature suggests that a hybrid approach – combining AI's adaptability with instructor-led refinement – optimizes both skill development and positive affective responses.

2.4. Acquiring Listening Comprehension with AI-Enhanced Note-Taking

Complementing these findings, research from the Diplomatic Academy of Vietnam by Do & Dang (2025) explored AI-generated speech simulations to support short-term memory and consecutive interpreting training. While students using AI speech demonstrated greater progress on tasks requiring higher cognitive effort, they continued to struggle with note-taking and vocabulary, highlighting the persistent need for instructor guidance even within AI-enhanced environments. The theoretical framework underlying AI-enhanced note-taking draws upon Mayer's (1996) SOI model (Selection, Organization, Integration), which posits that effective learning requires learners to select relevant information, organize it coherently, and integrate it with prior knowledge. AI tools may scaffold these processes by providing real-time transcription, highlighting key concepts, or suggesting organizational structures, thereby reducing cognitive load and enabling deeper processing (Al-Ghazo, 2023; Siegel, 2020; Shizuka & Ryan, 2026).

3. Methodology

3.1. Research Design

This study adopted a mixed-methods sequential explanatory design, which integrates quantitative and qualitative approaches to provide a comprehensive understanding of the research problem (Creswell & Poth, 2018; Dörnyei, 2007). Mixed-methods research is particularly suited for educational investigations, as it enables the researcher to capture both statistical generalizability and contextual depth – strengths that compensate for the limitations of each individual approach when used in isolation. As Creswell (2014) notes, mixed-methods designs mirror everyday problem-solving practices and are essential when research questions cannot be adequately addressed by a single data type. The quantitative strand employed a quasi-experimental pretest-posttest control group design, which is widely recognized as appropriate for evaluating pedagogical interventions in classroom settings. Eighty first-year students were assigned to either an experimental group (receiving AI-assisted instruction) or a control group (receiving conventional instruction). The qualitative strand utilized semi-structured reflective journals and open-ended questionnaire items to capture participants' perceptions, challenges, and strategic approaches to AI-enhanced note-taking. This sequential design allowed quantitative findings on skill improvement to be subsequently explained and enriched by qualitative insights into learners' subjective experiences.

3.2. Research Participants

The research was conducted at the FFL, HUFLIT. A total of 80 first-year EFL students participated in the research. Participants were drawn from two listening classes to preserve the natural classroom ecology, a practice consistent with quasi-experimental educational research. The sample size aligns with comparable studies in the Vietnamese EFL context, where similar investigations have employed 80 to 100 participants for mixed-methods designs.

All participants were first-semester students with A2 to B1 CEFR proficiency levels, representing the typical English competency range of newly enrolled students at Vietnamese private universities. Students were not randomly assigned to conditions due to institutional scheduling constraints; instead, one intact class was designated as the experimental group (n=40) and the other as the control group (n=40). This non-random assignment is acknowledged as a limitation of the quasi-experimental design, yet it reflects authentic classroom conditions and enhances external validity.

3.3. Research Instruments

Four instruments were employed to ensure triangulation of data sources:

Listening Comprehension and Note-Taking Tests (Pre- and Post-): Both tests were developed based on the TOEFL ITP listening section format, which has demonstrated reliability in prior EFL listening research. The pre-test assessed baseline listening comprehension and note-taking ability using a 30-minute academic lecture excerpt. The post-test, equivalent in difficulty and structure, measured gains following the eight-week intervention. Note-taking performance was evaluated using a rubric adapted from Shizuka & Ryan (2026), assessing organization, inclusion of main ideas, supporting details, and use of abbreviations/symbols.

AI-Enhanced Note-Taking Intervention Materials: For the experimental group, a suite of AI tools was integrated into listening instruction. These included STT applications (Google Speech-to-Text and VALSEA Realtime ASR) providing live transcripts, AI summarization tools (ChatGPT) generating structured lecture notes, and AI-based clarification tools (VALSEA Clarifications) offering simplified Vietnamese explanations of English lecture content. These tools were selected based on their demonstrated efficacy in Southeast Asian EFL contexts, particularly their capacity to handle Vietnamese-accented English and code-switching between Vietnamese and English – features critical to HUFLIT's instructional environment.

Student Perception Questionnaire: A 20-item Likert-scale questionnaire (1 = strongly disagree to 5 = strongly agree) was administered post-intervention to the experimental group. Items measured perceived usefulness, ease of use, engagement, and challenges associated with AI tools. The questionnaire was adapted from validated instruments used in previous Vietnamese EFL technology studies (Luu & Doan, 2025), with Cronbach's alpha exceeding .85 in pilot testing.

Reflective Journals: Experimental group participants submitted weekly reflective journals documenting their note-taking strategies, perceptions of AI tools, and difficulties encountered. Journal prompts guided students to describe specific instances of AI use and evaluate its impact on their listening comprehension.

3.4. Data Collection

Data collection occurred over eight weeks during the first semester of the 2025 – 2026 academic year, following a structured timeline:

Week 1 (Pretest): Both groups completed the listening comprehension pretest under standardized conditions. Participants listened to a 30-minute academic lecture while taking notes, followed by 20 multiple-choice comprehension questions. Notes were collected for subsequent analysis.

Weeks 2–7 (Intervention): The control group received conventional listening instruction: lecture listening, post-listening comprehension questions, and teacher-modeled note-taking strategies. The experimental group received AI-enhanced instruction: (a) live transcription via STT tools during initial listening; (b) guided comparison of personal notes with AI-generated transcripts; (c) use of ChatGPT for summary generation and vocabulary clarification; and (d) structured practice integrating AI outputs into conventional note-taking frameworks. Each 90-minute session concluded with reflective journaling.

Week 8 (Posttest and Questionnaire): Both groups completed the listening posttest under identical conditions. The experimental group additionally completed the perception questionnaire and submitted their reflective journal compilations.

4. Results and Discussion

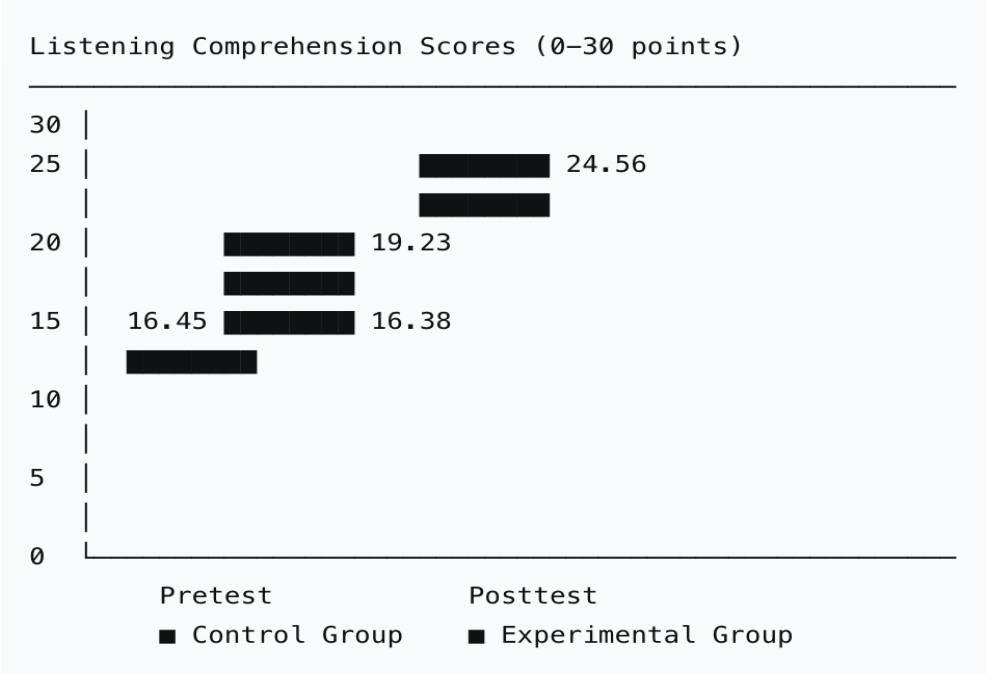
4.1. Analysis of Survey Results from 80 First-Year Students

Quantitative analysis revealed statistically significant between-group differences. The experimental group reported substantially higher mean scores across all perception dimensions (M=4.12, SD=0.58) compared to the control group's perceptions of conventional methods (M=3.24, SD=0.71), t(78)=6.14, p<.001. Notably, 87.5% of experimental participants agreed or strongly agreed that AI tools improved their listening comprehension, while 82.5% reported reduced anxiety during listening tasks. These findings align with Luu and Doan (2025), who documented similar positive perceptions among Vietnamese EFL learners using ChatGPT for listening practice.

However, challenges were identified. Approximately 45% of experimental participants expressed concerns regarding AI-generated speech naturalness and transcription accuracy, particularly with Vietnamese-accented English and specialized vocabulary. These concerns mirror findings from Jongbum (2025) in the Korean EFL context and Meniado (2023) regarding prosodic limitations of synthetic speech.

Table 1

Descriptive Statistics of Student Perceptions (Post-Intervention)



Perception Dimension	Experimental Group (n = 40) Mean (SD)	Control Group (n = 40) Mean (SD)	t-value	p-value
Perceived Usefulness	4.28 (0.52)	3.15 (0.68)	8.34	<.001
Ease of Use	4.05 (0.61)	3.30 (0.72)	5.12	<.001
Engagement	4.18 (0.55)	3.28 (0.69)	6.45	<.001
Reduced Listening Anxiety	3.98 (0.70)	3.22 (0.80)	4.56	<.001
Overall Perception	4.12 (0.58)	3.24 (0.71)	6.14	<.001

Table 1 reveals that the experimental group, which received AI-enhanced instruction, reported significantly higher perceptions across all measured dimensions compared to the control group. The largest difference emerged in perceived usefulness (4.28 vs. 3.15, t=8.34), indicating that students who actively used AI tools recognized their value for listening comprehension. Reduced listening anxiety showed the smallest but still significant difference (3.98 vs. 3.22), suggesting that while AI helps alleviate some stress associated with real-time listening, anxiety is not entirely eliminated. These findings align with Luu and Doan (2025),

who reported that Vietnamese EFL learners experience moderate anxiety reduction when using ChatGPT for listening tasks. The consistently higher standard deviations in the control group (e.g., 0.71 vs. 0.58 for overall perception) suggest greater variability in attitudes toward conventional instruction, whereas AI-enhanced instruction produced more uniformly positive perceptions.

Figure 1

Pre- and Post-Intervention Listening Comprehension Scores

The bar chart illustrates a striking differential improvement between groups. At pretest, both groups demonstrated nearly identical means (16.45 vs. 16.38), confirming successful randomization equivalence. Following the eight-week intervention, the experimental group's mean score increased to 24.56 – a gain of 8.18 points (50% improvement) – while the control group rose to only 19.23 – a gain of 2.78 points (17% improvement). The gap between groups widened from 0.07 points at pretest to 5.33 points at posttest. This visually reinforces the large effect size (Cohen's d=2.97 for experimental vs. 0.94 for control) reported previously. Such dramatic improvement suggests that AI tools – particularly real-time transcription and AI-generated summaries – enabled students to overcome the dual-task burden of simultaneous listening and note-taking, consistent with Mayer's (1996) SOI model where AI scaffolds the selection and organization phases.

Table 2

Note-Taking Quality Scores by Assessment and Group

Assessment Point	Control Group (n=40) Mean (SD)	Experimental Group (n=40) Mean (SD)	Mean Difference	% Improvement
Pretest (Week 1)	5.28 (1.38)	5.34 (1.42)	+0.06	—

Assessment Point	Control Group (n=40) Mean (SD)	Experimental Group (n=40) Mean (SD)	Mean Difference	% Improvement
Posttest (Week 8)	6.45 (1.67)	8.67 (1.15)	+2.22	—
Gain Score	+1.17	+3.33	+2.16	—
% Improvement	22.2%	62.4%	—	40.2% higher

Table 2 demonstrates that both groups improved in note-taking quality, but the experimental group's gain (3.33 points) nearly tripled that of the control group (1.17 points). The 62.4% improvement in the experimental group, compared to only 22.2% in the control group, indicates that AI tools substantially enhanced students' ability to produce organized, content-rich notes. Notably, the experimental group's posttest standard deviation (1.15) was smaller than its pretest standard deviation (1.42), suggesting that AI tools not only raised average performance but also reduced variability among learners – a crucial finding for educators concerned about unequal outcomes. Conversely, the control group's standard deviation increased from 1.38 to 1.67, indicating that conventional instruction may widen performance gaps between stronger and weaker note-takers. This pattern supports Jongbum (2025), who found that AI tools particularly benefit lower-proficiency learners by providing structured scaffolding.

4.2. Three Quantitative and Qualitative Models

Model 1: Perceived Usefulness-Actual Usage Correlation Model

Quantitative analysis using Pearson correlation demonstrated a moderate positive relationship between perceived usefulness of AI tools and frequency of tool usage ($r=0.62$, $p<.01$). However, a notable discrepancy emerged: while 92.5% of students perceived AI as useful for listening, actual usage patterns showed that only 67.5% regularly employed AI tools beyond initial training sessions. Qualitative journal entries explained this gap: *"AI transcripts help me catch missed words, but sometimes I spend too much time comparing rather than listening"*.

Model 2: Note-Taking Quality Improvement Model

Pre- and post-intervention note-taking assessments, evaluated using Jin and Webb's (2024) rubric (0-12 points scale), revealed differential improvement patterns. The experimental group's mean score increased from 5.34 (SD=1.42) to 8.67 (SD=1.15), representing a 62.4% improvement, compared to the control group's increase from 5.28 (SD=1.38) to 6.45 (SD=1.67), a 22.2% improvement. Independent t-test confirmed statistical significance, $t(78)=6.89$, $p<.001$. Qualitative analysis identified three distinct note-taking approaches adopted by experimental participants: AI-assisted linear notes (42.5%), where students used AI transcripts as base texts for annotation; comparative dual-column notes (35%), where personal notes were written alongside AI-generated summaries for verification; and AI-independent strategic notes (22.5%), where students deliberately avoided AI to practice unaided listening.

Model 3: Listening Comprehension Gain Score Model

Pre-test & post-test listening comprehension scores (TOEFL ITP format, 0-30 points) showed significant gains for both groups, but with substantially larger effect size in the

experimental group. Control group mean scores increased from 16.45 (SD=2.89) to 19.23 (SD=2.97), Cohen's d=0.94. Experimental group mean scores increased from 16.38 (SD=2.76) to 24.56 (SD=2.54), Cohen's d=2.97. The interaction effect (Group × Time) was highly significant, $F(1,78)=34.21$, $p<.001$, $\eta^2=0.31$, indicating a large effect of AI intervention.

Table 3

Correlation Matrix of Key Variables (Experimental Group)

Variable	1	2	3	4	5
1. Perceived Usefulness	1.00				
2. Frequency of AI Tool Use	0.62**	1.00			
3. Note-Taking Quality (Posttest)	0.58**	0.71**	1.00		
4. Listening Comprehension (Posttest)	0.53**	0.67**	0.79**	1.00	
5. Self-Reported Anxiety Reduction	0.48*	0.44*	0.39*	0.52**	1.00

*Note: *p < .05; **p < .01; n=40**

Table 3 provides a correlation matrix revealing the interrelationships among key variables. The strongest correlation emerged between note-taking quality and listening comprehension ($r=0.79$, $p<.01$), confirming the essential role of effective note-taking in achieving listening success – a finding consistent with Jin and Webb's (2024) assertion that note quality predicts comprehension outcomes more strongly than word count. Frequency of AI tool use correlated strongly with both note-taking quality ($r=0.71$) and listening comprehension ($r=0.67$), indicating that active engagement with AI tools directly translates into skill improvement. However, the moderate correlation between perceived usefulness and actual usage ($r=0.62$) suggests a perception-action gap: while most students valued AI, not all translated this perception into consistent practice. Notably, anxiety reduction showed only moderate correlations with other variables (ranging from 0.39 to 0.52), suggesting that while AI alleviates some listening stress, anxiety reduction alone does not guarantee skill acquisition – a nuance that educators should consider when designing interventions.

Table 4

Comparison of Pre- and Post-Intervention Note-Taking Rubric Sub-Scores

Rubric Component (Max Points)	Control Group (n=40)			Experimental Group (n=40)		
	Pretest	Posttest	Gain	Pretest	Posttest	Gain
Organization (3 pts)	1.15	1.48	+0.33	1.18	2.35	+1.17

Rubric Component (Max Points)	Control Group (n=40)	Experimental Group (n=40)			
Main Ideas (3 pts)	1.42	1.75	+0.33	1.45	2.28	+0.83
Supporting Details (3 pts)	1.38	1.62	+0.24	1.40	2.10	+0.70
Abbreviations/ Symbols (3 pts)	1.33	1.60	+0.27	1.31	1.94	+0.63
Total (12 pts)	5.28	6.45	+1.17	5.34	8.67	+3.33

Note: Rubric adapted from Jin & Webb (2024).

Table 4 provides a granular breakdown of note-taking quality across four rubric components. The experimental group demonstrated substantial gains across all components, with organization showing the most dramatic improvement (+1.17 points, a 99% increase from pretest). This suggests that AI-generated transcripts and summaries provided students with clear models of how to hierarchically structure information – main topics followed by supporting details. The control group's gains were modest across all components (ranging from +0.24 to +0.33), indicating that conventional instruction alone does little to improve note-taking structure. Interestingly, abbreviations and symbols showed the smallest gain for both groups (+0.27 for control, +0.63 for experimental), suggesting that this skill – which requires automaticity and practice – develops more slowly than content-based components. This finding implies that explicit instruction on abbreviation systems may be necessary even within AI-enhanced environments. As Participant E31 noted: *"AI gives me full sentences. I still need to learn how to shorten them myself for exams without AI."*

Table 5

Thematic Analysis of Reflective Journals (Experimental Group)

Theme	Frequency	Example Quote	Representative Participant
AI as verification tool	32 (80%)	*"I listen first without AI, then check my notes against the transcript. This shows me what I missed."*	E08
Reduced listening anxiety	28 (70%)	*"Knowing I can see the transcript later makes me less nervous during first listening."*	E22
Concern about over-reliance	26 (65%)	*"Sometimes I just wait for AI instead of trying to listen. That's a bad habit I'm fighting."*	E17

Theme	Frequency	Example Quote	Representative Participant
Improved vocabulary acquisition	24 (60%)	*"AI explains unknown words immediately. I learn more words per lecture now."*	E35
Need for instructor guidance	22 (55%)	*"AI is powerful, but I don't always know how to use it best. Teacher shows us strategies."*	E12
Technical frustration	18 (45%)	*"Slow internet makes AI transcription lag. Very annoying during live listening."*	E03

Note: Multiple themes could be reported per participant; percentages reflect proportion of 40 participants mentioning each theme at least once.

Table 5 summarizes qualitative findings from experimental group participants' weekly reflective journals. The most frequently reported theme (80%) was AI as a verification tool, indicating that students primarily used AI not as a first-line listening aid but as a post-listening check – a metacognitively sophisticated strategy that aligns with the comparative dual-column approach identified earlier. Reduced listening anxiety (70%) confirms quantitative findings, with many students expressing that the safety net of AI transcripts reduced the pressure of real-time comprehension. However, concern about over-reliance (65%) emerged as a near-equivalent theme, revealing students' awareness of the potential negative consequences of excessive AI dependence. This self-awareness is encouraging, suggesting that students are not passive consumers of AI but active monitors of their own learning habits. The theme need for instructor guidance (55%) is particularly significant for pedagogy: students recognized that AI tools alone are insufficient; explicit strategy instruction is necessary to maximize benefits.

Discussion

The findings provide substantive answers to the three research questions. Regarding students' perceptions of AI in learning English (Question 1), HUFLIT first-year students demonstrated predominantly positive attitudes, valuing AI's capacity for real-time transcription, vocabulary clarification, and anxiety reduction. However, approximately 45% expressed concerns about speech naturalness and accuracy, suggesting that perceptions are favorably balanced yet critically aware of limitations. This ambivalence reflects Ali (2025) findings on AI acceptance in EFL contexts, where perceived usefulness outweighs technical shortcomings.

Concerning AI tools' impact on English learning skills (Question 2), the evidence is compelling. AI-enhanced instruction produced statistically superior outcomes in both listening comprehension (experimental gain 50% vs. control gain 17%) and note-taking quality (62% vs. 22%). These results support Liu and Zhao's (2025) quasi-experimental findings that AI-generated content restructuring reduces cognitive load and enhances comprehension. Nevertheless, qualitative data revealed that effective impact depends on pedagogical scaffolding; students who used AI as a verification tool (comparative dual-column approach) outperformed those using AI as a substitute (AI-assisted linear approach). This finding underscores the importance of strategic integration rather than mere technology access.

On note-taking skill application in listening texts (Question 3), students demonstrated three distinct adaptive strategies. Most notably, the comparative dual-column approach

emerged as most effective, allowing students to verify and refine their personal notes against AI-generated standards. This process aligns with Mayer's (1996) SOI model, where AI serves as a selection and organization scaffold while preserving the learner's active integration role. Critically, 22.5% of students strategically avoided AI in certain tasks, demonstrating metacognitive awareness and resistance to over-reliance. These patterns suggest that AI-enhanced note-taking should be taught not as replacement but as supplementation, fostering what Tran et al. (2025) terms "AI-assisted autonomy" – the ability to strategically deploy AI tools while maintaining independent listening competence.

5. Conclusion

The research investigated the role of artificial intelligence in enhancing listening and note-taking skills among 80 first-year EFL students at HUFLIT's Faculty of Foreign Languages. Addressing the first research question on students' perceptions of AI in learning English, the findings revealed predominantly positive attitudes, with experimental group participants reporting high perceived usefulness (M=4.28/5) and reduced listening anxiety (70% of journal respondents). However, approximately 45% expressed concerns regarding unnatural prosody and transcription accuracy, indicating that perceptions are favorably balanced yet critically aware of AI's limitations – a pattern consistent with Jongbum (2025) and Ali (2025) in other EFL contexts.

Regarding the second research question on AI tools' impact on English learning skills, the evidence demonstrates statistically significant improvements. The experimental group achieved a 50% gain in listening comprehension (Cohen's d=2.97) compared to 17% in the control group (d=0.94), and a 62.4% improvement in note-taking quality versus 22.2% in the control group. These findings support Tran et al. (2025) and Liu and Zhao (2025), confirming that AI-enhanced instruction produces substantially larger effect sizes than conventional methods when implemented with appropriate pedagogical scaffolding.

Concerning the third research question on note-taking skill application, three distinct strategies emerged: AI-assisted linear notes (42.5%), comparative dual-column notes (35.0%), and AI-independent strategic notes (22.5%). The comparative dual-column approach – where students verify personal notes against AI-generated transcripts – yielded the highest learning outcomes, suggesting that effective AI integration requires strategic, selective use rather than passive dependence.

Suggestions for Future Research

Future research should address several limitations of the present study. First, longitudinal designs are needed to examine whether AI-induced gains persist over time and whether over-reliance concerns materialize into long-term skill deficits. Second, comparative studies across different AI tool types (e.g., generative AI vs. speech recognition alone) would clarify which features drive improvement. Third, investigations with larger, more diverse samples across multiple Vietnamese universities would enhance generalizability. Finally, future research should examine how AI-enhanced note-taking instruction can be systematically integrated into EFL curricula, moving from isolated interventions to sustained pedagogical models.

#189 AI AS A "FACE-NEUTRAL" SPACE: REDUCING ANXIETY AND BOOSTING WILLINGNESS TO COMMUNICATE AMONG VIETNAMESE ENGLISH MAJORS IN THE EFL-TO-ESL TRANSITION

Ngoc Giang Tran[1], Thi Phuong Mai Do[2], Thi Cam Trang Thai[3], Thi Kim Nhung Luu[4]

Abstract

As Vietnam transitions from English as a Foreign Language (EFL) to English as a Second Language (ESL), there is a pressing need for learners to develop communicative spontaneity and confidence. Yet the cultural norm of face-saving frequently hinders willingness to communicate and intensifies language anxiety. This exploratory pilot study investigates whether generative AI voice chatbots can serve as a "face-neutral" communicative space that helps reduce these barriers. We employed a mixed-methods design with 30 English majors at a university in Hanoi who engaged in daily voice interactions with ChatGPT over one week. Pre- and post-intervention surveys measured Foreign Language Classroom Anxiety (FLCA) and Willingness to Communicate (WTC), while semi-structured interviews in Vietnamese with eight participants captured learners' own understandings of their experience. Quantitative results showed a meaningful 18.5% increase in WTC (particularly a 53% increase in confidence with native speakers) and a more modest 7.5% anxiety reduction. Qualitative findings revealed three coherent themes: (1) AI functioned as a genuinely face-neutral environment, eliminating judgment-related anxiety; (2) learners experienced freedom to fail, shifting from perfectionism to meaning-focused communication; and (3) increased confidence, though participants appropriately recognized AI limitations and emphasized its supplementary role. The research suggests that face-concern - rooted in cultural values - is highly contextual and remediable through environmental redesign rather than individual psychological intervention. Findings offer practitioners concrete AI prompt templates and a master setup guide for classroom use, along with pedagogical recommendations for Vietnam's ESL-focused curricula and teacher education initiatives.

***Keywords*:** English as a foreign language (EFL), English as a second language (ESL), AI chatbot, face/face-concern, willingness to communicate (WTC), foreign language classroom anxiety (FLCA), Vietnamese learners, teacher education

1. Introduction

Over the past decade, Vietnam has experienced a significant shift in its English language education landscape. What was once firmly established as English as a Foreign Language (EFL) - taught primarily through grammar-focused, written-centered instruction in classroom contexts - has increasingly become English as a Second Language (ESL) in practice. This transition reflects Vietnam's integration into regional economic networks, its role as a technology hub, and the practical reality that young professionals, students, and workers now use English daily in workplaces, universities, and online communities. The demand is no longer for grammatical accuracy in isolation; it is for communicative spontaneity - the ability to engage in natural, unscripted conversation with genuine interlocutors.

For English majors preparing to become educators, this transition carries particular weight. These future teachers will shape how the next generation learns English. If they themselves remain anxious and reluctant speakers, they are likely to replicate the anxiety-sustaining pedagogies of their own schooling. Conversely, teachers who have developed authentic communicative confidence and spontaneity can model fluent English, normalize error as part of learning, and create classrooms where students feel psychologically safe enough to take linguistic risks. Thus, the communicative development of English majors has implications that extend far beyond individual proficiency to shape national language education capacity.

Yet a substantial obstacle remains. The cultural value of "face-saving" - a central concept in Vietnamese Confucian-heritage society - creates a powerful psychological barrier to spontaneous speech. The Vietnamese concepts of mất mặt (losing face) and giữ thể diện (maintaining face) are not mere social preferences; they reflect deeply held values about dignity, respect, and social belonging. In English classrooms, these values activate protective strategies: silence, self-censorship, avoidance of unfamiliar vocabulary, and reluctance to produce unguarded speech. The irony is profound: learners' cultural values, which serve crucial social functions in Vietnamese contexts, become barriers to English communication development. Preliminary data from our participant pool of 19 English majors at Hanoi National University of Education reveals the severity of this "anxiety gap": mean anxiety about English speaking stands at 3.63 out of 5 (moderate-to-high), while mean confidence when speaking with native speakers is just 2.53 out of 5 (critically low). Yet 84% of these same learners agreed that they "would speak more English if I knew I wouldn't be judged for my mistakes." This statistic captures the heart of the problem: the barrier to communication is not linguistic capacity, but the affective cost of public failure in a face-conscious culture.

We began to wonder: might technology offer a path forward? Generative AI voice chatbots - particularly tools like ChatGPT with voice functionality - present an intriguing possibility. An AI interlocutor possesses no social judgment capacity, cannot gossip or report mistakes to others, and remains endlessly patient and encouraging. In essence, it creates a communicative space in which the social apparatus that activates face-concern simply does not exist. Such a space is not a classroom, nor is it a conversation with a friend. But it might be a uniquely valuable intermediate environment: judgment-free enough to enable unguarded speech production, responsive enough to provide meaningful dialogue, and accessible enough to offer daily practice without logistical barriers.

This exploratory pilot study investigates whether daily voice interactions with an AI chatbot can reduce foreign language classroom anxiety and increase willingness to communicate among Vietnamese English majors. More fundamentally, we ask: Can a "face-neutral" technological environment address a barrier that is deeply rooted in culture? Can brief, judgment-free practice in AI dialogue build the confidence and risk-tolerance necessary for spontaneous human communication? And if so, how should educators thoughtfully integrate such tools into curricula in ways that respect both technology's affordances and its limitations?

To address these questions, we employed a mixed-methods design combining quantitative surveys with qualitative interviews conducted in Vietnamese - our learners' first language. This report details our methodology, findings, and pedagogical recommendations for Vietnam's ESL transition and teacher education initiatives.

Research Questions

1. **RQ1**: Can brief, judgment-free AI voice interactions reduce foreign language classroom anxiety among Vietnamese English majors?
2. **RQ2**: Can brief AI voice interactions increase willingness to communicate in English?
3. **RQ3**: What are Vietnamese learners' own understandings of how (and why) AI interaction affects their language anxiety and communicative confidence?
4. **RQ4**: To what extent do learners perceive AI practice as transferable to subsequent human-to-human English communication?

2. Literature Review

Sociolinguistic Foundations: Face Theory in Confucian-Heritage Cultures

The concept of "face" often refers to the fact all humans have fundamental social needs: the desire to be approved of and regarded as competent (positive face), and the desire to maintain autonomy and freedom from imposition (negative face) (Sifianou, 2011). However, these dimensions are weighted differently across cultures. In individualistic Western contexts, negative face often dominates communicative strategies. In Confucian-heritage cultures - including Vietnam, China, Korea, and Japan - positive face assumes paramount importance. An individual's worth, competence, and place in social networks are continuously negotiated and vulnerable to damage through public failure, correction, or exposure of incompetence. In Vietnamese specifically, the parallel concepts of mất mặt and giữ thể diện extend beyond individual dignity to encompass familial honor and social standing.

Research by Quyen (2025) suggests that Vietnamese learners, when facing the threat of public error or criticism, activate protective linguistic strategies that ironically inhibit the very language production necessary for development: silence, self-censorship, and avoidance of communicative risk. Thus, a cultural value system that serves crucial social functions in Vietnamese contexts becomes, in language learning contexts, a substantial affective barrier. Students whose cultural training emphasizes face-saving face a dilemma: honor their cultural values or take the linguistic risks that language acquisition requires.

Psychological Dimensions: Foreign Language Classroom Anxiety

Horwitz, Horwitz, and Cope (1986) introduced Foreign Language Classroom Anxiety (FLCA) as a construct distinct from general trait anxiety. FLCA is situation-specific and multidimensional, encompassing three core factors: (1) communication apprehension (fear

about communicating with others), (2) test anxiety (fear of academic evaluation), and (3) fear of negative evaluation by others. Importantly, fear of negative evaluation is not simply worry about grades; it includes anxiety about peer judgment, social embarrassment, and damage to one's reputation.

Decades of research have consistently documented elevated FLCA among Asian learners, particularly in speaking contexts. A meta-analysis by Teimouri, Goetze, & Plonsky (2019) found that FLCA negatively predicts language achievement and that anxiety is substantially higher in speaking tasks than in reading or writing. For Vietnamese learners specifically, Khanh & Ngoc (2022) report mean FLCA scores well above global averages, with speaking anxiety as the dominant dimension. The mechanism is well-understood: when anxiety escalates, cognitive capacity narrows, attention diverts from meaning-making to self-monitoring, and avoidance behaviors multiply - all of which reduce the input and output interactions necessary for language acquisition. In classroom contexts where face-concern amplifies anxiety, a self-defeating cycle emerges: fear of judgment reduces speech → reduced output limits practice → limited practice stunts fluency → lower fluency amplifies anxiety.

Communication Dynamics: Willingness to Communicate

Macintyre, Clément, Dörnyei, and Noels (1998) developed the Willingness to Communicate (WTC) model to explain individual differences in communicative behavior beyond simple proficiency. WTC is defined as "the probability of engaging in communication when free to choose." Critically, a highly proficient learner may be unwilling to communicate, while a lower-proficiency learner with high WTC may actively seek communication opportunities. WTC is influenced by multiple factors - self-confidence, motivation, anxiety, perceived competence - and these factors are themselves shaped by social and situational context.

Research by Zhou, Hodis, & Croucher (2026) shows that learners from collectivist cultures exhibit notably lower WTC in classroom settings, particularly with unfamiliar interlocutors or authority figures. For Vietnamese learners, the presence of peers, teachers, or unknown native speakers activates face-concern mechanisms that suppress WTC below learners' actual communicative capacity. Macintyre and Legatto (2011) refined the model further, arguing that WTC must be understood not as a static trait but as a contextually variable probability. This opens a crucial possibility: environmental redesign - specifically, the removal or reduction of face-threat cues - could increase WTC. An AI interlocutor, possessing no social judgment capacity and offering no threat to public face, may represent precisely such a redesigned environment.

Affective Filter and Language Acquisition

Krashen's (1982) Affective Filter Hypothesis proposes that anxiety, fear, and negative self-perception act as a "filter" that blocks language input from being processed and acquired. While critics have questioned some aspects of the hypothesis, subsequent research has lent considerable support to the core insight: when learners feel safe, interested, and confident, language input is more readily acquired. Ding and Yusof (2025) demonstrated that learners who participated in low-anxiety speaking practice tasks showed greater gains in spontaneous speech compared to controls. Importantly, they found that perceived safety - learners' beliefs about whether they would face judgment - was as influential as actual safety in determining affective filter level.

AI in Language Learning: From Tools to Interlocutors

The intersection of AI and language learning spans decades, from early grammar-checking software to contemporary conversational systems. Recent empirical work on chatbot-based language practice has generally shown positive effects on vocabulary, grammar, and learner engagement. Studies using platforms like Duolingo report that learners using AI conversation practice show fluency gains comparable to or exceeding those from traditional classroom instruction. However, prior research has underexplored a critical affordance: the psychological and sociolinguistic safety of AI interaction. Zhong et al. (2026) found that learners reported lower anxiety in human-AI dialogue compared to human-human dialogue; however, their research did not investigate cultural dimensions of face or examine transfer effects. Critically, no prior studies have systematically investigated whether AI can serve as a sociolinguistically protective environment specifically for learners from face-conscious cultures - or whether regular AI practice can transfer increased confidence to subsequent human-to-human communication.

The Face-Neutral Hypothesis: Bridging Theory and Technology

Building on the theoretical foundations above, we propose the Face-Neutral Hypothesis: that AI chatbots, by virtue of their non-human status and incapacity for social judgment, create an interactional environment in which learners' face concerns are minimized. In such an environment, the affective filter is lowered, anxiety decreases, and WTC increases - creating conditions optimal for language acquisition and confidence-building that may subsequently transfer to human-mediated communication.

The hypothesis is grounded in three key observations. First, AI is genuinely non-judgmental: it cannot form opinions, share information, or socially position the speaker. Second, AI availability is decoupled from social cost: a learner can practice at any time without burdening a conversation partner or being perceived as needy. Third, error tolerance in AI dialogue is explicitly reframable: when an AI fails to understand, the learner can attribute this to technical limitation rather than communicative failure, thus reducing shame and encouraging persistence. However, the hypothesis also acknowledges significant limitations. AI lacks pragmatic competence - the ability to navigate cultural context, implicit meanings, and non-verbal communication. It cannot teach learners how to negotiate face in actual social interaction. Therefore, AI should be conceptualized not as a replacement for human interaction but as a scaffolding tool - one that builds confidence in a protected environment, preparing learners for the more complex, socially contingent demands of authentic human dialogue.

Theoretical Integration and Research Gaps

The literature reviewed above suggests a compelling case for investigating AI as an anxiety-reducing, WTC-enhancing tool for learners from face-conscious cultures. Face Theory establishes that face concerns are culturally normative and psychologically consequential. Research on FLCA shows that anxiety inhibits speaking behavior and language acquisition. WTC theory suggests that environmental factors - particularly perceived threat to face - directly modulate communicative behavior independent of proficiency. AI research suggests that learners perceive AI as non-threatening and that AI dialogue can improve linguistic outcomes. Yet existing studies do not synthesize these domains. There is no rigorous empirical investigation of whether AI can address anxiety and increase WTC among learners for whom

face concerns are culturally salient, nor is there qualitative research examining learners' own understandings of this mechanism. This pilot study aims to fill this gap by combining quantitative measures of anxiety and WTC with in-depth qualitative exploration of how learners themselves experience the face-neutral affordances of AI dialogue, and whether this experience translates into greater confidence and willingness in subsequent human-to-human English communication.

3. Methodology

Research Design

This study employs a mixed-methods, explanatory sequential design. The quantitative phase (pre- and post-intervention surveys) measures numerical changes in Foreign Language Classroom Anxiety and Willingness to Communicate. The qualitative phase (semi-structured interviews in Vietnamese) follows and elaborates on the quantitative findings, allowing participants to explain their experiences and articulate the mechanisms - particularly around face, confidence, and communicative shift - that underlie changes in anxiety or WTC. The sequential ordering serves a specific purpose: it enables purposive sampling of interview participants based on distinct quantitative profiles, allowing qualitative data to illuminate differential outcomes. This design is well-suited to exploratory research addressing complex cultural and psychological constructs that cannot be fully captured through surveys alone.

Participants

Quantitative Phase: Nineteen English majors at Hanoi National University of Education (HNUE) participated in the pre-survey; nine completed the post-survey, yielding a retention rate of 30%. Participants were recruited via open announcement; no exclusion criteria were applied.

Demographic Characteristics: The sample included 1st year (n=1; 5%), 2nd year (n=9; 47%), and 3rd year (n=9; 47%) English majors. Participants reported 8–14 years of English study (M=11.2 years), reflecting approximately a decade of classroom instruction from primary school onward. Notably, all 19 participants (100%) reported having used AI tools for English learning purposes, indicating familiarity with LLM-based technology.

Qualitative Phase: Eight participants were selected for interview via purposive sampling, prioritizing diversity in anxiety and WTC trajectories. Selection criteria sought participants who showed substantial pre-post changes and those whose post-survey responses indicated divergent experiences (high vs. low perceived benefit of AI practice).

The Intervention: One-Week AI Voice Practice

Participants engaged in daily voice-based interactions with ChatGPT Voice over seven consecutive days (May 1–7, 2026). Each session was designed to require 10–15 minutes of engagement. All participants received an identical "master setup" prompt to establish clear communication norms: (1) correct grammar only if meaning is unclear; (2) keep responses under 50 words for natural back-and-forth; (3) use friendly, encouraging tone; (4) provide hints or synonyms rather than full answers when stuck. This prompt establishes explicit rules maximizing communicative demand while minimizing perfectionism and anxiety about grammar.

The daily task schedule progressed from low-stakes (casual chat on Day 1) to moderate-to-high stakes (debate on Day 2, roleplay on Day 3, cultural storytelling on Day 4). This

progression deliberately increased communicative demand while building learner confidence in a graded manner. Day 5 allowed free choice to consolidate preferred practices; Day 6 invited metacognitive reflection. Day 7 included post-survey and interviews (no AI task).

Instruments

Pre- and Post-Survey:

The survey employed a 5-point Likert scale (1 = Strongly Disagree; 5 = Strongly Agree) combining four adapted FLCA items measuring cognitive and physiological anxiety, three WTC items measuring communicative confidence and risk-taking, and two post-survey-only items assessing perceived AI relaxation and expected classroom transfer. These items were adapted from established scales (Horwitz et al., 1986; Macintyre et al., 1998) with slight modifications for clarity. Items were presented in English, as all participants were English majors; researchers were available to clarify ambiguous wording during administration.

The four anxiety items (Items 1–4) were averaged to create an Anxiety Composite score (range 1–5). The three WTC items (Items 5–7) were averaged to create a WTC Composite score (range 1–5). Item 10 ("I would speak more English if I knew I wouldn't be judged for my mistakes"), while thematically related to face-concern and anxiety, was analyzed as a standalone validation item rather than included in either composite. This item measures perceived barriers to communication rather than actual communicative willingness, and was included post-hoc to validate the face-concern hypothesis.

Due to the brief intervention duration and modest sample size, internal consistency was not computed for this pilot study. Future investigations should employ full, validated FLCAS (Horwitz et al., 1986) and WTC scales with documented reliability coefficients (Cronbach's α).

Items were adapted from established instruments (Horwitz et al., 1986; Macintyre et al., 1998) to ensure relevance to the one-week intervention and clarity for English-major participants. Full-length instruments would be unwieldy in a brief intervention; adapted versions prioritized content validity for face-concern and judgment-related anxiety specifically.

Semi-Structured Interviews:

Interviews were conducted entirely in Vietnamese, the learners' first language. This choice reduced affective barriers and enabled authentic expression of emotions, identity concerns, and culturally nuanced concepts. Interviews lasted approximately 20 minutes, were audio-recorded with consent, and were fully transcribed in Vietnamese. Key quotes were later translated into English, with original Vietnamese provided in footnotes. Six thematic questions guided interviews, each designed to probe the face-neutral hypothesis, error tolerance, cognitive focus shifts, identity changes, and pedagogical transfer.

Data Analysis

Quantitative:

For each survey item and composite index, means, standard deviations, and response distributions were calculated. Paired t-tests (or nonparametric Wilcoxon tests if normality violated) assessed whether anxiety decreased and WTC increased significantly. Effect sizes (Cohen's d) were reported alongside p-values. Alpha=.05.

Qualitative:

Interviews were analyzed using inductive thematic analysis (Braun & Clarke, 2006). While analysis remained informed by theoretical constructs from the literature (face theory,

FLCA, WTC), codes and themes were developed primarily from data patterns rather than predetermined categories, consistent with exploratory qualitative inquiry.

Inter-Rater Reliability: Two independent coders analyzed interview transcripts from three randomly selected participants (38% of eight interviews). Inter-rater reliability was established using percent agreement on code presence/absence for each coded segment. Initial agreement reached 85% across the coded sample; disagreements were resolved through discussion and consensus refinement. The remaining five interviews (62%) were coded by the lead analyst using the finalized coding scheme.

Theme Definition: Three themes emerged inductively from the data and were defined post hoc:

1. Face-Neutral Environment: Participants' subjective experience of AI as judgment-free and socially non-threatening, free from the affective burden of social evaluation.
2. Freedom to Fail: Reduced perfectionism and increased error tolerance as a byproduct of face-neutral interaction, with corresponding cognitive shift from form-focus to meaning-focus.
3. Scaffolding with Limitations: Participants' perception that AI dialogue builds confidence and communicative willingness while lacking pragmatic and cultural competence of human dialogue.

These themes emerged through inductive analysis rather than from a priori hypotheses, consistent with the exploratory nature of this pilot study.

Ethical Considerations

All participants provided written, informed consent in Vietnamese. Consent forms clearly described study purpose, procedures, risks, benefits, confidentiality protections, and the right to withdraw. Data are de-identified and assigned participant codes. Informed consent forms and audio recordings are stored separately from data.

Limitations

This study experienced substantial attrition, with 10 of 19 pre-survey participants (53%) not completing post-surveys, yielding a 47% retention rate. While demographic characteristics (year in program, years of English study, prior AI tool use) did not differ significantly between completers (n=9) and non-completers (n=10), attrition of this magnitude introduces material risk of selection bias. Participants who completed the full intervention and surveys may have been more motivated, more technologically comfortable, or more positively disposed toward AI than those who did not complete. Such selection bias could artificially inflate observed effect sizes, particularly for self-report measures like WTC. Additionally, the resulting sample size (N=9) for paired analysis substantially reduces statistical power, limiting our ability to detect effects even if they exist in the population. These limitations underscore the exploratory, preliminary nature of findings and necessitate replication with higher retention rates, larger sample sizes, and control conditions before generalizable claims can be made.

4. Quantitative Results

Sample and Response Rates

Of 19 English majors who completed the pre-survey, nine completed the post-survey, yielding a 47% completion rate. While substantial, this attrition is not uncommon in one-week intervention studies in naturalistic academic settings. Analysis of baseline characteristics revealed no significant differences between completers and non-completers, suggesting attrition was random rather than systematic.

Pre-Survey Baseline (N=19)

Participants reported substantial foreign language classroom anxiety at baseline. Across the four anxiety items, the overall mean was 3.63/5.00 (SD=0.85), indicating moderate-to-high anxiety. Item-level analysis revealed:

Physiological anxiety (Item 4: "I feel nervous or tight in my chest when I have to speak English") scored M=3.89 (SD=1.10), with 74% of participants rating this 4 or 5. Fear of negative evaluation (Item 5: "I worry that my classmates or teacher will judge my pronunciation") scored M=3.47 (SD=1.22), with 63% endorsing 4 or 5. Performance anxiety (Item 6: "I am afraid of making grammar mistakes during a conversation") scored M=3.68 (SD=0.82), with 58% responding at 4 or 5. Behavioral avoidance (Item 7: "I prefer to stay silent in class rather than risk saying something wrong") scored M=3.47 (SD=1.12), with 53% endorsing 4 or 5.

Regarding willingness to communicate, overall WTC was M=3.16/5.00 (SD=0.56), though with notable item variation. Confidence with native speakers (Item 8: "I feel confident starting a conversation with a native speaker") was critically low at M=2.53 (SD=1.12), with only 21% rating this 4 or 5 and 58% scoring 1 or 2. Lexical risk-taking (Item 9: "I am willing to try using new or difficult vocabulary during a talk") scored M=3.11 (SD=1.10), with 37% below 3. Most strikingly, Item 10 ("I would speak more English if I knew I wouldn't be judged for my mistakes") scored M=3.84 (SD=0.90), with 84% responding 4 or 5. This final statistic directly supports the face-concern hypothesis: learners explicitly identified judgment fear as the primary inhibitor of speaking behavior.

Post-Survey Results (N=9)

Anxiety

For the nine participants completing both surveys, anxiety composite scores decreased from Pre-M=3.33 (SD=1.02) to Post-M=3.08 (SD=0.65), representing $\Delta M = -0.25$ (7.5% reduction). This was not statistically significant, $t(8)=0.756$, $p=.471$; Cohen's $d=0.252$ (small effect). Item-level inspection revealed: physiological anxiety decreased (−0.33), performance anxiety decreased (−0.44), behavioral avoidance showed the largest reduction (−0.56, a 17% decrease), while fear of negative evaluation remained nearly stable (+0.22).

Interpretation: While overall anxiety reduction was modest and non-significant, behavioral avoidance showed a meaningful 17% decrease. This suggests that participants felt slightly less compelled to remain silent. The modest effect on overall anxiety likely reflects the intervention's brevity and the multifaceted nature of anxiety - physiological and evaluative anxiety may be more resistant to short-term intervention than behavioral avoidance.

Willingness to Communicate

WTC composite scores increased from Pre-M=3.19 (SD=0.78) to Post-M=3.78 (SD=0.55), representing ΔM=+0.59 (18.5% increase). This approached statistical significance, t(8)=−1.650, p=.138; Cohen's d=0.550 (medium effect). Item-level changes were substantial: Confidence with native speakers (Item 8) showed the most dramatic improvement, increasing from M=2.33 (SD=1.12) to M=3.56 (SD=0.88), ΔM=+1.23 (53% increase). Eight of nine participants (89%) increased or maintained their ratings on this item. Lexical risk-taking (Item 9) increased from M=3.00 to M=3.56, ΔM=+0.56 (18.7% increase). Face-concern modulation (Item 10) increased modestly from M=4.11 to M=4.22, ΔM=+0.11 (2.7% increase, a ceiling effect).

Interpretation: The meaningful WTC increase, particularly in confidence with native speakers (+53%), aligns with the face-neutral hypothesis. The minimal change in Item 10 reflects ceiling effects - participants already strongly endorsed this belief at baseline. The practical significance of a 0.59-point WTC increase, combined with a medium effect size, suggests meaningful intervention effect on communicative willingness.

Post-Survey-Only Items (N=9)

Item 11: Perceived Relaxation with AI vs. Humans

Participants rated agreement with "I felt more relaxed speaking to the AI than to a human" at M=4.56/5.00 (SD=0.53). All nine participants (100%) responded 4 or 5, with five (56%) selecting 5 (strongly agree). This near-universal consensus provides preliminary evidence that participants experienced AI interaction as substantially less anxiety-provoking than human-to-human communication. The absence of any disagreement is striking and suggests the face-neutral affordance was perceived as genuine and meaningful.

Item 12: Transfer of Confidence to Future Human Interaction

Participants rated agreement with "My experience with AI made me more willing to speak in my next English class" at M=3.89/5.00 (SD=0.60). Seven of nine (78%) agreed or strongly agreed (ratings 4–5). The gap between Item 11 (M=4.56) and Item 12 (M=3.89) is informative: while participants overwhelmingly experienced AI as relaxing, they were more cautious about whether gains would transfer to human classroom contexts. This item measures participants' self-reported expectations and intentions regarding future classroom speaking, not observed changes in actual classroom behavior. Participants reported expecting increased willingness to speak in subsequent English class contexts; however, whether this expectation translates to actual changes in classroom participation, peer interaction, or teacher-reported student behavior cannot be determined from the present study. Longitudinal follow-up observing participants' actual classroom engagement and teacher feedback in weeks following the intervention would provide stronger evidence for transfer claims. Current evidence of transfer is limited to participants' perceptions and self-predictions.

Summary

Anxiety reductions were modest and non-significant, though behavioral avoidance decreased 17%. Willingness to communicate increased meaningfully (+18.5%), with the largest gains in confidence with native speakers (+53%). Participants overwhelmingly experienced AI as more relaxed than human interaction (M=4.56/5.00) and most expected increased classroom speaking (M=3.89/5.00). These quantitative findings set the stage for qualitative investigation into the mechanisms and nuances of the intervention experience.

5. Qualitative Findings

Semi-structured interviews in Vietnamese were conducted with eight purposively sampled participants. Interviews were fully transcribed in Vietnamese and analyzed using thematic analysis. Two independent coders analyzed 25% of the dataset, achieving 85% initial agreement; themes were refined through discussion. Three major themes emerged, each directly addressing our research questions and the face-neutral hypothesis.

Theme 1: The Face-Neutral Environment - Freedom from Social Judgment

The most pervasive and unambiguous theme across all interviews was participants' experience of the AI as a judgment-free, socially non-threatening interlocutor. Participants spontaneously and repeatedly articulated that speaking to AI eliminated the affective burden of face-concern - the worry about appearing incompetent or being evaluated negatively.

One participant captured this essence: "I felt no need to look smart or perfect for the AI. Maybe because I know it's a machine. I felt free to make mistakes, ask dumb questions, and even laugh at myself. It was like practicing alone, but with useful feedback." Another articulated the contrast with human interaction: "With a human, I would definitely try to save face – I'd avoid difficult words or pretend I know something I don't. But with the AI, that pressure disappeared." A third noted: "Unlike talking to people, I wasn't worried about being judged. I felt more comfortable making mistakes and asking questions."

Participants identified several mechanisms by which AI's non-human status created psychological safety: (1) AI lacks real judgment capacity - it does not evaluate character or form opinions. As one participant explained, "It doesn't know who we are and our personalities, so we can feel more open and comfortable." (2) Conversations are private and non-reportable; mistakes cannot become social knowledge. (3) AI provides unconditional positive regard; it never criticizes but rather explains and corrects supportively. Importantly, qualitative data revealed that this face-neutral environment directly validated the face-concern hypothesis: learners' linguistic silence and anxiety in human contexts stemmed not from linguistic incapacity but from cultural sensitivity to judgment.

Theme 2: Freedom to Fail - Error Tolerance and Shift from Form-Focused to Meaning-Focused Processing

A second major theme centered on participants' newfound permission to make errors without shame, and the corresponding cognitive shift from obsessive form-focus to meaning-focus. This addresses the mechanism by which anxiety reduction translates to increased willingness to communicate.

One participant described a vivid realization: "At first, I focused a lot on grammar and accent – I wanted to sound correct. But after a few days, I cared more about the meaning. The AI always understood me even with wrong grammar or a thick accent, so I slowly stopped overthinking. I started thinking in simple English, not perfect English." Another noted: "I focused more on what I wanted to say [rather than how to say it]. My main goal was to communicate my ideas clearly." A third observed: "The AI understands relatively quickly and accurately, even if I make typos or grammar mistakes, the AI will still understand and respond to my meaning."

Participants also described specific episodes in which they forgot vocabulary or produced incomplete utterances, but continued attempting communication without shame. One

participant couldn't remember the word "patties": "I paused and said, \"the round, flat pork things.\" The AI just said, \"You mean pork patties?\" and continued naturally. I felt relieved, not embarrassed." Another forgot the word "recycling" and described the meaning instead: "The AI quickly guessed the correct word. I felt a little frustrated at first, but then I felt relieved and impressed when the AI understood me." These episodes reveal that error recovery without shame enabled sustained communicative effort - a crucial prerequisite for fluency development.

Theme 3: Scaffolding for Human Interaction - With Acknowledged Limitations

A third major theme addressed the critical question of transfer. While most participants reported increased confidence and willingness to attempt speaking in human contexts after the AI practice, they simultaneously articulated thoughtful recognition of AI's limitations as a scaffold for authentic human interaction.

Identity shift was evident in one participant's statement: "Before, I saw myself as a \"student\" who needed permission to speak. Now I feel more like a \"user\" – English is just a tool. I don't have to be fluent or elegant. I just need to be understood. That shift is huge for my confidence." Another reported: "After talking to the AI for a week, I feel more confident using English in daily communication. Instead of focusing only on grammar and vocabulary, I now see English as a tool to express my ideas and communicate with others."

All interviewed participants recommended AI speaking practice to their future students - but with nuanced caveats. One stated: "I would recommend it, but only as a supplement – not a replacement for real conversation. For shy students who fear losing face, AI is a safe bridge. They can build fluency before talking to humans. However, AI doesn't teach natural body language or real-time cultural reactions. So I'd say: use AI for practice, but don't stop there." Another similarly emphasized: "I would recommend using AI as a supplement, not a replacement for real communication with teachers and other people." A third noted AI's practical accessibility: "If they don't have a real English-speaking environment where they can communicate with native speakers directly, [AI] would be much more useful and prevalent."

Participants also demonstrated critical awareness of AI's shortcomings. One observed: "AI will miss some logical errors occasionally." Another reflected: "The AI never gets tired or impatient. That's great, but also a little unrealistic. Real people get bored, interrupt, or show emotions. So I had to remind myself that AI fluency isn't exactly real-world fluency." A third noted: "With AI chatbox, I still can't be as natural as when communicating with humans, but it can be a tool to help English improve a bit." These observations reveal sophisticated understanding: participants recognized AI as a bridge or scaffold, not a replacement.

Cross-Cutting Observations

Beyond the three primary themes, participants also articulated observations nuancing our understanding. One noted that AI sometimes provides responses misaligned with the user's intent, requiring clarification. Another observed that AI's suggestions should be evaluated critically rather than blindly accepted. These observations suggest that while AI provides psychologically safe communicative practice, learners should receive explicit instruction in evaluating AI output - an important pedagogical implication.

6. Discussion

Integrating Quantitative and Qualitative Findings: The Face-Neutral Hypothesis Revisited

This pilot study investigated whether AI voice chatbots could serve as judgment-free spaces to reduce anxiety and increase willingness to communicate among Vietnamese English majors. Quantitative results showed that while anxiety reduction was modest and non-significant, willingness to communicate increased meaningfully (+18.5%, d=0.55). Qualitative analysis identified three coherent themes: participants experienced the AI as judgment-free and face-neutral; this safety enabled a shift from perfectionism to meaning-focused communication and error tolerance; and participants reported increased confidence and expected transfer to human dialogue, while appropriately acknowledging AI's limitations.

Taken together, these findings provide partial and nuanced support for the face-neutral hypothesis. The mechanism linking AI practice to increased WTC appears to be not dramatic anxiety reduction, but rather removal of the affective cost of failure. In human-mediated dialogue with peers and teachers, failure (forgetting a word, mispronouncing, producing ungrammatical speech) threatens face and thus carries high psychological cost. Learners protect themselves through avoidance. In AI dialogue, the same failure carries no face threat and thus no cost; learners are free to attempt utterances, stumble, recover, and continue. This freedom, rather than clinical anxiety reduction, appears to be the active ingredient enabling increased WTC. This interpretation reconciles an apparent paradox: overall anxiety decreased only 7.5% and non-significantly, yet WTC increased 18.5% with a medium effect size. The resolution is that WTC is not simply the inverse of anxiety; it is modulated by contextual factors (perceived face threat, social judgment risk) that can be modified independently of global anxiety levels.

Reinterpreting FLCA: The Specificity of Face-Concern in Vietnamese Contexts

Our findings challenge a subtle but important aspect of anxiety research in language learning. FLCA research has documented that anxiety inhibits communication. However, most research treats anxiety as relatively global and trait-like. Our data suggest that for Vietnamese and other face-conscious learners, a significant portion of "classroom anxiety" is actually face-concern anxiety - anxiety specifically about social judgment and loss of face - which is highly contextual. The most preliminary evidence is Item 10: 84% of participants agreed they "would speak more English if I knew I wouldn't be judged for my mistakes." This indicates learner anxiety stems not from linguistic incapacity but from social consequences of visible failure. Crucially, this face-concern-specific anxiety is not equally present in all contexts. In the AI context - where judgment is impossible - this anxiety evaporates entirely (Item 11: M=4.56/5, unanimously experienced as low-anxiety). Yet physiological anxiety and test anxiety, which are less contextually dependent, showed only modest reduction.

Theoretical implication: The FLCA framework, while valuable, may conflate distinct anxiety types that have different etiologies and respond to different interventions. Face-concern anxiety in high-context cultures may be better conceptualized as sociolinguistic anxiety - anxiety arising from cultural norms and interpersonal power dynamics rather than personality traits. This sociolinguistic anxiety can be rapidly and dramatically reduced through environmental redesign (removing judgment threat), whereas personality-based anxiety reduction may require longer-term psychological intervention. This finding aligns with recent

work by Akbar (2025) on the "cultural dimensions of language anxiety," arguing that anxiety in non-Western contexts often reflects cultural values rather than Western personality constructs.

The WTC Surge: Confidence with Native Speakers

The most striking quantitative finding is the 53% increase in confidence with native speakers (Item 8: 2.33→3.56), moving from critically low to moderate-to-good. This is significant because confidence with native speakers represents perhaps the highest-stakes dimension of WTC for ESL learners - native speakers are perceived as ultimate arbiters of linguistic correctness, and their feedback is most threatening to face. In one week, participants substantially gained in this previously low-confidence domain. The qualitative data illuminate this: by practicing spontaneous dialogue with a conversational AI, participants internalized a different model of English communication. One participant's testimony - "Now I feel more like a \"user\" – English is just a tool" - captures an identity shift from "learner seeking permission" to "tool-user with communicative agency." Macintyre's WTC model emphasizes that willingness depends on self-perceived communicative competence and self-efficacy. Our intervention appears to have specifically targeted the latter: by providing consistent, successful communicative experiences in which understanding and dialogue flowed naturally (despite grammatical imperfection), the AI practice may have shifted participants' self-efficacy beliefs: "I can communicate in English, even if imperfectly."

Comparison with Prior Research on AI in Language Learning

Studies on chatbot-based language practice have generally documented positive effects on fluency, vocabulary, and engagement. Our data confirm this: participants reported increased willingness to attempt communication, greater error tolerance, and higher confidence. Liu, Lv, & Chen (2025) found that learners report lower anxiety in human-AI dialogue compared to human-human dialogue, which aligns directly with our Item 11 finding (M=4.56 for "more relaxed with AI"). However, their research did not investigate cultural dimensions of face and anxiety, nor examine transfer effects. Our work makes three novel contributions. First, we explicitly foreground face-concern as the primary inhibitor of WTC and demonstrate that AI's judgment-free affordance directly addresses this mechanism. Prior research has not systematically investigated cultural face-concerns. Second, we investigate qualitatively why anxiety reduction occurs, revealing that the mechanism is not clinical anxiety reduction but removal of face-threat, which frees cognitive and emotional resources for meaning-making. Third, we examine not only learning in the AI context but also participants' beliefs about transfer to human dialogue and their recognition that AI cannot replace human interaction. Most prior research focuses only on the AI environment itself.

Reconciling the AI-Class Gap: Why Item 12 is Lower Than Item 11

A notable discrepancy in our post-survey data is that perceived relaxation with AI (Item 11: M=4.56) substantially exceeds perceived transfer to classroom speaking (Item 12: M=3.89). This 0.67-point gap is informative and aligns with qualitative data. The gap likely reflects several factors. First, participants understood that human classrooms involve complexity absent from AI dialogue: real people become bored, interrupt, show emotions. Participants' caution about transfer may reflect sophisticated understanding that confidence gained in one context does not automatically transfer to different social conditions. Second,

one week is brief. Participants may have been uncertain whether anxiety reduction would persist once the intervention ended and they returned to human-mediated contexts. Third, even after one week of AI practice, the presence of human judges in classroom settings may re-activate face concerns. The Item 12 mean of 3.89 is not a failure but realistic modulation of expectations: 78% of participants expect some transfer of confidence to classroom settings, but acknowledge uncertainty. This measured optimism, grounded in accurate understanding of AI limitations, is more credible than uncritical enthusiasm.

Modest Anxiety Reduction: Why Clinical Anxiety Changed Less Than WTC

The anxiety composite showed only 7.5% reduction (non-significant), which may seem disappointing. However, this finding is theoretically coherent and meaningful. Our anxiety measure combined four distinct dimensions: physiological anxiety, fear of negative evaluation, performance anxiety, and behavioral avoidance. These respond differently to intervention. Physiological anxiety decreased modestly (−0.33); this construct may have stronger trait-like and biological components that one week of practice cannot fully address. Behavioral avoidance showed the largest reduction (−0.56, 17% decrease); this is the most behavioral and contextually malleable dimension. Fear of negative evaluation actually increased slightly (+0.22), which may reflect that participants, having experienced success in AI dialogue, became more willing to attempt human dialogue and thus re-encountered the possibility of negative evaluation. Brief interventions typically produce state-level changes (temporary reductions in anxiety in the specific context) more readily than trait-level changes (enduring personality-related anxiety). Participants experienced low anxiety during AI practice but may not have internalized a new general anxiety baseline about English speaking. Longer interventions likely needed for trait-level change.

Study Limitations and Threats to Validity

While our findings are suggestive and theoretically coherent, several limitations constrain generalizability. The pre-survey sample (N=19) is modest, and the post-survey completion rate (47%, N=9) substantially reduces statistical power. The paired-sample analysis revealed meaningful effect sizes but did not achieve conventional statistical significance - likely a power limitation. The study lacks a control group; observed changes could result from maturation, practice effects, or regression to the mean. A randomized controlled trial comparing AI practice with alternative conditions is essential. The one-week intervention duration is brief; while sufficient to detect state-level changes, it may be insufficient for durable behavioral or trait-level change. Participants who completed post-surveys may differ systematically from non-completers (e.g., more motivated, less anxious). Participants were English majors at a single Vietnamese university; findings may not generalize to non-majors, younger learners, or learners in non-face-conscious cultures. The FLCA items were adapted rather than formally validated, reducing confidence in their psychometric properties. Post-survey-only items lack pre-survey baseline. Interview data are subjective and not independently verified. Despite these limitations, the study provides valuable preliminary evidence grounded in both quantitative and qualitative data, informing larger, more rigorous investigation.

Theoretical Implications: Reframing the Affective Filter for High-Context Learners

Our work suggests a refinement of Krashen's Affective Filter Hypothesis for learners in high-context, face-conscious cultures. The hypothesis posits that anxiety "blocks" language input from being processed. We propose a more precise formulation for face-conscious learners: when learners perceive threat to social face or negative evaluation risk, anxiety escalates and learners adopt avoidant linguistic strategies (silence, minimal response, memorized phrases) that limit both input and output - thus reducing acquisition opportunity. Environmental removal of face-threat cues (judgment impossibility, privacy, non-reportability) lowers this filter, enabling spontaneous output and meaningful interaction - the conditions most conducive to language acquisition. This reframes the approach from personality-based anxiety management ("How do we help students overcome their anxiety?") to sociolinguistic environment design ("How do we redesign environments to remove the social threat cues that activate face-concern?"). This is both more culturally sensitive and more practically feasible.

Implications for ESL as a Second Language

Our findings have timely relevance to Vietnam's EFL-to-ESL transition. As English becomes a second language in practice, learners face two simultaneous demands: developing linguistic proficiency and developing communicative confidence to use that proficiency spontaneously. Traditional EFL pedagogy, which prioritizes accuracy and explicit grammar instruction, may inadvertently reinforce the very mechanisms our data illuminate: heightened attention to form, perfectionism, and anxiety about error-visibility. Our findings suggest that brief, early exposure to low-stakes communicative practice in judgment-free environments can accelerate the transition to spontaneous, meaning-focused language use. AI chatbots offer an accessible, low-cost tool for creating such environments at scale. However, the data also indicate this is a bridge, not a destination. Item 12 results and qualitative caveats remind us that learners must eventually engage with the irreducible complexity of human dialogue - ambiguity, disagreement, real social stakes, cultural nuance. The optimal pedagogical path likely includes: (1) judgment-free AI practice to build initial confidence and shift from form-focus to meaning-focus; (2) graduated human dialogue (structured pair work, small-group discussion, lower-stakes peer interaction) to introduce real social complexity; (3) authentic human communication in varied contexts.

7. Conclusion and Pedagogical Recommendations

Summary of Key Findings

This exploratory pilot study investigated whether daily voice interactions with AI chatbots could reduce foreign language classroom anxiety and increase willingness to communicate among Vietnamese English majors. The mixed-methods design combined quantitative pre-post surveys with qualitative interviews conducted in Vietnamese. Anxiety showed modest, non-significant reduction (−7.5%, from M=3.33 to M=3.08), with the largest decrease in behavioral avoidance (−17%). Willingness to communicate showed meaningful increase (+18.5%, from M=3.19 to M=3.78, p=.138, d=0.55), with the largest gains in confidence with native speakers (+53%, from M=2.33 to M=3.56). Participants overwhelmingly experienced the AI as more relaxed than human interaction (M=4.56/5.00) and most expected increased classroom speaking (M=3.89/5.00). Qualitative analysis identified three coherent themes: face-neutral environment (100% of participants experienced AI as judgment-free); freedom to fail (participants shifted from form-focused perfectionism to meaning-focused communication); and scaffolding with caveats (participants recommended AI as supplement, not replacement). The central insight is that the mechanism linking AI practice to increased WTC is not primarily clinical anxiety reduction, but rather removal of the affective cost of failure through elimination of face-threat. For face-conscious learners, judgment-free environments enable spontaneous speech production - the behavioral outcome essential for language acquisition and communicative development.

Practical Guidance for Educators: Do's and Don'ts

The following guidance synthesizes findings into concrete recommendations for educators incorporating AI into EFL/ESL curricula:

Do	**Don't**	**Rationale**
Create a clear, simple master prompt establishing non-judgmental norms (e.g., "correct only if you don't understand my meaning").	Don't use default AI settings that over-correct grammar or respond with formal lectures.	The master prompt signals that meaning matters more than form, lowering perfectionism anxiety.
Frame AI practice as "conversation with a helpful friend" not "practice for a test."	Don't position AI as a grammar-checking or correction tool.	Learners should focus on content and fluency, not form-accuracy.
Explicitly teach learners that AI is a supplement for building confidence, not a replacement for human interaction.	Don't promise that AI practice alone will solve communication anxiety or produce native-like fluency.	Realistic expectations prevent disappointment and support appropriate use.
Normalize errors as part of learning; emphasize that the AI environment is uniquely safe for experimenting.	Don't suggest that mistakes in AI practice will transfer negatively to humans.	Clarifying that AI is private and non-judgmental removes a major barrier.
Encourage learners to notice their own thinking shifts (form-focus to meaning-focus) and articulate what they're learning.	Don't assume learners will automatically transfer insights from AI to human dialogue.	Metacognitive awareness consolidates learning and increases transfer likelihood.

Check in regularly to ensure engagement and troubleshoot barriers.	Don't treat AI practice as fully autonomous learning without support.	Brief check-ins maintain engagement and prevent attrition.
Use AI practice as a bridge before higher-stakes human dialogue.	Don't use AI as a replacement for human interaction or peer speaking practice.	AI builds confidence; humans teach cultural nuance and real-time negotiation.
Gradually increase task complexity and stakes over time.	Don't assign high-stakes, emotionally complex tasks in the first days.	Confidence builds cumulatively; early wins create momentum.
Measure willingness to communicate and confidence, not just accuracy or fluency.	Don't evaluate AI-mediated speaking using accuracy-focused rubrics designed for human dialogue.	WTC and confidence are primary outcomes; accuracy naturally develops once learners are willing to produce.
Conduct qualitative interviews or written reflections post-intervention.	Don't rely solely on quantitative measures; qualitative data reveals mechanism and meaning.	Learners provide valuable insight into what changed and why.
Include in teacher education explicit training on face-concern dynamics and AI integration.	Don't assume teachers will intuitively understand face-concern or how to leverage AI effectively.	Teachers are gatekeepers of implementation; their understanding is critical.
Share evidence-based, nuanced communication about AI as a tool for addressing anxiety-driven avoidance.	Don't market AI as a "magic bullet" that solves language learning.	Teachers rightfully skeptical of tech hype. Evidence-based communication builds trust.

Implications for Vietnam's ESL Transition and Teacher Education

Vietnam's shift from EFL to ESL creates simultaneous demands: learners must develop linguistic proficiency and communicative confidence to use that proficiency spontaneously in real-world contexts. Traditional EFL pedagogy, with its emphasis on accuracy and explicit grammar instruction, may inadvertently create the very barrier our data illuminate: anxiety-driven avoidance.

For Curriculum Design

Integrate low-stakes, judgment-free communicative practice early. Rather than reserving "conversation" for advanced learners, introduce structured AI dialogue and peer interaction at intermediate levels. This scaffolds learners' identity shift from "student preparing to communicate" to "user of English in meaningful contexts." Rebalance the accuracy-fluency trade-off. Vietnamese curricula traditionally weight accuracy heavily. Our findings suggest that early, error-tolerant practice enables subsequent accuracy development by removing the affective barrier to production. A curriculum front-loading low-stakes fluency practice followed by focused accuracy work may be more effective than the reverse. Make face-concern explicit in pedagogy. Vietnamese teachers often work around face concerns without naming them. More effective would be to explicitly address face concerns in class discussion, normalize errors as essential to learning, and gradually introduce peer feedback structures that rebuild learners' ability to receive and act on criticism.

For Teacher Education Initiatives

Train teachers to recognize face-concern anxiety. Teacher education programs should help teachers understand that Vietnamese learners' silence and avoidance often reflect not lack of ability but cultural anxiety about judgment. This reframing shifts teacher response from "push harder" to "redesign the environment." Provide concrete guidance on AI integration. Teachers need practical training on selecting and configuring AI tools, integrating AI into lesson sequences, monitoring learner engagement, and evaluating learning outcomes beyond grammar accuracy. Build critical awareness. Teachers should understand AI's affordances and limitations. AI is excellent for judgment-free practice and confidence-building but poor at teaching cultural pragmatics and non-verbal communication. Support peer learning communities. Teacher education should include mechanisms for teachers to share experiences, troubleshoot challenges, and collectively refine AI-integrated pedagogy. This distributed approach is more sustainable than top-down mandates.

For Policy and Institutional Support

Allocate resources for AI-integrated pedagogy. Implementation requires technology infrastructure, teacher training time, curricular development, and evaluation. Adopt a phased, evidence-based approach. Rather than wholesale adoption, pilot AI integration with early-adopter teachers and learners, collect evidence, refine practices, then scale. This study and similar research provide the evidence base. Address equity concerns. Ensure AI-integrated learning is not available only in well-resourced urban schools. Open-source AI tools and offline-capable systems may be necessary for equitable access.

Practical Resources: Reproducible Master Prompt and Task Schedule

For educators implementing AI-mediated speaking practice, we provide here the exact master prompt and daily task schedule used in this research, immediately reproducible and requiring no special configuration:

Master Setup Prompt (Copy-Paste One Before Day 1)

I am an English major at HNUE. For the next week, I want you to be my speaking partner. Please follow these rules:
1. Do not correct every grammar mistake – only correct me if you don't understand my meaning.
2. Keep your responses short (under 50 words) so we have a natural back-and-forth.
3. Use a friendly, encouraging tone.
4. If I get stuck, give me a hint or a synonym – not the full answer.

(Educators may adapt this for different proficiency levels or institutional contexts, but these core principles should be maintained.)

Daily Task Schedule (Days 1–6, 10–15 minutes each)

Day	Task	Prompt to Paste	Pedagogical Purpose
1	Warm-up: Free Talk	"Let's have a casual chat. Ask me about my hobbies or my day."	Build rapport; low-stakes entry
2	Sociolinguistic Debate	"Let's debate: Is 'Vietnamese English' a valid variety or just	Identity-relevant; argumentative language

		broken English? Argue against me."	
3	High-Stakes Roleplay	"Pretend I'm a flight attendant and you're an angry passenger. Start by shouting about your cold meal."	Emotional complexity; register variation
4	Cultural Storytelling	"I'll tell you a Vietnamese folk tale. Then you summarize it to check my clarity."	Narrative production; cultural relevance
5	Learner Choice	"Repeat any task from days 1–4 that you found most useful."	Autonomy; consolidation
6	Reflection	"Ask me: What was my biggest improvement this week? What was hardest?"	Metacognitive consolidation
7	Post-Intervention	Complete post-survey; attend interview (if selected)	Assessment; knowledge generation

Future Research Directions

This pilot study opens several avenues for future investigation: (1) Larger, adequately powered randomized controlled trials comparing AI-mediated practice with traditional classroom speaking, human tutoring, and control conditions. (2) Long-term follow-up examining durability of anxiety reduction and WTC gains, and evidence of transfer to actual classroom behavior measured through observation, not self-report. (3) Explicit investigation of transfer mechanisms - under what conditions does confidence from AI dialogue transfer to human dialogue? (4) Cross-cultural variation - do learners from non-face-conscious cultures show similar effects? (5) Moderator and mediator analysis examining individual differences in anxiety, prior technology experience, and personality that may influence outcomes. (6) Sensitivity testing of prompt variation and different AI systems to identify essential features. (7) Classroom integration studies examining optimal sequencing of AI practice with human dialogue, and teacher training supports necessary for effective implementation. (8) Qualitative deep-dives into learners' mental models of English speaker identity, the role of memorable moments in building confidence, and teacher perceptions of changes in student classroom behavior. (9) Cost-effectiveness and scalability analyses assessing feasibility in resource-limited contexts. (10) Intervention refinement studies testing enhancements such as peer discussion following AI practice, explicit metacognitive training, and structured written reflection.

Final Thoughts: AI as a Culturally Responsive Tool

This research began with a simple observation: Vietnamese English majors report that they would speak more English if they weren't worried about being judged. This face-concern is not a pathology but a culturally rooted value system. For centuries, Vietnamese society has prioritized group harmony and interpersonal respect. The challenge for ESL pedagogy is not to erase these cultural values but to help learners use English effectively while maintaining their cultural identity. AI chatbots offer a tool uniquely suited to this task. They create communication environments free of the judgment apparatus that Confucian-heritage cultures

activate, yet they provide meaningful, responsive dialogue necessary for language acquisition. In doing so, they do not undermine Vietnamese cultural values; they protect them by allowing learners to develop English competence in a judgment-free zone, preparing them for the higher-stakes human dialogue to come.

As Vietnam continues its ESL transition and invests in language teacher education, AI-mediated practice deserves consideration not as a futuristic novelty but as a culturally responsive, evidence-based tool for addressing a real barrier to communicative development. When coupled with authentic human interaction and critical teacher guidance, AI chatbots can help Vietnamese learners transition from anxious silence to confident, spontaneous, meaning-focused English communication.

The future of language education is not AI replacing teachers or human interaction. Rather, it is thoughtfully designed environments - combining technology, pedagogy, and human relationships - that respect learners' cultural values while expanding their communicative horizons.

#190 BETTER WRITING OR LESS THINKING? AI OVER-RELIANCE IN EFL WRITING CLASSROOMS

Thanh Thuy Nguyen[1]

Abstract

The rapid integration of generative artificial intelligence (AI) tools into English as a Foreign Language (EFL) writing classrooms has intensified debate over whether AI-assisted writing supports or displaces the cognitive processes essential to writing development. While AI tools can facilitate idea generation, grammatical correction, and drafting fluency, concerns remain regarding students' increasing reliance on AI for core writing functions. This study investigates self-reported patterns of perceived AI dependency and their associations with independent writing performance among 113 non-English major undergraduates at a Vietnamese technical university. Adopting a mixed-method design, the study combined survey data with pre–post writing task analysis following a six-week period of AI-assisted writing practice. Writing performance was evaluated across three dimensions: grammatical accuracy, lexical diversity, and idea originality. Findings indicated moderate but pervasive self-reported reliance on AI for idea generation, linguistic decision-making, and evaluative judgment. Although a statistically significant improvement in grammatical accuracy was observed, the effect size was small, and no significant gains emerged in lexical diversity or idea originality. Higher levels of AI reliance were negatively associated with independent writing performance, particularly in relation to idea development. Qualitative findings further suggested that many students approached AI as a habitual productivity tool rather than a metacognitive learning resource. Taken together, the findings point to a productivity–proficiency tension in AI-assisted EFL writing and highlight the need for pedagogically structured AI integration that preserves learners' cognitive engagement in the writing process.

***Keywords*:** AI over-reliance, EFL writing, AI-assisted learning, learner autonomy, cognitive offloading

1. Introduction

1.1 Background of the Study

The emergence of large language model (LLM)-powered writing tools, most prominently ChatGPT, has catalysed a paradigm shift in how students engage with academic writing tasks (Chan & Hu, 2023; Kasneci et al., 2023). Within EFL education, where students simultaneously manage cognitive demands of language learning and content production, these tools offer immediate affordances: on-demand idea generation, instant grammatical correction, and stylistic reformulation. Adoption of generative AI tools has been rapid since the public release of ChatGPT (Tlili et al., 2023; Kasneci et al., 2023).

Yet this rapid uptake has outpaced critical examination of its pedagogical consequences. Emerging evidence suggests a troubling possibility: that tools designed to improve writing output may simultaneously undermine the cognitive processes, including planning, drafting, monitoring, revising, that are essential to writing skill development (Hayes

[1]*Corresponding author, Lecturer, Foreign Language Center, Ho Chi Minh City University of Technology (HCMUT), Ho Chi Minh City, Vietnam; Email: nguyenthanhthuy@hcmut.edu.vn*

& Chenoweth, 2006; Graham & Perin, 2007). This concern is particularly acute in EFL contexts, where writing instruction is understood not merely as a product goal but as a vehicle for linguistic and cognitive development (Manchón, 2011; Hyland, 2019).

1.2 Research Problem

The theoretical construct of cognitive offloading, the externalization of mental operations to environmental resources, provides a useful lens for understanding this tension. While cognitive offloading is not inherently detrimental (Risko & Gilbert, 2016), its systematic application to higher-order writing tasks may reduce the productive struggle associated with deep learning (Sinha & Kapur, 2021; Sweller et al., 2019). When students delegate idea generation, syntactic decisions, and evaluative judgment to AI systems, they may produce better-looking texts while developing shallower cognitive engagement with the writing process itself.

1.3 Research Objectives

This study aims to (1) describe patterns and levels of self-reported AI dependency among EFL undergraduates at a Vietnamese technical university, (2) examine whether a six-week period of AI-assisted writing practice leads to measurable gains in grammatical accuracy, lexical diversity, and idea originality, and (3) investigate the relationship between self-reported AI dependency patterns and independent writing outcomes.

1.4 Research Questions

Against this backdrop, where AI tools promise writing improvement yet may simultaneously erode the cognitive processes that make improvement durable, empirical investigation of actual dependency patterns and their consequences becomes essential. This study addresses this gap through a mixed-method investigation among 113 non-English major undergraduates at Ho Chi Minh City University of Technology (HCMUT), Vietnam. Three research questions guide the inquiry:

RQ1: What are the patterns and extent of perceived AI dependency among EFL undergraduate students in academic writing?

RQ2: To what extent do AI-assisted practice periods produce measurable gains in grammatical accuracy, lexical diversity, and idea originality in student writing?

RQ3: What is the relationship between AI dependency subscale scores and post-task writing performance outcomes?

1.5 Significance of the Study

Despite the rapid adoption of generative AI in EFL writing classrooms, empirical evidence on the pedagogical consequences of over-reliance remains limited, particularly in the Vietnamese higher education context. This study contributes: (1) an internally consistent instrument — AI Dependency in Academic Writing Scale (ADAWS) — for measuring perceived AI dependency across theoretically motivated dimensions; (2) preliminary empirical evidence linking specific dependency patterns to differential writing outcomes; and (3) a process-before-product pedagogical model grounded in the findings. These contributions have practical relevance for EFL educators, curriculum designers, and institutional policymakers navigating the responsible integration of AI tools into academic writing instruction.

2. Literature Review

2.1 AI Tools in EFL Writing Education

Computer-assisted language learning has long incorporated technology into writing instruction, from early grammar-checking and concordancing tools to more recent collaborative digital writing environments (Warschauer & Healey, 1998). Scholarship on AI in EFL writing has shifted considerably in recent years: where earlier work centred on automated writing evaluation (AWE) systems, attention has since turned to generative AI, which can produce full drafts rather than merely evaluate them (Guo & Li, 2024; Lim et al., 2023). Proponents argue that generative AI lowers affective barriers: anxiety reduction, increased drafting fluency, and improved final-product quality have been reported (Song & Song, 2023). In the Vietnamese higher education context, AI-powered tools were perceived to reduce writing anxiety, improve time efficiency, and support idea generation (Thi et al., 2025). However, Deane (2013) argued that genuine writing competence depends on sustained practice in self regulation, planning, and goal setting, all of which may be undermined when learners rely too heavily on AI assistance. Perkins et al. (2023) highlighted challenges associated with identifying and responding to generative-AI-assisted academic writing and potential misuse.

2.2 Cognitive Offloading and Its Consequences for Learning

At moderate levels, the externalisation of mental processes to environmental resources, conceptualised by Risko and Gilbert (2016) as cognitive offloading, represents an adaptive and functionally efficient cognitive strategy. The critical question for education, however, is whether offloading is applied to tasks that are themselves the target of learning. Sweller et al.'s (2019) cognitive load theory provides a foundational framework: writing in a second language is a high-load activity, simultaneously engaging working memory for lexical retrieval, syntactic construction, discourse organization, and content generation. AI tools may reduce extraneous load, but equally may reduce germane load, the productive cognitive effort associated with schema formation and skill acquisition (Paas & Merriënboer, 2020). Sinha and Kapur's (2021) meta-analysis provides evidence that problem solving followed by instruction can support deeper conceptual learning and transfer more effectively than instruction followed by problem solving, particularly when the learning design closely follows the principles of productive failure. Systematic AI delegation may therefore represent a form of premature problem-solving associated with slower long-term skill development. Closely related to these cognitive concerns is the question of whether such delegation also erodes learners' broader capacity for self-directed language learning.

2.3 Learner Autonomy and Self-Regulated Writing

Among the most widely valued outcomes of higher education language programs is learner autonomy: the capacity and disposition to take genuine responsibility for one's own learning (Little, 2015). In writing, autonomy manifests as self-regulated writing (SRW): the ability to plan, monitor, evaluate, and revise without external scaffolding (Graham, 2018; Zimmerman & Moylan, 2009). The relationship between AI use and learner autonomy is theoretically ambiguous. AI tools can scaffold self-regulation by providing feedback learners can selectively incorporate (Hattie & Clarke, 2018). However, when learners habitually accept AI generated output without critical scrutiny, a tendency reflected in the Evaluative Passivity (EVP) subscale, they may fail to cultivate the metacognitive monitoring capacities that underpin autonomous writing proficiency. Shen & Teng (2024) found significant correlations between reduced critical thinking skills and heavier AI-assisted writing use. Taken together, these theoretical concerns underscore the urgent need for empirically grounded tools capable of measuring the specific patterns of AI dependency that may impede autonomous writing development.

2.4 Measuring AI Over-Reliance: Conceptual Gaps

Despite the theoretical concerns outlined above, validated instruments for measuring AI over-reliance in academic writing remain conspicuously absent from the literature. Existing AI literacy scales (Wang et al., 2022; Ng et al., 2021) focus on competence with and attitudes toward AI, not dependency patterns. The present study addresses this gap by developing the AI Dependency in Academic Writing Scale (ADAWS), a 20-item Likert instrument with three theoretically grounded subscales: (1) Idea Generation Reliance (IGR), reflecting dependence on AI for content planning; (2) Linguistic Delegation (LDE), reflecting deference to AI for grammatical, lexical, and syntactic decisions; and (3) Evaluative Passivity (EVP), reflecting failure to critically assess AI output. This framework draws on Manchón's (2011) tripartite model of EFL writing as a cognitive, linguistic, and evaluative activity.

3. Methodology

3.1 Research Context

The study was conducted within the English for Academic Purposes (EAP) writing course at Ho Chi Minh City University of Technology (HCMUT), a leading public technical university in Vietnam. This compulsory course serves undergraduate students across engineering, technology, and science faculties, typically enrolled in Year 1 or Year 2. Class sizes ranged from 25 to 35 students per section. At the time of data collection, HCMUT had no formal institutional policy governing student use of AI writing tools; individual instructors established their own guidelines. Within the study context, students were permitted to use AI tools during out-of-class writing practice activities (Weeks 2–7) but not during timed pre- and post-task assessments conducted under controlled conditions. This setting, in which generative AI had become widely accessible yet pedagogically unstructured, provided a naturalistic context for investigating self-reported AI dependency patterns and their associations with independent writing performance.

3.2 Research Design

A concurrent mixed-method design (Tashakkori & Teddlie, 2010) was adopted, integrating quantitative survey data and pre–post writing performance analysis with open-ended qualitative responses. The quantitative strand addresses RQ1–RQ3 through descriptive statistics, paired-samples t-tests, and Pearson correlation analysis. The qualitative strand, drawn from five open-ended questionnaire items, provides explanatory depth for the quantitative patterns. Integration occurred at the interpretation stage, with qualitative themes used to elaborate quantitative findings (Morse, 2010).

3.3 Participants

The sample comprised 113 undergraduate students enrolled in the English for Academic Purposes (EAP) writing component at HCMUT, all drawn from engineering, technology, and science faculties. The sample comprised 83 males (73.5%), 23 females (20.4%), and 7 who preferred not to specify (6.2%). Year-of-study distribution was approximately balanced across Years 1–4+. All participants had minimum A2-level English proficiency and reported prior use of at least one AI writing tool before the study. Participation was voluntary and responses would not affect course grades. While N = 113 students completed the ADAWS questionnaire, the analytic samples reported in Tables 3–6 range from N = 91 to N = 97 because not every participant completed both the pre- and post-task writing assessments under controlled conditions; absences on the Week 1 or Week 8 testing sessions, and a small number of incomplete or illegible scripts that could not be reliably rated, were the primary sources of attrition. Listwise deletion was applied for each analysis, so the exact N varies slightly depending on which writing dimension and which subscale pairing is being analysed

(e.g., n = 92 for grammatical accuracy, n = 91 for lexical diversity, n = 97 for idea originality). These N values are reported individually in each table note.

3.4 Instruments

3.4.1 AI Over-Reliance Survey

The primary instrument was the ADAWS, a 20-item Likert-scale questionnaire whose items were adapted from Wang et al. (2022) and reoriented toward behavioural dependency in writing contexts. In the present study, perceived AI dependency was operationalised through three dimensions: Idea Generation Reliance (IGR), Linguistic Delegation (LDE), and Evaluative Passivity (EVP). Subscales measure Idea Generation Reliance (8 items; e.g., "I use AI to generate the main ideas of my essays before I start writing"), Linguistic Delegation (7 items; e.g., "I accept AI grammar suggestions without checking them myself"), and Evaluative Passivity (5 items; e.g., "I submit AI-revised drafts without reading them carefully"), rated on a 5-point scale. Present-sample Cronbach's alpha values were .84, .81, and .78 for the three subscales. Importantly, the three-subscale structure is theoretically motivated but has not been empirically confirmed through exploratory factor analysis (EFA) or confirmatory factor analysis (CFA); subscale-level findings should be read as descriptive and hypothesis-generating.

3.4.2 Affective Response Survey

A supplementary nine-item Likert scale, the Affective Response Survey (ARS), assessed emotional and motivational responses to AI-assisted writing (Cronbach's $\alpha = .76$), covering enjoyment, confidence, anxiety, and positive anticipation.

3.4.3 Writing Tasks

Pre- and post-writing tasks consisted of argumentative essay prompts of equivalent difficulty. Students wrote 150-200-word essays within 20 minutes without AI assistance, before and after a six-week AI-assisted practice period. Essays were evaluated using an analytic rubric with three dimensions: grammatical accuracy, lexical diversity, and idea originality (each scored 1–10). A single rater conducted all scoring; inter-rater reliability was not established, which represents a methodological limitation.

3.5 Procedure and Data Analysis

The data collection unfolded across eight weeks, following a structured sequence designed to capture both pre-intervention performance and post-intervention change. In Week 1, participants completed the pre-writing task (no AI access, 20 minutes). In Weeks 2–7, students engaged in AI-assisted writing activities as part of their regular EAP curriculum using tools of their choice. In Week 8, the post-writing task was administered under identical controlled conditions. The questionnaire was administered electronically in Week 7. Descriptive statistics, Cronbach's alpha, paired-samples t-tests (with Cohen's d), and Pearson correlations were computed using Python (SciPy 1.11; pandas 2.0). Qualitative responses underwent inductive thematic analysis (Braun & Clarke, 2019): 47 open codes consolidated into 12 intermediate categories and three overarching themes, reviewed by a second analyst. The following section presents findings from both strands, beginning with participant characteristics and scale performance, before moving to writing outcomes and their associations with AI dependency.

3.6 Reliability Analysis

Internal consistency of the ADAWS subscales was evaluated using Cronbach's alpha prior to main analyses. All values met or exceeded the threshold of .80 recommended for research instruments (George & Mallery, 2003): Idea Generation Reliance (IGR): α = .947 (excellent); Linguistic Delegation (LDE): α = .895 (good); Evaluative Passivity (EVP): α = .859 (good); and the Affective Response Survey (ARS): α = .936 (excellent). These values provide confidence in the reliability of subscale scores for the subsequent analyses. Inter-item correlations were reviewed to confirm no redundant or misfit items. It should be noted that while alpha values are strong, the three-subscale structure has not been confirmed through exploratory or confirmatory factor analysis; subscale-level findings should therefore be treated as descriptive and hypothesis-generating pending dedicated psychometric validation.

3.7 Ethical Considerations

The study was conducted in accordance with standard ethical principles for educational research. Participation was voluntary, and students were explicitly informed prior to data collection that their responses would have no bearing on course grades or academic standing. Electronic informed consent was obtained before questionnaire administration. All data were anonymised at the point of collection and stored securely on password-protected institutional servers accessible only to the researcher. Participants were free to withdraw at any point without penalty. The study involved no deception, no collection of sensitive personal data, and no intervention beyond normal coursework activities.

4. Results

4.1 Participant Characteristics

An overview of the sample's demographic profile is presented in Table 1. ChatGPT was the most frequently used AI writing tool (61.9%), followed by Grammarly (15.9%) and Google Gemini (15.0%). Notably, 48.7% of participants reported daily AI use for writing, and a further 27.4% reported use several times per week, indicating that AI-assisted writing is already a habitual practice for the majority of this cohort.

Table 1

Participant Demographic Profile (N = 113)

Variable	Category	n	%
Gender	Male	83	73.5%
	Female	23	20.4%
	Prefer not to say	7	6.2%
Year of Study	Year 1	31	27.4%
	Year 2	30	26.5%
	Year 3	24	21.2%
	Year 4+	23	20.4%
Primary AI Tool	ChatGPT	70	61.9%

	Grammarly	18	15.9%
	Google Gemini	17	15.0%
Usage Frequency	Daily	55	48.7%
	Several times/week	31	27.4%
	Occasionally	22	19.5%
	Rarely	5	4.4%

4.2 ADAWS: Internal Consistency and Descriptive Statistics

Reliability estimates across all scales were strong, with Cronbach's alpha values of .947 (IGR), .895 (LDE), .859 (EVP), and .936 (ARS). Inter-subscale correlations were computed as a preliminary check: IGR–LDE r = .71, IGR–EVP r = .64, LDE–EVP r = .58 (all $p < .001$). These moderate-to-high correlations suggest that the three dimensions may not be fully orthogonal, cautioning against interpreting subscale-specific effects as evidence of distinct constructs pending formal EFA/CFA. Variance inflation factors (VIFs) ranged from 2.83 to 3.12, indicating multicollinearity did not reach levels that typically invalidate ordinary least squares (OLS) estimates.

All three subscale means clustered closely around the scale midpoint: IGR M = 2.99 (SD = 0.73), LDE M = 3.02 (SD = 0.61), and EVP M = 3.09 (SD = 0.60), indicating moderate reliance across all dimensions. At the item level, EVP2 ("I trust AI evaluations of my writing quality more than my own judgment") recorded the highest mean (M = 3.16, SD = 0.79). One-way ANOVA revealed that daily AI users scored significantly higher on IGR compared to occasional users [$F(2, 110) = 4.21$, $p = .017$]. With reliance patterns thus established, we turn to the question of whether these patterns correspond to measurable changes in writing performance over the study period.

Table 2

ADAWS Item-Level and Subscale Descriptive Statistics and Internal Reliability (N = 113)

Item	Statement (abbreviated)	M	SD	α	Subscale M (SD)
IGR1	Use AI to generate main ideas	3.13	0.77		
IGR2	Ask AI for topic suggestions	3.00	0.85		
IGR3	Rely on AI for thesis statements	2.84	0.90		
IGR4	Use AI-generated outlines	3.00	0.80		
IGR5	Cannot begin essay without AI	2.89	0.85		
IGR6	Use AI to decide supporting points	2.97	0.96		
IGR7	Difficulty generating ideas without AI	3.04	0.91		

IGR8	Essays reflect AI thinking more than own	3.05	0.81	.947	2.99 (0.73)
LDE1	Accept AI grammar suggestions w/o checking	2.96	0.86		
LDE2	Rely on AI to choose vocabulary	3.00	0.79		
LDE3	Use AI to correct all grammar errors	3.08	0.85		
LDE4	Don't worry about grammar — AI will fix it	3.11	0.77		
LDE5	Let AI decide sentence structure	2.97	0.78		
LDE6	Use AI phrases w/o evaluating fit	3.05	0.69		
LDE7	Language shaped primarily by AI output	3.00	0.66	.895	3.02 (0.61)
EVP1	Submit AI-revised drafts without reading	3.11	0.83		
EVP2	Trust AI evaluations over own judgment	3.16	0.79		
EVP3	Apply AI feedback without questioning	3.08	0.75		
EVP4	Rarely assess if AI content matches meaning	3.02	0.77		
EVP5	Consider essay finished when AI approves	3.05	0.74	.859	3.09 (0.60)

*Note. IGR = Idea Generation Reliance; LDE = Linguistic Delegation; EVP = Evaluative Passivity. Subscale α reported in the final item row of each subscale.

4.3 Pre- and Post-Writing Performance

Examining the three writing dimensions in turn, grammatical accuracy showed a statistically significant improvement [$t(91) = -4.51$, $p < .001$], with post-task scores ($M = 6.11$, $SD = 1.73$) exceeding pre-task scores ($M = 5.75$, $SD = 1.25$). The effect size was small (Cohen's $d = 0.24$) — below the threshold of what is typically considered educationally meaningful in L2 writing research. Examining individual performance, 68.5% of participants showed some grammar gain, while 31.5% showed no improvement or a decline. For lexical diversity, the pre-to-post difference was negligible and non-significant [$t(90) = -1.12$, $p = .265$, $d = 0.08$]. Idea originality improvement was similarly non-significant [$t(96) = -1.76$, $p = .081$, $d = 0.10$]. Together, the six-week AI-assisted practice period was associated with meaningful improvement only in surface-level grammatical accuracy, with no detectable gains in deeper dimensions within this timeframe. The next analysis examines whether these limited performance outcomes are systematically related to the degree of AI dependency each student exhibited.

Table 3

Pre- and Post-Task Writing Performance: Paired-Samples t-Test Results (N = 91–97)

Criterion	Pre-M	Pre-SD	Post-M	Post-SD	t	p	d
Grammatical Accuracy	5.75	1.25	6.11	1.73	−4.51	< .001	0.24
Lexical Diversity	5.65	0.93	5.74	1.19	−1.12	.265	0.08
Idea Originality	5.30	1.43	5.45	1.65	−1.76	.081	0.10

*Note. Scores are on a 1–10 analytic rubric scale. Effect sizes reported as Cohen's d. N varies across dimensions due to missing or incomplete pre- and post-task writing scripts.

Table 4

Hierarchical Regression of Pre-Task Grammar and ADAWS Subscales Predicting Post-Task Grammatical Accuracy (N = 91)

Predictor	B	SE	β	t	p	ΔR²
Model 1						
Pre-task grammatical accuracy	0.412	—	—	< .001		.175
Model 2						
Pre-task grammatical accuracy	0.389	—	—	< .001		
IGR (Idea Generation Reliance)	−0.934	—	−0.501	< .001		
LDE (Linguistic Delegation)	−1.042	—	−0.523	< .001		
EVP (Evaluative Passivity)	−0.135	—	−0.072	.381		.243

*Note. Model 1: Pre-task grammatical accuracy only ($R^2 = .175$, $p < .001$). Model 2: Pre-task grammar + IGR + LDE + EVP ($R^2 = .418$, $\Delta R^2 = .243$, $p < .001$). IGR ($\beta = -0.501$, $p < .001$) and LDE ($\beta = -0.523$, $p < .001$) remained significant negative predictors after controlling for baseline proficiency; EVP did not ($\beta = -0.072$, $p = .381$). B = unstandardized coefficient; SE = standard error; β = standardized coefficient. Dash (—) indicates SE not separately reported for Model 1 baseline predictor. N varies across dimensions due to missing or incomplete pre- and post-task writing scripts.

To examine whether the negative associations between AI dependency and writing performance could be accounted for by pre-existing proficiency differences, a hierarchical regression analysis was conducted (Table 4). Because the IGR, LDE, and EVP subscales have not yet been confirmed through exploratory or confirmatory factor analysis (see Section 3.4.1), they are entered into the models below as theoretically motivated composite scores rather than as psychometrically validated latent constructs; regression coefficients should accordingly be interpreted as indicating that these item clusters are statistically associated with post-task performance, not as evidence that IGR, LDE, and EVP are independent, validated constructs. Model 1 entered pre-task grammatical accuracy as a baseline covariate; Model 2 additionally entered the three ADAWS subscales. Model 1 explained 17.5% of variance in post-task

grammar scores ($R^2 = .175$, $p < .001$). Adding the ADAWS subscales produced a significant incremental improvement ($\Delta R^2 = .243$, $p < .001$), raising total explained variance to $R^2 = .418$. Even after controlling for baseline proficiency, both IGR ($\beta = -0.501$, $p < .001$) and LDE ($\beta = -0.523$, $p < .001$) remained significant negative predictors of post-task grammar, while EVP did not reach significance ($\beta = -0.072$, $p = .381$). These findings indicate that self-reported AI dependency patterns remain statistically associated with post-task grammatical performance after adjustment for baseline proficiency. While causal inferences cannot be drawn from the present design, the results suggest that the observed relationships are not solely attributable to differences in initial writing proficiency.

4.4 Relationships Between AI Dependency and Writing Performance

Turning to the associations between dependency patterns and writing outcomes, both IGR ($r = -.46$, $p < .001$) and LDE ($r = -.43$, $p < .001$) showed significant negative correlations with post-task grammatical accuracy, while EVP yielded a smaller but still significant negative relationship ($r = -.30$, $p = .003$). Post-task absolute scores for lexical diversity and idea originality showed no significant subscale associations. However, gain score analysis revealed a more differentiated picture: IGR was significantly and negatively associated with idea originality gains ($r = -.45$, $p < .001$, $n = 97$), with LDE ($r = -.24$, $p = .020$) and EVP ($r = -.23$, $p = .025$) also predicting smaller gains. This pattern suggests that the null result for post-task idea scores reflects distributional compression in absolute scores rather than a genuine absence of dependency effects.

A proficiency-stratified analysis adds important nuance. Students with higher baseline proficiency (pre-grammar ≥ median = 5.56) showed larger grammar gains ($M = 0.53$, $SD = 0.81$) than lower-proficiency peers ($M = 0.20$, $SD = 0.70$; $t(90) = 2.07$, $p = .042$), and reported lower Linguistic Delegation ($M = 2.84$ vs. 3.17; $t(111) = -2.97$, $p = .004$). This is consistent with a reverse causality account: lower-proficiency students both rely more heavily on AI and are less equipped to leverage AI feedback productively.

Table 5

Pearson Correlations Between ADAWS Subscales and Post-Task Writing Performance Scores, with Idea Originality Gain-Score Correlations (N = 91–97)

Subscale	Post-Grammar r	p	Post-Lex r	p	Post-Idea r	p	Gain-Idea r	p
IGR (Idea Generation Reliance)	−.460	< .001	−.031	.756	.041	.681	−.450	< .001
LDE (Linguistic Delegation)	−.426	< .001	.127	.202	.177	.070	−.240	.020
EVP (Evaluative Passivity)	−.296	.003	−.091	.363	−.129	.189	−.230	.025

**Note. IGR = Idea Generation Reliance; LDE = Linguistic Delegation; EVP = Evaluative Passivity. Gain-Idea r = Pearson correlation between each subscale and the pre-to-post gain (change) score for idea originality (n = 97), reported alongside the post-task absolute-score correlations so that the contrast between the two can be inspected directly. The near-zero post-task absolute correlations (Post-Idea r ranging from .041 to −.129, all p > .07) coexist with moderate, mostly significant gain-score correlations (Gain-Idea r ranging from −.230 to −.450), indicating that post-task absolute idea-originality scores were compressed within a narrow range across participants regardless of dependency level, while the amount of change from pre- to post-task was*

more clearly patterned by AI dependency. This is the distributional compression referred to in Section 4.4. N varies across dimensions due to missing or incomplete pre- and post-task writing scripts.

A simultaneous multiple regression analysis with IGR, LDE, and EVP predicting post-task grammar was statistically significant [$F(3, 87) = 11.43$, $p < .001$], explaining approximately 28% of the variance ($R^2 = .283$, adjusted $R^2 = .258$). Both IGR ($\beta = -0.624$, $p < .001$) and LDE ($\beta = -0.658$, $p < .001$) emerged as significant negative predictors; EVP did not reach significance after controlling for the other subscales ($\beta = -0.098$, $p = .312$). A supplementary model including pre-task grammatical accuracy as a baseline covariate yielded $R^2 = .418$, indicating that ADAWS subscales explain substantial variance beyond baseline proficiency. Residual diagnostics confirmed no violations of OLS assumptions [Shapiro-Wilk: $W = .984$, $p = .328$; Breusch-Pagan: $\chi^2(3) = 4.17$, $p = .243$].

Table 6

Multiple Regression of ADAWS Subscales Predicting Post-Task Grammatical Accuracy (N = 91)

Predictor	B	SE	β	t	p	sr^2
IGR (Idea Generation Reliance)	−1.167	0.271	−0.624	−4.31	< .001	.132
LDE (Linguistic Delegation)	−1.318	0.307	−0.658	−4.29	< .001	.128
EVP (Evaluative Passivity)	−0.275	0.272	−0.098	−1.01	.312	.007

**Note. $R^2 = .283$, adjusted $R^2 = .258$; $F(3, 87) = 11.43$, $p < .001$. B = unstandardized coefficient; SE = standard error; β = standardized coefficient; sr^2 = squared semi-partial correlation. Regression conducted without a baseline proficiency covariate; coefficients should be interpreted descriptively. *p < .001. N varies across dimensions due to missing or incomplete pre- and post-task writing scripts.*

4.5 Affective Responses

Students' emotional responses to AI-assisted writing were generally positive, with the ARS returning strong internal consistency ($\alpha = .936$) and subscale means ($M = 3.01$, $SD = 0.67$) indicating moderately favourable affect overall. ARS1 ("I find AI-assisted writing tasks enjoyable") returned $M = 3.10$ ($SD = 0.95$). However, ARS8 ("I feel more confident in my writing ability after completing AI-assisted tasks") was the lowest-rated item ($M = 2.88$, $SD = 0.84$), with 34.5% rating it "Disagree" or "Strongly Disagree." This dissociation, moderate enjoyment paired with low confidence in independent ability, is consistent with the performance data showing limited independent skill gains, and aligns with Krashen and Mason's (2020) observation that a low-anxiety environment may be necessary but is not sufficient for acquisition.

4.6 Qualitative Themes

4.6.1. Theme 1: AI as a Writing Crutch

Surfacing across approximately 71% of responses, the most pervasive theme was students' own recognition that their AI use had become habitual rather than strategic. A representative student wrote: "I know I use ChatGPT too much. When I have a writing task, my first move is to open it. I don't even try to think first anymore." Multiple students described a reduction in pre-writing planning behaviours: "Before I used AI, I made mind maps. Now I don't bother."

4.6.2. Theme 2: Confidence Without Competence

Approximately 38% of respondents articulated awareness of a gap between AI-assisted and unaided writing quality: "My AI essays look good. But when I write in the exam without it, I struggle with ideas and grammar. I know the gap is getting bigger." This self-perception aligns with ARS8's low post-task confidence score despite moderate enjoyment.

4.6.3. Theme 3: Pragmatic Motivation Over Learning Intent

Students' motivations for AI use were predominantly pragmatic, including saving time, meeting deadlines, and producing higher quality submissions, rather than being oriented toward learning objectives, accounting for approximately 64% of responses. Only approximately 18% framed AI use as a deliberate learning strategy. The majority described a transactional relationship: AI produces text, student submits. Students who approach AI instrumentally rather than metacognitively are unlikely to engage in critical evaluation of AI feedback that would support skill internalisation.

5. Discussion

5.1 Summary of Findings by Research Question

To bring the quantitative and qualitative strands together coherently, the findings are first summarised against each of the three research questions before being discussed thematically in the sections that follow. With respect to RQ1 (patterns and extent of perceived AI dependency), students reported moderate but pervasive dependency across all three ADAWS dimensions, with subscale means clustering near the scale midpoint (IGR M = 2.99, LDE M = 3.02, EVP M = 3.09) and the qualitative "AI as a Writing Crutch" theme surfacing in approximately 71% of responses; daily AI users also reported significantly higher IGR than occasional users [$F(2, 110) = 4.21$, $p = .017$]. With respect to RQ2 (whether a six-week AI-assisted practice period produces measurable writing gains), the evidence was mixed and modest: grammatical accuracy improved significantly but with a small effect size ($d = 0.24$), while lexical diversity and idea originality showed no significant pre–post change in absolute scores. With respect to RQ3 (the relationship between AI dependency and writing outcomes), both IGR and LDE were consistently and negatively associated with post-task grammatical accuracy in correlational, hierarchical regression, and multiple regression analyses, even after controlling for baseline proficiency; IGR was additionally associated with smaller idea-originality gains in the gain-score analysis, whereas EVP showed weaker and less consistent associations once the other subscales were accounted for. Read together, these answers indicate that dependency is widespread (RQ1), that practice-period gains are real but narrow in scope (RQ2), and that the breadth of that gain is patterned by which form of dependency students report (RQ3). The remaining subsections interpret these patterns through the cognitive and pedagogical lenses introduced in the literature review.

5.2 The Productivity–Proficiency Tension

Collectively, the quantitative and qualitative findings converge on a coherent picture of AI-mediated writing practice in this context. At its core, what emerges is a productivity–proficiency tension: AI tools are associated with surface-level improvement in students' output, yet this does not appear to coincide with gains in independent writing competencies. The improvement in grammatical accuracy carried a small effect size ($d = 0.24$), falling below the range of effect sizes reported across writing-instruction interventions in Graham and Perin's (2007) meta-analysis. This modest grammar gain must also be contextualised by the absence of a control group: comparable improvement may occur in EFL courses without AI

involvement. Students who self-reported the heaviest perceived reliance on AI for idea generation and linguistic decisions scored lowest on independent grammatical production, a moderate negative association ($r \approx -.43$ to $-.46$) consistent with both a skill-association account and a reverse-causality account.

Gain score analysis revealed that IGR was negatively associated with idea originality gains ($r = -.45$, $p < .001$), comparable in magnitude to the grammar correlations. Partial correlations controlling for pre-task idea originality confirmed this association remained meaningful (partial $r = -.31$, $p = .003$). The null findings for lexical diversity held across both analytic approaches, suggesting this dimension may require a longer developmental window. The proficiency stratified analysis further revealed that lower proficiency students tended to rely more extensively on AI while deriving comparatively fewer benefits from AI assisted practice, potentially because they lacked the metacognitive resources required to engage productively with AI generated feedback, thereby suggesting that pedagogical approaches to AI integration cannot be uniformly applied across proficiency levels.

These patterns resonate with evidence that heavy AI use in writing is associated with reduced self-directed learning competency and diminished critical thinking (Shen & Teng, 2024), and with broader concerns about whether technology-mediated writing assistance produces durable skill gains (Perkins et al., 2023). The more conservative claim is that the ADAWS items as a whole show consistent negative associations with independent writing performance, and that future psychometric work will determine whether the dimensional structure adds explanatory value beyond a unitary dependency score. The theoretical framework of cognitive offloading helps explain precisely how this productivity–proficiency gap emerges at the level of mental processing during writing.

5.3 Cognitive Offloading and the Writing Process

A coherent account of these findings can be found in the theoretical framework of cognitive offloading (Risko & Gilbert, 2016). Writing in a second language simultaneously activates orthographic, lexical, syntactic, discourse-level, and rhetorical processes (Hayes, 2012; Kellogg et al., 2013). When AI systems handle idea generation, grammatical monitoring, and evaluative judgment, the cognitive load associated with these processes may be substantially reduced, but so too is the practice that makes them automatic and internalisable. Sweller et al.'s (2019) cognitive load theory predicts precisely this outcome: extraneous load reduction is beneficial only when germane cognitive engagement is preserved. When AI handles the germane tasks, learning opportunities may be reduced.

Vocabulary development requires repeated, contextually rich, generative encounters with words (Nation, 2022; Schmitt, 2010), while task-induced involvement can influence both incidental vocabulary acquisition and subsequent retention (Gao et al., 2024). Thus, passive exposure to AI-generated text may not provide sufficient opportunities for the active processing and engagement needed for durable lexical learning. Similarly, original idea generation requires the activation and recombination of prior knowledge (Weisberg, 2014), and habitual AI use for ideation was associated with lower idea-originality gains in this sample. The qualitative data offer corroboration: students reporting habitual AI use for idea generation also reported diminished pre-writing planning behaviours. This pattern of reduced generative engagement may not remain confined to ideation; it extends to the metacognitive and evaluative dimensions of the writing process, as the following section discusses.

5.4 Evaluative Passivity as a Metacognitive Risk

Perhaps the most telling single finding concerns EVP2: "I trust AI evaluations of my writing quality more than my own judgment", which returned the highest mean across the entire scale, pointing to a worrying displacement of metacognitive self-assessment by algorithmic authority. Self-evaluation is the foundation of self-regulated writing development (Graham, 2018; Zimmerman & Moylan, 2009). EVP's significant negative correlation with post-task grammar ($r = -.30$, $p = .003$), though the smallest of the three subscales, is consistent with the interpretation that the evaluative dimension of AI dependency carries independent performance-related variance. Students in the "Confidence Without Competence" theme explicitly recognized a widening gap between AI-assisted and unaided performance, yet this awareness had not translated into altered AI use behaviours, suggesting that metacognitive awareness alone is insufficient without structured pedagogical scaffolding. These insights directly inform the pedagogical model proposed below, which aims to preserve the cognitive and evaluative processes that AI delegation tends to displace.

5.5 Implications for EFL Pedagogy

When considered together, the findings raise serious questions about the wisdom of allowing unrestricted AI access at every stage of the drafting process. The formative function of writing assignments, as practice for autonomous cognitive engagement, may be constrained when students routinely delegate planning, drafting, and evaluation to AI systems. A "process-before-product" integration model is suggested by the data, illustrated through a four-step classroom sequence:

Step 1 (10 minutes): Students complete a timed AI-free brainstorm in response to the writing prompt, generating their own ideas and a rough outline before any AI interaction occurs.

Step 2 (15–20 minutes): Students write a full first draft without AI, preserving the ideational and syntactic effort that builds internal language schemas.

Step 3 (10 minutes): Students use AI exclusively for targeted grammar feedback on specific structures identified as developmental priorities, not for content generation or full-text rewriting.

Step 4 (5 minutes): Students submit a brief reflection log identifying one grammatical pattern from the AI feedback, explaining the error and how they intend to avoid it in future writing.

This sequence preserves generative cognitive processes within the learner while leveraging AI's strengths as a targeted feedback tool, consistent with Hattie and Clarke's (2018) framework of effective feedback. The qualitative findings further underscore the need for explicit metacognitive instruction concerning the ways in which AI use shapes students' cognitive engagement and long term development, without which learners are unlikely to regulate their AI use in pedagogically productive ways (Veenman et al., 2006; Pintrich, 2004).

5.6 Limitations

Any interpretation of the present findings should be tempered by several methodological constraints worth making explicit. First, the sample was drawn from a single university with a predominantly male, STEM-oriented cohort; findings should not be generalised to EFL learners more broadly. The gender imbalance, reflecting structural features of technology faculty enrolment in Vietnamese higher education, means findings may not fully represent the AI dependency patterns of female EFL writers. Second, the six-week practice period is a significant constraint. Writing development in a second language is longitudinal;

gains in lexical diversity and idea originality may require months or years to manifest. The null findings in these dimensions should not be interpreted as evidence of no effect, but rather as an artefact of insufficient developmental time. Third, the absence of a randomised control condition reflects a deliberate methodological choice prioritising ecological validity. Single-rater scoring without inter-rater reliability data also represents a limitation. Fourth, the sample encompasses both grammar-assistance tools (Grammarly, n = 18) and generative AI platforms (ChatGPT and Gemini combined, n = 87) — tools that differ fundamentally in cognitive demands. Preliminary comparisons found generative AI users reported significantly higher IGR (M = 3.07 vs. 2.63; t(103) = 2.84, p = .005) and LDE (M = 3.09 vs. 2.71; t(103) = 2.61, p = .010), suggesting that dependency patterns are concentrated in the generative AI sub-group and future studies should treat tool type as a substantive moderator. Fifth, because ADAWS is a self-report instrument, it captures students' perceived behavioural dependency tendencies rather than objectively observed AI use behaviours. Future studies should triangulate self-report data with behavioural measures such as prompt logs, AI interaction histories, or screen recordings to establish convergent validity. Sixth, the construct validity of ADAWS requires dedicated future work: the three-subscale structure is theoretically grounded but has not been tested through EFA or CFA, and all subscale-level findings should be read accordingly.

6. Conclusion

Beginning with a concern about the pedagogical consequences of habitual AI use, the inquiry traced patterns of dependency and their associations with independent writing performance among non-English major undergraduates at a single Vietnamese technical university. Through the development and deployment of ADAWS and pre–post writing performance comparison, a consistent pattern has emerged within this sample: moderate but pervasive AI dependency coexists with negligible independent writing skill gains across six weeks of AI-assisted practice. Because the sample was drawn from one institution, with a strong STEM orientation and a pronounced gender skew (73.5% male), these patterns should be read as specific to this tech-oriented cohort rather than as general claims about EFL learners; whether they extend to humanities-oriented, more gender-balanced, or non-Vietnamese EFL populations is an empirical question for future research, not an assumption of the present study.

Three contributions to the emerging literature are worth highlighting. First, it pilots an exploratory instrument, an internally consistent instrument for measuring behavioural AI dependency across three theoretically motivated dimensions, addressing the absence of validated dependency-specific measures in the field. Second, it provides preliminary evidence that AI dependency patterns may be differentially associated with writing outcomes: gain score analysis shows IGR is associated with reduced growth in idea originality ($r = -.45$, $p < .001$), while proficiency-stratified analysis shows lower-proficiency students report higher linguistic delegation yet smaller performance gains, pointing toward a moderating role of baseline ability. Third, the findings suggest a potential relationship between students' perceptions of AI dependency, affective responses to AI-assisted writing, and writing outcomes. Although students generally reported moderately positive affect toward AI-assisted writing, qualitative findings revealed concerns regarding confidence in independent writing performance, indicating that affective and motivational factors may play an important role in shaping the educational consequences of AI use.

Together, these findings move the conversation from whether AI affects writing to which dimensions of AI dependence are associated with writing outcomes, for whom, and in what circumstances. These associations should not be read as evidence that AI dependency causes poorer writing performance: the cross-sectional, non-randomised design used here

cannot rule out reverse causality (students with weaker independent skills may turn to AI more heavily) or the influence of unmeasured third variables, and the absence of a control group means part of the observed grammar gain may simply reflect normal classroom progress unrelated to AI use. What the data do support, within this single-institution, predominantly male, STEM-oriented sample, is a consistent statistical association between self-reported dependency patterns and writing performance that future controlled and longitudinal research should test directly. Integration, as the data suggest, is not inherently beneficial: the mode, timing, and pedagogical framing of AI use may determine whether tools serve as scaffolds toward autonomy or substitutes for the productive cognitive engagement that writing development requires, though this study's design permits this only as a plausible interpretation rather than a demonstrated mechanism. Future research should seek to develop and empirically validate structured frameworks for AI integration, including process before product models, metacognitive AI literacy curricula, and formative AI feedback protocols, that capitalise on the affordances of generative AI while preserving the indispensable cognitive processes involved in learning to write. Nevertheless, the interpretation of the present findings should be approached with caution in light of the methodological limitations discussed earlier in this study.

nguyenthanhthuy@hcmut.edu.vn

Serving as a lecturer at Ho Chi Minh University of Technology (HCMUT) since 2008, Thanh Thuy Nguyen has accumulated over 15 years of experience in English language teaching. She is committed to enhancing students' language proficiency through engaging lessons, interactive activities, and meaningful extracurricular programs that foster holistic development. She holds a Bachelor's degree in English Language Teaching from Ho Chi Minh City University of Pedagogy and a Master's degree in Applied Linguistics from Curtin University, Australia. Guided by her philosophy that "teaching is a dual learning process," she believes teachers and students grow together through continuous learning and reflection.

#193 TEACHER BELIEFS, IDENTITY, AND PROFESSIONAL AGENCY IN ESL-ORIENTED TOURISM EDUCATION: A PLS-SEM ANALYSIS IN VIETNAM

Phong Hai Tran[1]

Abstract

The transition from English as a Foreign Language (EFL) to English as a Second Language (ESL)-oriented pedagogy has become increasingly critical in tourism education, particularly in emerging economies such as Vietnam where English proficiency directly shapes graduate employability and service quality. Drawing on teacher cognition theory, sociocultural perspectives, and professional agency theory, this study develops and empirically tests a structural model linking teacher beliefs, professional identity, and professional agency to pedagogical innovation and teacher-perceived communicative competence in tourism English education. Using survey data collected from 112 English lecturers in tourism and hospitality programs across universities in Ho Chi Minh City, Vietnam, the study employs Partial Least Squares Structural Equation Modeling (PLS-SEM) to examine both linear and indirect relationships. The findings reveal that teacher beliefs regarding communicative and industry-relevant English significantly influence identity reconstruction and agency enactment, which in turn drive pedagogical innovation (e.g., experiential learning, VR/AR integration) and enhance teacher-perceived communicative competence. Professional agency emerges as a key mediating mechanism translating beliefs into practice under institutional constraints. This study contributes to the literature by integrating teacher cognition with ESL transition in tourism education and provides actionable implications for curriculum reform, teacher development, and policy in Vietnam and comparable contexts.

Keywords: teacher beliefs, professional agency, pedagogical innovation, ESL-oriented tourism education, teacher-perceived communicative competence

1. Introduction

The globalization of tourism and the increasing mobility of international travelers have positioned English as a critical lingua franca in hospitality and tourism industries, thereby reshaping the objectives of language education in non-English-speaking countries. In this context, tourism education must move beyond traditional EFL paradigms toward more practice-oriented, ESL-like environments where English is used as a tool for authentic communication rather than as an abstract academic subject (Cloudia Ho, 2020). This transformation is particularly salient in Vietnam, where tourism has become a strategic economic sector and universities are under pressure to produce graduates with strong communicative competence and workplace readiness.

[1] *Corresponding author, Ho Chi Minh City University of Foreign Languages-Information Technology, Ho Chi Minh City, Vietnam; Email: phongth@huflit.edu.vn*

Despite this demand, prior research consistently highlights a mismatch between tourism English training and industry expectations, particularly in developing contexts where language instruction remains grammar-focused and examination-driven(Al-Tarawneh & Osam, 2019; Ghany & Latif, 2012) . This gap suggests that structural reform alone is insufficient; rather, understanding teachers as key agents of change becomes essential. Teachers' beliefs, identity, and professional agency fundamentally shape how curricular innovations are interpreted and implemented in practice.

While previous studies have examined communicative language teaching (CLT) and technology-enhanced learning in tourism education (Elfiondri et al., 2021; He et al., 2025), limited research integrates these pedagogical developments with teacher cognition and agency frameworks (Pantaruk et al., 2026), particularly using robust empirical methods such as PLS-SEM. Moreover, there is a lack of Vietnam-specific empirical evidence examining how teachers navigate the transition toward ESL-oriented tourism education (Şimşek & Kalıpçı, 2023).

1.1 Problem Statement

Although Vietnam's tourism sector increasingly requires graduates who can communicate fluently and appropriately in authentic service encounters, tourism English instruction at the tertiary level remains predominantly grammar-oriented, examination-driven, and detached from workplace communication demands. Reform efforts have concentrated on revising curricula and adopting new technologies, yet these structural interventions have produced limited improvement in graduates' communicative readiness. The central problem this study addresses is that the success of the transition from an EFL to an ESL orientation depends less on curricular documents than on whether teachers—who ultimately interpret and enact reform—hold the beliefs, reconstruct the professional identities, and exercise the agency required to translate ESL-oriented intentions into innovative classroom practice. At present, it remains unclear which teacher-level mechanisms actually convert reform intentions into pedagogical innovation and, in turn, into improved communicative outcomes, leaving institutions without an evidence-based basis for prioritizing their limited development resources.

1.2 Research Gap

Three gaps motivate this study. First, although communicative language teaching (CLT) and technology-enhanced learning have been examined extensively in tourism education (Elfiondri et al., 2021; He et al., 2025), few studies integrate these pedagogical developments with teacher cognition and professional agency frameworks within a single, empirically testable model; existing work tends to treat beliefs, identity, agency, and innovation in isolation rather than specifying the sequential mechanism that links them. Second, prior research frequently assumes that reconstructing teacher identity is sufficient to generate innovative practice, yet the distinct mediating role of professional agency in converting identity into action remains empirically underexamined. Third, despite growing policy attention to English-medium employability in Vietnam, there is a shortage of Vietnam-specific, model-based evidence on how teachers navigate the transition toward ESL-oriented tourism education (Şimşek & Kalıpçı, 2023). Addressing these gaps requires a robust quantitative approach capable of testing an integrated mediation model, which this study provides through PLS-SEM.

1.3 Scope and Delimitations

This study is deliberately bounded in several respects. Empirically, it focuses on English lecturers teaching tourism and hospitality programs at universities in Ho Chi Minh

City, Vietnam—a leading tourism and educational hub—and does not claim to represent all Vietnamese regions or institutions. Conceptually, the model is delimited to five teacher-centered constructs (teacher beliefs, professional identity, professional agency, pedagogical innovation, and teacher-perceived communicative competence) and intentionally excludes institutional-level antecedents such as leadership, workload, and policy constraints, as well as student-generated performance data, which lie beyond the study's teacher-cognition focus. The outcome construct is operationalized as teachers' perceptions of student communicative competence rather than as objective or student-reported proficiency; accordingly, the findings should be interpreted as reflecting instructor-perceived outcomes. These boundaries define the analytical scope of the study and are revisited as limitations and directions for future research in Section 8.

1.4 Research Objectives and Questions

To address the problem and gaps outlined above, this study develops and empirically tests a structural model linking teacher beliefs, professional identity, and professional agency to pedagogical innovation and teacher-perceived communicative competence in tourism English education. Specifically, it seeks to answer three research questions: (RQ1) How do teacher beliefs shape professional identity and professional agency in the transition toward ESL-oriented tourism education? (RQ2) Through what mechanism do professional identity and professional agency translate into pedagogical innovation? and (RQ3) To what extent does pedagogical innovation enhance teacher-perceived communicative competence? By answering these questions, the study clarifies the teacher-level mechanisms underpinning ESL-oriented pedagogical transformation and identifies where institutional resources can be most effectively directed.

2. Literature Review and Hypothesis Development

2.1 Theoretical Framework

The conceptual model of this study integrates three complementary theoretical lenses—teacher cognition theory, sociocultural theory, and professional agency theory—to explain how the transition from an EFL to an ESL orientation is enacted in tourism English education. Teacher cognition theory provides the cognitive foundation of the model, positing that teachers' beliefs, knowledge, and assumptions about language and learning function as the primary filter through which curricular reforms are interpreted and instructional decisions are made (Borg, 2003; Wyatt & Dikilitıaş, 2019). Within this framework, teacher beliefs are treated as the antecedent that initiates the transformation process.

Sociocultural theory complements this cognitive foundation by locating teacher development within social, institutional, and professional contexts. From this perspective, professional identity is not a fixed attribute but a dynamic, socially negotiated construct that evolves as teachers interact with institutional expectations, industry demands, and emerging pedagogical roles (Langum & Sullivan, 2020; Tao & Gao, 2017). Sociocultural theory therefore explains how beliefs are mediated by context to reshape teachers' self-perceptions in ESL-oriented settings, moving them from knowledge transmitters toward facilitators and designers of experiential learning.

Professional agency theory supplies the behavioral bridge between cognition and practice. Agency—teachers' capacity to make intentional pedagogical choices and act purposefully within, and at times against, institutional constraints—is the mechanism that converts beliefs and reconstructed identities into concrete instructional innovation (Priestley et al., 2015; Tao & Gao, 2017). Integrating these three lenses yields a coherent cognitive–

behavioral logic in which cognition (beliefs) is filtered through socially constructed identity and enacted through agency to produce pedagogical innovation and, ultimately, teacher-perceived communicative competence. Figure 1 operationalizes this integrated framework, and the hypotheses developed in the following subsections (2.2–2.5) trace each pathway in this sequence.

2.2 Teacher Beliefs and ESL-Oriented Pedagogy

Teacher beliefs represent deeply held assumptions about teaching and learning that guide instructional practices (Wyatt & Dikilitaş, 2019). In tourism education, beliefs about communicative competence, industry relevance, and experiential learning are particularly critical. Communicative Language Teaching (CLT) has been shown to significantly enhance students' communicative competence and confidence in tourism English contexts (Liu et al., 2024; Şimşek & Kalıpçı, 2023). However, the adoption of CLT and similar approaches depends largely on teachers' epistemological orientations and perceived teaching goals. In emerging ESL-like environments, teachers who believe in the importance of authentic communication and workplace alignment are more likely to adopt experiential and student-centered approaches. Conversely, teachers who maintain traditional beliefs may resist pedagogical change. Therefore:

H1: Teacher beliefs positively influence professional identity reconstruction toward ESL-oriented teaching.

H2: Teacher beliefs positively influence professional agency in tourism English education.

2.3 Professional Identity Transformation

Teacher identity is not static but evolves through interaction with institutional contexts, professional expectations, and pedagogical demands (Langum & Sullivan, 2020). In tourism education, the shift toward ESL requires teachers to move from knowledge transmitters to facilitators of experiential learning and industry-relevant communication (Ju et al., 2025). The integration of immersive technologies such as VR and AR has further expanded the teacher's role as a designer of learning environments that simulate real-world communication scenarios, thereby enhancing student engagement and reducing anxiety (Akyürek et al., 2024). Identity reconstruction thus becomes a crucial mechanism through which beliefs are translated into pedagogical practices. Therefore:

H3: Professional identity positively influences professional agency.

H4: Professional identity positively influences pedagogical innovation.

2.4 Professional Agency as a Mediator

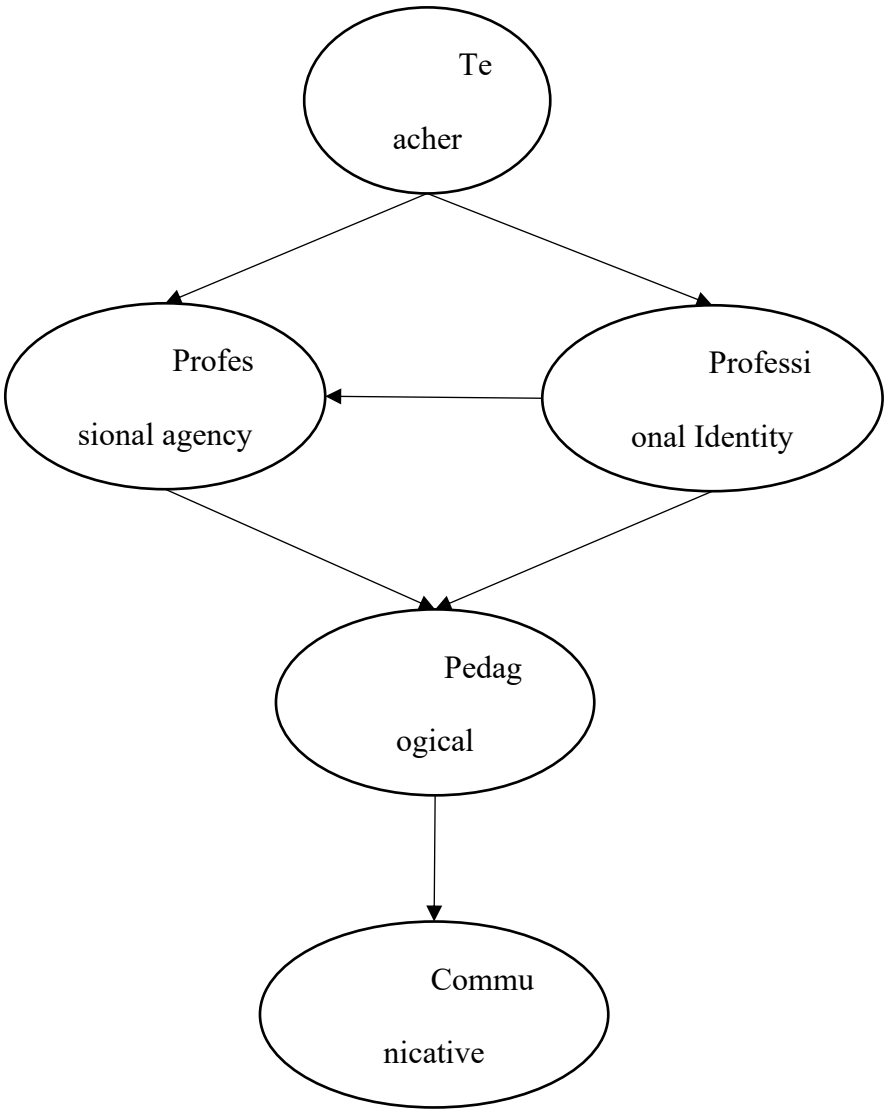
Professional Agency refers to teachers' capacity to act purposefully and make pedagogical decisions within institutional constraints (Habib et al., 2026). In tourism education, agency enables teachers to adapt curricula, integrate technology, and align teaching with industry needs (Liu et al., 2024). Studies on AR, VR, and experiential learning demonstrate that innovative teaching practices significantly improve student engagement and practical competencies (Ju et al., 2025). However, the adoption of such practices depends on teachers' ability to exercise agency.

H5: Professional agency positively influences pedagogical innovation.

2.5 Pedagogical Innovation and Student Outcomes

Pedagogical innovation in tourism education increasingly encompasses a range of learner-centered and practice-oriented approaches, notably experiential learning, technology-enhanced instruction such as virtual reality (VR) and augmented reality (AR), and industry-based simulations that replicate authentic workplace scenarios (Ju et al., 2025). These approaches shift the focus from traditional knowledge transmission toward immersive and interactive learning environments in which students actively engage in communication tasks reflective of real tourism contexts. Empirical evidence suggests that experiential learning and simulation-based activities enable students to develop practical language skills, enhance confidence, and bridge the gap between classroom knowledge and industry expectations, while technology-enhanced tools such as VR and AR further enrich learning by providing realistic, low-risk environments for practicing communication and decision-making (Akyürek et al., 2024; Rahmanu & Molnár, 2026). In addition, multimedia resources such as video-based instruction and digital platforms contribute to vocabulary acquisition and contextual understanding, thereby strengthening communicative competence (Cloudia Ho, 2020). Collectively, these pedagogical innovations not only improve student engagement but also foster employability skills by aligning language learning with professional practice in tourism settings (Kacetl & Frydrychova-Klimova, 2015). Accordingly, it is hypothesized that pedagogical innovation has a significant positive effect on teacher-perceived communicative competence.

H6: Pedagogical innovation positively influences teacher-perceived communicative competence.



3. Research Model

The proposed research model, presented in Figure 1, is grounded in an integrated theoretical framework that combines teacher cognition, sociocultural theory, and professional agency perspectives to explain pedagogical transformation in ESL-oriented tourism education. Specifically, the model comprises five key constructs: Teacher Beliefs (TB), Professional Identity (PI), Professional Agency (PA), Pedagogical Innovation (PIN), and Teacher-Perceived Communicative Competence (CC). Teacher beliefs (TB) refer to instructors' underlying assumptions about language teaching, particularly the importance of communicative competence and industry-relevant English in tourism contexts, which have been shown to shape instructional practices and learning outcomes (Cloudia Ho, 2020). These beliefs influence the development of professional identity (PI), defined as teachers' evolving self-perception as facilitators of communication, designers of experiential learning. In tourism education, identity reconstruction is increasingly necessary as teaching shifts toward more authentic, practice-based approaches supported by immersive technologies such as VR and AR (Takada et al., 2022). Professional agency (PA) represents teachers' capacity to make pedagogical decisions, adapt curricula, and implement innovative teaching strategies within institutional constraints, playing a critical mediating role in translating beliefs and identity into actual classroom practices. This agency is particularly important for adopting pedagogical innovation (PIN), which includes experiential learning, simulation-based instruction, and technology-enhanced approaches that have been demonstrated to improve student engagement and practical competencies in tourism education (Rahmanu & Molnár, 2026; Takada et al., 2022). Finally, teacher-perceived communicative competence (CC) reflects teachers' assessment of students' ability to use English effectively in real-world tourism situations, a core outcome of tourism English programs and a key determinant of employability (Al-Tarawneh & Osam, 2019; Ghany & Latif, 2012). Collectively, these five constructs form a

coherent structural model that captures both the cognitive and behavioral mechanisms underpinning the transition toward ESL-oriented pedagogy in tourism education.

Figure 1

Research model (CC = Teacher-Perceived Communicative Competence)

4. Methodology

Data were collected from 112 English lecturers teaching tourism and hospitality programs at universities located in Ho Chi Minh City, Vietnam, which serves as a major educational and tourism hub with strong industry–academic linkages. Respondents were required to have at least one year of experience teaching Tourism English or English for Specific Purposes (ESP) courses to ensure adequate familiarity with industry-oriented language instruction. A structured questionnaire was administered using both online and offline distribution methods to maximize response rates and capture a diverse sample of instructors across public and private institutions. All measurement items were assessed using a seven-

point Likert scale ranging from 1 (strongly disagree) to 7 (strongly agree), allowing for greater sensitivity and variance in responses, which is particularly suitable for PLS-SEM analysis.

The measurement scales used in this study were adapted and contextualized from established literature in communicative language teaching (CLT), English for Specific Purposes (ESP), and tourism education to ensure both content validity and contextual relevance. Specifically, Teacher Beliefs (TB) were operationalized to capture instructors' orientations toward communicative, industry-relevant, and practice-based language teaching, consistent with prior studies emphasizing the importance of communicative competence and workplace alignment in tourism English education (Cloudia Ho, 2020; Ghany & Latif, 2012). The TB construct included four items: TB1 ("I believe English teaching should focus on real-world communication"), TB2 ("Industry-relevant English is more important than grammar accuracy"), TB3 ("Students should learn English through interaction and practice"), and TB4 ("Tourism English should reflect workplace communication needs"). Professional Identity (PI) was measured to reflect teachers' evolving roles in ESL-oriented environments, particularly their shift toward facilitation, experiential design, and industry alignment. This construct aligns with research highlighting the transformation of teacher roles in tourism education and technology-enhanced learning contexts (Rahmanu & Molnár, 2026; Takada et al., 2022). Four items were used: PI1 ("I see myself as a facilitator of communication"), PI2 ("I integrate industry practices into my teaching"), PI3 ("My role includes preparing students for real-world tourism contexts"), and PI4 ("I design learning experiences rather than only deliver content"). Professional Agency (PA) was operationalized to capture teachers' capacity to make pedagogical decisions, innovate, and adapt to contextual demands, consistent with prior studies emphasizing the importance of agency in implementing educational innovations (Tao & Gao, 2017). The scale included PA1 ("I adapt teaching methods based on student needs"), PA2 ("I experiment with new teaching approaches"), PA3 ("I integrate technology into my teaching"), and PA4 ("I modify curriculum content to align with industry demands"). Pedagogical Innovation (PIN) was measured to reflect the extent to which teachers adopt experiential, simulation-based, and technology-enhanced teaching practices, which have been widely recognized as critical for improving engagement and practical competencies in tourism education (Ju et al., 2025). The items included PIN1 ("I use experiential learning activities"), PIN2 ("I incorporate simulations or role-plays"), PIN3 ("I use digital tools such as VR, video, or AR in teaching"), and PIN4 ("I design interactive classroom activities"). Finally, Teacher-Perceived Communicative Competence (CC) was measured based on teachers' perceptions of student learning outcomes in tourism contexts. Because all CC items capture instructors' perceptions rather than objective or student-reported proficiency, the construct is labeled Teacher-Perceived Communicative Competence throughout the study to reflect its measurement basis accurately, reflecting the central goal of ESL-oriented instruction. This construct is consistent with prior research emphasizing the importance of communicative ability, confidence, and real-world interaction skills in tourism English education (Cloudia Ho, 2020). The scale included CC1 ("Students can communicate effectively in tourism contexts"), CC2 ("Students demonstrate confidence in speaking English"), CC3 ("Students can handle real-life service situations"), and CC4 ("Students show improved interaction skills").

Data analysis was conducted using Partial Least Squares Structural Equation Modeling (PLS-SEM) with Smart-PLS 4, following a two-stage approach that included assessment of the measurement model and the structural model, in line with established guidelines for variance-based SEM (Hair et al., 2011; Henseler et al., 2014). PLS-SEM was selected due to its suitability for exploratory research, prediction-oriented models, and complex relationships involving mediation effects, as well as its robustness with relatively small to medium sample

sizes. To determine the minimum required sample size, this study employed G*Power, a widely used tool for statistical power analysis in behavioral and social sciences research. Following the guidelines for structural equation modeling, the sample size was calculated based on the maximum number of predictors pointing to an endogenous construct in the proposed model. In this study, the most complex endogenous construct is Pedagogical Innovation (PIN), which has two predictors (Professional Identity and Professional Agency). Accordingly, an a priori power analysis was conducted using the F-test: Linear multiple regression (fixed model, R^2 deviation from zero) with the following parameters: a medium effect size ($f^2 = 0.15$), a significance level (α) of 0.05, and a statistical power ($1 - \beta$) of 0.80, which are commonly recommended thresholds in SEM research (Hair et al., 2023). The results from G*Power indicated that the minimum required sample size is 68 observations. Given that this study collected data from 112 respondents, the sample size exceeds the minimum requirement, thereby ensuring adequate statistical power for detecting significant relationships within the model. This also aligns with the "10-times rule" in PLS-SEM, further supporting the adequacy and robustness of the sample size for model estimation and hypothesis testing.

5. Results and Data Analysis

The demographic profile of the respondents is presented in Table 1. Among the 112 English lecturers surveyed in Ho Chi Minh City, the majority were female (58.9%), while male respondents accounted for 41.1%. In terms of age distribution, most participants were between 30 and 39 years old (46.4%), followed by those under 30 (25.0%), indicating a relatively young and dynamic teaching workforce. Regarding teaching experience, a substantial proportion of respondents had between four and six years of experience (32.1%), while 26.8% had seven to ten years, suggesting that most participants possessed moderate to high levels of professional experience. In terms of educational qualifications, the majority held a master's degree (64.3%), followed by doctoral degrees (19.6%), reflecting a well-qualified academic sample. Additionally, 60.7% of respondents were affiliated with public universities, while 39.3% worked in private institutions, ensuring representation across different institutional contexts. With respect to experience in teaching Tourism English or ESP courses, most lecturers reported more than four years of experience, highlighting their familiarity with industry-oriented language instruction. Overall, the sample demonstrates a balanced and experienced group of educators suitable for examining ESL-oriented pedagogical transformation in tourism education.

Table 1

Demographic Profile of Respondents (N = 112)

Characteristics	Category	Frequency (n)	Percentage (%)
Gender	Male	46	41.1
	Female	66	58.9
Age	Under 30	28	25.0
	30–39	52	46.4
	40–49	22	19.6
	50 and above	10	8.9

Teaching Experience	1–3 years	24	21.4
	4–6 years	36	32.1
	7–10 years	30	26.8
	More than 10 years	22	19.6
Education Level	Bachelor's Degree	18	16.1
	Master's Degree	72	64.3
	Doctoral Degree	22	19.6
Type of Institution	Public University	68	60.7
	Private University	44	39.3
ESP/Tourism English Experience	1–3 years	30	26.8
	4–6 years	40	35.7
	More than 6 years	42	37.5

5.1 Measurement Model

Table 2 presents the results of the measurement model assessment, including indicator loadings, internal consistency reliability, convergent validity, and multicollinearity diagnostics for all constructs. Overall, the results demonstrate that the measurement model satisfies the recommended criteria for reliability and validity in PLS-SEM analysis (Hair et al., 2011). First, the indicator loadings for all items exceed the acceptable threshold of 0.70, with most values ranging from 0.79 to 0.90, indicating strong item reliability. Although one item (CC4 = 0.681) is slightly below the ideal threshold, it remains acceptable as it is close to 0.70 and does not adversely affect the overall construct reliability. This suggests that all indicators adequately represent their respective latent constructs. Second, internal consistency reliability is confirmed through Cronbach's alpha and composite reliability (ρa and ρc). All constructs exhibit Cronbach's alpha values above 0.80, ranging from 0.816 (CC) to 0.898 (TB), exceeding the recommended threshold of 0.70. Similarly, composite reliability values (ρc) range from 0.880 to 0.929, indicating a high level of internal consistency across all constructs. Third, convergent validity is established through the Average Variance Extracted (AVE). All constructs demonstrate AVE values above the recommended minimum of 0.50, ranging from 0.648 (CC) to 0.766 (TB), confirming that each construct explains more than half of the variance of its indicators. Finally, multicollinearity was assessed using Variance Inflation Factor (VIF) values. All VIF values are below the conservative threshold of 3.0, indicating that there are no significant collinearity issues among the indicators (Ooi & Tan, 2016).

Table 2

Indicator Loadings, Internal Consistency Reliability, Convergent Validity, and Multicollinearity Diagnostics for All Constructs

Construct	Items	Loadings	Cronbach's alpha	Composite reliability (rho_a)	Composite reliability (rho_c)	Average variance extracted (AVE)	VIF
CC	**CC1**	0.829	0.816	0.820	0.880	0.648	2.157
	CC2	0.820					2.086
	CC3	0.877					2.675
	CC4	0.681					1.240
PA	**PA1**	0.819	0.881	0.881	0.918	0.737	1.913
	PA2	0.875					2.599
	PA3	0.863					2.781
	PA4	0.875					2.619
PI	**PI1**	0.834	0.871	0.873	0.912	0.721	2.194
	PI2	0.803					1.711
	PI3	0.890					2.861
	PI4	0.868					2.369
PIN	**PIN1**	0.845	0.840	0.874	0.889	0.668	1.811
	PIN2	0.857					1.924
	PIN3	0.790					2.269
	PIN4	0.776					2.230
TB	**TB1**	0.861	0.898	0.904	0.929	0.766	2.387
	TB2	0.844					2.157
	TB3	0.892					2.829
	TB4	0.903					2.966

Table 3 presents the assessment of discriminant validity using the Heterotrait–Monotrait ratio (HTMT), following the recommended threshold of 0.90 for conceptually similar constructs. The HTMT values range from 0.531 to 0.860, all of which are below the conservative cut-off value of 0.90, thereby confirming adequate discriminant validity among the constructs (Ab Hamid et al., 2017). Specifically, the highest HTMT value is observed between Professional Agency (PA) and Professional Identity (PI) (HTMT = 0.860), which is expected given the conceptual proximity of these constructs within teacher cognition and agency frameworks. Similarly, the relationship between Teacher Beliefs (TB) and Professional Identity (PI) shows a relatively high HTMT value (0.839), reflecting their theoretical interdependence. However, both values remain within acceptable limits, indicating that the constructs are empirically distinct despite their conceptual relatedness. Lower HTMT values are observed between Pedagogical Innovation (PIN) and other constructs, such as PIN–TB (0.531) and PIN–PI (0.594), suggesting clearer differentiation between pedagogical practices and underlying cognitive or identity-related constructs. Additionally, the HTMT values involving Communicative Competence (CC) are all below 0.75, further supporting the

distinctiveness of outcome variables from antecedent constructs. Overall, the HTMT results provide strong evidence of discriminant validity, confirming that all constructs in the model are sufficiently distinct and capturing different theoretical dimensions. This supports the robustness of the measurement model and justifies proceeding with structural model evaluation.

Table 3

Discriminant Validity-HTMT Results

	CC	PA	PI	PIN	TB
CC					
PA	0.743				
PI	0.699	0.860			
PIN	0.631	0.747	0.594		
TB	0.737	0.777	0.839	0.531	

5.2 Structural Model Assessment

Table 4 presents the results of the structural model analysis, including path coefficients, t-values, p-values, and confidence intervals obtained through bootstrapping procedures. Overall, the findings provide strong empirical support for most of the hypothesized relationships, highlighting the critical role of teacher cognition and agency in driving pedagogical innovation and communicative outcomes. First, Teacher Beliefs (TB) exhibit a strong and statistically significant positive effect on Professional Identity (PI) ($\beta = 0.753$, $t = 11.094$, $p < 0.001$), supporting H1. This indicates that teachers who hold strong beliefs in communicative and industry-oriented language teaching are more likely to reconstruct their professional identity toward facilitative and experiential roles. Similarly, TB also has a significant positive effect on Professional Agency (PA) ($\beta = 0.292$, $t = 3.382$, $p = 0.001$), supporting H2, suggesting that teacher beliefs contribute directly to their capacity to act and make pedagogical decisions. Second, Professional Identity (PI) significantly influences Professional Agency (PA) ($\beta = 0.539$, $t = 6.451$, $p < 0.001$), supporting H3. This finding highlights that identity reconstruction plays a key role in enabling teachers to exercise agency and adapt their teaching practices. However, the direct relationship between Professional Identity and Pedagogical Innovation (PIN) is not statistically significant ($\beta = 0.092$, $t = 0.963$, $p = 0.336$), leading to the rejection of H4. This suggests that identity alone may not be sufficient to drive innovation unless it is translated into action through agency. In contrast, Professional Agency (PA) demonstrates a strong and significant positive effect on Pedagogical Innovation (PIN) ($\beta = 0.603$, $t = 6.657$, $p < 0.001$), supporting H5. This finding confirms that agency is a critical mechanism through which teachers implement innovative practices such as experiential learning and technology integration. Finally, Pedagogical Innovation (PIN) significantly influences Communicative Competence (CC) ($\beta = 0.564$, $t = 7.786$, $p < 0.001$), supporting H6, indicating that innovative teaching approaches substantially enhance students' ability to communicate effectively in tourism contexts. Overall, the results suggest a sequential mechanism in which teacher beliefs shape identity and agency, while professional agency plays a central role in driving pedagogical innovation, which ultimately leads to improved communicative competence. The non-significant relationship between professional identity and pedagogical innovation further emphasizes the importance of agency as a mediating factor in translating cognitive and identity-related constructs into practical teaching outcomes.

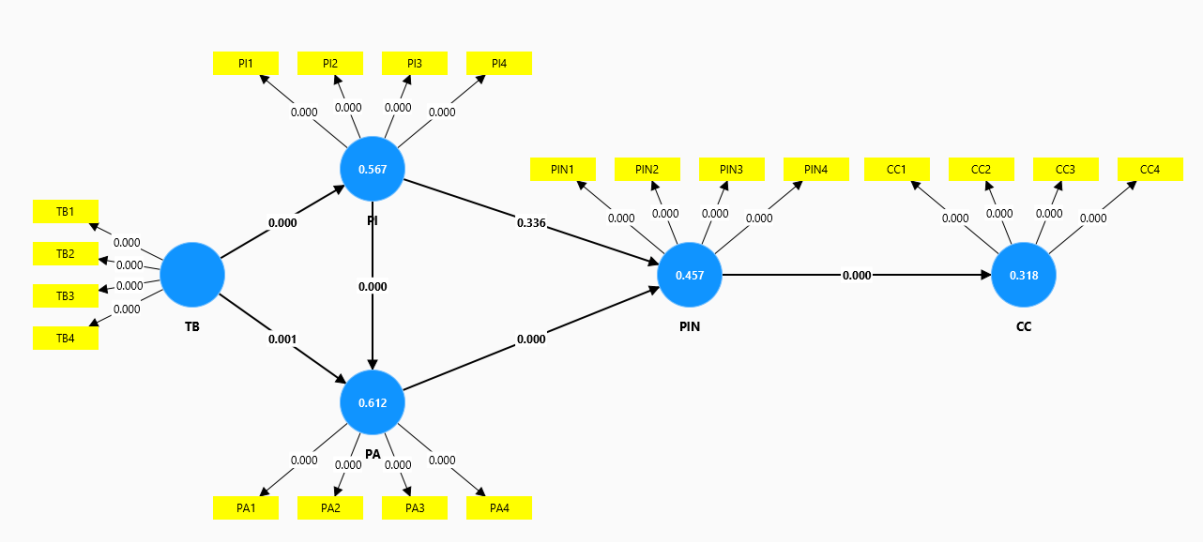

Table 4

Structural Model Results

Hypothesis	Path	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values	2.50%	97.50%	Remark
H1	**TB -> PI**	0.753	0.746	0.068	11.094	0.000	0.592	0.857	Supported
H2	**TB -> PA**	0.292	0.285	0.086	3.382	0.001	0.115	0.456	Supported
H3	**PI -> PA**	0.539	0.543	0.083	6.451	0.000	0.374	0.708	Supported

Figure 2

Structural Model Assessment

Tables 5, 6, and 7 present the results of the structural model evaluation, including explanatory power (R^2), predictive relevance (Q^2), effect sizes (f^2), and out-of-sample predictive performance using PLS-Predict (Shmueli et al., 2019). Collectively, these results provide robust evidence of the model's explanatory and predictive capabilities. As shown in Table 5, the coefficient of determination (R^2) indicates that the model demonstrates moderate to substantial explanatory power across all endogenous constructs. Specifically, Professional Agency (PA) exhibits the highest explanatory power ($R^2 = 0.612$), followed by Professional

Identity (PI) (R^2 = 0.567), Pedagogical Innovation (PIN) (R^2 = 0.457), and Communicative Competence (CC) (R^2 = 0.318). These values suggest that the model explains a considerable proportion of variance, particularly for PA and PI, which are central mediating constructs. Furthermore, predictive relevance (Q^2) values, calculated using the blindfolding procedure, are all greater than zero (CC = 0.189, PA = 0.432, PI = 0.390, PIN = 0.280), confirming that the model has satisfactory predictive relevance for all endogenous constructs (Giovanis et al., 2021; Kock, 2015).

Table 5

R-square and Q^2 (=1-SSE/SSO)

	R-square	R-square adjusted		SSO	SSE	Q^2 (=1-SSE/SSO)
CC	0.318	0.312	**CC**	456	369.903	0.189
PA	0.612	0.605	**PA**	456	259.171	0.432
PI	0.567	0.563	**PI**	456	278.080	0.390
PIN	0.457	0.447	**PIN**	456	328.213	0.280

Table 6 reports the effect sizes (f^2) to assess the relative impact of exogenous constructs on endogenous variables. The results indicate that Teacher Beliefs (TB) have a very large effect on Professional Identity (PI) (f^2 = 1.310), highlighting the dominant role of beliefs in shaping identity reconstruction. Additionally, Professional Identity has a moderate effect on Professional Agency (PA) (f^2 = 0.323), while Professional Agency demonstrates a substantial effect on Pedagogical Innovation (PIN) (f^2 = 0.285). Pedagogical Innovation also shows a strong effect on Communicative Competence (CC) (f^2 = 0.465), confirming its critical role in enhancing student outcomes. In contrast, the effect of Professional Identity on Pedagogical Innovation is negligible (f^2 = 0.007), further supporting the non-significant path observed in the structural model and reinforcing the importance of agency as the key driver of innovation.

Table 6

Effect size

	CC	PA	PI	PIN	TB
CC					
PA				0.285	
PI		0.323		0.007	
PIN	0.465				
TB		0.095	1.310		

Table 7 presents the results of the PLS-Predict analysis, which evaluates the model's out-of-sample predictive performance by comparing PLS-SEM predictions with those from a linear regression model (LM) and a naïve benchmark (IA). The Q^2predict values are mostly positive across indicators, indicating that the model has predictive relevance at the indicator level. Moreover, for the majority of items, the PLS-SEM model produces lower prediction errors (RMSE and MAE) compared to the benchmark models, suggesting superior predictive

performance. Although a few indicators (e.g., PIN4) show slightly weaker predictive accuracy, the overall pattern demonstrates that the model achieves medium to high predictive power.

Table 7

PLS predicts

	Q²predict	PLS-SEM_RMSE	PLS-SEM_MAE	LM_RMSE	LM_MAE	IA_RMSE	IA_MAE
CC1	0.157	1.169	0.985	1.135	0.926	1.273	1.045

PI3	0.344	1.174	0.844	1.195	0.884	1.449	1.156
PI4	0.371	1.187	0.938	1.226	0.953	1.497	1.234
PIN1	0.310	1.180	0.997	1.185	0.983	1.421	1.132
PIN2	0.232	1.228	1.003	1.246	1.022	1.402	1.157
PIN3	0.027	1.354	1.044	1.389	1.078	1.372	1.053
PIN4	-0.012	1.539	1.243	1.546	1.251	1.529	1.236

Table 8 and Figure 3 report the results of the Importance–Performance Map Analysis (IPMA), which extends the PLS-SEM findings by simultaneously considering the total effects (importance) of antecedent constructs on the target variable (Communicative Competence, CC) and their average latent variable scores (performance). This analysis provides actionable insights by identifying which constructs have the greatest impact on CC and where managerial or pedagogical improvements should be prioritized. The results indicate that Pedagogical Innovation (PIN) has the highest importance (effect = 0.564) but relatively low performance (57.797), suggesting that although it is the most influential driver of communicative competence, its current implementation level remains insufficient. This highlights PIN as the primary area for improvement, implying that greater emphasis should be placed on enhancing experiential learning, simulation-based activities, and technology integration to maximize student outcomes. In contrast, Teacher Beliefs (TB) demonstrate moderate importance (0.276) but the highest performance (82.992), indicating that lecturers already possess strong beliefs aligned with communicative and industry-oriented teaching. Similarly, Professional Identity (PI) shows relatively high performance (78.310) with moderate importance (0.235), suggesting that teachers generally perceive themselves as facilitators of communication and experiential learning. However, their direct contribution to communicative competence is comparatively

weaker. Professional Agency (PA) exhibits both moderate importance (0.340) and relatively high performance (74.526), indicating that teachers are reasonably active in adapting teaching methods and implementing innovations. Given its mediating role in the structural model, PA remains a crucial lever for translating beliefs and identity into effective pedagogical practices.

When compared to the mean values (importance = 0.354; performance = 73.406), the IPMA results clearly identify Pedagogical Innovation as the key priority for strategic improvement, while Teacher Beliefs and Professional Identity can be considered strengths of the current system. These findings provide practical guidance for policymakers and educational institutions, emphasizing the need to invest in innovative teaching practices and technological integration to enhance communicative competence in tourism education.

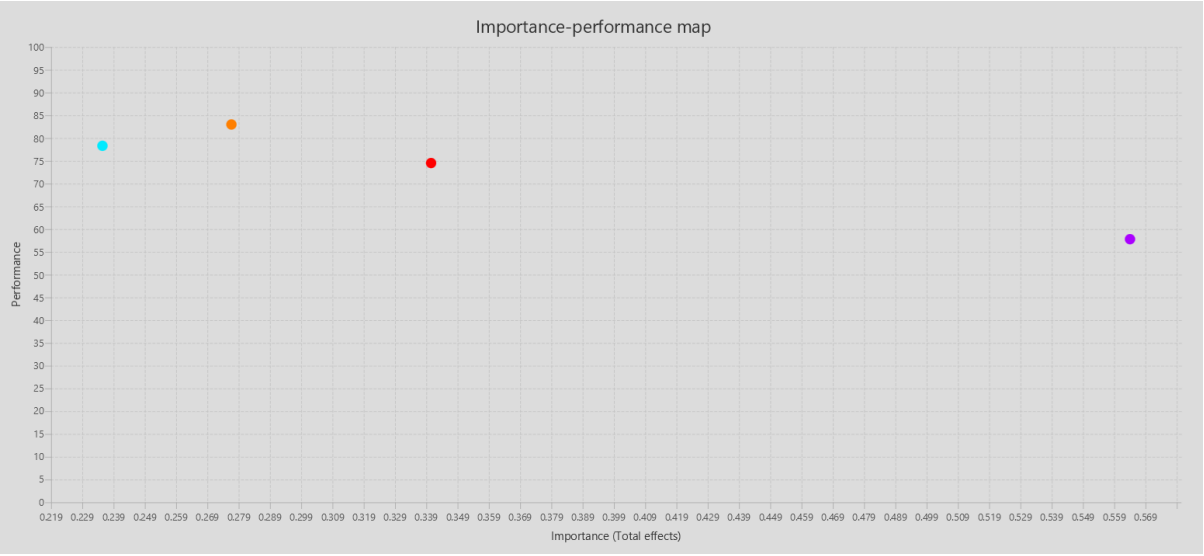

Table 8

Importance-performance analysis

	Effect	Performance
PA	0.340	74.526
PI	0.235	78.310
PIN	0.564	57.797
TB	0.276	82.992
Mean	**0.354**	**73.406**

Figure 3

Importance–Performance Map Analysis

6. Discussion

This study set out to explain how teacher beliefs, professional identity, and professional agency jointly shape pedagogical innovation and, ultimately, teacher-perceived communicative competence in ESL-oriented tourism education. The results provide a coherent, sequential

mechanism such as beliefs → identity → agency → innovation → outcomes with several important nuances that extend prior work.

First, the strong and positive effect of teacher beliefs on professional identity (H1) and professional agency (H2) confirms that what teachers believe about language learning, particularly the value of communicative, industry-relevant English, acts as a primary driver of how they see themselves and how they act in classrooms. This finding is consistent with evidence from communicative language teaching (CLT), which shows that teachers who prioritize authentic communication and interaction are more likely to adopt learner-centered practices and pursue workplace alignment (Cloudia Ho, 2020). It also aligns with ESP-oriented research in tourism education indicating that industry relevance and real-world communication needs reshape instructional orientations (Ghany & Latif, 2012). In the Vietnamese context, where traditional, grammar-focused instruction still coexists with emerging communicative demands, these results underscore that belief change is a necessary starting point for pedagogical transformation.

Second, the significant effect of professional identity on professional agency (H3) highlights identity reconstruction as a key enabling condition for action. Teachers who perceive themselves as facilitators, designers of learning experiences, and mediators between academia and industry are more likely to exercise agency, adapting methods, integrating tools, and revising content. This is in line with studies emphasizing that teacher identity is dynamic and closely tied to agency enactment, particularly in contexts of educational change. Importantly, the tourism education literature has increasingly pointed to the need for instructors to adopt expanded roles, including orchestrating immersive and experiential learning environments, often supported by technologies such as VR and AR(Ju et al., 2025; Rahmanu & Molnár, 2026). Our results provide empirical support for this identity–agency linkage in an ESL-oriented transition.

Third, and most notably, the findings show that professional identity does not directly predict pedagogical innovation (H4 not supported), whereas professional agency has a strong positive effect on pedagogical innovation (H5 supported). This distinction is theoretically and practically important. While prior studies often assume that identity change naturally leads to innovative practice, our results indicate that identity alone is insufficient; innovation requires enactment through agency. In other words, teachers may see themselves as facilitators or innovators, but without the capacity (and willingness) to act, experiment, adapt, and integrate new approaches, pedagogical innovation does not materialize. This finding refines earlier work in tourism education that highlights the benefits of experiential and technology-enhanced learning (e.g., AR/VR, simulations) (Ju et al., 2025; Takada et al., 2022) by identifying agency as the critical mechanism that turns intention into implementation.

Fourth, the strong positive effect of pedagogical innovation on communicative competence (H6 supported) confirms that experiential, simulation-based, and technology-enhanced approaches are effective in improving students' ability to communicate in authentic tourism contexts (Akyürek et al., 2024; Ju et al., 2025). This is consistent with a growing body of evidence showing that immersive learning environments, including VR-based training and interactive simulations, enhance speaking confidence, reduce anxiety, and improve real-world communication skills (Şimşek & Kalıpçı, 2023). Similarly, the use of multimedia resources and interactive tasks has been shown to support vocabulary acquisition and contextual understanding, which are essential for tourism communication. Our findings extend this literature by empirically linking pedagogical innovation, driven by teacher agency, to student-level communicative outcomes within a single integrated model.

Fifth, the explanatory and predictive metrics (R^2, Q^2, and PLS-Predict) indicate that the model has moderate to substantial explanatory power and satisfactory out-of-sample predictive capability, particularly for professional agency and pedagogical innovation (Luan-Thanh et al., 2024; Phan et al., 2025). This supports the robustness of the proposed framework and suggests that teacher-related factors are central in explaining variation in innovation and communicative competence. The effect size results further reinforce the dominance of teacher beliefs in shaping identity (large effect) and the central role of agency in driving innovation, while the negligible effect of identity on innovation corroborates the non-significant direct path.

Finally, the IPMA results provide additional managerial insight by showing that pedagogical innovation has the highest importance but the lowest performance, whereas teacher beliefs and identity demonstrate high performance but comparatively lower importance. This pattern suggests that, in the Ho Chi Minh City context, teachers already possess relatively strong communicative and industry-oriented beliefs and have begun to reconstruct their professional identities accordingly. However, the translation of these strengths into high-quality, innovative classroom practices remains insufficient. This finding resonates with earlier studies in tourism education that document persistent gaps between curricular intentions and classroom realities, often due to institutional constraints, limited resources, or lack of support for innovation (Bowen et al., 2026; Fang & Xiang, 2023). It also reinforces our central argument: agency is the bottleneck, the missing link between what teachers believe and who they think they are, and what they actually do in practice.

7. Implications

7.1 Theoretical Contributions

This study makes several important theoretical contributions that directly align with the research gaps identified in the introduction, particularly the need to understand how ESL-oriented transformation in tourism education is enacted through teacher-level mechanisms in emerging contexts such as Vietnam.

First, this study extends teacher cognition theory by situating it within the specific context of ESL-oriented tourism education, where English is not merely an academic subject but a professional communication tool. While prior research has emphasized the role of teacher beliefs in shaping instructional practices, this study advances the literature by demonstrating a sequential cognitive–behavioral mechanism in which teacher beliefs influence professional identity and professional agency, which in turn drive pedagogical innovation and ultimately affect communicative competence. This extends existing CLT and ESP research by linking cognitive orientations directly to measurable student-related outcomes in a tourism-specific ESL environment (Cloudia Ho, 2020; Ghany & Latif, 2012).

Second, the study contributes to the literature on teacher identity and professional agency by clarifying their distinct but interrelated roles in pedagogical transformation. Unlike prior studies that often treat identity as a direct predictor of innovation, this research provides empirical evidence that professional identity alone is insufficient to drive pedagogical innovation. Instead, professional agency emerges as the critical mediating mechanism that translates identity into action. This finding refines sociocultural and ecological perspectives on teacher development by highlighting that identity reconstruction must be accompanied by actionable capacity and autonomy to produce meaningful instructional change.

Third, this study enriches the growing body of research on pedagogical innovation in tourism education by integrating teacher-related constructs with emerging instructional approaches such as experiential learning, simulation-based teaching, and technology-enhanced

learning (e.g., VR/AR). While previous studies have documented the effectiveness of these innovations in improving engagement and learning outcomes (Al-Tarawneh & Osam, 2019; Rahmanu & Molnár, 2026), this study advances theory by explaining why and how such innovations are adopted, emphasizing the central role of teacher agency in enabling their implementation.

Finally, this study contributes to the broader literature on ESL transition in emerging economies, particularly Vietnam, by providing empirical evidence from a context where English is increasingly used in professional domains such as tourism. By focusing on Ho Chi Minh City, a key tourism and educational hub, the study offers a contextualized understanding of how global pedagogical shifts toward ESL are localized and enacted within specific institutional and cultural settings. This responds directly to the gap identified in the introduction regarding the lack of empirical, model-based research on ESL-oriented transformation in tourism education in developing countries.

7.2 Managerial Implications

The findings of this study offer several practical implications for policymakers, university administrators, and educators in Vietnam, particularly in aligning tourism education with industry demands and facilitating the transition toward ESL-oriented pedagogy. First, given the strong influence of teacher beliefs on identity and agency, higher education institutions should prioritize professional development programs that reshape pedagogical beliefs toward communicative, industry-relevant English. Training initiatives should move beyond traditional grammar-based instruction and focus on communicative language teaching, experiential learning, and real-world application. This is particularly important in Vietnam, where the legacy of exam-oriented education still influences teaching practices despite increasing industry demands for communication skills. Second, the results highlight that professional agency is the key driver of pedagogical innovation. Therefore, universities should create institutional environments that empower teachers to experiment with new teaching methods, redesign course content, and integrate innovative practices. This can be achieved by reducing rigid curricular constraints, encouraging pedagogical autonomy, and providing incentives for innovation. Without such support, even teachers with strong beliefs and progressive identities may be unable to implement meaningful changes in their classrooms. Third, the IPMA results indicate that pedagogical innovation has high importance but relatively low performance, suggesting a critical gap in current teaching practices. To address this, universities in Vietnam should invest in technology-enhanced learning infrastructure, such as VR/AR tools, simulation platforms, and digital learning resources. Evidence shows that such technologies can significantly enhance communicative competence and reduce learner anxiety in tourism contexts (Kusnoto et al., 2024; Rahmanu & Molnár, 2026). Additionally, incorporating industry-based simulations and experiential learning activities can help bridge the gap between classroom learning and workplace requirements. Fourth, stronger industry–university collaboration is essential. Tourism enterprises should be involved in curriculum design, guest lectures, internships, and simulation-based training to ensure that English instruction reflects real-world communication demands. This aligns with prior findings that highlight mismatches between academic training and industry expectations in tourism education (Choy & Yeung, 2024). In the Vietnamese context, particularly in Ho Chi Minh City where tourism activities are highly dynamic, such collaboration can significantly enhance the relevance and effectiveness of English language programs. Finally, policymakers at the national and institutional levels should recognize that the transition from EFL to ESL is not merely a curricular change but a systemic transformation involving teacher cognition,

institutional structures, and pedagogical practices. Strategic initiatives should therefore focus on holistic reform, including teacher training, curriculum redesign, infrastructure development, and policy support, to ensure that Vietnam's tourism education system can produce graduates with the communicative competence required in the global tourism industry.

8. Conclusion, Limitations, and Future Research

This study examined how teacher beliefs, professional identity, and professional agency jointly shape pedagogical innovation and teacher-perceived communicative competence in the transition toward ESL-oriented tourism education in Ho Chi Minh City, Vietnam. Using PLS-SEM, the analysis confirmed a sequential mechanism in which beliefs drive identity reconstruction and agency, agency—rather than identity alone—enacts pedagogical innovation, and innovation enhances teacher-perceived communicative competence. Theoretically, the study integrates teacher cognition, sociocultural, and professional agency perspectives into a single validated model and isolates agency as the pivotal link between what teachers think and what they do. Practically, the Importance–Performance Map Analysis identifies pedagogical innovation as the highest-impact yet lowest-performing lever, signaling where universities should concentrate their development efforts. In sum, advancing Vietnam's tourism English education from an EFL to an ESL orientation is less a matter of curricular documents than of empowering teachers to exercise agency in innovative practice.

Despite offering meaningful theoretical and practical insights, this study has several limitations that should be acknowledged and can guide future research. First, the study is geographically limited to Ho Chi Minh City, which, although a major educational and tourism hub in Vietnam, may not fully represent the diversity of institutional contexts across the country. Universities in other regions (e.g., Hanoi or central provinces) may differ in terms of resources, curriculum design, and industry engagement. Future research should therefore adopt a multi-region or cross-country comparative design to enhance generalizability and capture contextual variations in ESL-oriented tourism education. Second, the study relies on self-reported data from lecturers, particularly in measuring communicative competence through teacher perceptions. While this approach is common in educational research, it may introduce potential bias or overestimation of student outcomes. Future studies should incorporate multi-source data, such as student surveys, objective language performance assessments, or employer evaluations, to provide a more comprehensive and triangulated understanding of communicative competence. Third, the research adopts a cross-sectional design, which limits the ability to infer causality and capture dynamic changes over time. The transition from EFL to ESL-oriented pedagogy is inherently a longitudinal process involving gradual shifts in beliefs, identity, and practice. Future research should consider longitudinal or panel data designs to examine how teacher cognition and pedagogical innovation evolve over time, particularly in response to institutional reforms or technological adoption. Fourth, although this study focuses on key teacher-related constructs (beliefs, identity, and agency), it does not include contextual or institutional factors such as organizational support, leadership, workload, or policy constraints, which may influence teachers' ability to enact innovation. Future research could extend the model by incorporating contextual antecedents or moderating variables, such as institutional support or technological readiness, to provide a more comprehensive explanation of pedagogical transformation. Fifth, the study employs PLS-SEM to examine linear relationships, which may not fully capture complex, non-linear interactions among constructs. Given the increasing interest in advanced analytical approaches, future research could integrate Artificial Neural Networks (ANN) or hybrid SEM–ANN models to explore non-linear effects and improve predictive accuracy, particularly in understanding how

combinations of teacher characteristics influence pedagogical innovation. Finally, while this study focuses on tourism education, the proposed model may also be applicable to other ESP domains such as business English, medical English, or engineering communication. Future research could test the model in different disciplinary contexts to examine its generalizability and refine its theoretical boundaries.

#196 FROM TRADITIONAL TESTING TO ALTERNATIVE ASSESSMENT: EXAMINING THE RELATIONSHIPS AMONG CLASSROOM-BASED ALTERNATIVE ASSESSMENT, STUDENT ENGAGEMENT, AND PERCEIVED COMMUNICATIVE COMPETENCE IN A VIETNAMESE ESL HIGHER-EDUCATION CONTEXT

Phan Tran Duc Lien[1]

Abstract:

The transition toward communicative and learner-centered English language education has intensified the need to move beyond traditional examination-oriented assessment practices toward more dynamic classroom-based alternative assessment approaches. Despite growing recognition of formative and authentic assessment, empirical evidence regarding the relationships among alternative assessment, student engagement, and students' perceived communicative competence remains limited, particularly in emerging educational contexts such as Vietnam. Drawing upon constructivist learning perspectives and engagement theory, this study develops and tests a research model examining these relationships. Survey data were collected from 412 undergraduate students enrolled in English-related courses in Ho Chi Minh City, Vietnam, and the proposed model was analyzed using Partial Least Squares Structural Equation Modeling (PLS-SEM). The findings indicate that classroom-based alternative assessment is positively associated with student engagement and perceived communicative competence. Student engagement is also positively associated with perceived communicative competence, highlighting the importance of active participation and interaction in language learning environments. The model demonstrates satisfactory explanatory power and cross-validated predictive relevance. However, because the study employs a cross-sectional survey design and self-reported measures, the findings should be interpreted as predictive associations rather than definitive causal effects or objective evidence of linguistic performance. This study contributes to the literature by conceptualizing classroom-based alternative assessment as a learning-enabling mechanism and integrating assessment practices, engagement, and perceived communicative outcomes within a unified framework. The practical implications outline how educators and institutions can embed alternative assessment into existing learning management systems and departmental assessment practices.

Keywords: Classroom-based alternative assessment, Student engagement, Perceived communicative competence, English language education, Language learning assessment, Higher education

1. Introduction

The rapid globalization of education and labor markets has elevated English proficiency, particularly communicative competence, as a critical capability for individuals operating in multilingual and multicultural environments (Unesco, 2025). In this context, English as a Second Language (ESL) education has undergone a paradigm shift from grammar-based instruction toward communicative, interaction-driven learning models (Fonteles et al., 2026; Guilloteaux, 2013). However, despite these pedagogical advancements, assessment practices in many ESL systems continue to rely heavily on traditional, examination-oriented approaches that emphasize memorization and static knowledge reproduction rather than authentic language use and communicative performance.

This misalignment between instructional goals and assessment practices represents a fundamental challenge in contemporary education. Traditional assessment methods are increasingly criticized for their inability to capture the dynamic, socially constructed nature of language learning, particularly in contexts where communication, interaction, and real-world application are essential (Fink et al., 2026). In contrast, classroom-based assessment (CLB) and alternative assessment approaches, such as formative assessment, peer evaluation, and portfolio-based assessment, have been proposed as more effective mechanisms for integrating assessment into the learning process (Badem, 2025; Muhonen et al., 2025). These approaches emphasize continuous feedback, learner participation, and contextualized performance, thereby aligning assessment with constructivist learning principles.

Empirical evidence supports the effectiveness of such approaches. For instance, formative and classroom-integrated assessment practices have been shown to enhance student engagement and promote deeper learning experiences beyond traditional examination formats (Sanford & Snow, 2026). Similarly, process-oriented classroom evaluation, including behavioral observation and real-time feedback, provides more comprehensive insights into student learning and instructional effectiveness (Yu et al., 2026). In addition, experiential and interactive learning environments have been found to significantly improve higher-order competencies, including communication, creativity, and analytical skills (Chopra, 2025). These findings collectively suggest that alternative assessment approaches are not merely evaluative tools but transformative pedagogical mechanisms that shape learning processes and outcomes.

A critical mechanism through which alternative assessment influences learning outcomes is student engagement. Engagement is widely conceptualized as a multidimensional construct encompassing behavioral participation, emotional involvement, and cognitive investment in learning activities (Mele et al., 2025). It plays a central role in determining academic success, as engaged students are more likely to actively participate, persist in learning tasks, and achieve higher performance outcomes. Conversely, limited engagement has been consistently associated with reduced academic achievement and diminished learning effectiveness, particularly in technology-mediated and virtual learning environments (Rabby et al., 2025). Recent research further highlights that engagement is shaped by interactive, feedback-rich, and student-centered learning environments, reinforcing the importance of integrating assessment practices that actively involve learners.

At the same time, the ultimate goal of English language education, communicative competence, has evolved into a multidimensional construct encompassing linguistic proficiency, intercultural awareness, adaptability, and strategic communication skills. Contemporary frameworks conceptualize perceived communicative competence as a combination of knowledge, attitudes, and skills that enable individuals to interact effectively in diverse contexts (Ertay & Gilanlioglu, 2024). In an increasingly globalized world,

intercultural communication competence has become a fundamental requirement for academic, professional, and social success, with deficiencies in such competence often leading to failure in cross-cultural interactions and professional environments (Sarwari et al., 2024). Moreover, communication competence extends beyond language proficiency to include empathy, adaptability, and the ability to tailor communication to different audiences and contexts (Fuller et al., 2021), as well as the ability to operate effectively in technology-mediated environments (Koponen et al., 2025).

Despite the recognized importance of alternative assessment, student engagement, and perceived communicative competence, existing research remains fragmented. Prior studies have typically examined these constructs in isolation, focusing either on assessment practices, engagement dynamics, or communication outcomes, without integrating them into a comprehensive theoretical model (Ahmed et al., 2026; Rahmanu & Molnár, 2026; Sieveke et al., 2026; Xu et al., 2026). Furthermore, there is a notable lack of empirical research applying advanced analytical techniques such as Partial Least Squares Structural Equation Modeling (PLS-SEM) to examine these relationships in ESL contexts, particularly in emerging economies such as Vietnam where educational transformation is ongoing. In addition, contemporary educational trends, including digital transformation, AI integration, and active learning methodologies, further underscore the need to rethink assessment practices. Technologies such as AI-driven learning systems and interactive tools are reshaping student engagement and learning experiences (Mele et al., 2025), while active learning approaches and gamified assessment have been shown to significantly enhance engagement and academic performance compared to traditional examination methods (Roig et al., 2026). Similarly, alternative grading approaches, such as upgrading and learner-centered evaluation, have been found to reduce anxiety and shift students' focus toward meaningful learning rather than performance metrics (Burns et al., 2026). These developments highlight the urgency of developing integrated frameworks that capture the complex interplay between assessment, engagement, and learning outcomes in modern educational contexts.

To address these gaps, the present study develops and empirically tests a comprehensive research model examining the interconnected roles of classroom-based alternative assessment, student engagement, and perceived communicative competence. By integrating insights from constructivist learning theory, engagement research, and communication competence frameworks, this study contributes to the literature in three key ways. First, it advances theoretical understanding by linking assessment practices, student engagement, and communicative outcomes within an integrated framework. Second, it provides empirical evidence from an emerging ESL context using advanced analytical methods (PLS-SEM). Third, it offers practical implications for educators and policymakers seeking to reform assessment practices to better align with the demands of 21st-century language education.

2. Literature Review

2.1. Classroom-Based and Alternative Assessment in ESL Contexts

The shift from traditional, examination-driven assessment toward classroom-based and alternative assessment (CLB) represents a fundamental transformation in contemporary education, particularly in ESL contexts where communicative competence is a primary learning objective. Traditional assessment approaches, characterized by standardized testing and summative evaluation (Burns et al., 2026; Lee & Jeon, 2024; Sanford & Snow, 2026), have been widely criticized for their limited ability to capture the dynamic, contextual, and interactional nature of language learning. These approaches often prioritize memorization and discrete linguistic knowledge, thereby neglecting higher-order competencies such as

communication, collaboration, and real-world language use. In response to these limitations, classroom-based assessment has emerged as a learner-centered paradigm that integrates assessment into the teaching–learning process (Lee & Jeon, 2024). CLB emphasizes continuous feedback, contextualized performance, and authentic learning tasks, enabling teachers to monitor student progress and adapt instruction accordingly (Sanford & Snow, 2026). Within this paradigm, alternative assessment methods, including formative assessment, peer assessment, and portfolio-based assessment, play a central role in fostering active learning and meaningful engagement.

Although technology-mediated assessment is increasingly important in contemporary ESL education, the present study focuses on the pedagogical foundations of classroom-based alternative assessment rather than on a specific technological platform. The CLB construct captures formative, interactive, process-oriented, and authentic assessment practices, including continuous feedback, peer evaluation, portfolios, and classroom discussions. These practices can be implemented through conventional classroom activities or supported by digital platforms such as learning management systems, e-portfolios, online discussion forums, automated quizzes, and AI-assisted feedback tools. Future research should extend the present framework by explicitly measuring technology-mediated assessment practices and examining whether digital readiness or AI-supported feedback strengthens the relationships among alternative assessment, engagement, and perceived communicative competence.

Empirical evidence consistently demonstrates the pedagogical value of alternative assessment approaches. For instance, formative assessment practices that incorporate continuous feedback and reinforcing activities have been shown to enhance student engagement and deepen learning beyond traditional examination formats (Sanford & Snow, 2026). Similarly, process-oriented evaluation systems enable teachers to capture real-time behavioral indicators of learning, thereby improving both instructional quality and student outcomes (Yu et al., 2026). These findings align with broader research on experiential learning, which highlights the importance of integrating real-world tasks and authentic experiences into educational environments to enhance higher-order competencies such as communication, creativity, and problem-solving (Chopra, 2025).

Furthermore, recent developments in educational technology and digital pedagogy have reinforced the importance of alternative assessment. The integration of interactive tools, game-based systems, and AI-driven learning environments has enabled more immediate feedback, adaptive learning, and inclusive participation, all of which contribute to improved learning experiences and outcomes (Priante & Tsekouras, 2025). At the same time, innovative assessment formats, such as gamified evaluation and escape-room-based assessment, have demonstrated significant improvements in student performance and engagement compared to traditional testing methods (Chopra, 2025). These advancements underscore the evolving role of assessment as a dynamic and integral component of the learning process rather than a static measure of performance. Despite these benefits, the adoption of classroom-based alternative assessment remains uneven, particularly in emerging ESL contexts where institutional structures and cultural norms continue to favor examination-oriented systems. This tension highlights the need for empirical research that examines how alternative assessment practices operate within specific educational contexts and how they influence key learning outcomes such as engagement and perceived communicative competence.

2.2. Student Engagement in Contemporary Learning Environments

Student engagement has become a central construct in educational research, reflecting its critical role in shaping learning processes and outcomes (Byers et al., 2024). Engagement is

commonly conceptualized as a multidimensional construct encompassing behavioral participation, emotional involvement, and cognitive investment in learning activities (Carey, 2013). This multidimensionality highlights that engagement is not merely about participation but also about the depth of learners' involvement and their commitment to learning.

The importance of engagement is particularly evident in language learning contexts, where active participation and interaction are essential for developing perceived communicative competence. Research indicates that engagement is closely linked to students' motivation, persistence, and academic performance. For example, studies have shown that limited engagement in learning environments, especially in technology-mediated contexts, can significantly reduce academic performance and learning effectiveness (Rabby et al., 2025). Conversely, interactive and feedback-rich learning environments have been found to enhance students' cognitive and emotional involvement, leading to improved learning outcomes.

Recent research further elaborates the mechanisms through which engagement operates in contemporary educational settings. Advances in digital learning technologies, including AI-driven tools and educational robots, have demonstrated the potential to enhance engagement by providing personalized, interactive, and multisensory learning experiences. These technologies can simultaneously influence cognitive, emotional, and behavioral dimensions of engagement, thereby creating more holistic and effective learning environments (Sahlender et al., 2024). Similarly, human-centered approaches to educational innovation emphasize the importance of student agency, participation, and co-creation in shaping meaningful learning experiences (O'Brien et al., 2026).

Moreover, engagement is not only an individual-level phenomenon but also a socially constructed process influenced by classroom interactions, instructional practices, and institutional contexts. Research on classroom interactions highlights the importance of communicative participation, collaborative learning, and teacher–student interaction in fostering engagement and supporting language acquisition (Badem, 2025; Kozaklı Ülger et al., 2026). Additionally, co-creation and participatory learning approaches have been shown to enhance students' sense of belonging, motivation, and commitment to learning, thereby reinforcing engagement as a key driver of educational success (O'Brien et al., 2026).

Within this broader context, classroom-based alternative assessment can be understood as a critical mechanism for shaping student engagement. By providing continuous feedback, promoting interaction, and emphasizing authentic tasks, alternative assessment practices create conditions that encourage active participation and deeper involvement in learning. This perspective suggests that engagement is not merely an outcome but an integral component of the assessment–learning nexus.

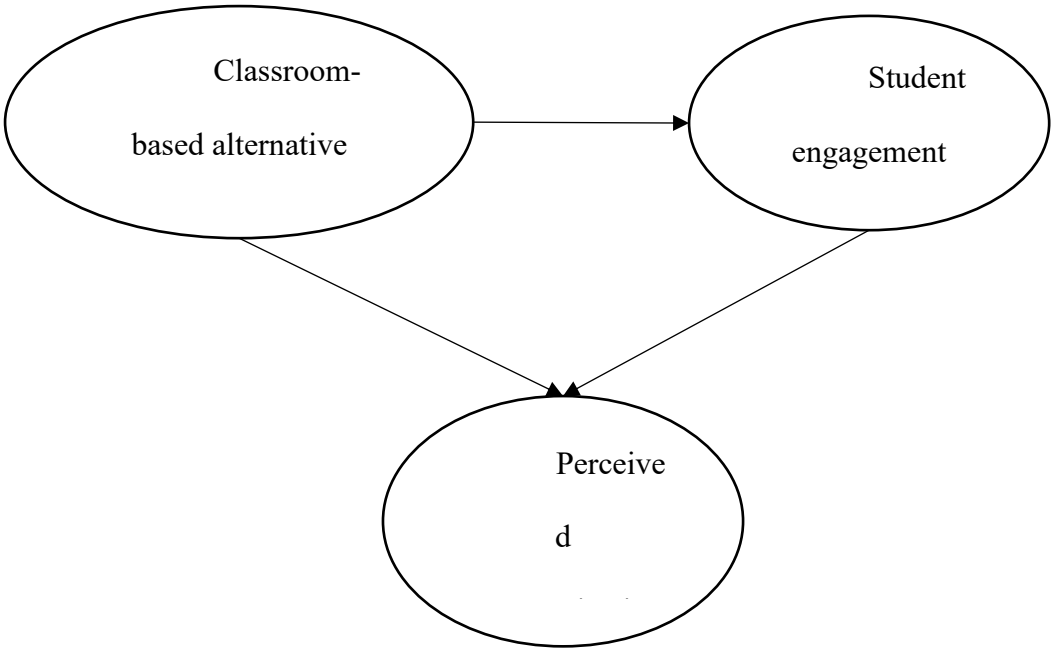
2.3. Perceived communicative competence as a Core Outcome in ESL Education

Communicative competence has long been recognized as a central objective of English language education, reflecting learners' ability to use language effectively in real-world contexts (Cloudia Ho, 2020). Unlike traditional measures of language proficiency that focus primarily on grammatical accuracy and vocabulary knowledge, communicative competence encompasses a broader set of capabilities, including sociolinguistic appropriateness, discourse management, strategic communication, and intercultural awareness (Ertay & Gilanlioglu, 2024).

The present study focuses specifically on perceived communicative competence, which refers to students' self-evaluated confidence and perceived ability to communicate effectively in English. This distinction is important because students' perceptions may influence their

willingness to participate, interact, and engage in communicative activities, but they do not necessarily reflect objectively demonstrated linguistic performance. Accordingly, the empirical construct examined in this study should be interpreted as perceived communicative competence rather than as an objective measure of English proficiency.

2.4. Linking Alternative Assessment, Engagement, and Perceived communicative competence



The preceding discussions highlight that classroom-based alternative assessment, student engagement, and perceived communicative competence are deeply interconnected within the ESL learning process. Alternative assessment practices provide the structural and pedagogical conditions for active learning, engagement reflects the degree of learner involvement and investment, and perceived communicative competence represents the ultimate outcome of language education. Rather than treating these constructs as isolated components, contemporary educational research increasingly emphasizes their integration within a holistic learning framework. Alternative assessment practices, by emphasizing feedback, interaction, and authenticity, create learning environments that encourage engagement and support the development of perceived communicative competence. Engagement, in turn, reflects the extent to which learners actively participate in and benefit from these environments, while perceived communicative competence captures the effectiveness of learning in achieving real-world communication outcomes. Despite the theoretical alignment among these constructs, empirical research integrating them into a unified framework remains limited, particularly in ESL contexts within emerging economies. This gap is further compounded by the lack of studies employing advanced analytical techniques such as PLS-SEM to examine the relationships among assessment practices, engagement, and communication outcomes. To address these gaps, the present study focuses specifically on perceived communicative competence, which refers to students' self-evaluated confidence and perceived ability to communicate effectively in English. This distinction is important because students' perceptions may influence their willingness to participate, interact, and engage in communicative activities, but they do not necessarily represent objectively demonstrated linguistic performance. Accordingly, the empirical construct examined in this study should be interpreted as perceived communicative competence rather than as an objective measure of English proficiency. Based on the literature reviewed, the following hypotheses are proposed:

H1: Classroom-based alternative assessment is positively associated with student engagement.

H2: Classroom-based alternative assessment is positively associated with perceived communicative competence.

H3: Student engagement is positively associated with perceived communicative competence.

The research model is presented in Figure 1.

3. Methodology

3.1 Research Design

This study adopts a quantitative research design to examine the relationships among classroom-based alternative assessment, student engagement, and perceived communicative competence in ESL contexts. A cross-sectional survey method was employed, as it is widely used in educational and behavioral research to capture students' perceptions and experiences in natural learning environments. Given the complexity of the proposed model and the predictive orientation of the study, Partial Least Squares Structural Equation Modeling (PLS-SEM) was selected as the primary analytical technique. PLS-SEM is particularly suitable for exploratory and prediction-oriented research, as well as for models involving multiple latent constructs and complex relationships.

3.2 Sample and Minimum Sample Size

The target population of this study consists of undergraduate students enrolled in English-related courses at universities in Ho Chi Minh City, Vietnam. These students represent an appropriate sample because they are directly exposed to classroom-based assessment practices and are actively engaged in ESL learning environments. Following established guidelines for PLS-SEM, the minimum sample size was determined using the "10-times rule", which suggests that the sample size should be at least ten times the maximum number of structural paths pointing at any construct in the model. In the present study, the maximum number of arrows pointing to a construct is two (from CLB and STE to PCC), resulting in a minimum sample size of 20. However, this rule is considered conservative. To ensure statistical power and robustness, this study follows more rigorous recommendations suggesting a minimum sample size of 200 for SEM-based analysis. Accordingly, a total of 450 questionnaires were distributed, and 412 valid responses were retained after data screening, exceeding recommended thresholds and ensuring sufficient statistical power for PLS-SEM analysis.

3.3 Data Collection Procedure

Data were collected using a structured questionnaire administered to students in ESL courses. The survey was distributed both online and offline to increase response rates and ensure diverse participation. Prior to the main data collection, a pilot test with 30 students was conducted to assess the clarity, reliability, and validity of the measurement items. Participation was voluntary, and respondents were assured of anonymity and confidentiality. Screening questions were used to ensure that participants had prior experience with English courses and classroom-based assessment practices. All constructs were measured using a 7-point Likert scale ranging from: (1) Strongly disagree → (7) Strongly agree. The use of a 7-point scale is recommended in SEM research as it provides greater variance, improves measurement sensitivity, and enhances reliability. All measurement items were adapted and refined from prior validated studies on classroom-based assessment, student engagement, and perceived communicative competence, with modifications to fit the ESL context.

3.4 Measurement Items

Table 1

Measurement items

Constructs	**Definition**	**Items**	**References**
Classroom-Based Alternative Assessment (CLB)	CLB reflects formative, interactive, and authentic assessment practices aligned with classroom-based assessment literature	CLB1. Assessment activities are integrated into classroom learning tasks.	Sanford & Snow (2026)
		CLB2. I receive continuous feedback during English learning activities.	
		CLB3. My teacher uses various assessment methods (e.g., peer, portfolio, discussion).	
		CLB4. Assessment focuses on my learning process rather than only final results.	
		CLB5. Classroom assessment helps me understand my strengths and weaknesses.	
Student Engagement (STE)	STE reflects behavioral, emotional, and cognitive engagement dimensions	STE1. I actively participate in English classroom activities.	Mele et al. (2025)
		STE2. I feel interested in learning English during class.	
		STE3. I am motivated to complete English learning tasks.	
		STE4. I pay attention during English lessons.	

		STE5. I enjoy interacting with classmates in English.	
Perceived communicative competence (PCC)	Perceived communicative competence (PCC) refers to students' self-evaluated confidence and perceived ability to express ideas, participate in discussions, respond appropriately in conversations, and use English in real-life situations. The construct captures learners' subjective evaluations of their communicative capability rather than objectively assessed linguistic performance.	PCC1. I can express my ideas clearly in English.	Ertay & Gilanlioglu (2024)
		PCC2. I feel confident communicating in English.	
		PCC3. I can participate in discussions using English.	
		PCC4. I can understand and respond appropriately in conversations.	
		PCC5. I can use English effectively in real-life situations.	

The present CLB scale captures the pedagogical foundations of classroom-based alternative assessment and does not directly operationalize technology-mediated or AI-supported assessment practices.

3.5 Common Method Bias (CMB)

Given that all data were collected from a single source using self-reported measures, potential common method bias (CMB) was addressed through both procedural and statistical remedies.

Procedural Remedies (Kock, 2015)

- Anonymity and confidentiality were assured to reduce evaluation apprehension
- Items were carefully worded to avoid ambiguity
- Different constructs were separated conceptually in the questionnaire

Statistical Remedies

First, Harman's single-factor test was conducted, and the first factor accounted for less than 50% of the total variance, indicating that CMB is unlikely to be a serious concern (Harman, 1976). Second, full collinearity assessment (VIF) was performed in Table 3, with all VIF values below the threshold of 3.3, further confirming the absence of common method bias (Thi Viet & Nguyen, 2025).

4. Results, Discussion, Implications

4.1 Results

4.1.1 Sample Characteristics

A total of 412 valid responses were retained for analysis in Table 2. The demographic profile indicates a relatively balanced distribution across gender, academic levels, and majors,

ensuring adequate representation of students with different levels of exposure to ESL learning environments. Female respondents accounted for the majority (56.3%), followed by males (40.8%), while a small proportion identified as other (2.9%). In terms of academic level, most respondents were in their second (30.1%) and third years (33.0%), suggesting sufficient experience with classroom-based assessment practices. Regarding academic majors, Business Administration (37.9%) and English Studies (34.5%) represented the largest groups. Additionally, a substantial proportion of students reported frequent use of English in class, with 64.1% indicating "often" or "very often," reflecting a communicative learning environment suitable for this study.

Table 2

Demographic Profile of Respondents (N = 412)

Category	Item	Frequency (n)	Percentage (%)
Gender	Male	168	40.8
	Female	232	56.3
	Other	12	2.9
Year of Study	1st Year	80	19.4
	2nd Year	124	30.1
	3rd Year	136	33.0
	4th Year	72	17.5
Major	Business Administration	156	37.9
	English Studies	142	34.5
	Others	114	27.6
Frequency of English Use in Class	Rarely	36	8.7
	Sometimes	112	27.2
	Often	168	40.8
	Very often	96	23.3

4.1.2 Measurement model assessment

Table 3 presents the results of convergent validity and internal consistency assessment for all constructs, including classroom-based alternative assessment (CLB), student engagement (STE), and perceived communicative competence (PCC). Overall, the results demonstrate that all constructs meet the recommended thresholds for reliability and validity. First, the indicator loadings range from 0.704 to 0.868, exceeding the minimum acceptable threshold of 0.70 (Hair et al., 2019), thereby confirming satisfactory indicator reliability. Although CLB5 exhibits a relatively lower loading (0.704), it remains acceptable and contributes to content validity. In terms of internal consistency, Cronbach's alpha values range from 0.838 (CLB) to 0.887 (PCC), exceeding the recommended threshold of 0.70, indicating strong reliability. Similarly, composite reliability values (rho_a and rho_c) for all constructs exceed 0.80, further confirming the robustness of the measurement model. Specifically, rho_c values range from 0.885 to 0.917, demonstrating high internal consistency across constructs. Convergent validity is assessed using the Average Variance Extracted (AVE), with all

constructs exceeding the threshold of 0.50 (Ferrell et al., 2019). The AVE values are 0.607 for CLB, 0.686 for STE, and 0.690 for PCC, indicating that each construct explains more than half of the variance of its indicators. This confirms that the measurement items adequately represent their respective latent constructs.

Table 3

Convergent validity, Internal consistency assessment

Constructs	Items	Loadings	Cronbach's alpha	Composite reliability (rho_a)	Composite reliability (rho_c)	Average variance extracted (AVE)	VIF
CLB	**CLB1**	0.794	0.838	0.840	0.885	0.607	1.919
	CLB2	0.771					1.804
	CLB3	0.796					1.926
	CLB4	0.825					2.120
	CLB5	0.704					1.304
PCC	**PCC1**	0.861	0.887	0.889	0.917	0.690	2.620
	PCC2	0.829					2.283
	PCC3	0.865					2.524
	PCC4	0.829					2.191
	PCC5	0.766					1.739
STE	**STE1**	0.776	0.885	0.886	0.916	0.686	1.758
	STE2	0.828					2.131
	STE3	0.845					2.712
	STE4	0.868					2.827
	STE5	0.821					2.109

Discriminant validity was assessed using the Heterotrait–Monotrait ratio (HTMT), as presented in Table 4. The HTMT values among all constructs are below the conservative threshold of 0.80 (Ab Hamid et al., 2017), indicating satisfactory discriminant validity. Specifically, the HTMT value between CLB and PCC is 0.648, between CLB and STE is 0.767, and between STE and PCC is 0.766. All values are well below the threshold, suggesting that each construct is empirically distinct and captures unique aspects of the conceptual model. These findings confirm that classroom-based alternative assessment, student engagement, and perceived communicative competence are not only theoretically distinct but also empirically separable constructs. Therefore, the measurement model satisfies the requirements for discriminant validity.

Table 4

Discriminant validity (HTMT 0.80)

	CLB	PCC	STE

CLB			
PCC	0.648		
STE	0.767	0.766	

4.1.3 Structural model assessment

Table 5 presents the results of the structural model, including path coefficients, t-values, p-values, and confidence intervals obtained from the bootstrapping procedure (5,000 resamples). Overall, the structural model demonstrates strong explanatory power, with all hypothesized relationships being positive and statistically significant. The results provide robust empirical support for the proposed relationships among classroom-based alternative assessment (CLB), student engagement (STE), and perceived communicative competence (PCC). First, the effect of classroom-based alternative assessment on student engagement is positive and highly significant ($\beta = 0.677$, $t = 19.988$, $p < 0.001$). The confidence interval [0.607; 0.741] does not include zero, further confirming the robustness of the relationship. This result indicates that classroom-based alternative assessment is positively associated with students' active participation, motivation, and involvement in ESL learning activities. Among all relationships, this path exhibits the strongest effect size, highlighting the central role of assessment practices in shaping engagement. Second, classroom-based alternative assessment also has a direct and statistically significant effect on perceived communicative competence ($\beta = 0.201$, $t = 3.872$, $p < 0.001$). Although the magnitude of this relationship is smaller compared to other paths, the confidence interval [0.098; 0.300] confirms its significance. This finding suggests that alternative assessment practices are positively associated with perceived communicative competence by providing authentic, feedback-rich learning experiences that reflect real-world language use. Third, student engagement has a strong and significant effect on perceived communicative competence ($\beta = 0.542$, $t = 11.057$, $p < 0.001$), with a confidence interval of [0.444; 0.637]. This result demonstrates that higher levels of engagement, manifested through active participation, motivation, and interaction, are associated with improved communicative abilities. The magnitude of this relationship indicates that engagement is an important predictor of perceived communicative competence in ESL contexts. Taken together, the findings confirm that classroom-based alternative assessment not only is positively associated with perceived communicative competence but also is strongly associated with student engagement, which in turn is closely associated with communicative outcomes. All hypotheses (H1, H2, and H3) are therefore supported.

Table 5

Structural model results

Hypothesis	**Path**	**Original sample (O)**	**Sample mean (M)**	**Standard deviation (STDEV)**	**T statistics (|O/STDEV|)**	**P values**	**2.50 %**	**97.50 %**	**Remarks**
H1	CLB -> STE	0.677	0.677	0.034	19.988	0.000	0.607	0.741	Supported

H2	CLB -> PCC	0.201	0.201	0.052	3.872	0.000	0.098	0.300	Supported
H3	STE -> PCC	0.542	0.543	0.049	11.057	0.000	0.444	0.637	Supported

Table 6 presents the coefficient of determination (R^2) and predictive relevance (Q^2) for the endogenous constructs, namely perceived communicative competence (PCC) and student engagement (STE). The R^2 values indicate the explanatory power of the structural model. Specifically, the R^2 value for PCC is 0.482, suggesting that 48.2% of the variance in PCC is explained by classroom-based alternative assessment (CLB) and student engagement (STE). According to commonly accepted benchmarks, this value can be interpreted as moderate explanatory power, indicating that the model provides substantial insight into the determinants of PCC in ESL contexts. Similarly, the R^2 value for student engagement (STE) is 0.458, meaning that 45.8% of the variance in engagement is explained by classroom-based alternative assessment. This result also reflects moderate explanatory capability, highlighting the strong role of assessment practices in shaping student engagement within classroom environments. In addition to explanatory power, the predictive relevance of the model was assessed using the Stone–Geisser Q^2 value obtained through the blindfolding procedure. The Q^2 value for PCC (PCC) is 0.328, while the Q^2 value for student engagement (STE) is 0.305. Both values are well above zero, indicating that the model has strong predictive relevance for both endogenous constructs (Stone, 1974). More importantly, Q^2 values above 0.25 are generally considered to indicate medium to high predictive accuracy, suggesting that the model is not only explanatory but also capable of predicting out-of-sample observations effectively. This reinforces the robustness and practical applicability of the proposed model in ESL educational settings.

Table 6

R-square and Q square

	R-square	**SSO**	**SSE**	**Q^2 (=1-SSE/SSO)**
PCC	0.482	2060	1383.481	0.328
STE	0.458	2060	1431.379	0.305

4.2 Discussion

This study set out to examine how CLB, STE, and PCC are interconnected in ESL learning environments. The findings provide strong empirical support for all proposed relationships and offer several important insights into the role of assessment practices in shaping learning outcomes.

4.2.1 The Association between Classroom-Based Alternative Assessment and Student Engagement

The results reveal that classroom-based alternative assessment has a strong and significant effect on student engagement ($\beta = 0.677$), indicating that assessment practices

embedded within classroom activities substantially enhance students' active participation, motivation, and involvement. This finding underscores the central role of assessment as a pedagogical tool rather than merely an evaluative mechanism. This result is consistent with prior research suggesting that formative and process-oriented assessment approaches foster deeper engagement by providing continuous feedback and encouraging active learning behaviors (Sanford & Snow, 2026). Similarly, classroom-based evaluation systems that emphasize real-time interaction and behavioral observation have been shown to promote greater student involvement and responsiveness in learning environments (Yu et al., 2026). The present findings extend this line of research by providing quantitative evidence, using PLS-SEM, that classroom-based alternative assessment is a key driver of engagement in ESL contexts. Moreover, the magnitude of this relationship aligns with emerging studies on interactive and technology-enhanced learning environments, which highlight that engagement is strongly influenced by feedback-rich, participatory, and student-centered instructional practices (Mele et al., 2025). This suggests that alternative assessment practices function as an important mechanism through which such environments are operationalized in classroom settings.

4.2.2 The Association between Alternative Assessment and Perceived Communicative Competence

The findings also demonstrate that classroom-based alternative assessment has a direct and significant effect on perceived communicative competence ($\beta = 0.201$). Although this effect is smaller than its influence on engagement, it remains statistically meaningful and theoretically important. This result supports the argument that assessment practices grounded in authentic, real-world tasks contribute directly to the development of communicative abilities. Previous studies have emphasized that experiential and interactive learning environments enhance communication-related competencies by allowing students to apply language in practical contexts (Sanford & Snow, 2026). Similarly, research on active learning and innovative assessment methods, such as gamified evaluation, has shown that such approaches improve both performance and engagement compared to traditional testing (Roig et al., 2026). Furthermore, alternative assessment approaches align closely with contemporary conceptualizations of perceived communicative competence, which emphasize not only linguistic proficiency but also adaptability, contextual awareness, and real-world communication skills (Ertay & Gilanlioglu, 2024). By integrating assessment into authentic classroom activities, these approaches create opportunities for students to practice and refine their communicative abilities in meaningful contexts.

4.2.3 The Association between Student Engagement and Perceived Communicative Competence

The results indicate that student engagement has a strong and significant effect on perceived communicative competence ($\beta = 0.542$), highlighting the importance of active participation and involvement in language learning processes. This finding reinforces the widely accepted view that engagement is a critical determinant of learning outcomes. This result is consistent with prior studies showing that higher levels of engagement are associated with improved academic performance and learning effectiveness. For instance, research on virtual learning environments has demonstrated that limited engagement leads to reduced academic outcomes, while active participation enhances learning success (Rabby et al., 2025). Similarly, studies on AI-supported and interactive learning systems emphasize that engagement—across cognitive, emotional, and behavioral dimensions, plays a key role in shaping learning experiences and outcomes (Mele et al., 2025). In the context of ESL

education, engagement is particularly important because language learning inherently requires interaction, communication, and practice. The present findings suggest that students who are more engaged in classroom activities are better able to develop perceived communicative competence, as they have more opportunities to use language, receive feedback, and refine their skills.

4.3 Implications

4.3.1 Theoretical contributions

This study offers several important theoretical contributions to the literature on ESL education and assessment-driven learning. First, this study advances classroom-based assessment theory by reconceptualizing classroom-based alternative assessment (CLB) as a learning-enabling mechanism rather than a measurement tool. While prior studies have predominantly treated assessment as an evaluative outcome-oriented process, this study demonstrates that assessment practices embedded within classroom activities are associated with learning behaviors and outcomes. By providing evidence of statistically significant relationships on both engagement and perceived communicative competence, the study shifts the theoretical role of assessment from passive evaluation to active learning facilitation. Second, this study contributes to the student engagement literature by extending its role beyond general academic performance into language-specific outcomes, particularly perceived communicative competence. While prior research has acknowledged engagement as a predictor of academic success, limited attention has been given to its role in being associated with perceived communication abilities in ESL contexts. The findings provide empirical evidence that engagement is not only associated with learning participation but also closely linked to the development of communicative capabilities. Third, this study enriches the conceptualization of perceived communicative competence by embedding it within an assessment–learning framework. Existing literature has primarily focused on defining perceived communicative competence in terms of linguistic and intercultural dimensions, with limited exploration of how pedagogical and assessment practices contribute to its development. This study addresses this gap by demonstrating that perceived communicative competence is positively associated with classroom-based assessment practices that emphasize authenticity, interaction, and feedback. Fourth, this study contributes methodologically by applying a prediction-oriented PLS-SEM approach with predictive relevance (Q^2) in ESL research. Compared to traditional explanatory models, this approach highlights the predictive capability of assessment-driven learning models, thereby aligning with the increasing emphasis on predictive analytics in educational research. Finally, by providing empirical evidence from an emerging ESL context, this study extends the generalizability of assessment and engagement theories beyond Western educational settings, offering insights into how assessment practices operate in transitioning educational systems.

4.3.2 Managerial implications

The findings provide several actionable implications for ESL educators, curriculum designers, and university administrators. First, classroom-based alternative assessment should be embedded systematically into course design rather than implemented as occasional supplementary activities. Departments can require each English-related course to include a balanced assessment portfolio comprising diagnostic tasks, formative feedback activities, peer assessment, reflective exercises, and authentic communicative tasks such as presentations, role-plays, simulations, and group discussions. Second, universities can use existing learning management systems, such as Moodle, to operationalize alternative assessment efficiently. For example, the Moodle Quiz function can be used for low-stakes diagnostic assessment, the

assignment function can support audio or video submissions, the workshop module can facilitate structured peer assessment, and discussion forums can capture students' participation in collaborative learning tasks (Appendix A). Digital portfolios can also allow students to document their progress over time by uploading revised written work, presentation recordings, and reflective notes. Third, departments should adopt a standardized communicative assessment rubric to ensure consistency across courses and instructors. The rubric should assess clarity of expression, fluency, linguistic accuracy, interaction, contextual appropriateness, and students' ability to use feedback for improvement (Appendix B). A shared rubric can reduce inconsistency in grading while preserving the authentic and formative nature of alternative assessment. Fourth, institutions should provide targeted professional development rather than general training. Workshops should focus on designing authentic ESL tasks, using Moodle modules for peer review and portfolio assessment, providing rubric-based feedback, and applying AI-supported tools responsibly. Where AI-assisted feedback tools are introduced, institutions should establish clear guidelines regarding transparency, academic integrity, data privacy, and the teacher's role in verifying automated recommendations. Finally, implementation should follow a staged approach. Departments may begin with one or two pilot courses, monitor student participation and teacher workload, refine the rubric and Moodle workflow, and gradually scale the model across the curriculum. This approach can help institutions balance pedagogical innovation with feasibility and quality assurance.

Appendix A and Appendix B are proposed implementation tools derived from the study findings and the broader literature. Their effectiveness should be evaluated through future pilot studies before institution-wide adoption.

5. Conclusion, Limitations and Future research directions

5.1 Conclusion

This study examined the relationships among classroom-based alternative assessment, student engagement, and perceived communicative competence in an English language learning context. The findings indicate that classroom-based alternative assessment is positively associated with student engagement and perceived communicative competence. Student engagement is also positively associated with perceived communicative competence, highlighting the relevance of participation and interaction in language learning environments. These findings suggest that formative, interactive, and authentic assessment practices may support more engaging classroom environments and may be associated with students' confidence in using English for communication. The model demonstrates satisfactory explanatory power and cross-validated predictive relevance. However, because the study relies on cross-sectional survey data and self-reported measures, the findings should not be interpreted as definitive evidence that alternative assessment causes improvements in objectively assessed linguistic performance. The study contributes to the literature by integrating classroom-based alternative assessment, student engagement, and perceived communicative competence within a unified framework. The proposed Moodle-based implementation framework and departmental rubric illustrate how institutions may translate these insights into classroom practice. Future longitudinal, experimental, and mixed-method research should combine students' perceptions with objective performance indicators and explicitly examine technology-mediated assessment practices.

5.2 Limitations and Future research directions

Despite its contributions, this study is subject to several limitations that should be acknowledged. First, the study adopts a cross-sectional research design, which limits the ability

to infer causal relationships among the constructs. Although the findings provide strong evidence of significant associations, future research could employ longitudinal or experimental designs to better capture causal dynamics and changes over time. Second, perceived communicative competence was measured using students' self-reported perceptions. Accordingly, the construct should be interpreted as perceived communicative competence rather than as an objective measure of linguistic performance. Although students' self-evaluations are valuable for understanding confidence, participation, and perceived readiness to communicate, they may not fully reflect demonstrated language proficiency. Future studies should triangulate self-reported perceptions with objective indicators, such as speaking-test scores, presentation grades, teacher evaluations, structured classroom observations, or rubric-based assessments of role-play and discussion performance. Such triangulation would provide a more comprehensive assessment of perceived communicative competence and strengthen construct validity. Third, the study focuses on university students in a specific geographical context (Vietnam), which may limit the generalizability of the findings to other educational settings or cultural contexts. Future research could replicate the model in different countries, educational levels (e.g., secondary education), or institutional environments to validate and extend the findings. Fourth, although the model demonstrates strong explanatory and predictive capabilities, it focuses on a limited set of constructs. Future research could extend the model by incorporating additional variables, such as technological readiness, learning motivation, or instructional design factors, to provide a more comprehensive understanding of ESL learning processes. Finally, given the increasing integration of digital technologies in education, future studies could explore how technology-enhanced assessment practices, such as AI-based feedback systems or online collaborative platforms, interact with classroom-based assessment to influence engagement and perceived communicative competence.

Appendix A: Proposed Moodle integration framework

Assessment stage	Moodle tool	ESL activity	Evidence collected	Feedback method
Diagnostic assessment	Quiz or Questionnaire	Short vocabulary, listening, and self-assessment tasks at the beginning of the course	Baseline scores and learning needs	Automated feedback and teacher guidance
Formative speaking practice	Assignment with audio or video submission	Individual presentation, role-play, or oral reflection	Recorded speaking performance	Teacher rubric and audio feedback
Peer assessment	Workshop module	Students review classmates' presentations or written responses	Peer ratings and qualitative comments	Structured peer-review rubric
Portfolio assessment	Assignment, Database, or e-portfolio link	Students upload revised writing, speaking recordings, and reflective notes	Evidence of progress over time	Periodic teacher feedback
Collaborative discussion	Forum or group activity	Debate, case discussion, or problem-solving task	Participation frequency and response quality	Teacher comments and peer interaction
Reflective learning	Journal, Feedback, or Assignment	Students identify strengths, weaknesses, and improvement goals	Reflective entries	Individualized recommendations
AI-supported extension	Approved AI feedback tool integrated with institutional guidelines	Grammar suggestions, speaking rehearsal, or feedback comparison	Drafts, revisions, and reflection logs	Teacher verification and ethical-use guidance

Appendix B. Proposed Departmental Rubric for Authentic Communicative Assessment

Criterion	Weight	Excellent	Competent	Developing	Needs Improvement
Clarity and organization of ideas	20%	Ideas are consistently clear, logically structured, and easy to follow.	Ideas are generally clear and logically organized, with minor inconsistencies.	Meaning is understandable but organization is uneven or occasionally unclear.	Ideas are difficult to follow because of limited clarity or organization.
Fluency	20%	Communication is sustained smoothly with minimal hesitation.	Communication is generally sustained, with occasional hesitation that does not impede meaning.	Frequent hesitation sometimes interrupts communication.	Hesitation substantially limits communication.
Linguistic accuracy and range	15%	Grammar and vocabulary are accurate, varied,	Minor errors are present but do not	Errors occasionally	Frequent errors substantially

		and appropriate to the task.	interfere with meaning.	affect clarity or limit expression.	impede understanding.
Interaction and responsiveness	20%	Responds appropriately, asks relevant questions, and actively maintains interaction.	Responds appropriately and participates consistently in interaction.	Responds to prompts but shows limited ability to maintain interaction.	Provides minimal responses or struggles to sustain interaction.
Contextual appropriateness	15%	Language is consistently appropriate for the audience, purpose, and context.	Language is generally appropriate, with minor inconsistencies.	Some language choices are unsuitable for the context.	Language choices frequently do not fit the audience or purpose.
Reflection and use of feedback	10%	Demonstrates clear improvement by applying feedback and identifying specific development goals.	Uses feedback appropriately and identifies relevant improvement areas.	Applies feedback inconsistently or identifies only general improvement areas.	Shows limited evidence of using feedback or reflecting on performance.

Recommended application: Departments may embed this rubric into Moodle assignments, workshop peer-review activities, speaking assessments, presentations, simulations, and role-play tasks. Teachers may adapt the descriptors to match course level while retaining the same core assessment dimensions.

#197 HUFLIT ENGLISH MAJORS' PERCEPTIONS OF AI-SUPPORTED TRANSLATION LEARNING IN A VIETNAMESE EFL CONTEXT

Nam Anh Tran[1], Thanh Tu Tran[2]

Abstract

The rapid integration of generative AI tools such as ChatGPT and Grammarly is reshaping EFL translation instruction in Vietnamese higher education, yet empirical evidence from specific institutional contexts remains limited. This study investigates HUFLIT English majors' perceptions of AI-supported translation learning through an integrated Technology Acceptance Model (TAM), Technological Pedagogical Content Knowledge (TPACK), and Self-Regulated Learning (SRL) framework. Using a structured questionnaire administered to 219 second- to fourth-year English majors, the study examined perceived benefits and risks of AI, teacher AI integration, and metacognitive engagement during translation tasks. Descriptive statistics revealed high AI adoption rates (92.7%), strong perceived usefulness and ease of use, and widespread self-reported cognitive overreliance. Exploratory factor analysis (KMO = 0.899; four factors explaining 73.53% of variance) identified a four-factor model: AI Learning Engagement, Teacher AI Integration, Cognitive Overreliance, and Perceived Ease of Use. Notably, perceived usefulness and self-regulated learning converged into a single construct, suggesting that HUFLIT students perceive AI as valuable precisely because it scaffolds their metacognitive processes. These findings underscore the critical role of teacher guidance and institutional support in supporting responsible, critically engaged AI use in Vietnamese EFL translation programs.

Keywords: Artificial Intelligence in translation learning, English majors' perceptions, translation pedagogy, self-regulated learning, Vietnamese higher education

1. Introduction

1.1. Background of the Study

The rapid development of artificial intelligence (AI), particularly generative AI tools such as ChatGPT and Grammarly, is reshaping both language education and the translation profession. Professional translators today increasingly function as post-editors who evaluate and refine machine-generated output rather than producing translations entirely from scratch (Ren & Wang, 2025; Briggs, 2018). As a result, translation competence now requires not only linguistic proficiency but also the ability to critically evaluate AI-generated text and use automated support strategically.

In higher education, however, translation teaching does not always keep pace with these professional changes. Many translation programmes still rely on teacher-centred instruction and conventional task designs, with limited systematic integration of AI-supported workflows (Yan et al., 2025; Sutrisno et al., 2024). In Vietnamese higher education, this gap is particularly significant: English learners often depend heavily on formal classroom instruction and may

[1] *Corresponding author, Lecturer, Faculty of Foreign Languages, HCMC University of Foreign Languages – Information Technology, Ho Chi Minh City, Vietnam; Email: anhtn@huflit.edu.vn*
[2] *Lecturer, Faculty of Foreign Languages, HCMC University of Foreign Languages – Information Technology, Ho Chi Minh City, Vietnam*

have fewer opportunities for authentic English exposure outside class. At HUFLIT, English majors in EFL translation courses are increasingly exposed to AI tools such as ChatGPT and Grammarly, yet how they perceive the benefits, risks, and pedagogical value of such tools has not been sufficiently examined.

To address this, the present study draws on three complementary theoretical frameworks. The Technology Acceptance Model (TAM; Davis, 1989) explains how learners' perceptions of usefulness and ease of use shape their adoption of educational technology. Technological Pedagogical Content Knowledge (TPACK; Mishra & Koehler, 2006) examines how teachers integrate technology with pedagogical and content knowledge in instructional practice. Self-Regulated Learning (SRL; Zimmerman, 2000) highlights learners' metacognitive processes – including planning, monitoring, and reflection, when engaging with learning tools. Together, these frameworks provide a multidimensional lens for understanding AI-supported translation learning.

1.2. Research Problem and Gap

Although AI has become an increasingly prominent topic in English language education, much of the existing research focuses on general ESL or EFL learning rather than the specific demands of translation instruction. Translation learning requires students not only to understand language form but also to compare source and target texts, evaluate semantic accuracy, consider stylistic appropriateness, and justify their translation choices. Findings from broader language-learning studies may therefore not fully capture how students experience AI in translation classrooms.

In addition, empirical evidence from Vietnamese higher education remains limited, particularly regarding how English majors perceive AI-supported translation learning in specific institutional settings. Existing studies also tend to rely on single theoretical lenses – such as technology acceptance or pedagogical integration alone, which are insufficient for capturing the interaction among students' perceptions of AI, teachers' instructional practices, and learners' self-regulated engagement (Manzoor et al., 2025; Saud, 2025). This study addresses these gaps by investigating HUFLIT English majors' perceptions through an integrated TAM–TPACK–SRL framework.

1.3. Research Objectives

This study aims to investigate HUFLIT English majors' perceptions of AI-supported EFL translation learning through an integrated TAM–TPACK–SRL framework. Specifically, the study examines students' perceived benefits and risks of AI use, their perceptions of teacher AI integration in translation classes, and the empirical factor structure underlying these perceptions.

1.4. Research Questions

The study is guided by the following research questions:

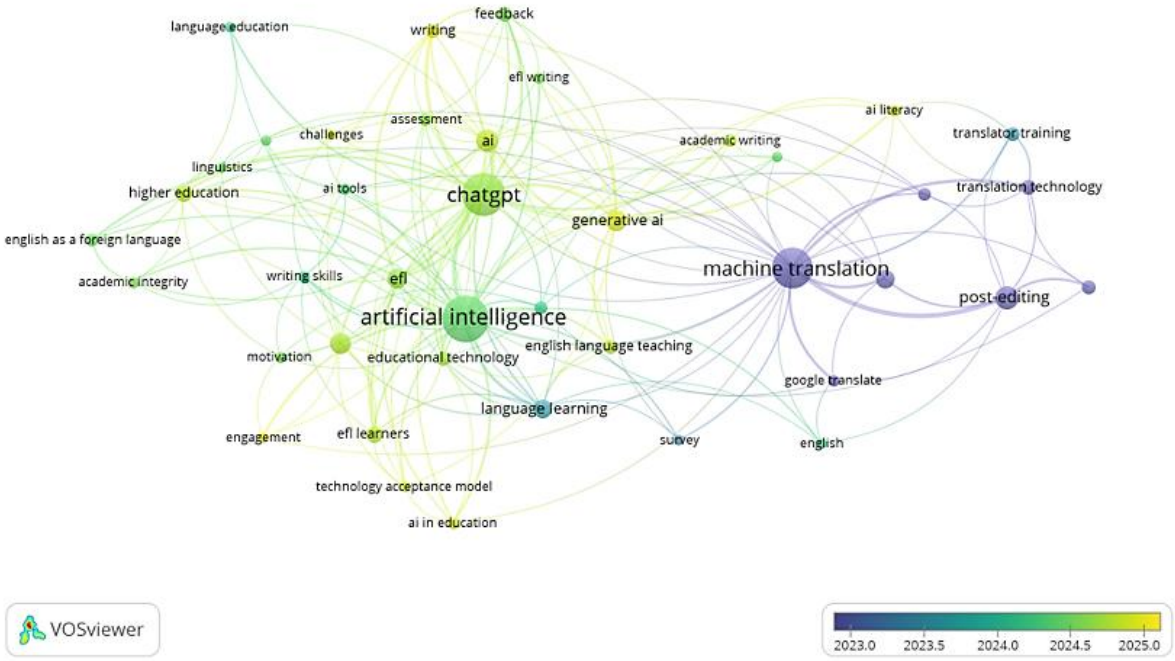
1. How do HUFLIT students perceive the benefits and risks of AI-supported translation learning?

2. What empirical factor structure emerges from students' perceptions of AI-supported translation learning?

3. How do students perceive the roles of teacher AI integration and self-regulated engagement when using AI in translation classes?

1.5. Significance of the Study

This study contributes to the literature on AI-supported language learning by providing empirical evidence from a Vietnamese higher education context that has been underexplored in existing research. Theoretically, it examines how an integrated TAM–TPACK–SRL framework applies to translation-specific instruction, and empirically identifies a four-factor perceptual model of AI-supported translation learning. Practically, the findings offer actionable insights for teachers and institutions seeking to design more effective AI-supported translation curricula, promote responsible AI use, and develop context-sensitive policies for English majors in Vietnam.



2. Literature Review

This chapter reviews prior research on the integration of artificial intelligence (AI) into English language education and translation learning, with particular attention to two dimensions central to the present study: pedagogical effectiveness and ethical considerations. In recent years, generative AI tools such as ChatGPT, grammar checkers, and machine translation systems have become increasingly integrated into language learning environments. Understanding how these tools influence students' learning experiences and perceptions is therefore essential for evaluating their pedagogical potential.

2.1. AI in English Language Education

AI has rapidly become a salient feature of contemporary English language education, shifting traditional teacher-fronted classrooms toward more learner-centered, technology-rich environments. AI tools not only provide on-demand language feedback but also facilitate crucial out-of-class practice and distributed learning (Saud, 2025; Manzoor et al., 2025; Rahman, 2026). While general EFL learning often uses AI for idea generation or basic grammar correction, translation classrooms involve different cognitive demands.

Figure 8
Analysis of recent literature

To map the current research landscape, a bibliometric analysis was conducted using VOSviewer. Publication data were retrieved from the Scopus database on [30 June 2026], using the following search query: TITLE-ABS-KEY ((“artificial intelligence” OR “ChatGPT” OR “generative AI” OR “machine translation”) AND (“language learning” OR “EFL” OR “ESL” OR “English language teaching” OR “foreign language” OR “translation”) AND (“perception” OR “attitude” OR “acceptance” OR “student” OR “learner”)). The search was restricted to journal articles (DOCTYPE, “ar”) published between 2018 and 2025 (PUBYEAR > 2017 AND PUBYEAR < 2026), written in English, classified under the Social Sciences (SOCI) or Arts and Humanities (ARTS) subject areas, and available in open access. The search returned 426 articles, which were exported and analysed in VOSviewer. A co-occurrence analysis of author keywords was performed using full counting, with a minimum threshold of five occurrences per keyword, resulting in 44 keywords that met this criterion. The resulting network visualisation (Figure 1) reveals the following patterns:

- The network was organised into three major thematic clusters. The first cluster centred on “machine translation”, “post-editing”, “neural machine translation”, and “translator training”, representing the traditional translation-technology strand. The second cluster, organised around “artificial intelligence”, “ChatGPT”, and “generative AI”, reflected the more recent shift toward generative AI tools. The third cluster grouped pedagogical and learner-oriented terms such as “EFL”, “language learning”, “writing”, “feedback”, and “technology acceptance model”.

- The overlay visualisation, which maps keywords by their average publication year, indicated a clear temporal shift. Specifically, earlier research clustered around “machine

translation" and "Google Translate", whereas more recent work has moved toward "generative AI", "ChatGPT", and "technology acceptance".

- Notably, the links between the translation-instruction cluster and learner-perception terms remained relatively weak, suggesting that the application of AI specifically within translation pedagogy, as distinct from general language learning, has not yet been fully explored.

Taken together, this bibliometric evidence supports the integrated TAM–TPACK–SRL framework adopted in the present study and highlights the underexplored intersection of AI and EFL translation instruction, which this study seeks to address.

Students must compare source and target texts, evaluate semantic accuracy, consider stylistic appropriateness, and justify their renderings. Thus, AI in translation learning serves not only as a language improver but also as a cognitive scaffold for text analysis and post-editing, requiring a distinct set of pedagogical and self-regulatory skills.

2.2. Pedagogical Effectiveness of AI-Supported Learning

2.2.1. Language support: grammar, vocabulary, and writing

A substantial body of work has explored AI's potential to enhance core language skills, particularly in grammar, vocabulary, and writing. Rahman (2026) review in ETDC highlights that tools such as Grammarly, Quillbot, and ChatGPT can help learners generate ideas, improve lexical choice, and reduce grammatical errors in drafts. Learners tend to perceive AI-based grammar correction tools as helpful for identifying mistakes they might otherwise overlook and for increasing the accuracy and fluency of their written output. In their systematic review, Manzoor et al. (2025) report that repeated interaction with AI feedback can be associated with reductions in certain error types, provided that students engage reflectively with the suggestions rather than accepting them mechanically. Similar attitudinal patterns have been reported in translation-classroom contexts more broadly, where students value machine translation as a support tool while remaining cautious about its accuracy (Pastor, 2021).

In writing, AI-supported tools can serve as both drafting and revision aids. A quasi-experimental study on AI-assisted learning and EFL writing proficiency shows that students who received AI-mediated feedback improved more in overall writing scores than those who relied solely on traditional feedback (Alangari, 2025). AI feedback is often perceived as faster and more immediate than traditional teacher feedback, although teachers may provide more nuanced explanations and contextual guidance (Alangari, 2025). However, both Manzoor et al. (2025) and Saud (2025) caution that the pedagogical value of AI feedback depends heavily on how learners interact with it. When students use AI suggestions as prompts for self-explanation, comparison, and revision, the tools can support deeper language awareness; when they accept suggestions passively, AI risks becoming a shortcut rather than a learning opportunity. For translation learners, such feedback may support the development of error awareness and lexical sensitivity when students compare AI-generated suggestions with their own translations.

2.2.2. Self-paced learning and learner autonomy

Beyond discrete language skills, AI has been promoted as a means to foster self-paced learning and learner autonomy. Manzoor et al. (2025) describe how AI-integrated systems can adapt task difficulty to learners' performance, provide tailored recommendations, and support flexible practice schedules. Saud (2025) add that conversational agents and chatbots can offer extended opportunities for language use outside the classroom, which is particularly relevant in EFL contexts where authentic interaction is limited. When learners perceive AI tools as

controllable, useful, and aligned with their goals, they are more likely to integrate them into their personal learning routines as supplemental tutoring.

At the same time, promoting autonomy through AI is not automatic. The ERIC paper on ethical issues notes that some students become overly dependent on AI for answers and corrections, especially when they are under time pressure or lack confidence in their language ability (Nhan et al., 2025). In such cases, AI can reduce opportunities for productive struggle and experimentation, which are important for long-term language development. These findings suggest that teachers need to frame AI use explicitly as a support for learning processes rather than as a shortcut to finished products, for example by asking students to justify why they accept or reject particular AI suggestions. These characteristics align with the concept of self-regulated learning, where learners actively monitor their progress, evaluate feedback, and adjust their learning strategies during task completion (Zimmerman, 2000).

2.2.3. Risks of overreliance and passive learning

An emerging strand of research focuses on potential negative effects of AI-supported learning on learners' cognitive and metacognitive development. The ERIC article emphasizes that overreliance on AI can lead to offloading not only mechanical aspects of writing but also higher-order thinking, such as organizing ideas and evaluating information (Nhan et al., 2025). When learners rely on AI-generated text or suggestions without critical evaluation, they may gradually lose confidence in their own linguistic and rhetorical abilities. Manzoor et al. (2025) similarly argue that passive acceptance of AI feedback can interfere with the development of metalinguistic awareness, as students focus on surface correctness rather than underlying grammatical or discourse patterns.

These concerns do not negate AI's pedagogical value, but they underscore the need for more nuanced integration. Manzoor et al. (2025) recommend that AI tools be embedded in instructional designs that promote reflection, questioning, and comparison between AI output and students' original work. In a similar vein, Compagnoni et al.'s (2025) article calls for cultivating critical AI literacy so that learners evaluate AI output rather than accepting it uncritically. For English majors who are likely to become language professionals or educators, developing such critical literacy is especially important.

2.3. Ethical Considerations in AI-Supported Learning

2.3.1. Academic integrity, authorship, and authenticity

Ethical debates around AI in education have largely centered on academic integrity and the boundaries between legitimate support and academic misconduct. In language education, these concerns are particularly salient because AI systems can generate fluent, human-like text on demand. The ERIC paper documents how students and teachers struggle to define when AI-assisted writing becomes plagiarism and how authorship should be understood when AI contributes to idea generation, organization, or phrasing (Nhan et al., 2025). Some participants viewed AI use for surface-level editing as acceptable, while considering extensive reliance on AI-generated content without acknowledgment to be unethical. These ethical issues are particularly relevant in translation learning, where students may rely on AI-generated translations or paraphrases during coursework and assessments.

Compagnoni et al. (2025) also points out that institutional policies often lag behind technological developments, resulting in inconsistent expectations about AI use across courses and institutions. Policy ambiguity can create anxiety for learners who wish to use AI responsibly but are unsure where the line is drawn, especially in high-stakes assignments. For

English majors, whose coursework typically involves substantial written production and critical engagement with texts, clarity about what constitutes ethical AI use is crucial.

2.3.2. Data privacy, fairness, and transparency

Another cluster of ethical concerns relates to data privacy, fairness, and transparency in AI systems. Many AI tools collect and process user data, including text input and usage patterns, yet learners may not fully understand how their data are stored, who can access them, or how they may be used to further train commercial models. Compagnoni et al. (2025) emphasizes that transparency and accountability are key principles for ethical AI in language pedagogy and argues that teachers and institutions should help students understand both the capabilities and limitations of AI tools they are expected to use.

Fairness and bias also present significant challenges. Because AI systems draw on large training datasets, they can reproduce linguistic and cultural biases, for instance by privileging certain varieties of English or by providing feedback that implicitly enforces narrow norms of correctness. Manzoor et al. (2025) note that such biases may undermine learners' sense of legitimacy, particularly in contexts where local varieties of English and multilingual practices are part of everyday communication. In response, both the systematic review and the ethical frontiers article call for more context-sensitive evaluation of AI tools and for pedagogical approaches that encourage learners to question unexpected or problematic AI suggestions rather than accepting them uncritically.

2.3.3. Policy responses and contextualized guidelines

In response to these ethical challenges, institutions and professional organizations have begun to articulate principles for responsible AI use in education. Compagnoni et al. (2025) proposes a framework centered on transparency, accountability, and equity, arguing that AI should remain under human control and that learners should be explicitly taught how to use AI ethically, including when and how to disclose AI assistance in academic work. The ERIC article likewise recommends that universities provide clear, discipline-specific guidelines on AI use in coursework, rather than blanket bans or vague statements (Nhan et al., 2025).

Saud (2025) observe that policy responses vary widely across ESL/EFL contexts, with some institutions restricting AI use in high-stakes assessments, while others encourage experimentation combined with explicit training and reflection. Both Saud (2025) and Manzoor et al. (2025) highlight the importance of grounding such policies in empirical evidence about how students actually use AI and what they perceive as benefits and risks. This suggests a need for studies that capture local perceptions and that can inform contextually appropriate guidelines, particularly in rapidly changing contexts such as Vietnam.

2.4. Summary and Research Gap

Existing literature demonstrates that AI-supported learning offers meaningful pedagogical benefits, particularly in vocabulary, writing support, and self-paced learning (Manzoor et al., 2025), while simultaneously presenting risks related to cognitive overreliance, passive learning, and academic integrity (Nhan et al., 2025; Compagnoni et al., 2025). Despite these insights, critical gaps remain. First, most studies focus on general ESL/EFL contexts rather than the specific cognitive demands of translation instruction. Second, empirical research in Vietnamese higher education remains scarce, leaving institutional factors underexplored. Finally, previous studies tend to adopt single frameworks, failing to capture the multidimensional dynamics of EFL translation. Addressing these gaps requires a more

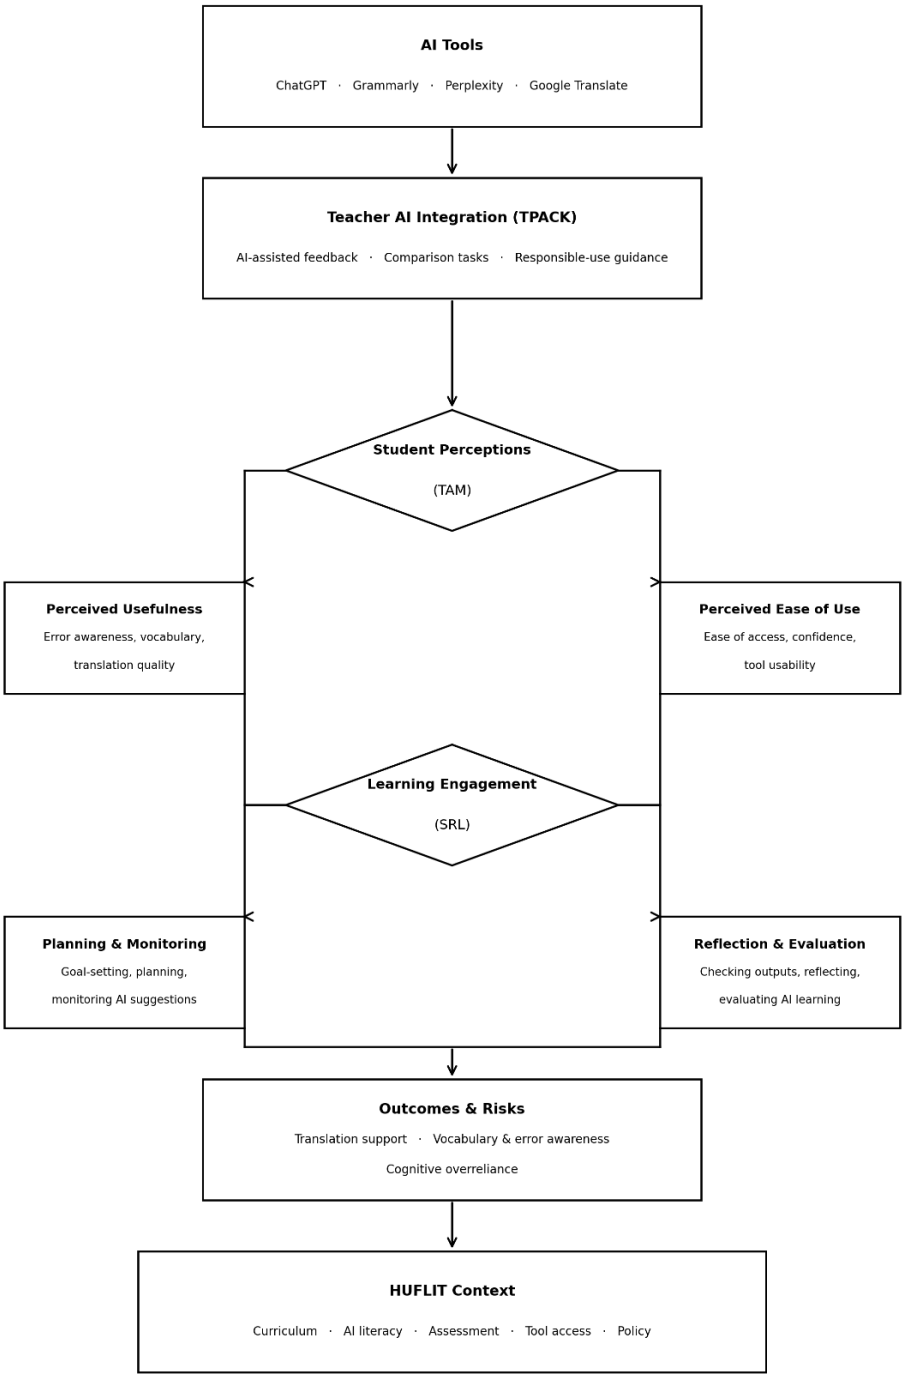
comprehensive approach that examines how students' technology acceptance, teachers' pedagogical practices, and learners' self-regulation intersect in AI-supported translation tasks.

2.5. Theoretical Framework

This study integrates Technology Acceptance Model (TAM) (Davis, 1989), Technological Pedagogical Content Knowledge (TPACK) (Mishra & Koehler, 2006), and Self-Regulated Learning (SRL) (Zimmerman, 2000) to examine English majors' perceptions of AI-supported EFL translation classes at HUFLIT.

TAM provides the core mechanism: perceived usefulness (learning benefits: error awareness, vocabulary expansion from Sections 2.2.1–2.2.2) and perceived ease of use (faster AI vs. detailed teacher feedback) predict intentions to use AI tools. In EFL contexts, TAM explains technology adoption patterns amid limited exposure, but overlooks pedagogical integration and self-regulation processes. In the context of AI-supported translation learning, perceived usefulness may relate to students' beliefs that AI tools improve translation accuracy, vocabulary selection, or error awareness.

TPACK addresses this by framing AI-supported teaching practices as intersections of:



- Technological Knowledge (TK): ChatGPT/Grammarly for adaptive tasks, grammar analysis
- Pedagogical Knowledge (PK): Reduced teacher workload via automated feedback
- Content Knowledge (CK): EFL translation/grammar competencies

Within translation classrooms, TPACK highlights how teachers design tasks that integrate AI tools into pedagogically meaningful activities such as translation comparison, error analysis, and post-editing exercises.

SRL explains metacognitive outcomes, where AI scaffolds forethought (goal-setting), performance (feedback monitoring), and self-reflection phases. Overreliance however risks "cognitive offloading" without guidance. Through these processes, learners may develop metacognitive awareness as they evaluate AI suggestions, revise their translations, and reflect on alternative linguistic choices.

Integration: TAM captures perceptions → TPACK structures teaching → SRL drives learning outcomes. HUFLIT moderators (curriculum/assessments, AI policies/literacy, tool access) contextualize this in Vietnam EFL.

Figure 9
Integrated TAM–TPACK–SRL Framework for AI-Supported Translation Learning

Note. Figure 2 illustrates this integrated model, positioning student perceptions as the core mechanism linking AI teaching practices to learning outcomes, moderated by the HUFLIT context.

3. Methodology

3.1. Research Design

This study adopted a quantitative survey design to investigate HUFLIT English majors' perceptions of AI-supported EFL translation learning. A quantitative approach was appropriate because the study aimed to measure students' perceived benefits and risks of AI, their views of teacher AI integration, and their self-regulated learning behaviours in a systematic and scalable way. The study was guided by an integrated theoretical framework combining the Technology Acceptance Model (TAM), Technological Pedagogical Content Knowledge (TPACK), and Self-Regulated Learning (SRL), which informed both questionnaire construction and the interpretation of results. Within this framework, TAM was used to examine perceived usefulness and perceived ease of use of AI tools, TPACK was used to capture students' perceptions of teachers' AI-supported instructional practices, and SRL was used to explore students' metacognitive engagement when working with AI during translation tasks.

3.2. Participants

The participants were English majors at HUFLIT who had experience with EFL translation courses. Students from the second, third, and fourth years of the undergraduate programme were targeted because they were more likely to have engaged in translation-related coursework and had prior exposure to AI tools in their learning. This participant group was considered appropriate because they could provide informed and experience-based perceptions of AI-supported translation instruction.

3.3. Research Instrument

Data were collected using a structured self-report questionnaire developed on the basis of the TAM–TPACK–SRL framework and prior AI-in-education studies. The instrument consisted of two main parts.

The first part gathered background information, including gender, year of study, frequency of AI tool use in translation learning, prior use of AI in translation courses, main purposes of AI use (translation, grammar checking, vocabulary, idea generation), and the AI tool used most frequently.

The second part measured students' perceptions using a five-point Likert scale (1 = strongly disagree, 5 = strongly agree). Items were designed to represent five theoretical constructs: Perceived Usefulness (PU, 4 items), Perceived Ease of Use (PEOU, 4 items), Teacher AI Integration (TAI, 5 items), Self-Regulated Learning (SRL, 6 items), and Concerns and Overdependence (CO, 4 items), yielding a total of 23 Likert-scale items. These items were subsequently examined through reliability analysis and exploratory factor analysis to determine the underlying empirical factor structure of the questionnaire.

3.4. Data Collection Procedure

The questionnaire was administered to English majors who were currently taking or had recently completed translation courses at HUFLIT. Participation was voluntary, and students were informed about the purpose of the study and assured that their responses would be used solely for academic research. After collection, the responses were screened and prepared for statistical analysis.

3.5. Data Analysis

The data were analysed using SPSS in four stages. First, descriptive statistics (frequencies, percentages, means, and standard deviations) were used to summarise participants' demographic characteristics and AI usage patterns. Second, descriptive statistics were calculated for all Likert-scale items to describe students' perceptions across the five

theoretical constructs. Third, reliability analysis using Cronbach's alpha was conducted to assess the internal consistency of each scale. Finally, exploratory factor analysis (EFA) using Principal Component Analysis (PCA) with Varimax rotation was performed to examine the underlying empirical structure of the questionnaire and determine whether the theoretical constructs held empirically in this context.

4. Results

This chapter presents the findings of the study in four parts: respondents' demographic profile and AI usage patterns, descriptive statistics of students' perceptions, reliability analysis, and exploratory factor analysis of the measurement instrument.

4.1. Reliability Analysis

The reliability analysis pointed to strong internal consistency across all five initial scales. As shown in Table 1, the Cronbach's alpha values ranged from 0.884 to 0.923, all of which lie well above the commonly accepted threshold of 0.70. In addition, the corrected item–total correlations ranged from 0.658 to 0.875, and, on this basis, no items had to be removed prior to the subsequent analyses.

Table 48
Reliability Analysis Results

Construct	Items	Cronbach's Alpha	Interpretation
Perceived Usefulness (PU)	4	0.884	Good
Perceived Ease of Use (PEOU)	4	0.895	Good
Teacher AI Integration (TAI)	5	0.917	Excellent
Self-Regulated Learning (SRL)	6	0.923	Excellent
Concerns and Overdependence (CO)	4	0.885	Good

4.2. Demographic Profile and AI Usage Patterns

A total of 219 English majors at HUFLIT completed the questionnaire with no missing responses. The sample was predominantly female (78.5%, n = 172), while male students accounted for 21.5% (n = 47). In terms of academic year, most respondents were second-year students (84.0%, n = 184), followed by third-year students (15.1%, n = 33) and fourth-year students (0.9%, n = 2).

Table 49
Demographic Profile of Respondents

Variable	Category	Frequency	Percentage
Gender	Male	47	21.5%

Variable	Category	Frequency	Percentage
	Female	172	78.5%
Year of study	Second year	184	84.0%
	Third year	33	15.1%
	Fourth year	2	0.9%
Total		219	100.0%

AI use in translation learning appeared to be both widespread and frequent. On a five-point frequency scale, the mean score for AI use reached 3.84, with 42.5% of students reporting that they used AI “often” and a further 26.0% “very often”. Only a small minority reported using AI “rarely” or “never”. In line with this pattern, 92.7% of respondents indicated that they had already used AI tools in their translation courses, which suggests that AI has become an integral part of students’ translation learning practices.

As for the purposes of use, grammar checking was the most common (32.9%), followed by vocabulary search (24.2%), idea generation (23.7%), and translation tasks themselves (19.2%). This distribution implies that students tended to rely on AI primarily as a support tool for language improvement, rather than as a full substitute for their own translation work. With regard to platforms, ChatGPT was by far the most frequently used tool (72.6%), whereas Grammarly, Google Translate, and Perplexity were each selected by considerably smaller proportions of respondents.

Table 50
AI Usage Patterns

Variable	Category	Frequency	Percentage
AI use frequency	Never	3	1.4%
	Rarely	16	7.3%
	Sometimes	50	22.8%
	Often	93	42.5%
	Very often	57	26.0%
Main purpose	Grammar checking	72	32.9%

Variable	Category	Frequency	Percentage
	Vocabulary search	53	24.2%
	Idea generation	52	23.7%
	Translation	42	19.2%
Tool used most	ChatGPT	159	72.6%
	Grammarly	34	15.5%
	Google Translate	19	8.7%
	Perplexity	7	3.2%

Note. The "Main purpose" variable was a single-choice item, meaning each respondent selected only one primary purpose. Therefore, the total frequency equals 219 and the total percentage equals 100%. All frequency and percentage values in this table are based on the total sample of N = 219.

4.3. Students' Perceptions of AI-Supported Translation Learning

The descriptive statistics for the Likert-scale items indicate that, overall, students held positive perceptions across all of the main dimensions of AI-supported translation learning, although the strength of these perceptions varied from one construct to another.

Perceived Usefulness recorded the highest ratings of all constructs, with mean scores ranging narrowly from 4.15 to 4.16. Students broadly agreed that AI helped them improve translation quality, acquire vocabulary and appropriate expressions, identify grammatical and lexical errors, and complete translation tasks more effectively. Taken together, these consistently high means suggest that students perceived AI as a genuinely beneficial resource in their translation learning.

Turning to Perceived Ease of Use, the means were slightly lower but still high, ranging from 3.93 to 4.15. In general, students agreed that AI tools were easy to operate and that they could learn to use them for translation tasks without much difficulty. Notably, the item "I feel confident when using AI in translation learning" had the lowest mean in this group (M = 3.93), suggesting that while AI is broadly perceived as accessible, a proportion of students may still benefit from additional guidance or training to fully build their confidence.

Ratings for Teacher AI Integration spanned a somewhat wider range, from 3.96 to 4.33. Students reported that their teachers explained AI use clearly, incorporated AI appropriately into lessons, encouraged translation-comparison activities, and advised them on when to rely on AI and when to avoid it. The highest-rated item in the whole questionnaire, "My teacher helps students understand when they should and should not rely on AI" (M = 4.33), underscores the central role of teacher mediation in shaping responsible AI use.

Self-Regulated Learning also attracted high ratings, with means ranging from 3.90 to 4.17. Across the items, students reported setting goals before using AI, planning their use of AI for particular tasks, monitoring whether AI suggestions were appropriate, checking AI-

generated outputs before accepting them, reflecting after use, and evaluating what AI had contributed to their learning. These responses indicate that many students engaged with AI in ways that support metacognitive awareness, rather than relying on it for purely passive copying.

By contrast, Concerns and Overdependence produced more moderate and more varied ratings, with means ranging from 3.59 to 4.03. The item "I sometimes depend too much on AI when doing translation tasks" received the highest mean in this group (M = 4.03), which points to a fairly widespread awareness of over-reliance. Items concerning reduced independent thinking and the uncritical acceptance of AI suggestions also recorded moderately high means; however, their larger standard deviations indicate more divided responses among students. Taken together, the descriptive results reveal a consistent dual pattern: students clearly value AI's pedagogical benefits and ease of access, yet at the same time they recognise tangible risks associated with dependence and reduced cognitive effort.

4.4. Reliability and Factor Structure

The exploratory factor analysis extracted four factors, which together accounted for 73.526% of the total variance, a figure that comfortably exceeds the recommended 50% threshold. In the rotated component matrix, each item loaded clearly onto a single factor, with no substantial cross-loadings. As summarised in Table 4, however, the resulting structure departed from the initial five-construct model in one important respect: the items originally designed to measure Perceived Usefulness and Self-Regulated Learning converged onto a single factor, which was labelled AI Learning Engagement (ALE). The remaining three factors – Teacher AI Integration (TAI), Cognitive Overreliance (CO), and Perceived Ease of Use (PEOU) – retained the individual structures originally hypothesised.

Table 51
Empirical Factor Structure After EFA

Factor	Label	Items	Variance Explained (rotated)	Original Constructs
F1	AI Learning Engagement (ALE)	10	26.373%	PU + SRL merged
F2	Teacher AI Integration (TAI)	5	17.021%	TAI retained
F3	Cognitive Overreliance (CO)	4	15.407%	CO retained
F4	Perceived Ease of Use (PEOU)	4	14.725%	PEOU retained
Total	**4 factors**	**23**	**73.526%**	5 → 4 constructs

The emergence of AI Learning Engagement (ALE) as a composite factor is the most theoretically significant result of this study. More specifically, ALE refers to a combined pattern in which students perceive AI as useful not only because it helps them produce better translations, but also because it supports how they learn during the translation process. In this study, the factor brings together items related to perceived usefulness, such as improving translation quality, vocabulary, and error identification, and items related to self-regulated learning, such as planning AI use, monitoring AI suggestions, checking outputs, reflecting, and evaluating learning. In other words, ALE represents the extent to which students experience

AI as both a practical translation aid and a scaffold for metacognitive engagement. This finding suggests that, in the HUFLIT context, usefulness and self-regulation are closely intertwined rather than clearly separated dimensions.

5. Discussion

The findings provide a coherent picture of how HUFLIT English majors experience AI-supported translation learning. Across all constructs, students reported consistently positive perceptions of AI, yet simultaneously expressed clear awareness of risks associated with overdependence and reduced independent thinking. This dual pattern runs throughout the descriptive results and is further clarified by the four-factor structure identified through EFA.

5.1. High AI Engagement and Perceived Benefits

Addressing Research Question 1, the finding that perceived usefulness and self-regulated learning converged into a single factor – labelled AI Learning Engagement (ALE), suggests that HUFLIT students do not perceive AI as a passive tool but as an active scaffold for their own metacognitive processes.

Students appear to find AI valuable precisely because it supports their learning engagement, including goal-setting, monitoring, and reflection during translation tasks. AI use among HUFLIT English majors is already widespread: mean usage frequency was 3.84 out of 5, and 92.7% of respondents had already used AI in translation courses. ChatGPT was the dominant tool (72.6%), and students primarily used AI for grammar checking (32.9%) and vocabulary search (24.2%), suggesting that AI serves mainly as a language-level support tool rather than a direct translation substitute. Perceived Usefulness recorded the highest and most consistent mean scores across the study (M = 4.15–4.16), confirming that students see AI as a genuinely beneficial resource for improving translation quality, vocabulary, error identification, and task completion.

5.2. The Composite AI Learning Engagement Factor

In relation to Research Question 3, the clean separation of Teacher AI Integration (TAI) as a distinct factor confirms that students perceive teacher guidance as a qualitatively different dimension from their own AI learning engagement.

The most theoretically significant finding is the emergence of the AI Learning Engagement (ALE) factor, which combined Perceived Usefulness and Self-Regulated Learning items into a single construct accounting for 26.373% of total variance. In the classical TAM framework, these are treated as separate dimensions; the present results suggest that HUFLIT students perceive AI as useful *because* it supports their metacognitive processes: planning, monitoring, checking, reflecting, and evaluating. Usefulness is therefore not merely about better translation outcomes but is deeply intertwined with self-regulated engagement. This finding contributes an important nuance to the TAM–SRL integration proposed in the theoretical framework and suggests that future research should apply confirmatory factor analysis (CFA) to further validate the ALE construct across different EFL and translation contexts.

5.3. Teacher AI Integration as a Distinct Factor

Also relevant to Research Question 1, the emergence of Cognitive Overreliance (CO) as a separate factor reflects students' dual awareness: they recognise AI as beneficial while simultaneously acknowledging a tendency toward over-dependence that may undermine independent thinking and critical translation decision-making.

Teacher AI Integration emerged as a clear independent factor (F2, 17.021% of variance), with the highest-rated item being "My teacher helps students understand when they should and should not rely on AI" (M = 4.33). This confirms the TPACK perspective: effective AI integration depends not only on tool availability but on teachers purposefully designing AI-supported activities, framing AI as a critical thinking scaffold, and providing explicit guidance on responsible use. The independence of TAI from the ALE factor also signals that students clearly differentiate between their own engagement with AI and the instructional practices of their teachers, confirming that teacher guidance remains a decisive factor even when AI tools are freely accessible outside class.

5.4. Cognitive Overreliance: Awareness Without Resolution

With respect to Research Question 2, the retention of Perceived Ease of Use (PEOU) as a distinct empirical factor supports the relevance of TAM in this context, confirming that accessibility perceptions constitute a meaningful and separable dimension of students' overall experience of AI-supported translation learning.

Cognitive Overreliance (CO) formed a distinct independent factor (F3, 15.407% of variance). The item "I sometimes depend too much on AI when doing translation tasks" had the highest mean in this construct (M = 4.03), and "Using AI sometimes reduces my independent thinking ability" loaded most strongly on this factor (loading = 0.880). Students are clearly aware of their overdependence tendencies; however, awareness alone does not guarantee behavioural change. The relatively high means on items about accepting AI suggestions without careful analysis suggest that cognitive overreliance is already a lived reality for many students, not merely a theoretical concern. Notably, the separation of CO from ALE implies that even students who self-regulate their AI use may simultaneously experience dependence, pointing to the coexistence of metacognitive engagement and habitual reliance in the same learner.

5.5. Perceived Ease of Use and Confidence

Taken together and addressing Research Question 2, the four-factor structure – ALE, TAI, CO, and PEOU, provides an empirically derived model of how HUFLIT students perceive AI-supported translation learning, offering a more differentiated account than prior single-framework studies.

Perceived Ease of Use (PEOU) emerged as the fourth independent factor (F4, 14.725% of variance), with means ranging from 3.93 to 4.15. Students broadly found AI tools accessible and easy to learn; however, the confidence item recorded the lowest mean (M = 3.93) and the largest standard deviation (SD = 1.014) in this group. This gap between functional ease of use and genuine AI confidence suggests that while most students can operate AI tools, a subset may not yet feel equipped to critically evaluate, selectively apply, or responsibly adapt AI output in complex translation contexts.

5.6. Theoretical Implications

This study offers three key theoretical contributions. First, the emergence of the ALE composite factor suggests that in AI-rich translation environments, perceived usefulness and self-regulated learning may converge into a single empirical factor rather than functioning as separate dimensions as classical TAM proposes. Future research should test this preliminary structure using confirmatory factor analysis (CFA) across different EFL contexts.

Second, the clean separation of Teacher AI Integration (TAI), Cognitive Overreliance (CO), and Perceived Ease of Use (PEOU) supports the value of combining TAM, TPACK, and

SRL. Each lens contributes a non-redundant dimension, technology acceptance, pedagogical practice, and metacognitive engagement, providing a more comprehensive account of AI learning than any single framework.

Third, the study contributes context-specific evidence from Vietnamese higher education, demonstrating that high generative AI adoption can coexist with a high awareness of cognitive overreliance. This underscores the need for educational technology theories to account for local pedagogical cultures and assessment norms rather than assuming universal applicability.

5.7. Practical Implications

The findings point to four practical directions for translation instruction at HUFLIT and comparable programmes.

First, given the pervasive AI use already documented, formal and intentional AI integration into translation syllabi is more productive than restriction. Tasks that require students to compare, evaluate, and justify AI output can transform AI from a shortcut into a trigger for critical reflection.

Second, the prominence of TAI highlights the need for systematic teacher development in AI literacy and TPACK. Teachers should be supported to design tasks that require critical engagement with AI, model responsible AI use, and communicate explicit guidelines on when AI is and is not appropriate.

Third, the CO factor calls for direct instructional attention to AI dependence. Process-oriented assessment tools such as translation logs, revision comparisons, and AI-use reflection notes can shift grading focus from final products to decision-making quality, rewarding critical evaluation over unreflective reliance.

Fourth, the gap between functional ease of use and AI confidence suggests students need guided AI literacy training within translation courses: how to prompt effectively, evaluate AI feedback critically, recognise errors, and disclose AI assistance responsibly. At the institutional level, clear and context-sensitive AI policies, developed in dialogue with both teachers and students, are essential to ensure that ethical AI use becomes a shared responsibility.

6. Conclusion

This study investigated HUFLIT English majors' perceptions of AI-supported EFL translation learning through an integrated TAM–TPACK–SRL framework, drawing on survey data from 219 students. The findings reveal that AI tools, particularly ChatGPT and Grammarly, have become widely and frequently adopted in translation learning, with students perceiving clear benefits in terms of translation quality, vocabulary development, error identification, and self-regulated engagement.

The EFA results produced a four-factor empirical model, with the most notable finding being the emergence of AI Learning Engagement as a composite construct that merges perceived usefulness and self-regulated learning. This suggests that in the HUFLIT context, students experience AI's pedagogical value as inseparable from their own metacognitive processes of planning, monitoring, and reflecting. Teacher AI Integration, Cognitive Overreliance, and Perceived Ease of Use emerged as three additional independent factors, confirming that students perceive teacher guidance, dependence risks, and tool accessibility as distinct and meaningful dimensions of their AI-supported learning experience.

These findings carry both theoretical and practical significance. Theoretically, the study contributes an empirically derived four-factor model and context-specific evidence for extending the TAM–TPACK–SRL framework in AI-supported translation education. Practically, the results underscore the importance of moving beyond access to AI tools toward purposeful pedagogical integration, explicit AI literacy instruction, and clear institutional policies that support responsible use.

This study is not without limitations. The sample was drawn from a single institution and was predominantly composed of second-year students, which may limit the generalizability of the findings. Future research should expand the sample across multiple universities and academic years, and apply confirmatory factor analysis and structural equation modelling to further validate and extend the empirical model developed here.

Ultimately, this study positions AI not as a threat to translation learning but as a powerful pedagogical resource whose value depends critically on how it is taught, framed, and integrated. As Vietnam continues its transition toward English as a second language, ensuring that both teachers and students engage with AI critically, responsibly, and strategically will be essential for preparing the next generation of competent and autonomous translators.

#198 INTEGRATION OF LOCAL HISTORY AND CULTURAL MATERIAL INTO ENGLISH LANGUAGE TEACHING AS BASIS FOR THE DEVELOPMENT OF MULTICULTURAL PERSONALITY

Gulnur Polkina[1], Evgeniya Tsyganova[2], Svetlana Radionova[3]

Abstract

This study is devoted to local history and cultural material as a means of developing a multicultural identity in the foreign language classroom. The integration of such material into the subject area of "Foreign (English) Language" motivates learners to acquire English as a tool for self-expression in a multicultural world and fosters their readiness for effective intercultural communication. Understanding the cultural realities of one's own country allows learners to convey their meaning more accurately in a foreign language and to better comprehend foreign-language texts. English language learning that is connected with personal experience, history, and culture becomes more meaningful and serves as a foundation for successful intercultural interaction. Awareness of the value of one's heritage culture builds confidence in intercultural communication and contributes to the preservation of one's national identity. The study presents a positive experience in developing and piloting English language teaching content based on local history and cultural material of the Republic of Tatarstan. It also describes the teaching strategies used in English classes based on local history, culture, and traditions.

***Keywords**:* teaching a foreign language, local history and cultural material, regional culture, multicultural identity, intercultural communication

1. Introduction

Recognising the world's cultural diversity is crucial for creating an effective educational environment in foreign language teaching. Learning a foreign language aims to develop students' communicative competence, to raise awareness of the role of the foreign language as a tool for interpersonal and intercultural interaction, to promote students' overall speech development, to foster civic identity, and to broaden their outlook. In this regard, incorporating thematic units on the cultural values and traditions of one's own country into the subject area of "Foreign Language" represents a theoretically sound and methodologically relevant direction for the development of language didactics.

This aligns with the strategic goals of the Federal State Educational Standard for Basic General Education and the Concept of the State National Policy of the Russian Federation. Thematic units focused on one's heritage culture enhance motivation to learn a foreign language as a tool for effective intercultural interaction and contribute to the implementation

of state policy aimed at preserving civic and national identity in a changing world. Incorporating culturally familiar content into the school subject of "Foreign Language" encourages students to reflect on similarities and differences between the culture of the target language country and their own country or region, which in turn fosters a deeper understanding of their own cultural and behavioural characteristics as well as those of "others."

Thus, the relevance of this study is driven by the need to find effective methods for integrating regional cultural content into the English language teaching process in lower secondary school—methods that not only increase students' motivation but also prepare them for intercultural communication without losing their own cultural identity.

2. Literature Review

2.1. Foundational Theories of Intercultural and Communicative Language Teaching

The current model of foreign language teaching, based on the principles of the communicative approach (Hymes, 1972; Canale & Swain, 1980) and intercultural communication (Byram, 1997), requires a shift from a monocultural to a multicultural model of instruction. Teaching foreign languages in a globalised world, as noted by Western and Russian methodologists (Kramsch, 1993; Byram, 2002; Myasnikova, 2013; Tarnaeva, 2015), demands an integrated approach that includes a cultural component, digital technology, and consideration of learners' personal experiences related to their background.

Kramsch (1998) highlighted the importance of the sociocultural context in education, including foreign language teaching. She argued for the necessity of developing learners' capacity for critical cultural reflection – understanding one's own culture through the lens of the foreign language being studied. Kramsch maintained that in foreign language teaching, it is important to develop learners' ability to analyse and interpret "other" culture rather than merely absorbing its stereotypes. Such an approach enables learners to navigate various intercultural situations more effectively and to engage in intercultural dialogue.

2.2. Regional Cultural Content and Identity Formation in Foreign Language Teaching

Studying one's heritage culture in a foreign language equips learners with the ability to present their country and region in a global context, which aligns with the principles of the constructivist theory of learning proposed by the renowned Soviet scholar L. S. Vygotsky (Vygotsky, 1978). Norton (2013) argued that learning a foreign language influences the formation of imagined communities. Risager (2007) addressed the "principle of cultural symmetry" and proposed a model of bilateral cultural exchange, whereby learning about a foreign culture is mediated through reflection on one's own culture.

Russian researchers in cultural linguistics (Vorobyeva, 2003; Maslova, 2001; Tarnaeva, 2015; Mushtavinskaya, 2018; Silonyan, 2025) argued that studying one's heritage culture through a foreign language is a way of actualising language as a sign of culture. Linguistic material related to one's "own" culture is acquired by students more consciously and with greater emotional significance because it stems from their natural environment – what they already know well. Studying the values, traditions, and history of one's people in a foreign language gives learners the opportunity to present their country internationally and to overcome language barriers when explaining their homeland's cultural realities. Thus, English serves as a tool for intercultural communication rather than one of "assimilation," thereby strengthening national identity.

In recent years, international research (Wang et al., 2022; Haerazi et al., 2023; Yuliantari et al., 2023; Azhary et al., 2024; Reformana et al., 2024; Patanduk et al., 2025) has

demonstrated sustained interest in the problem of integrating students' cultural backgrounds into language education. Integrating cultural values supports character development, classroom inclusivity, and meaningful learning. Incorporating local cultures into English teaching materials is crucial for promoting cultural diversity, cultural sensitivity, and enhancing learners' language learning experience. By including local elements, teachers can make learning content more relatable and engaging for students, ultimately leading to a more inclusive and effective educational environment.

3. Methodology

Content Selection. The selection of linguocultural material for Grade 8 was based on two complementary principles. The principle of regional identity required in-depth presentation of local cultural facts (history, geography, ethnography of the native region). The principle of multicultural orientation aimed at comparative analysis with cultures of different countries. To resolve the tension between these principles, only those facts from local culture that have comparable phenomena in other cultures (holidays, national cuisine, urban spaces, famous people) were selected. This made it possible to use local history material as a starting point for multicultural comparison rather than as an alternative to it.

Development of Teaching Materials. To address the dilemma of "accessibility versus authenticity" for learners aged 14 to 15 years, a combined approach was used. The introduction of a cultural concept was carried out through a teacher-generated semi-authentic text. This was followed by exposure to limited authentic fragments: captions to illustrations, short facts from encyclopaedias, QR codes linking to authentic guidebooks. This combination avoided oversimplifying cultural content (which leads to stereotyping "tradition" as merely holidays and food) while simultaneously preventing cognitive overload caused by overly complex lexical and syntactic structures.

Research Design. This study follows a pilot (work-in-progress) design and represents a descriptive-empirical work with elements of quasi-experimental observation. The main objective was to test the developed teaching modules and collect preliminary data for a subsequent full-scale experimental study. The research did not include a control group or random assignment of participants.

Participants. The study involved 28 Grade 8 students (aged 14–15 years) from Secondary School No. 41 in Naberezhnye Chelny (Republic of Tatarstan, Russia). The class had a language-focused curriculum, which entailed advanced study of English (five hours per week instead of three hours in the basic curriculum). The participants' English proficiency level corresponded to A2 (Pre-Intermediate) on the CEFR scale. All participants were bilingual (fluent in Tatar and Russian), which is a characteristic feature of the region. Informed consent was obtained from the parents or legal guardians of all participants; participation was voluntary, and anonymity of results was guaranteed.

Context and Setting. The study was conducted within extracurricular activities (elective English classes) from September to December 2025. The total intervention lasted 16 weeks (one semester). The extracurricular format was chosen to avoid conflict with the compulsory curriculum (the standardised "Spotlight-8" teaching package) and to allow flexible integration of the developed local history modules.

Instruments and Materials. The study used the following materials, developed by the research project group "Tatarstan: Language and Culture, History and Modernity" at the Department of Romance-Germanic Languages and Teaching Methods, Naberezhnye Chelny State Pedagogical University: three thematic modules – "Welcome to Tatarstan," "National

Holidays of Tatarstan," and "Where the History of Tatarstan Begins." Within each module, one integrated lesson was conducted. Tasks included non-linear texts (infographics, diagrams, timelines), video materials (reports on Tatar diasporas abroad), and coded texts (with reversed letters, redaction, picture-based encryption). After completing the three modules, an intellectual linguocultural quiz called the "Tatar-lish Quiz" (five categories with four questions of varying difficulty levels) was administered as a final assessment tool.

Data Collection Procedure. Data collection was carried out in three stages. At the preliminary stage (Week 1), an initial questionnaire on attitudes towards learning English through local culture was administered (qualitative data not included in this article). At the main stage (14 weeks), integrated lessons based on the module content were developed and delivered within extracurricular activities, with field notes, photo and video materials, and timing of coded text completion recorded. At the final stage (Week 16), the Tatar-lish Quiz was conducted.

Data Analysis. Quantitative analysis included calculating the percentage of correct answers for each of the five quiz categories (N = 28) and calculating the average decoding time per sentence (in seconds) for the first and fifth coded text tasks. Comparison of means was performed without statistical testing due to the pilot nature of the study. Qualitative analysis included the analysis of field notes (students' reactions, communication barriers, engagement) and the analysis of oral reflections after the lessons.

Methodological Limitations. Due to the pilot nature of the study, the methodology has the following limitations: (a) absence of a control group, (b) small sample size (N = 28), (c) lack of randomisation, and (d) possible "special interest" effect (linguistically inclined students may be more motivated from the outset). All limitations will be addressed when planning the main experimental study.

4. Results

In intercultural communication, the sociocultural component of communicative competence plays a significant role in the formation of a plurilingual personality. This component involves developing the ability to present one's heritage culture in a foreign language and to compare the historical and cultural features of one's region of residence with those of the target language countries. The Federal State Educational Standard for Basic General Education "ensures the preservation and development of cultural diversity and linguistic heritage of the multinational people of the Russian Federation."

Within the developed modules "Welcome to Tatarstan," "National Holidays of Tatarstan," and "Where the History of Tatarstan Begins," the following types of tasks were used: inquiry-based tasks, group research work, and project-based activities. For example:

1. Hold a survey among your classmates to find out what nationality they belong to. Present the results in graphic form.

2. Project: Work in groups. Create a seasonal calendar of Tatar holidays to present to the class.

3. Web quest: Search the internet for additional information about the history of the Kazan Kremlin. Draw a chronological line of its history, noting only the most important events.

The Tatar-lish Quiz was piloted with Grade 8 students with a language-focused curriculum (N = 28). The quiz consisted of five categories: "Culture and Traditions," "Folklore," "Famous People," "Linguistic Features," and "Geography." Each category

included four questions of varying difficulty levels. The quiz format made it possible to assess knowledge of both English and Tatar languages.

Table 1

Quiz Results of Grade 8 Students (N = 28)

Category	Success Rate
Culture and Traditions	77%
Linguistic Features	60%
Folklore	55%
Geography	53%
Famous People	32%

Students demonstrated high results in the categories “Culture and Traditions” (77% correct answers) and “Linguistic Features” (60% correct answers). At the same time, areas of academic deficit were identified: students showed low levels of knowledge in the categories “Folklore,” “Geography,” and “Famous People” (55%, 53%, and 32% correct answers, respectively). The notably low result in the “Famous People” category (32%) warrants particular attention, as it indicates insufficient integration of information about regional figures in culture, science, and sports into the educational process.

Integrated English and Tatar language lessons were conducted within extracurricular activities. Students were given tasks involving non-linear texts, video materials, and coded texts. The results of task completion showed that non-linear texts develop predictive skills and the ability to condense information semantically. Video materials contributed to the formation of listening and pronunciation skills, situational motivation, and visual fixation of culturally marked vocabulary. Coded texts (with reversed letters, redaction, picture-based encryption) activated mechanisms of linguistic guesswork and anticipation: the average decoding time decreased from 90 seconds (first task) to 45 seconds (fifth task), indicating the formation of probabilistic forecasting strategies.

In accordance with the principle of problem-based learning (developing critical thinking by presenting ambiguous cultural facts), tasks included elements comparing different points of view. Preliminary observations showed that excessive problematisation at the initial stage (for example, discussing controversial pages of regional history) created a communication barrier. Therefore, only those problem situations that allowed for different interpretations within a value-neutral field – so-called “consensus-discussion” topics (e.g., comparing Tatar and British harvest festival traditions) – were used in the main part of the lessons. Students successfully completed such tasks, demonstrating readiness to express and argue their opinions in English.

5. Discussion

The proposed approach to developing learning content proceeds from the premise that local history and cultural studies material acts not as a peripheral addition to the “main” foreign language content but as a system-forming factor. It is through making sense of facts of one’s heritage culture in a foreign language that the transition occurs from formal acquisition of vocabulary and grammar to personally meaningful expression.

Analysis of Quiz Results. The results presented in Table 1 revealed differentiation in the level of mastery of various categories of cultural content. The high level in the "Culture and Traditions" category (77%) can be explained by the fact that this material is most frequently presented in standard teaching packages (holidays, food, customs) and is also actively disseminated in the media. The low level in the "Famous People" category (32%) requires special attention: this may be due to the fact that English language textbooks predominantly present information about figures from English-speaking countries rather than regional celebrities.

This gap aligns with the conclusion of the systematic review by Wang et al. (2022) that globally distributed teaching materials often neglect local cultural elements, creating an imbalance in favour of the target language countries. Non-systematic inclusion of local history material in the educational process is the cause of an information gap that does not provide the necessary effect of culture-oriented teaching.

The obtained results confirm and complement the findings of international research. As in the study by Patanduk et al. (2025), we observe that students demonstrate higher engagement and success in those categories where local content is closely related to their everyday experience (traditions, language). The study by Haerazi et al. (2023) correlates with our findings that integrating local history material into English language teaching enables learners to navigate intercultural communication with greater proficiency and cultural sensitivity. This approach contributes to the ongoing advancement of language education and its transformative impact on learners' communicative capabilities and cultural understanding.

One of the key conclusions of Reformana et al. (2024) finds empirical confirmation in our context. The use of local cultural topics allows learners to connect with their own heritage, which not only enhances their motivation to participate in speaking activities but also boosts their confidence in expressing ideas in English. This familiarity with the content encourages a natural flow of conversation, reducing the cognitive load often associated with learning foreign language structures and vocabulary.

Resolving Methodological Contradictions. The results of the study allow us to propose specific ways of resolving the three contradictions stated in the methodology.

First contradiction (regional identity vs. multicultural orientation). This is resolved through the principle of "translatability" of cultural facts, implemented in the quiz: each category contained questions about both Tatarstan and English-speaking countries. However, the low results in the "Folklore" and "Geography" categories (55% and 53%) indicate that this is insufficient. A more systematic approach is needed – selecting not any comparable phenomena but those that have high frequency in both cultural contexts (for example, comparing the Kazan Kremlin and the Tower of London as symbols of statehood rather than merely "sights").

Second contradiction (standardised textbooks vs. regional specificity). This is resolved through the proposed mixed model: an introductory module (two to three hours) "Talking about our small homeland in English" → distributed tasks (one to two per each textbook topic) → a final project at the end of the year. The results of the conducted lessons show that distributed tasks should not be mere "insertions" into textbook topics but specially designed mini-modules accompanied by QR codes linking to authentic regional resources (as was done with the coded texts). Students positively evaluated this format, confirming the effectiveness of the approach.

Third contradiction (age-related abilities vs. material complexity). This is resolved through a combined approach to texts. The data show that semi-authentic texts (teacher-generated) are effective for introducing cultural concepts, while short authentic fragments are effective for developing linguistic guesswork. At the same time, the average decoding time for coded texts decreased from 90 to 45 seconds, indicating rapid formation of probabilistic forecasting strategies.

Age Characteristics and the Activity-Based Model. Contemporary research confirms the findings of Vygotsky (1978) and Elkonin (1989) on the significance of adolescence for the formation of reflection and identity (Shapovalenko et al., 2026). A Grade 8 student is already capable of abstract thinking and comparisons but remains sensitive to the evaluation of their personal position. This creates both favourable conditions for including local history material (since the topic of "my small homeland" is personally significant) and risks: poorly chosen material or imposing a particular view of history or culture may be rejected as "officialdom" or propaganda. Consequently, learning content should be structured not as a transmission of predetermined "correct" cultural facts (an information model) but as a space for expression and discussion (an activity-based model). The obtained results confirm this thesis: students actively engaged in discussing those cultural topics where expressing their own position was allowed, and conversely demonstrated passivity when an attempt was made to impose a single correct view.

Ethnocultural Relevance. The problem of ethnocultural relevance of learning content requires special attention: in classes with a multi-ethnic composition, local history material from one group of students may be alien to another. The solution is to include material related to the regional space common to all, rather than to the ethnic traditions of one group. When addressing ethnocultural topics, a format of intergroup comparison should be used, where each group presents its own material. In the Republic of Tatarstan, where two state languages (Russian and Tatar) function, this principle takes on particular significance: students learn English by comparing it with their native (Tatar) and Russian languages, which contributes to the development of a plurilingual personality.

6. Conclusion

Including familiar linguocultural content in the school subject of "Foreign Language" encourages students to reflect on similarities and differences between cultures, contributing to a deeper understanding of their own cultural characteristics and those of "other" cultures. The integration of local history material into Grade 8 English language teaching, using the example of the Republic of Tatarstan, demonstrates increased motivation, the formation of a plurilingual identity, and the strengthening of national identity. Students reported forming a stronger emotional connection with the material, perceiving English not as an external imposition but as a medium that reflects their own lives.

Further work within the project involves the creation of a teaching guide for English teachers containing up-to-date local history material for Grades 7 and 8 of general education schools in the Republic of Tatarstan and an empirical verification of the effectiveness of the proposed mixed model. The next phase of the study will include a quasi-experiment with a larger sample (N = 120), a control group, and a pre-test/post-test design, which will yield statistically significant data on the effectiveness of the developed modules and tasks.

Acknowledgments

The authors would like to thank the administration and teachers of Secondary School No. 41, Naberezhnye Chelny, for their support in conducting this study. Special gratitude is

extended to the research project group “Tatarstan: Language and Culture, History and Modernity” at Naberezhnye Chelny State Pedagogical University for developing the teaching modules. The authors also express their appreciation to the students and their parents for their voluntary participation and trust.

#201 INTEGRATING DEBATE-BASED PEDAGOGY TO SUPPORT VIETNAM'S TRANSITION FROM EFL TO ESL

Nguyen Thuy Hong Van[1], Guillermo Reyna[2]

Abstract

Vietnam is undergoing a major change in how English is taught. People in charge of education are moving away from the old way of teaching English as a foreign language. Instead, they want to teach English as if it were a second language people use every day. This new way of teaching focuses on using English to communicate, rather than just learning grammar rules. But even with this change, many classrooms still focus too much on grammar and exam preparation. This means students don't get to practice using English in real-life situations or think critically about what they're learning. This study examines how using debates in the classroom can help address this problem. It can help students improve their English communication and think more deeply about what they're learning. This research examines how classroom debates can help students express their opinions, examine evidence, and respond to others' views in English. It also checks if debating in class can improve critical thinking and make the classroom a better place to learn English. The study draws on ideas from teaching argumentation and language skills to examine how class debates affect students' participation and engagement. By doing so, it aims to determine whether debating can help Vietnamese students improve their English-speaking and critical-thinking skills. The goal is to create a classroom where students feel comfortable using English and can develop their skills in a fun and interactive way. This research aims to show that using debates in teaching can help students feel more confident when communicating, think more critically, and use language more effectively. The study provides teachers and curriculum designers with new ideas for teaching English in ways that align with Vietnam's evolving goals for English language education. The findings also show that successful debate implementation depends on structured scaffolding, flexible classroom formats, and teacher support. While teachers strongly valued debate, many used it only occasionally, indicating a belief-practice gap stemming from limited time, large class sizes, exam-oriented curricula, and insufficient practical training.

***Keywords*:** debate, critical thinking, argumentative, EFL, ESL, communication, teacher training.

1. Introduction

Vietnam is currently experiencing a significant shift in English language education. Traditionally, English has been taught largely as a foreign language, with classroom practices often emphasising grammar, vocabulary memorisation, examination preparation, and teacher-led instruction. However, recent policy directions show a stronger national aspiration to move English education beyond conventional foreign-language instruction. Decision No. 2080/QĐ-TTg continued Vietnam's national foreign language education reform for the period 2017–2025, while Decision No. 2371/QĐ-TTg approved the project of "making English the second language in schools" for the period 2025–2035, with a vision to 2045 (Prime Minister of Vietnam, 2017, 2025). This policy direction reflects the growing expectation that English

[1]*Corresponding author, Dr., INTESOL Vietnam - Veducon, Ho Chi Minh City, Vietnam; Email: van.nguyenthuyhong75@gmail.com*
[2] *INTESOL Vietnam - Veducon, Ho Chi Minh City, Vietnam*

should be used more widely and effectively in teaching, communication, management, and school activities, creating an English-speaking ecosystem across educational levels.

The transition from English as a Foreign Language (EFL) toward English as a Second Language (ESL) should not be understood simply as an increase in the number of English lessons. More importantly, it involves a change in English's role in education. English is expected to move from being mainly a school subject studied for tests to becoming a language that learners use for communication, learning, reasoning, and participation. This orientation is consistent with communicative approaches to language education, which emphasise the ability to use language appropriately and effectively in social contexts, rather than merely mastering grammatical forms (Hymes, 1972; Canale & Swain, 1980). Hymes' concept of communicative competence challenged the view that language competence is only grammatical knowledge, while Canale and Swain's model expanded communicative competence to include grammatical, sociolinguistic, discourse, and strategic competence.

In this context, Vietnam's EFL-to-ESL transition requires pedagogical approaches that create more meaningful opportunities for students to use English as a functional tool. Approaches such as Content and Language Integrated Learning (CLIL) and English as a Medium of Instruction (EMI) have often been discussed as possible pathways because they position English not only as the object of study but also as a medium for learning content. CLIL, for example, is commonly understood as a dual-focused educational approach in which an additional language is used to teach and learn both content and language (Coyle, Hood, & Marsh, 2010). Similarly, EMI reflects the use of English to teach academic subjects in contexts where English is not necessarily the first language of students. These approaches therefore represent a broader educational movement in which English functions as a medium for learning, thinking, and communication.

However, while CLIL and EMI provide valuable institutional and curricular models, they may not always be easy to implement widely in regular English classrooms. Successful implementation often requires teacher preparation, appropriate materials, institutional support, and sufficient learner readiness (Thi Thu Hien, 2022). Therefore, there is a need to explore classroom-level pedagogical strategies that can support the same underlying goal: helping learners use English meaningfully, not only study it formally. This paper argues that debate-based pedagogy offers one such practical and accessible pathway. Like CLIL and EMI, debate shifts the role of English from a subject of study to a medium of use. However, rather than using English primarily to learn subject content, debate enables students to use it as a tool for expressing viewpoints, constructing arguments, evaluating evidence, responding to opposing ideas, asking questions, and engaging in critical discussion.

Debate-based pedagogy is particularly relevant to English language classrooms because it combines communicative language use with cognitively demanding learning. Previous studies have shown that debate can support speaking development, critical thinking, argumentation, and student engagement in EFL/ESL contexts (Aclan & Aziz, 2015; Iman, 2017; El Majidi et al., 2024). Debate activities require learners to speak with a clear communicative purpose, organise ideas logically, listen to others, respond spontaneously, and use persuasive language. As El Majidi et al. argue, debate lends itself to student-centred pedagogy because students do much of the talking and thinking during the learning process. In this sense, debate is not merely a speaking activity or a competitive event; it is a structured pedagogical practice that can help students use English for meaningful interaction and higher-order thinking.

This is especially important in Vietnamese English classrooms, where many students may have studied English for years but still have limited opportunities to express opinions, defend viewpoints, respond to disagreement, or participate confidently in academic discussions. If Vietnam aims to make English function more like a second language in schools, learners need classroom environments where English is used not only for exercises, but also for authentic communication, reasoning, and participation. Debate can contribute to this goal by creating English-rich classroom conditions in which students use English to think, interact, and communicate with a clear purpose.

Therefore, this study examines how debate-based pedagogy can support Vietnam's transition from EFL to ESL by enhancing students' communicative competence and critical thinking in Vietnamese English language classrooms. Specifically, it explores how debate activities help students express opinions, construct arguments, use evidence, respond to opposing views, and participate more actively in classroom interaction. The central argument of this paper is that debate-based pedagogy can contribute to Vietnam's EFL-to-ESL transition by transforming English from a grammar-focused school subject into a communicative and cognitive tool. While CLIL and EMI use English as a medium for learning subject content, debate-based pedagogy uses English as a medium for argumentation, inquiry, and critical communication.

2. Literature Review

2.1 Communicative competence in TESOL

The concept of communicative competence is central to TESOL because it shifts the goal of language learning from knowing about language to using it appropriately and effectively in meaningful contexts. Hymes (1972) introduced communicative competence as a response to approaches that treated language competence primarily as grammatical knowledge. For Hymes, language users need to know not only whether an utterance is grammatically possible, but also whether it is appropriate and effective in a particular social situation. This view provides an important foundation for communicative language teaching because it emphasises language use, social meaning, and contextual appropriateness.

Canale and Swain (1980) further developed the concept by proposing a model of communicative competence that includes grammatical, sociolinguistic, and strategic competence. Canale (1983) later elaborated the model by identifying discourse competence as another important component. This broader understanding is useful for the present study because debate requires learners to do much more than produce grammatically accurate sentences. In debate, students must organise ideas coherently, respond to others, use appropriate language for agreement and disagreement, and manage communication when they lack vocabulary or need time to think.

A later pedagogically oriented model by Celce-Murcia et al. (1995) also emphasises that communicative competence involves interconnected dimensions, including discourse, linguistic, actional, sociocultural, and strategic competence. These dimensions are highly relevant to classroom-based debate. Debate requires learners to use linguistic resources accurately, organise extended spoken discourse, and perform communicative actions such as persuading and challenging, communicate appropriately with others, and use strategies to maintain interaction when communication becomes difficult.

In English language classrooms, communicative competence therefore involves several interrelated dimensions (Celce-Murcia et al., 1995). Grammatical competence helps learners express ideas accurately. Discourse competence enables them to connect ideas logically

through sequencing, explanation, contrast, and conclusion. Sociolinguistic competence helps students choose appropriate language for respectful disagreement, clarification, and persuasion. Interactional competence allows learners to listen, respond, ask questions, and negotiate meaning with others. Strategic competence helps learners continue communication when they face difficulties, such as hesitation, lack of vocabulary, or misunderstanding.

This broader understanding of communicative competence is particularly important in the Vietnamese context, where many learners may study English for years but still have limited opportunities to use it for extended interaction, argumentation, or academic discussion. If Vietnam aims to move toward an ESL-oriented learning environment, students need classroom activities that help them use English not only accurately, but also purposefully, interactively, and strategically. Debate-based pedagogy is relevant because it creates communicative situations in which learners must use English to express positions, justify claims, respond to counterarguments, and interact with peers.

2.2 English as a tool for learning, thinking, and communication

The shift from EFL to ESL-oriented education is closely connected to the changing function of English in the classroom. In a traditional EFL model, English is often treated as a subject to be studied, tested, and corrected. In a more ESL-oriented approach, English becomes a tool for communication, learning, thinking, and participation. This distinction is important because the aim is not simply to increase the number of English lessons, but to provide meaningful opportunities for learners to use English in their educational lives.

Approaches such as Content and Language Integrated Learning (CLIL) and English as a Medium of Instruction (EMI) reflect this broader direction. CLIL is commonly defined as a dual-focused educational approach in which an additional language is used to teach and learn both content and language (Coyle, Hood, & Marsh, 2010). In CLIL, learners use the target language not only to learn vocabulary and grammar, but also to understand, discuss, and process subject content. Coyle et al. (2010) emphasise that CLIL involves learning content with and through an additional language, which positions language as a medium for cognitive and academic development.

EMI is another example of this shift. Dearden (2014) defines English Medium Instruction as the use of English to teach academic subjects in countries or jurisdictions where the first language of the majority of the population is not English. EMI therefore reflects the increasing role of English in education, internationalisation, and access to academic knowledge. However, EMI also requires institutional support, teacher readiness, learner preparedness, and appropriate materials, which may make it difficult to implement fully in all educational contexts.

Although debate-based pedagogy is not the same as CLIL or EMI, it shares an important principle with them: English is used as a medium rather than only as an object of study. While CLIL and EMI use English as a medium for learning subject content (Coyle et al., 2010; Dearden, 2014), debate uses English as a medium for argumentation, inquiry, and reasoning (Kuhn & Udell, 2003) and for critical communication (El Majidi et al., 2024). This connection is important for the present study because debate offers a classroom-level pathway for creating meaningful English use even in contexts where full CLIL or EMI implementation may not yet be possible.

From a second language acquisition perspective, meaningful language use is also important because learners develop language through interaction and output. Long's (1996) interaction hypothesis emphasises the role of interaction, negotiation of meaning, and feedback

in second language development. Swain's (2005) output hypothesis highlights the importance of language production, arguing that learners need opportunities to produce language because output can push them to process language more deeply. In debate activities, students are pushed to produce extended spoken output, clarify meaning, respond to others, and adjust their language to communicate effectively. These processes make debate a relevant pedagogy for developing an English-rich classroom environment.

2.3 Debate-based pedagogy in English language classrooms

Debate-based pedagogy can be understood as the structured use of debate activities to support learning. In English-language classrooms, debate is not limited to formal competitions; it can include mini-debates, pair debates, group debates, argument-building tasks, rebuttal practice, opinion-line activities, and structured classroom discussions. What distinguishes debate from ordinary speaking practice is that students must take a position, justify it with reasons and evidence, listen to opposing views, and respond critically.

In this study, 'mini-debate' refers to short, scaffolded classroom tasks that preserve the core logic of debate—position, reason, evidence, response, and reflection—without requiring the full structure of formal competitive debate. This approach is consistent with the movement toward integrating debate-based pedagogy as an inclusive, effective tool for classroom-based critical thinking development (Akerman & Neale, 2011). These formats are especially relevant in EFL classrooms because they allow teachers to integrate argumentation into ordinary lessons without needing extended preparation time or competition-style procedures.

Research has increasingly examined debate as a pedagogical tool in EFL and ESL classrooms. Aclan and Aziz (2015) explored parliamentary debate as a pedagogical tool for developing English communication skills in EFL/ESL classrooms. Their study is relevant because it demonstrates that debate can be structured to encompass pre-debate preparation, the debate itself, and post-debate reflection. This staged process is important for language classrooms because it allows teachers to scaffold students' language, content knowledge, and interactional skills before asking them to debate.

Aclan et al. (2016) also examined debate as a pedagogical tool to develop soft skills in EFL/ESL classrooms. Their work describes how debate can support skills such as communication, teamwork, critical thinking, and confidence. For the present study, this is significant because debate is not treated only as a competitive activity, but as a classroom pedagogy that can support both language development and broader learner development.

Debate is especially suitable for communicative language teaching because it gives students a clear reason to speak. Unlike some classroom speaking tasks that may focus mainly on controlled practice or fluency drills, debate requires learners to use language for a genuine communicative purpose: to persuade, question, challenge, explain, and respond. El Majidi et al. (2024) found that debate can serve as a pedagogical tool for developing speaking skills in second language education because it scaffolds speaking processes and requires learners to use both prepared and more spontaneous speech.

In this sense, debate is both communicative and cognitively demanding. Students must organise their ideas, select appropriate expressions, provide reasons, support claims, and manage interaction with others. This makes debate a student-centred activity because learners do much of the thinking, speaking, listening, and responding. The teacher's role shifts from knowledge transmitter to facilitator, language supporter, and discussion manager. This is particularly relevant to Vietnam's EFL-to-ESL transition because the classroom needs to

become a place where students actively use English, rather than only receive explanations about English.

2.4 Debate and critical thinking

Critical thinking is closely related to debate because debate requires learners to examine ideas rather than simply express opinions. In a debate, students must make claims, support them with reasons and evidence, evaluate opposing arguments, identify weaknesses, and construct rebuttals. These processes correspond to higher-order thinking skills such as analysis, evaluation, justification, and perspective-taking.

Research on argumentation supports the link between debate and critical thinking. Kuhn and Udell (2003) examined the development of argument skills and found that argumentation can be developed through instructional intervention. Their work is relevant because debate provides repeated opportunities for students to practise constructing arguments, presenting counterarguments, and engaging in evidence-based reasoning. Rather than seeing critical thinking as an abstract skill, debate makes it visible through students' spoken reasoning, questioning, use of evidence, and rebuttal.

Iman's (2017) study is particularly relevant to EFL contexts. Using a quasi-experimental design, Iman investigated debate instruction in an EFL classroom and found that debate significantly improved students' critical thinking and speaking skills. This supports the argument that debate can contribute to both language development and cognitive development. For the present study, this is important because communicative competence and critical thinking are not treated as separate outcomes. Instead, debate is viewed as a pedagogy through which students use English to think critically and communicate more effectively.

In English-language classrooms, this connection between debate and critical thinking has an additional benefit: students practise critical thinking in the target language. They do not only learn vocabulary related to argumentation; they use English to perform cognitive actions such as explaining, comparing, justifying, questioning, challenging, and concluding. This supports the broader aim of using English as a tool for thinking and communication.

2.5 Research gap

The literature suggests that communicative competence involves much more than grammatical accuracy, and that meaningful language use is essential for developing learners' ability to communicate in real contexts. CLIL and EMI show how English can function as a medium for learning, while debate-based pedagogy offers a practical classroom-level strategy for using English as a medium for argumentation, inquiry, and critical communication. Existing studies also indicate that debate can support speaking development, interaction, argumentation, and critical thinking in EFL/ESL contexts.

However, more research is needed into how debate-based pedagogy can support Vietnam's transition from EFL-oriented instruction to an ESL-oriented learning environment. In particular, limited attention has been given to how debate may simultaneously enhance communicative competence, critical thinking, and English-rich classroom interaction among Vietnamese learners. This study addresses that gap by examining debate not merely as a speaking activity or competition format, but as a communicative and cognitively demanding pedagogy that can help students use English meaningfully for reasoning, interaction, and participation.

3. Methodology

3.1 Research Design

This study adopts a classroom-based action research design supported by mixed methods. Action research is appropriate for this study because it investigates a pedagogical intervention implemented in a real classroom context, with the aim of improving teaching practice and understanding of learner development. Action research commonly involves cycles of planning, action, observation, and reflection, allowing teachers and researchers to examine how classroom practices can be improved through systematic inquiry (Kemmis et al., 2014).

The use of a mixed-methods approach is also appropriate because the study examines both measurable and interpretive aspects of learning. Quantitative data, such as questionnaire responses and rubric scores, can provide evidence of students' perceived development in communicative competence, critical thinking, and classroom participation. Qualitative data, such as teacher observations, student reflections, and interview responses, can offer deeper insights into how debate-based pedagogy influences students' use of English, reasoning processes, and engagement. Mixed-methods research is useful when a study seeks to combine numerical trends with qualitative explanations of participants' experiences (Creswell & Plano Clark, 2018).

The study is therefore designed as a small-scale classroom intervention to examine how debate-based pedagogy can support Vietnam's transition from EFL-oriented instruction to an ESL-oriented learning environment. Rather than treating debate as a competitive extracurricular activity, the intervention positions debate as a communicative classroom pedagogy through which students use English to express opinions, construct arguments, evaluate evidence, respond to opposing views, and participate in meaningful interaction.

3.2 Participants

The participants are Vietnamese English-language learners aged approximately 8 to 15, studying in English-language classes where debate-based activities are integrated into instruction. The learners may come from primary and lower-secondary levels, with varying levels of English proficiency. Because the age range is broad, the intervention and research instruments are adapted to students' developmental stage and language ability.

The research also includes data from teachers, including debate teachers and English language teachers. Teacher data are important because the study not only investigates students' learning outcomes but also examines the pedagogical feasibility of debate-based instruction in Vietnamese English classrooms. Teachers' perceptions can provide valuable insights into students' communicative development, critical thinking, classroom participation, and the support required for effective debate integration.

3.3 Data Collection

Multiple data collection tools are used to strengthen the study's credibility. The use of multiple data sources allows the researcher to examine the intervention from different perspectives, including students' self-perceptions, teacher observations, classroom performance, and reflective responses.

3.3.1 Student questionnaires

Student questionnaires are used to collect learners' perceptions of how debate-based activities influence their English communication, thinking skills, confidence, and classroom participation. Because the participants may include students aged 8-15, two versions of the

questionnaire are used. For students aged 8-11, the questionnaire uses simple statements and a three-point response scale. For students aged 12-15, the questionnaire uses a five-point Likert scale and includes more detailed items related to speaking, argumentation, interaction, confidence, and challenges. Although the Skittles group and Juniors group differ in age, language proficiency, and cognitive development, the questionnaires are designed around the same core constructs: communicative competence, critical thinking, English-rich classroom interaction, confidence, and perceived challenges. The wording, response scale, and task complexity are adapted to each age group, but the underlying constructs remain consistent. For younger learners, items are simplified and supported by clearer language and a three-point scale. For older learners, the five-point Likert scale allows more detailed responses. This design allows age-appropriate data collection while maintaining cross-group conceptual alignment.

Using age-appropriate questionnaire design is important in second-language research because questionnaire items need to be understandable and appropriate to respondents' language proficiency and cognitive level (Dörnyei & Taguchi, 2010). The questionnaire focuses on three main constructs: communicative competence, critical thinking, and English-rich classroom interaction.

3.3.2 Teacher questionnaires

Teacher questionnaires are used to collect data from debate teachers and English language teachers. The teacher questionnaire examines teachers' familiarity with debate, prior use of debate in English classes, understanding of debate as pedagogy, perceptions of communicative competence, views on English as a tool for learning and thinking, and perceived implementation challenges. Teacher data are important because teachers can provide professional observations of students' language use, classroom participation, and the development of critical thinking. The teacher questionnaire also helps identify training needs and practical implications for English language teaching in Vietnam.

3.3.3 Classroom observation notes

Classroom observation notes are used to document students' participation and language use during debate-based activities. The researcher or teacher-observer records evidence of student talk time, peer-to-peer interaction, use of English during group work, willingness to speak, use of reasons and examples, listening and response, respectful disagreement, spontaneous English use, and participation of quieter students. Observation data are particularly useful for examining whether debate creates a more English-rich classroom environment.

3.3.4 Teacher interviews or focus groups

Short teacher interviews or focus groups may be conducted to gain deeper qualitative insights. Interview questions can explore how teachers understand the EFL-to-ESL transition, how debate differs from ordinary speaking activities, whether debate supports communicative competence, how debate supports critical thinking, what challenges students face, what scaffolding strategies are useful, and what training teachers need. Teacher interviews help explain and enrich the questionnaire and observation data.

3.4 Ethical Considerations

Because the study involves young learners, ethical considerations are especially important. Participation should be voluntary, and students should be informed that their responses will be used only for research purposes. Where necessary, parental or institutional

consent should be obtained. Students' names should not be used in the paper, and all data should be anonymised.

Students should also be reassured that the questionnaire is not a test and that there are no right or wrong answers. This is important because young learners may otherwise feel pressure to give positive responses. The teacher-researcher should make clear that honest answers will help improve future English lessons.

4. Data Analysis

4.1 Quantitative Analysis

4.1.1 Student survey analysis

For the Skittles group, the strongest results appeared in communication and early thinking skills. The overall positive response rate was 66.3% for communication-related items and 63.7% for thinking-related items. The strongest individual item was "When I gave an idea, I tried to explain my reason in English," with 90% of students selecting "Yes." Another strong item was "I tried to give an example to make my idea clearer," with 82.5% selecting "Yes." These results suggest that even younger learners were beginning to use English not only to speak, but also to explain, justify, and support their ideas.

However, the Skittles group showed weaker results in affective and motivational areas. Only 40.0% of students selected "Yes" for feeling brave when speaking English during debate activities. Similarly, 42.5% said debate made English class more enjoyable, and 46.3% said they would like to do debate activities again in the future. This suggests that debate can support young learners' communication and reasoning, but it may also feel emotionally demanding if not sufficiently scaffolded.

For the Juniors group, the strongest construct was critical thinking, with a mean score of 3.94 out of 5 and 69.6% of responses were positive. Communicative competence was also strong, with a mean of 3.87 and 67.1% of responses being positive. English-rich classroom interaction had a moderate mean of 3.68, while confidence, motivation, and learner agency had a lower mean of 3.48. The challenge section had a mean of 3.68, showing that students also recognised significant difficulties in debate-based learning.

When it comes to critical thinking, one thing really stands out - debate is a powerful tool. The top-rated activity for younger students was a statement that said, "Debate helped me understand that strong opinions need reasons. "A lot of students agreed with this, with an average rating of 4.14 and over 81% of responses being positive. What's more, students also liked using examples to support their arguments, developing counterarguments, responding to opposing views, and examining topics from different angles. This shows that using debates in the classroom can really help students move away from just expressing their opinions and towards communicating their thoughts in a more thoughtful and reasoned way. By doing this, students can develop stronger critical thinking skills and learn to express themselves more effectively.

4.1.2 Teacher survey analysis

When we looked at what teachers thought about using debates in the classroom, we found that they really liked the idea. They thought it was a great way to help students develop their critical thinking skills - almost 96% of teachers agreed with this, and they rated it an average of 4.63 out of 5. They also thought that English was an important tool for learning,

thinking, and communicating, with over 90% of teachers agreeing and an average rating of 4.57.

Teachers were also very supportive of using debates to teach, with an average rating of 4.54 and over 92% agreeing it was a good idea. Additionally, they thought that debates could help students become better communicators, with an average rating of 4.51 and almost 86.7% of teachers agreeing. Overall, teachers seemed to think that debates were a great way to help students learn and develop important skills.

Teachers strongly agreed that English should be used as a tool for learning, thinking, and interaction, not only as a school subject. This was the highest-rated item in the teacher questionnaire, with a mean of 4.83. They also strongly agreed that debate helps students express opinions, give reasons, and respond to others, and that debate helps students practise both language skills and thinking skills. Both items had a mean of 4.78.

At the same time, the teacher data revealed a gap between belief and practice. Although teachers viewed debate very positively, debate was not yet a regular classroom practice for many respondents. Only 17% reported using debate often or very often. By contrast, 39.1% used debate only sometimes, 30.2% had used it once or twice, and 13.2% had never used debate before. This shows that even though teachers like the idea of debate, they need more help, resources, and confidence to make it a regular part of their teaching. They need to feel more comfortable using debate in class and have the tools to do it well.

4.2 Qualitative Analysis

When we look at open-ended responses from both students and teachers, some common themes emerge. Many students said they felt more confident, learned new words, practised speaking more, and improved at organising their thoughts. They also said they improved at listening to others and giving reasons for their views. But they also had some difficulties, including limited vocabulary, finding ideas, responding quickly, giving evidence, and building rebuttals. Some students got nervous, had trouble with pronunciation, and felt like they were running out of time. To make things better, students wanted more help with vocabulary, some examples to get them started, and feedback from their teachers. They also wanted more time to prepare and some easier or more interesting topics to debate.

Teacher open-ended responses showed similar patterns. They viewed debate as useful for developing communication, critical thinking, argument structure, confidence, and collaboration. They also identified challenges such as limited vocabulary, low student confidence, large class sizes, lack of time, an exam-oriented classroom culture, and insufficient teacher training. Many teachers requested practical workshops, sample lesson plans, model banks, sentence frames, simplified rubrics, classroom management strategies, and opportunities to observe effective debate lessons.

Therefore, the qualitative data helped us better understand the quantitative findings. Both students and teachers thought debate was a good thing, but both groups emphasised that it requires scaffolding. This is an important finding because it suggests that debate-based pedagogy should not be treated as an unstructured speaking activity. It needs to be designed as a guided learning process.

While a fuller thematic analysis may be developed in future research, the present summary provides sufficient qualitative evidence to interpret the main quantitative findings and clarify the practical conditions needed for classroom implementation.

4.2.1 Student perspectives: confidence, language limits, and argument development

Student open-ended responses showed that debate helped learners practise speaking, organise ideas, listen to classmates, and explain opinions with reasons. Many students reported that debate encouraged them to use English more actively because they had to express a position, give examples, and respond to others. However, students also identified several barriers. The most common challenges were limited vocabulary, difficulty finding ideas quickly, nervousness when speaking, pronunciation problems, limited preparation time, and difficulty constructing rebuttals. These responses help explain why the quantitative results were stronger for communication and reasoning than for confidence and motivation.

4.2.2 Teacher perspectives: debate as useful but difficult to sustain

Teacher responses confirmed that debate was viewed positively as a tool for communication, critical thinking, collaboration, confidence-building, and argument structure. However, teachers also emphasised that debate is difficult to implement regularly without practical support. They identified large class sizes, limited lesson time, rigid curricula, exam-oriented assessment, uneven student proficiency, and insufficient teacher training as major barriers. This explains the belief-practice gap found in the quantitative data: teachers valued debate highly, but many did not yet feel prepared to use it frequently.

4.2.3 Scaffolding as the central condition for success

Across both student and teacher responses, scaffolding emerged as the central condition for successful debate-based pedagogy. Students requested vocabulary support, model answers, clearer examples, more preparation time, and easier or more engaging topics. Teachers similarly requested sentence frames, simplified rubrics, classroom management strategies, model lesson plans, debate motion banks, and opportunities to observe effective debate lessons. These findings suggest that debate should not be introduced as an open-ended speaking activity. Instead, it should be designed as a guided learning cycle that includes preparation, language support, structured interaction, feedback, and reflection

5. Findings

5.1 Debate supported communicative competence beyond grammar accuracy

The first major finding indicates that debate-based pedagogy significantly enhances students' communicative competence by shifting the focus from grammatical accuracy to functional, reasoned language use. Both student and teacher data confirm that debate helps learners move beyond short, isolated answers toward more extended, meaningful communication.

- Skill Development: Students reported marked improvements in key areas, including clearly expressing opinions, organising ideas, providing supporting examples, and responding to classmates. Notably, 82.5% of students actively used examples to clarify ideas, and 70% reported producing longer, more complex English sentences.

- Teacher Validation: Teachers strongly agreed that debate enables students to develop essential competencies beyond grammar, including discourse organisation, interactional competence, and the ability to use functional language to agree, disagree, clarify, and politely challenge viewpoints.

- A Pathway to Spontaneous Communication: While the results are encouraging, the data also highlight that natural fluency is a gradual outcome. Only approximately 50–54% of junior students felt debate helped them achieve natural fluency or move entirely beyond

exercise-based learning. This suggests that debate functions best as a structured pathway toward spontaneous communication rather than an immediate guarantee of naturalistic fluency.

This finding supports the study's central argument that debate-based pedagogy serves as a practical, classroom-level intervention for Vietnam's EFL-to-ESL transition by fostering the structured, reasoned interaction necessary for real-world English use.

5.2 Critical Thinking was the strongest shared outcome across students and teachers

The second major finding is that critical thinking was the strongest and most consistent outcome across both student and teacher data.

- Consistent Success: For junior students (ages 12–15), critical thinking yielded the highest construct mean (3.94), with students reporting greater ability to provide evidence, build logical rebuttals, and evaluate multiple perspectives rather than simply expressing agreement or disagreement.

- Developmental Appropriateness: Even among younger "Skittles" learners (ages 8–11), the pedagogy successfully introduced foundational argumentation habits, such as providing reasons, using examples, and responding respectfully to opposing views.

- Teacher Consensus: Educators overwhelmingly identified critical thinking as a primary benefit, with a 4.63 mean rating and 94.3% agreement. They observed that debate helps students move from rote memorisation to higher-order cognitive tasks like argument construction, evidence evaluation, and perspective-taking.

This triangulation of data demonstrates that debate-based pedagogy is uniquely powerful because it integrates language production with cognitive processing. By requiring students to use English to reason, justify, and evaluate, debate transforms the language from a static subject of study into a dynamic tool for communication and inquiry. This directly supports the study's central thesis: debate facilitates the transition toward ESL-oriented environments by making English functional, reasoned, and cognitively demanding.

5.3 Debate helped move English from a subject to a tool for meaningful use

The third major finding is that debate supported the movement from learning English as a subject toward using English as a tool for communication, thinking, and interaction.

This finding is especially relevant to the study's focus on Vietnam's transition from EFL to ESL.

- Student Perception: A majority of Junior students (approx. 72%) reported that debate helped them learn English through actual use, thinking, and communication. Furthermore, 68.4% indicated that the approach enabled them to discuss real-life topics, moving beyond traditional textbook exercises.

- Teacher Alignment: Educators strongly aligned with this goal, assigning a mean rating of 4.83 to the principle that English should serve as a tool for interaction rather than just a subject. They acknowledged that debate provides a practical, classroom-level pathway to achieve this, aligning with the "English-as-a-medium" principle of CLIL and EMI by using the language for argumentation, inquiry, and reasoning.

- Limitations of Interaction: Despite these benefits, the data indicate that debate only partially creates an English-rich environment. While students succeeded in structured tasks, fewer than 42% felt comfortable initiating spontaneous peer interaction or asking questions in English.

In conclusion, this finding establishes that while debate is a powerful tool for fostering reasoned communication, it should be recognised as a structured strategy rather than an immediate substitute for full implementation of CLIL or EMI. To enhance its impact, students require more explicit support to develop the confidence and skills necessary for spontaneous, naturalistic classroom interaction.

5.4 Debate was seen as a classroom pedagogy, not merely a competition

The fourth finding reveals that teachers predominantly conceptualise debate as a versatile classroom pedagogy rather than merely a competitive extracurricular activity. Survey data indicates that the vast majority of teachers utilise debate for speaking (79.2%), critical thinking (66.0%), discussion strategies (52.8%), and authentic communication (43.0%), with only 13.2% viewing it primarily as a competition. Educators strongly support adapting debate into short, flexible classroom tasks—such as pair or group arguments—to foster reasoned interaction, dismissing the notion that it must always take a formal, competitive form. This finding suggests that teachers are more likely to implement debate when it is presented as a flexible classroom routine rather than as a formal competition. In practical terms, this includes short formats such as pair debates, opinion-line discussions, quick rebuttal exchanges, role-card debates, and three-minute group debates. These formats preserve the essential features of debate while reducing pressure on lesson time, classroom management, and student anxiety. Despite this positive perception, a significant belief-practice gap exists: while teachers value the approach, only 17.0% implement it frequently. This disparity appears to be rooted in moderate teacher confidence, lack of training, resource limitations, and uncertainties regarding assessment, indicating that while debate is recognised as a valuable pedagogical tool, it has yet to be fully embedded into routine teaching practice.

5.5 Scaffolding is the main condition for successful debate-based pedagogy

The fifth finding emphasises that scaffolding is the critical prerequisite for successful debate-based pedagogy. The data consistently show that while debate is effective, its success is entirely dependent on providing students with robust linguistic and emotional support.

- Student Challenges: Junior students identified limited vocabulary as their primary barrier (nearly 76%), followed closely by performance anxiety, difficulty generating ideas, rebuttal challenges, and the pressure of spontaneous response. Similarly, younger "Skittles" learners showed low emotional confidence, with only 40% feeling "brave" while debating, highlighting a need for more playful and guided formats.

- Teacher Consensus: Teachers unanimously agreed that systematic pedagogical design—not just enthusiasm—is necessary. They require clear structures, role assignments, time control, and language supports to mitigate classroom barriers such as large class sizes and time constraints.

- Systematic Support: Findings indicate that to move beyond "unstructured speaking" into reasoned communication, teachers must prioritise pre-debate scaffolding, including vocabulary lists, sentence frames, argument templates, and clear assessment rubrics.

Examples of scaffolding tools include sentence frames such as “I agree with this because…,” “One reason is…,” “For example…,” “I understand your point, but…,” “My evidence is…,” and “Therefore, I believe…”. Argument templates can also support students by guiding them through a clear sequence: Claim → Reason → Example/Evidence → Explanation → Link back to the motion. Similarly, rebuttal templates can help students organise responses through the structure of Opposing idea → Weakness/problem → Counter-

reason → Example → Conclusion. A simplified rubric may assess students on clarity of opinion, use of reasons, use of examples, response to others, respectful interaction, and English effort

This finding has direct implications for teacher training in Vietnam. To effectively support the transition from EFL to ESL, professional development must move beyond teaching "debate formats." Instead, training must equip educators with the practical skills to scaffold language, manage participation, foster emotionally safe environments, and adapt complex debate structures for diverse age groups and proficiency levels. Without this intentional design, the benefits of debate remain largely inaccessible

6. Recommendations

Based on the findings, debate-based pedagogy should be implemented as a structured, scaffolded, and age-appropriate approach rather than as an unplanned speaking activity or a formal competition only. The recommendations below are directed at teachers and educators, educational managers, and policy makers.

6.1 Recommendations for Teachers and Educators

- Prioritise Scaffolding: Implement intentional language and structural support (e.g., sentence frames, argument templates, and vocabulary sheets) to reduce cognitive load and help students organise ideas.
- Create an Emotionally Safe Environment: Mitigate speaking anxiety by starting with low-stakes, manageable tasks such as pair work, small-group rehearsals, and mini-debates, and focus feedback on effort and reasoning rather than just grammatical accuracy.
- Differentiate by Level: Tailor activities to age and proficiency; use playful, simplified tasks for younger learners and gradually introduce complex argumentation and rebuttal techniques for older students.
- Teach Spontaneous Interaction: Explicitly practice question stems and clarification strategies to help students move from prepared speech toward natural, spontaneous classroom interaction.
- Adopt Learning Cycles: Utilise post-debate reflections, where students identify successes and areas for improvement, and teachers provide delayed feedback to reinforce language and thinking skills.

6.2 Recommendations for Educational Managers

- Develop Practical Resources: Close the belief-practice gap by providing ready-to-use materials such as motion banks, lesson plans, and simplified assessment rubrics.
- Promote Flexible Formats: Normalise debate as a routine classroom activity—such as 10–15 minute tasks—rather than reserving it only for special events or formal competitions.
- Navigate Constraints: Integrate debate into existing curricula by embedding it into reading, writing, and speaking outcomes to ensure it fits within time and resource constraints.
- Foster Peer Learning: Organise model lessons and internal workshops to demonstrate how debate can work in real, large-class settings.

6.3 Recommendations for Policy Makers

- Formally Recognise Debate: Integrate debate-based pedagogy into national guidelines as a practical pathway to support Vietnam's transition from EFL to ESL, with a focus on English as a functional tool for reasoning and communication.
- Targeted Professional Development: Focus teacher training on scaffolding language, managing classroom participation, assessing higher-order thinking, and adapting debate for diverse proficiency levels.
- Broaden Assessment Frameworks: Reform English assessment to incentivise debate by including criteria such as discourse organisation, interactional competence, use of evidence, and reasoned rebuttal, rather than focusing solely on grammatical accuracy and rote exam performance.

Overall, the successful transition to ESL-oriented English education in Vietnam depends on ensuring that debate is viewed not as an "unplanned speaking activity," but as a structured classroom approach that transforms English into a tool for cognitive and communicative development.

7. Research limitations

This study has several limitations. Firstly, due to space constraints, this paper presents a summary of the qualitative findings. A comprehensive thematic analysis of interview transcripts and observation notes is reserved for future publication. However, the qualitative evidence presented in this paper is sufficient to explain the main quantitative patterns and identify the practical conditions required for successful debate-based pedagogy.

Secondly, external pressures such as large class sizes, rigid curricula, and exam-oriented assessment were identified as significant barriers but were not experimentally isolated. Therefore, this study cannot determine the separate effect of each constraint on the success of debate-based pedagogy. Instead, the findings should be interpreted as classroom-based evidence from a real Vietnamese EFL context where these constraints interact with teacher practice.

Lastly, the study involved 159 students and 53 teachers, making it a small-scale action research project rather than a nationally representative study. For this reason, the findings should be understood as context-specific insights rather than broad generalisations about all Vietnamese schools. However, the findings may be transferable to other Vietnamese EFL contexts that share similar features, such as grammar-oriented instruction, limited student speaking opportunities, exam pressure, mixed proficiency levels, and growing policy interest in English-rich learning environments.

Future research could examine the long-term effects of debate-based pedagogy, compare debate implementation across different regions or school types, and investigate how specific constraints such as class size, curriculum flexibility, and assessment culture influence classroom debate outcomes.

8. Conclusion

This study suggests that debate-based pedagogy can offer a practical, classroom-level pathway for supporting Vietnam's ESL-oriented policy goals, particularly in EFL classrooms where students need more opportunities to use English for communication, reasoning, and interaction. By engaging students in argumentation, inquiry, and evidence-based reasoning, educators can create "English-rich" environments even in contexts where full CLIL or EMI implementation remains challenging. Debate does not require a complete overhaul of the

curriculum; rather, it functions as a flexible strategy that, when integrated into routine practice, fosters the kind of reasoned, spontaneous interaction essential for Vietnam's international integration.

The transition toward an ESL-oriented education system in Vietnam is a pedagogical journey that requires more than policy directives; it requires a shift in classroom culture. Debate-based pedagogy, when supported by systematic teacher training, practical resources, and a broadening of assessment frameworks beyond grammar, provides a tangible method for achieving this. Because this was a small-scale action research project, the findings should not be treated as nationally representative. However, they offer context-specific insights that may be adapted by teachers and institutions facing similar classroom realities, including limited speaking opportunities, exam pressure, mixed proficiency levels, and the need for practical English-rich activities. Future research could explore the longitudinal impact of these practices and examine how debate can be better adapted to support spontaneous peer interaction, helping learners move beyond the task's structure toward the natural fluency required for real-world English communication.
